**Trientine** is used for the treatment of Wilson's disease only in patients intolerant of penicillamine; it is **not** an alternative to penicillamine for rheumatoid arthritis or cystinuria. Penicillamine-induced systemic lupus erythematosus may not resolve on transfer to trientine.

**Zinc** prevents the absorption of copper in Wilson's disease. Symptomatic patients should be treated initially with a chelating agent because zinc has a slow onset of action. When transferring from chelating treatment to zinc maintenance therapy, chelating treatment should be co-administered for 2–3 weeks until zinc produces its maximal effect.

#### PENICILLAMINE

**Indications** see under Dose below

**Cautions** section 10.1.3; also neurological involvement in Wilson's disease

**Contra-indications** section 10.1.3

**Renal impairment** section 10.1.3

**Pregnancy** section 10.1.3

**Breast-feeding** section 10.1.3

**Side-effects** section 10.1.3; also neuropathy (especially if previous neurological involvement in Wilson's disease—prophylactic pyridoxine recommended, see section 9.6.2)

#### Dose

- Wilson's disease, 1.5–2 g daily in divided doses before food; max. 2 g daily for 1 year; maintenance 0.75–1 g daily; **ELDERLY** 20 mg/kg daily in divided doses, adjusted according to response; **CHILD** see *BNF for Children*

- Autoimmune hepatitis (used rarely; after disease controlled with corticosteroids), initially 500 mg daily in divided doses increased slowly over 3 months; usual maintenance dose 1.25 g daily; **ELDERLY** not recommended
- Cystinuria, therapeutic, 1–3 g daily in divided doses before food, adjusted to maintain urinary cystine below 200 mg/litre; prophylactic (maintain urinary cystine below 300 mg/litre) 0.5–1 g at bedtime; maintain adequate fluid intake (at least 3 litres daily); **ELDERLY** minimum dose to maintain urinary cystine below 200 mg/litre; **CHILD** see *BNF for Children*
- Severe active rheumatoid arthritis, section 10.1.3

#### Preparations

Section 10.1.3

#### TRIENTINE DIHYDROCHLORIDE

**Indications** Wilson's disease in patients intolerant of penicillamine

**Cautions** see notes above; **interactions:** Appendix 1 (trientine)

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk; monitor maternal and neonatal serum-copper concentration; teratogenic in *animal* studies

**Side-effects** nausea, rash; *very rarely* anaemia; duodenitis and colitis also reported

#### Dose

- ADULT** and **CHILD** over 12 years, 1.2–2.4 g daily in 2–4 divided doses before food; **CHILD** 2–12 years, initially 0.6–1.5 g daily in 2–4 divided doses before food, adjusted according to response

**Trientine Dihydrochloride** (Univar) (POM)

Capsules, trientine dihydrochloride 300 mg. Label: 6, 22

#### ZINC ACETATE

**Indications** Wilson's disease (initiated under specialist supervision)

**Cautions** portal hypertension (risk of hepatic decompensation when switching from chelating agent); monitor full blood count and serum cholesterol; **interactions:** Appendix 1 (zinc)

**Pregnancy** reduce dose to 25 mg 3 times daily adjusted according to plasma-copper concentration and urinary copper excretion

**Breast-feeding** manufacturer advises avoid; present in milk—may cause zinc-induced copper deficiency in infant

**Side-effects** gastric irritation (usually transient; may be reduced if first dose taken mid-morning or with a little protein); *less commonly* sideroblastic anaemia and leucopenia

#### Dose

**Note** Dose expressed as elemental zinc

- Wilson's disease, 50 mg 3 times daily (max. 50 mg 5 times daily), adjusted according to response; **CHILD** 1–6 years, 25 mg twice daily; 6–16 years, body-weight under 57 kg, 25 mg 3 times daily, body-weight over 57 kg, 50 mg 3 times daily; **ADOLESCENT** 16–18 years, 50 mg 3 times daily

**Wilzin**® (Orphan Europe) (POM)

Capsules, zinc (as acetate) 25 mg (blue), net price 250-cap pack = £132.00; 50 mg (orange), 250-cap pack = £242.00. Label: 23

## Carnitine deficiency

**Levocarnitine** is available for the management of primary carnitine deficiency due to inborn errors of metabolism or of secondary deficiency in haemodialysis patients.

### LEVOCARNITINE

(Carnitine)

**Indications** primary and secondary carnitine deficiency

**Cautions** diabetes mellitus; monitoring of free and acyl carnitine in blood and urine recommended

**Renal impairment** accumulation of metabolites may occur with chronic oral administration in severe impairment

**Pregnancy** appropriate to use; no evidence of teratogenicity in *animal* studies

**Side-effects** nausea, vomiting, abdominal pain, diarrhoea, body odour; side-effects may be dose-related—monitor tolerance during first week and after any dose increase

#### Dose

- Primary deficiency, **by mouth**, up to 200 mg/kg daily in 2–4 divided doses; usual max. 3 g daily; **by intravenous injection** over 2–3 minutes, up to 100 mg/kg daily in 2–4 divided doses
- Secondary deficiency, **by intravenous injection** over 2–3 minutes, 20 mg/kg after each dialysis session (dosage adjusted according to plasma-carnitine concentration); maintenance (if benefit gained from first intravenous course), **by mouth**, 1 g daily

**Levocarnitine** (Non-proprietary) PoM

**Paediatric oral solution**, levocarnitine 300 mg/mL (30%), net price 20 mL = £55.55

**Carnitor**<sup>®</sup> (Sigma-Tau) PoM

**Tablets**, levocarnitine 330 mg, net price 90-tab pack = £103.95

**Chewable tablets**, levocarnitine 1 g, net price 10-tab pack = £35.00

**Oral liquid**, levocarnitine 100 mg/mL (10%), net price 10 × 10-mL (1-g) single-dose bottle = £35.00

**Injection**, levocarnitine 200 mg/mL, net price 5-mL amp = £11.90

## Fabry's disease

**Agalsidase alfa** and **agalsidase beta**, enzymes produced by recombinant DNA technology, are licensed for long-term enzyme replacement therapy in Fabry's disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

### AGALSIDASE ALFA and BETA

**Indications** Fabry's disease (specialist use only)

**Cautions** interactions: Appendix 1 (agalsidase alfa and beta)

**Infusion-related reactions** Infusion-related reactions very common; manage by slowing the infusion rate or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature

**Pregnancy** use with caution

**Breast-feeding** use with caution—no information available

**Side-effects** gastro-intestinal disturbances, taste disturbances; tachycardia, bradycardia, palpitation, hypertension, hypotension, chest pain, oedema, flushing; dyspnoea, cough, rhinorrhoea; headache, fatigue, dizziness, asthenia, paraesthesia, syncope, neuropathic pain, tremor, sleep disturbances; influenza-like symptoms, nasopharyngitis; muscle spasms, myalgia, arthralgia; eye irritation; tinnitus; hypersensitivity reactions, angioedema, pruritus, urticaria, rash, acne; *less commonly* cold extremities, parosmia, ear pain and swelling, skin discoloration, and injection-site reactions

**Fabrazyme**<sup>®</sup> (Genzyme) PoM

**Intravenous infusion**, powder for reconstitution, agalsidase beta, net price 5-mg vial = £315.08; 35-mg vial = £2196.59

**Dose** **By intravenous infusion**, **ADULT** and **CHILD** over 8 years 1 mg/kg every 2 weeks

**Replagal**<sup>®</sup> (Shire HGT) PoM

**Concentrate for intravenous infusion**, agalsidase alfa 1 mg/mL, net price 3.5-mL vial = £1068.64

**Dose** **By intravenous infusion**, **ADULT** and **CHILD** over 7 years 200 micrograms/kg every 2 weeks

## Gaucher's disease

**Imiglucerase**, an enzyme produced by recombinant DNA technology, is administered as enzyme replacement therapy for non-neurological manifestations of type I or type III Gaucher's disease, a familial disorder affecting principally the liver, spleen, bone marrow, and lymph nodes.

**Velaglucerase alfa**, an enzyme produced by recombinant DNA technology, is administered as enzyme replacement therapy for the treatment of type I Gaucher's disease.

**Miglustat**, an inhibitor of glucosylceramide synthase, is licensed for the treatment of mild to moderate type I Gaucher's disease in patients for whom enzyme replacement therapy is unsuitable; it is given by mouth; see p. 698.

### IMIGLUCERASE

**Indications** (specialist use only) non-neurological manifestations of type I or type III Gaucher's disease

**Cautions** monitor immunoglobulin G (IgG) antibody concentration; when stabilised, monitor all parameters and response to treatment at intervals of 6–12 months

**Pregnancy** manufacturer advises use with caution—limited information available

**Breast-feeding** no information available

**Side-effects** hypersensitivity reactions (including urticaria, angioedema, cyanosis, hypotension, flushing, tachycardia, paraesthesia, backache); *less commonly* nausea, vomiting, diarrhoea, abdominal cramps, headache, dizziness, fatigue, fever, arthralgia, and injection-site reactions

#### Dose

- **By intravenous infusion**, initially 60 units/kg once every 2 weeks (doses as low as 15 units/kg once every 2 weeks may improve haematological parameters and organomegaly); maintenance, adjust dose according to response; **CHILD** under 18 years see *BNF for Children*

**Cerezyme**<sup>®</sup> (Genzyme) **[Pom]**

**Intravenous infusion**, powder for reconstitution, imiglucerase, net price 200-unit vial = £535.65; 400-unit vial = £1071.29

**Electrolytes** Na<sup>+</sup> 0.62 mmol/200-unit vial, 1.24 mmol/400-unit vial

**VELAGLUCERASE ALFA**

**Indications** (specialist use only) type I Gaucher's disease

**Cautions** monitor immunoglobulin G (IgG) antibody concentration in severe infusion-related reactions or if there is a lack or loss of effect with velaglucerase alfa  
**Infusion-related reactions** Infusion-related reactions very common; manage by slowing the infusion rate, or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature

**Pregnancy** manufacturer advises use with caution—limited information available

**Breast-feeding** manufacturer advises use with caution—no information available

**Side-effects** nausea, abdominal pain, tachycardia, hypertension, hypotension, flushing, headache, dizziness, malaise, pyrexia, arthralgia, bone pain, back pain, hypersensitivity reactions, rash, urticaria

**Dose**

- **By intravenous infusion**, 60 units/kg once every 2 weeks; adjusted according to response to 15–60 units/kg once every 2 weeks; **CHILD** under 18 years see *BNF for Children*

**VPRIV**<sup>®</sup> (Shire HGT) **[Pom]**

**Intravenous infusion**, powder for reconstitution, velaglucerase alfa, net price 400-unit vial = £1410.20

**Electrolytes** Na<sup>+</sup> 0.53 mmol/400-unit vial

**Mucopolysaccharidosis**

**Laronidase**, an enzyme produced by recombinant DNA technology, is licensed for long-term replacement therapy in the treatment of non-neurological manifestations of mucopolysaccharidosis I, a lysosomal storage disorder caused by deficiency of alpha-L-iduronidase.

**Idursulfase**, an enzyme produced by recombinant DNA technology, is licensed for long-term replacement therapy in mucopolysaccharidosis II (Hunter syndrome), a lysosomal storage disorder caused by deficiency of iduronate-2-sulfatase.

**Galsulfase**, a recombinant form of human N-acetylgalactosamine-4-sulfatase, is licensed for long-term replacement therapy in mucopolysaccharidosis VI (Maroteaux-Lamy syndrome).

**Infusion-related reactions** Infusion-related reactions often occur with administration of laronidase, idursulfase, and galsulfase; they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

**GALSULFASE**

**Indications** (specialist use only) mucopolysaccharidosis VI

**Cautions** respiratory disease; acute febrile or respiratory illness (consider delaying treatment)

**Infusion-related reactions** See notes above

**Pregnancy** manufacturer advises avoid unless essential

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** abdominal pain, umbilical hernia, gastroenteritis; chest pain, hypertension; dyspnoea, apnoea, nasal congestion; rigors, malaise, areflexia; pharyngitis; conjunctivitis, corneal opacity; ear pain; facial oedema

**Dose**

- **By intravenous infusion**, **ADULT** and **CHILD** over 5 years, 1 mg/kg once weekly

**Naglazyme**<sup>®</sup> (BioMarin) **[Pom]**

**Concentrate for intravenous infusion**, galsulfase 1 mg/mL, net price 5-mL vial = £982.00

**IDURSULFASE**

**Indications** (specialist use only) mucopolysaccharidosis II

**Cautions** severe respiratory disease; acute febrile respiratory illness (consider delaying treatment)

**Infusion-related reactions** See notes above

**Contra-indications** women of child-bearing potential

**Pregnancy** manufacturer advises avoid

**Breast-feeding** manufacturer advises avoid—present in milk in *animal* studies

**Side-effects** gastro-intestinal disturbances, swollen tongue; arrhythmia, tachycardia, chest pain, cyanosis, peripheral oedema, hypertension, hypotension, flushing; bronchospasm, hypoxia, cough, wheezing, tachypnoea, dyspnoea; headache, dizziness, tremor; pyrexia; arthralgia; facial oedema, urticaria, pruritus, rash, infusion-site swelling, erythema; pulmonary embolism and anaphylaxis also reported

**Dose**

- **By intravenous infusion**, **ADULT** and **CHILD** over 5 years, 500 micrograms/kg once weekly

**Elaprase**<sup>®</sup> (Shire HGT) **[Pom]**

**Concentrate for intravenous infusion**, idursulfase 2 mg/mL, net price 3-mL vial = £1985.00

**LARONIDASE**

**Indications** (specialist use only) non-neurological manifestations of mucopolysaccharidosis I

**Cautions** monitor immunoglobulin G (IgG) antibody concentration; **interactions**: Appendix 1 (laronidase)  
**Infusion-related reactions** See notes above

**Pregnancy** manufacturer advises avoid unless essential—no information available

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** nausea, vomiting, diarrhoea, abdominal pain; cold extremities, pallor, flushing, tachycardia, blood pressure changes; dyspnoea, cough, angioedema, anaphylaxis; headache, paraesthesia, dizziness, fatigue, restlessness; influenza-like symptoms; musculoskeletal pain, pain in extremities; rash, pruritus, urticaria, alopecia, infusion-site reactions; bronchospasm and respiratory arrest also reported

**Dose**

- **By intravenous infusion**, 100 units/kg once weekly; **CHILD** see *BNF for Children*

**Aldurzyme®** (Genzyme) (PoM)

Concentrate for intravenous infusion, laronidase

100 units/mL, net price 5-mL vial = £444.70

Electrolytes Na<sup>+</sup> 1.29 mmol/5-mL vial**Nephropathic cystinosis**

Mercaptamine is available for the treatment of nephropathic cystinosis.

**MERCAPTAMINE**

(Cysteamine)

**Indications** (specialist use only) nephropathic cystinosis**Cautions** leucocyte-cystine concentration and haematological monitoring required—consult product literature; dose of phosphate supplement may need to be adjusted if transferring from phosphocysteamine to mercaptamine**Contra-indications** hypersensitivity to penicillamine**Pregnancy** avoid—teratogenic and toxic in *animal* studies**Breast-feeding** avoid**Side-effects** breath and body odour, nausea, vomiting, diarrhoea, anorexia, abdominal pain, gastroenteritis, dyspepsia, encephalopathy, headache, malaise, fever, rash; *less commonly* gastro-intestinal ulcer, seizures, hallucinations, drowsiness, nervousness, leucopenia, nephrotic syndrome**Dose**

- Initial doses should be one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks
- Maintenance, **ADULT** and **CHILD** over 50 kg body-weight, 2 g daily in 4 divided doses  
**CHILD** up to 12 years, 1.3 g/m<sup>2</sup> (approx. 50 mg/kg) daily in 4 divided doses

**Cystagon®** (Orphan Europe) (PoM)

Capsules, mercaptamine (as bitartrate) 50 mg, net price 100-cap pack = £70.00; 150 mg, 100-cap pack = £190.00. Label: 21

**Note** **CHILD** under 6 years at risk of aspiration, capsules can be opened and contents sprinkled on food (at a temperature suitable for eating); avoid adding to acidic drinks (e.g. orange juice)**Pompe disease****Alglucosidase alfa**, an enzyme produced by recombinant DNA technology, is licensed for long-term replacement therapy in Pompe disease, a lysosomal storage disorder caused by deficiency of acid alpha-glucosidase.**ALGLUCOSIDASE ALFA****Indications** (specialist use only) Pompe disease**Cautions** cardiac and respiratory dysfunction—monitor closely; monitor immunoglobulin G (IgG) antibody concentration**Infusion-related reactions** Infusion-related reactions very common, calling for use of antihistamine, antipyretic, or corticosteroid; consult product literature for details**Pregnancy** toxicity in *animal* studies, but treatment should not be withheld**Breast-feeding** manufacturer advises avoid—no information available**Side-effects** nausea, vomiting, diarrhoea; flushing, tachycardia, blood pressure changes, cold extremities,

cyanosis, facial oedema, chest discomfort; cough, tachypnoea, bronchospasm; headache, agitation, tremor, irritability, restlessness, paraesthesia, dizziness, fatigue; pyrexia; antibody formation; myalgia, muscle spasm; sweating, rash, pruritus, urticaria, injection-site reactions; hypersensitivity reactions (including anaphylaxis); severe skin reactions (including ulcerative and necrotising skin lesions) also reported

**Dose**

- By intravenous infusion, **ADULT** and **CHILD** 20 mg/kg every 2 weeks

**Myozyme®** (Genzyme) (PoM)

Intravenous infusion, powder for reconstitution, alglucosidase alfa, net price 50-mg vial = £356.06

**Tyrosinaemia type I**

Nitisinone is licensed for the treatment of hereditary tyrosinaemia type I in combination with dietary restriction of tyrosine and phenylalanine.

**NITISINONE**

(NTBC)

**Indications** hereditary tyrosinaemia type I (specialist use only)**Cautions** slit-lamp examination of eyes recommended before treatment; monitor liver function regularly; monitor platelet and white blood cell count every 6 months**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies**Breast-feeding** manufacturer advises avoid—adverse effects in *animal* studies**Side-effects** thrombocytopenia, leucopenia, granulocytopenia; conjunctivitis, photophobia, corneal opacity, keratitis, eye pain; *less commonly* leucocytosis, blepharitis, pruritus, exfoliative dermatitis, and erythematous rash**Dose**

- ADULT** and **CHILD** initially 500 micrograms/kg twice daily, adjusted according to response; max. 2 mg/kg daily

**Note** Capsules can be opened and the contents suspended in a small amount of water or formula diet and taken immediately**Orfadin®** (Swedish Orphan) (PoM)

Capsules, nitisinone 2 mg, net price 60-cap pack = £564.00; 5 mg, 60-cap pack = £1127.00; 10 mg, 60-cap pack = £2062.00

**Urea cycle disorders****Sodium phenylbutyrate** is used in the management of urea cycle disorders. It is indicated as adjunctive therapy in all patients with neonatal-onset disease and in those with late-onset disease who have a history of hyperammonaemic encephalopathy.**Carglumic acid** is licensed for the treatment of hyperammonaemia due to *N*-acetylglutamate synthase deficiency and organic acidemia.**Emergency management**For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at [www.bimdg.org.uk](http://www.bimdg.org.uk).

## CARGLUMIC ACID

**Indications** hyperammonaemia due to *N*-acetylglutamate synthase deficiency and organic acidemia under specialist supervision; see also notes above

**Pregnancy** manufacturer advises avoid unless essential—no information available

**Breast-feeding** manufacturer advises avoid—present in milk in *animal* studies

**Side-effects** sweating; *less commonly* diarrhoea, vomiting, bradycardia, pyrexia

### Dose

- Hyperammonaemia due to *N*-acetylglutamate synthase deficiency, **ADULT** and **CHILD** initially 100–250 mg/kg daily in 2–4 divided doses immediately before food, adjusted according to plasma-ammonia concentration; maintenance 10–100 mg/kg daily in 2–4 divided doses
- Hyperammonaemia due to organic acidemia, **ADULT** and **CHILD** initially 100–250 mg/kg daily in 2–4 divided doses immediately before food, adjusted according to plasma-ammonia concentration

**Carbaglu**<sup>®</sup> (Orphan Europe) (PoM)

**Dispersible tablets**, carglumic acid 200 mg, net price 5-tab pack = £299.00, 60-tab pack = £3499.00.

Label: 13

**Note** Must be dispersed in at least 5–10 mL of water and taken orally immediately, or administered via a nasogastric tube

## SODIUM PHENYLBUTYRATE

**Indications** adjunct in long-term treatment of urea cycle disorders (under specialist supervision); see also notes above

**Cautions** congestive heart failure; **interactions:** Appendix 1 (sodium phenylbutyrate)

**Hepatic impairment** manufacturer advises caution

**Renal impairment** manufacturer advises caution

**Pregnancy** avoid—toxicity in *animal* studies; manufacturer advises adequate contraception during administration

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** gastro-intestinal disturbances, weight gain, taste disturbance, decreased appetite; syncope, oedema; headache, depression, irritability; renal tubular acidosis, menstrual disorders; blood disorders, metabolic acidosis, alkalosis; rash, body odour; *less commonly* rectal bleeding, peptic ulcer, pancreatitis, and arrhythmias

### Dose

- ADULT** 9.9–13 g/m<sup>2</sup> daily in divided doses with meals (max. 20 g daily); **CHILD** see *BNF for Children*

**Ammonas**<sup>®</sup> (Swedish Orphan) (PoM)

**Tablets**, sodium phenylbutyrate 500 mg. Contains Na<sup>+</sup> 2.7 mmol/tablet. Net price 250-tab pack = £493.00

**Granules**, sodium phenylbutyrate 940 mg/g. Contains Na<sup>+</sup> 5.4 mmol/g of sodium phenylbutyrate. Net price 266-g pack = £860.00

**Note** Granules should be mixed with food before taking

**Pheburane**<sup>®</sup> (Lucane) (PoM)

**Granules**, sodium phenylbutyrate 483 mg/g. Contains Na<sup>+</sup> 5.4 mmol/g of sodium phenylbutyrate, net price 174-g pack = £331.00

**Note** Granules should be mixed with food before taking orally and must not be administered by nasogastric or gastrostomy tubes

## Homocystinuria

**Betaine** is licensed for the adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism. Betaine should be used in conjunction with dietary restrictions and may be given with supplements of Vitamin B<sub>12</sub>, pyridoxine, and folate under specialist advice.

The *Scottish Medicines Consortium* (p. 4) has advised (July 2010) that betaine anhydrous (*Cystadane*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism in patients who are not responsive to pyridoxine treatment.

## BETAINE

**Indications** (specialist use only) adjunctive treatment of homocystinuria

**Cautions** monitor plasma-methionine concentration before and during treatment—interrupt treatment if symptoms of cerebral oedema occur

**Pregnancy** manufacturer advises avoid unless essential—limited information available

**Breast-feeding** manufacturer advises caution—no information available

**Side-effects** *less commonly* gastro-intestinal disorders, anorexia, reversible cerebral oedema (see **Cautions**), agitation, depression, personality disorder, sleep disturbances, urinary incontinence, alopecia, and urticaria

### Dose

- ADULT** and **CHILD** over 10 years, 3 g twice daily, adjusted according to response; max. 20 g/day; **CHILD** under 10 years 50 mg/kg twice daily, dose and frequency adjusted according to response; max. 75 mg/kg twice daily

**Cystadane**<sup>®</sup> (Orphan Europe) (PoM)

**Powder**, betaine (anhydrous), net price 180 g = £347.00

**Note** Powder should be mixed with water, juice, milk, formula, or food until completely dissolved and taken immediately; measuring spoons are provided to measure 1 g, 150 mg, and 100 mg of powder

## Other metabolic disorders

**Miglustat** is available for the treatment of progressive neurological manifestations of Niemann-Pick type C disease, a neurodegenerative disorder characterised by impaired intracellular lipid trafficking; it is also licensed for the treatment of mild to moderate type 1 Gaucher's disease for whom imiglucerase is unsuitable, see also p. 695.

## MIGLUSTAT

**Indications** mild to moderate type I Gaucher's disease (specialist supervision only); Niemann-Pick type C disease (specialist supervision only)

**Cautions** monitor cognitive and neurological function; monitor growth and platelet count in Niemann-Pick type C disease

**Hepatic impairment** no information available—manufacturer advises caution

**Renal impairment** for Gaucher's disease initially 100 mg twice daily if eGFR 50–70 mL/minute/1.73 m<sup>2</sup>; initially 100 mg once daily if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>; for Niemann-Pick type C disease, initially 200 mg twice daily if eGFR 50–70 mL/minute/1.73 m<sup>2</sup>; initially 100 mg twice daily if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>; child under 12 years—consult product literature; avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** manufacturer advises avoid (toxicity in animal studies)—effective contraception must be used during treatment; also men should avoid fathering a child during and for 3 months after treatment

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** diarrhoea, flatulence, abdominal pain, dyspepsia, constipation, nausea, vomiting, anorexia, weight changes, tremor, dizziness, headache, peripheral neuropathy, ataxia, amnesia, hypoaesthesia, paraesthesia, insomnia, depression, chills, malaise, decreased libido, thrombocytopenia, muscle spasm and weakness

#### Dose

- Gaucher's disease, **ADULT** over 18 years, 100 mg 3 times daily; reduced if not tolerated to 100 mg 1–2 times daily
- Niemann-Pick type C disease, **ADULT** and **CHILD** over 12 years, 200 mg 3 times daily; **CHILD** 4–12 years, body surface area less than 0.47 m<sup>2</sup>, 100 mg once daily; body surface area 0.47–0.73 m<sup>2</sup>, 100 mg twice daily; body surface area 0.73–0.88 m<sup>2</sup>, 100 mg three times daily; body surface area 0.88–1.25 m<sup>2</sup>, 200 mg twice daily; body surface area greater than 1.25 m<sup>2</sup>, adult dose

**Zavesca**<sup>®</sup> (Actelion) (PoM)

**Capsules**, miglustat 100 mg, net price 84-cap pack = £3934.17 (hospital only)

## 9.8.2 Acute porphyrias

The acute porphyrias (acute intermittent porphyria, variegate porphyria, hereditary coproporphyrin, and 5-aminolaevulinic acid dehydratase deficiency porphyria) are hereditary disorders of haem biosynthesis; they have a prevalence of about 1 in 10 000 of the population.

Great care must be taken when prescribing for patients with acute porphyria, since certain drugs can induce acute porphyric crises. Since acute porphyrias are hereditary, relatives of affected individuals should be screened and advised about the potential danger of certain drugs.

Treatment of serious or life-threatening conditions should not be withheld from patients with acute porphyria. When there is no safe alternative, treatment should be started and urinary porphobilinogen excretion should be measured regularly; if it increases or symptoms occur, the drug can be withdrawn and the acute attack treated. If an acute attack of porphyria occurs during pregnancy, contact an expert porphyria service for further advice.

**Haem arginate** is administered by short intravenous infusion as haem replacement in moderate, severe, or unremitting acute porphyria crises.

The National Acute Porphyria Service (NAPS) provides clinical support and treatment with haem arginate from

three centres (University Hospital of Wales, Addenbrooke's Hospital, and King's College Hospital). To access the service telephone (029) 2074 7747 and ask for the Acute Porphyria Service.

### HAEM ARGINATE

(Human hemin)

**Indications** acute porphyrias (acute intermittent porphyria, porphyria variegate, hereditary coproporphyrin)

**Pregnancy** manufacturer advises avoid unless essential

**Breast-feeding** manufacturer advises avoid unless essential—no information available

**Side-effects** pain and thrombophlebitis at injection site; rarely hypersensitivity reactions and fever; also reported headache

#### Dose

- By intravenous infusion, **ADULT** and **CHILD** 3 mg/kg once daily (max. 250 mg daily) for 4 days; if response inadequate, repeat 4-day course with close biochemical monitoring

**Normosang**<sup>®</sup> (Orphan Europe) (PoM)

**Concentrate for intravenous infusion**, haem arginate 25 mg/mL, net price 10-mL amp = £434.25

### Drugs unsafe for use in acute porphyria

The following list contains drugs on the UK market that have been classified as 'unsafe' in porphyria because they have been shown to be porphyrinogenic in animals or *in vitro*, or have been associated with acute attacks in patients. Absence of a drug from the following lists does not necessarily imply that the drug is safe. For many drugs no information about porphyria is available.

An up-to-date list of drugs considered **safe** in acute porphyria is available at [www.wmic.wales.nhs.uk/porphyria\\_info.php](http://www.wmic.wales.nhs.uk/porphyria_info.php)

Further information may be obtained from: [www.porphyrin-europe.org](http://www.porphyrin-europe.org)

and also from:

Welsh Medicines Information Centre  
University Hospital of Wales  
Cardiff, CF14 4XW  
Tel: (029) 2074 2979/3877

**Note** Quite modest changes in chemical structure can lead to changes in porphyrinogenicity but where possible general statements have been made about groups of drugs; these should be checked first.

### Unsafe Drug Groups (check first)

Alkylating drugs <sup>1</sup>	Calcium channel blockers <sup>5</sup>	Non-nucleoside reverse transcriptase inhibitors <sup>1</sup>	Taxanes <sup>1</sup>
Amfetamines	Contraceptives, hormonal <sup>6</sup>	Progesterogens <sup>6</sup>	Thiazolidinediones <sup>1</sup>
Anabolic steroids	Ergot derivatives <sup>7</sup>	Protease inhibitors <sup>1</sup>	Triazole antifungals <sup>8</sup>
Antidepressants <sup>2</sup>	Hormone replacement therapy <sup>6</sup>	Sulfonamides <sup>9</sup>	
Antihistamines <sup>3</sup>	Imidazole antifungals <sup>8</sup>	Sulfonyleureas <sup>10</sup>	
Barbiturates <sup>4</sup>			

### Unsafe Drugs (check groups above first)

Aceclofenac	Disopyramide	Metolazone	Riluzole
Alcohol	Disulfiram	Metyrapone	Risperidone
Amiodarone	Erythromycin	Mifepristone	Selegiline
Aprepitant <sup>1</sup>	Etamsylate	Minoxidil <sup>14</sup>	Spironolactone
Artemether with lumefantrine	Ethosuximide	Mitotane	Sulfipyrazone
Bexarotene	Etomidate	Nalidixic acid	Tamoxifen
Bosentan	Fenfluramine	Nitrazepam	Telithromycin
Bromocriptine	Flupentixol	Nitrofurantoin	Temoporfin
Buspirone	Flutamide	Orphenadrine	Tiagabine
Cabergoline	Fosaprepitant <sup>1</sup>	Oxcarbazepine	Tinidazole
Carbamazepine	Fosphenytoin	Oxybutynin	Topiramate
Chloral hydrate <sup>11</sup>	Griseofulvin	Pentazocine <sup>15</sup>	Toremifene
Chloramphenicol	Hydralazine	Pentoxifylline	Trimethoprim
Chloroform <sup>12</sup>	Indapamide	Phenoxybenzamine	Valproate
Clindamycin	Isometheptene mucate	Phenytoin	Xipamide
Cocaine	Isoniazid <sup>13</sup>	Pivmecillinam	Zidovudine <sup>1</sup>
Colistimethate sodium	Ketamine	Porfimer	Zuclopenthixol
Danazol	Mefenamic acid <sup>14</sup>	Raloxifene	
Dapsone	Meprobamate	Rifabutin <sup>13</sup>	
Dexfenfluramine	Methyldopa	Rifampicin	

- Contact Welsh Medicines Information Centre for further advice.
- Includes tricyclic (and related) antidepressants and MAOIs; fluoxetine, duloxetine, venlafaxine, and trazodone thought to be safe.
- Alimemazine, chlorphenamine, desloratadine, fexofenadine, ketotifen, loratadine, and promethazine thought to be safe.
- Includes primidone and thiopental.
- Amlodipine, felodipine, and nifedipine thought to be safe.
- Progestogens are more porphyrogenic than oestrogens; oestrogens may be safe at least in replacement doses. Progestogens should be avoided whenever possible by all women susceptible to acute porphyria; however, when non-hormonal contraception is inappropriate, progestogens may be used with extreme caution if the potential benefit outweighs risk. The risk of an acute attack is greatest in women who have had a previous attack or are aged under 30 years. Long-acting progestogen preparations should **never** be used in those at risk of acute porphyria.
- Includes ergometrine (oxytocin probably safe) and pergolide.
- Applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure.
- Includes co-trimoxazole and sulfasalazine.
- Glipizide and glimepiride are thought to be safe.
- Although evidence of hazard is uncertain, manufacturer advises avoid.
- Small amounts in medicines probably safe.
- Safety uncertain, contact Welsh Medicines Information Centre for further advice.
- May be used with caution if safer alternative not available.
- Buprenorphine, codeine, diamorphine, dihydrocodeine, fentanyl, methadone, morphine, oxycodone, pethidine, and tramadol are thought to be safe.

# 10 Musculoskeletal and joint diseases

<b>10.1</b>	<b>Drugs used in rheumatic diseases and gout</b>	<b>701</b>
10.1.1	Non-steroidal anti-inflammatory drugs	702
10.1.2	Corticosteroids	712
10.1.2.1	Systemic corticosteroids	712
10.1.2.2	Local corticosteroid injections	712
10.1.3	Drugs that suppress the rheumatic disease process	713
10.1.4	Gout and cytotoxic-induced hyperuricaemia	728
10.1.5	Other drugs for rheumatic diseases	731
<b>10.2</b>	<b>Drugs used in neuromuscular disorders</b>	<b>731</b>
10.2.1	Drugs that enhance neuromuscular transmission	731
10.2.2	Skeletal muscle relaxants	733
<b>10.3</b>	<b>Drugs for the treatment of soft-tissue disorders and topical pain relief</b>	<b>736</b>
10.3.1	Enzymes	737
10.3.2	Rubefacients, topical NSAIDs, capsaicin, and poultices	737

This chapter also includes advice on the drug management of the following:

- dental and orofacial pain, p. 703
- extravasation, p. 736
- gout, p. 728
- myasthenia gravis, p. 731
- osteoarthritis and soft-tissue disorders, below
- rheumatoid arthritis and other inflammatory disorders, below

For treatment of septic arthritis see Table 1, section 5.1.

## 10.1 Drugs used in rheumatic diseases and gout

10.1.1	Non-steroidal anti-inflammatory drugs
10.1.2	Corticosteroids
10.1.3	Drugs that suppress the rheumatic disease process
10.1.4	Gout and cytotoxic-induced hyperuricaemia
10.1.5	Other drugs for rheumatic diseases

### Rheumatoid arthritis and other inflammatory disorders

A **non-steroidal anti-inflammatory drug** (NSAID) is indicated for pain and stiffness resulting from inflammatory rheumatic disease; analgesics such as **paracetamol** or **codeine** can also be used. For advice on the prophylaxis and treatment of NSAID-associated gastrointestinal ulcers, see p. 51.

Drugs are also used to influence the rheumatic disease process itself (section 10.1.3). For *rheumatoid arthritis* these **disease-modifying antirheumatic drugs** (DMARDs) include methotrexate, cytokine modulators, azathioprine, ciclosporin, cyclophosphamide, leflunomide, penicillamine, gold, antimalarials (chloroquine and hydroxychloroquine), and sulfasalazine. **Corticosteroids** also have a significant role in the management of rheumatoid arthritis (section 10.1.2.1).

Drugs which may affect the disease process in *psoriatic arthritis* include sulfasalazine, gold, azathioprine, methotrexate, leflunomide, and cytokine modulators (section 10.1.3).

For long-term control of *gout*, xanthine-oxidase inhibitors or uricosuric drugs (section 10.1.4) can be used.

### Osteoarthritis and soft-tissue disorders

For pain relief in osteoarthritis and soft-tissue disorders, **paracetamol** (section 4.7.1) should be used first and may need to be taken regularly. A **topical NSAID** (section 10.3.2) or topical **capsaicin** 0.025% (section 10.3.2) should also be considered, particularly in knee or hand osteoarthritis. An **oral NSAID** (section 10.1.1) can be substituted for, or used in addition to, paracetamol. If further pain relief is required in osteoarthritis, then the addition of an **opioid** analgesic (section 4.7.2) may be considered, but with a substantial risk of adverse effects; however, an opioid analgesic should be considered

before a NSAID in patients taking low-dose aspirin. For advice on the prophylaxis and treatment of NSAID-associated gastro-intestinal ulcers, see p. 51.

Intra-articular **corticosteroid** injections (section 10.1.2.2) may produce temporary benefit in osteoarthritis, especially if associated with soft-tissue inflammation.

Non-drug measures, such as weight reduction and exercise, should also be encouraged.

**Glucosamine** (section 10.1.5) and **rubefacients** (section 10.3.2) are not recommended for the treatment of osteoarthritis.

**Hyaluronic acid** and its derivatives are available for osteoarthritis of the knee, but are not recommended. Sodium hyaluronate (*Durolane*<sup>®</sup>, *Euflexa*<sup>®</sup>, *Fermatron*<sup>®</sup>, *Hyalgan*<sup>®</sup>, *RehenaVis*<sup>®</sup>, *Orthovisc*<sup>®</sup>, *Ostenil*<sup>®</sup>, *Ostenil Plus*<sup>®</sup>, *RehenaVis*<sup>®</sup>, *Suplasyn*<sup>®</sup>, *Synocrom*<sup>®</sup>, *Synopsis*<sup>®</sup>) or hylan G-F 20 (*Synvisc*<sup>®</sup>) is injected intra-articularly to supplement natural hyaluronic acid in the synovial fluid. These injections may reduce pain over 1–6 months, but are associated with a short-term increase in knee inflammation. Sodium hyaluronate (*SportVis*<sup>®</sup>) is also licensed for the relief of pain and optimisation of recovery following ankle sprain, and for the relief of chronic pain and disability associated with tennis elbow.

### 10.1.1 Non-steroidal anti-inflammatory drugs

In *single doses* non-steroidal anti-inflammatory drugs (NSAIDs) have analgesic activity comparable to that of paracetamol (section 4.7.1), but paracetamol is preferred, particularly in the elderly (see also Prescribing for the Elderly, p. 25).

In regular *full dosage* NSAIDs have both a lasting analgesic and an anti-inflammatory effect which makes them particularly useful for the treatment of continuous or regular pain associated with inflammation. Therefore, although paracetamol often gives adequate pain control in osteoarthritis, NSAIDs are more appropriate than paracetamol or the opioid analgesics in the *inflammatory arthritides* (e.g. rheumatoid arthritis) and in some cases of *advanced osteoarthritis*. NSAIDs can also be of benefit in the less well defined conditions of *back pain* and *soft-tissue disorders*.

**Choice** Differences in anti-inflammatory activity between NSAIDs are small, but there is considerable variation in individual response and tolerance to these drugs. About 60% of patients will respond to any NSAID; of the others, those who do not respond to one may well respond to another. Pain relief starts soon after taking the first dose and a full analgesic effect should normally be obtained within a week, whereas an anti-inflammatory effect may not be achieved (or may not be clinically assessable) for up to 3 weeks. If appropriate responses are not obtained within these times, another NSAID should be tried.

NSAIDs reduce the production of prostaglandins by inhibiting the enzyme cyclo-oxygenase. They vary in their selectivity for inhibiting different types of cyclo-oxygenase; selective inhibition of cyclo-oxygenase-2 is associated with less gastro-intestinal intolerance. Several other factors also influence susceptibility to gastro-intestinal effects, and a NSAID should be chosen on the

basis of the incidence of gastro-intestinal and other side-effects.

**Ibuprofen** is a propionic acid derivative with anti-inflammatory, analgesic, and antipyretic properties. It has fewer side-effects than other non-selective NSAIDs but its anti-inflammatory properties are weaker. Doses of 1.6 to 2.4 g daily are needed for rheumatoid arthritis and it is unsuitable for conditions where inflammation is prominent, such as acute gout. **Dexibuprofen** is the active enantiomer of ibuprofen. It has similar properties to ibuprofen and is licensed for the relief of mild to moderate pain and inflammation.

Other propionic acid derivatives:

**Naproxen** is one of the first choices because it combines good efficacy with a low incidence of side-effects (but more than ibuprofen, see NSAIDs and Gastro-intestinal Events, below).

**Fenoprofen** is as effective as naproxen, and **flurbiprofen** may be slightly more effective. Both are associated with slightly more gastro-intestinal side-effects than ibuprofen.

**Ketoprofen** has anti-inflammatory properties similar to ibuprofen and has more side-effects (see also NSAIDs and Gastro-intestinal Events, below). **Dexketoprofen**, an isomer of ketoprofen, has been introduced for the short-term relief of mild to moderate pain.

**Tiaprofenic acid** is as effective as naproxen; it has more side-effects than ibuprofen (**important**: reports of severe cystitis, see CSM advice on p. 712).

Drugs with properties similar to those of propionic acid derivatives:

**Diclofenac** and **aceclofenac** are similar in efficacy to naproxen.

**Etodolac** is comparable in efficacy to naproxen; it is licensed for symptomatic relief of osteoarthritis and rheumatoid arthritis.

**Indometacin** has an action equal to or superior to that of naproxen, but with a high incidence of side-effects including headache, dizziness, and gastro-intestinal disturbances (see also NSAIDs and Gastro-intestinal Events, below).

**Mefenamic acid** has minor anti-inflammatory properties. It has occasionally been associated with diarrhoea and haemolytic anaemia which require discontinuation of treatment.

**Meloxicam** is licensed for the short-term relief of pain in osteoarthritis and for long-term treatment of rheumatoid arthritis and ankylosing spondylitis.

**Nabumetone** is comparable in effect to naproxen.

**Phenylbutazone** is licensed for ankylosing spondylitis, but is not recommended because it is associated with serious side-effects, in particular haematological reactions; it should be used only by a specialist in severe cases where other treatments have been found unsuitable.

**Piroxicam** is as effective as naproxen and has a long duration of action which permits once-daily administration. However, it has more gastro-intestinal side-effects than most other NSAIDs, and is associated with more frequent serious skin reactions (**important**: see CHMP advice, p. 711).

**Sulindac** is similar in tolerance to naproxen.

**Tenoxicam** is similar in activity and tolerance to naproxen. Its long duration of action allows once-daily administration.

**Tolfenamic acid** is licensed for the treatment of migraine (section 4.7.4.1).

**Ketorolac** and the selective inhibitor of cyclo-oxygenase-2, **parecoxib**, are licensed for the short-term management of postoperative pain (section 15.1.4.2).

The selective inhibitors of cyclo-oxygenase-2, **etoricoxib** and **celecoxib**, are as effective as non-selective NSAIDs such as diclofenac and naproxen. Although selective inhibitors can cause serious gastro-intestinal events, available evidence appears to indicate that the risk of serious upper gastro-intestinal events is lower with selective inhibitors compared to non-selective NSAIDs; this advantage may be lost in patients who require concomitant low-dose aspirin.

**Celecoxib** and **etoricoxib** are licensed for the relief of pain in osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis; **etoricoxib** is also licensed for the relief of pain from acute gout.

**Dental and orofacial pain** Most mild to moderate dental pain and inflammation is effectively relieved by NSAIDs. Those used for dental pain include **ibuprofen** and **diclofenac**.

For information on the risks of serious gastro-intestinal side-effects of NSAIDs, see p. 704.

For further information on the management of dental and orofacial pain, see p. 274.

**Cautions and contra-indications** NSAIDs should be used with caution in the elderly (risk of serious side-effects and fatalities, see also Prescribing for the Elderly p. 25), in allergic disorders (they are **contra-indicated** in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID), and in coagulation defects. Long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment. Caution is also required in patients with connective-tissue disorders, see Side-effects below.

In patients with cardiac impairment, caution is required since NSAIDs may impair renal function (see also Side-effects, below). All NSAIDs are contra-indicated in severe heart failure. **Diclofenac** and the selective inhibitors of cyclo-oxygenase-2 (**celecoxib**, **etoricoxib**, and **parecoxib**) are contra-indicated in ischaemic heart disease, cerebrovascular disease, peripheral arterial disease, and mild to severe heart failure. They should be used with caution in patients with a history of cardiac failure, left ventricular dysfunction, hypertension, in patients with oedema for any other reason, and in patients with other risk factors for cardiovascular events. Other non-selective NSAIDs should be used with caution in uncontrolled hypertension, heart failure, ischaemic heart disease, peripheral arterial disease, cerebrovascular disease, and when used long term in patients with risk factors for cardiovascular events.

### NSAIDs and cardiovascular events

All NSAID use (including cyclo-oxygenase-2 selective inhibitors) can, to varying degrees, be associated with a small increased risk of thrombotic events (e.g. myocardial infarction and stroke) independent of baseline cardiovascular risk factors or duration of NSAID use; however, the greatest risk may be in those receiving high doses long term.

**Cyclo-oxygenase-2 selective inhibitors, diclofenac** (150 mg daily) and **ibuprofen** (2.4 g daily) are associated with an increased risk of thrombotic events. The increased risk for diclofenac is similar to that of licensed doses of **etoricoxib**. **Naproxen** (1 g daily) is associated with a lower thrombotic risk, and low doses of ibuprofen (1.2 g daily or less) have not been associated with an increased risk of myocardial infarction.

The lowest effective dose of NSAID should be prescribed for the shortest period of time to control symptoms and the need for long-term treatment should be reviewed periodically.

All NSAIDs (including cyclo-oxygenase-2 selective inhibitors) are contra-indicated in patients with active gastro-intestinal ulceration or bleeding. Piroxicam, ketoprofen, and ketorolac are contra-indicated in patients with any history of gastro-intestinal bleeding, ulceration, or perforation. Other non-selective NSAIDs are contra-indicated in patients with a history of recurrent gastro-intestinal ulceration or haemorrhage (two or more distinct episodes), and in patients with a history of gastro-intestinal bleeding or perforation related to previous NSAID therapy (see also, p. 704). While it is preferable to avoid NSAIDs in patients with active or previous gastro-intestinal ulceration or bleeding, and to withdraw them if gastro-intestinal lesions develop, nevertheless patients with serious rheumatic diseases (e.g. rheumatoid arthritis) are usually dependent on NSAIDs for effective relief of pain and stiffness. Patients at risk of gastro-intestinal ulceration (including the elderly), who need NSAID treatment should receive gastroprotective treatment; for advice on the prophylaxis and treatment of NSAID-associated gastro-intestinal ulcers, see section 1.3. NSAIDs should also be used with caution in Crohn's disease or ulcerative colitis, as these conditions may be exacerbated.

For **interactions** of NSAIDs, see Appendix 1 (NSAIDs).

**Hepatic impairment** NSAIDs should be used with caution in patients with hepatic impairment; there is an increased risk of gastro-intestinal bleeding and fluid retention. NSAIDs should be avoided in severe liver disease; see also individual drugs.

**Renal impairment** NSAIDs should be avoided if possible or used with caution in patients with renal impairment; the **lowest effective dose** should be used for the **shortest possible duration**, and renal function should be **monitored**. Sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure; deterioration in renal function has also been reported after topical use; see also individual drugs.

**Pregnancy** Most manufacturers advise avoiding the use of NSAIDs during pregnancy or avoiding them unless the potential benefit outweighs the risk. NSAIDs should be avoided during the third trimester because use is associated with a risk of closure of fetal ductus

arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn. In addition, the onset of labour may be delayed and its duration may be increased. See also individual monographs for celecoxib and etoricoxib.

**Breast-feeding** NSAIDs should be used with caution during breast-feeding; see also individual drugs.

**Side-effects** Gastro-intestinal disturbances including discomfort, nausea, diarrhoea, and occasionally bleeding and ulceration occur (see also NSAIDs and Gastro-intestinal Events, below and Cautions above). Systemic as well as local effects of NSAIDs contribute to gastro-intestinal damage; taking oral formulations with milk or food, or using enteric-coated formulations, or changing the route of administration may only partially reduce symptoms such as dyspepsia.

#### NSAIDs and gastro-intestinal events

All NSAIDs are associated with serious gastro-intestinal toxicity; the risk is higher in the elderly. Evidence on the relative safety of non-selective NSAIDs indicates differences in the risks of serious upper gastro-intestinal side-effects—piroxicam (see also CHMP advice, p. 711), ketoprofen, and ketorolac are associated with the highest risk; indometacin, diclofenac, and naproxen are associated with intermediate risk, and ibuprofen with the lowest risk (although high doses of ibuprofen have been associated with intermediate risk). **Selective inhibitors of cyclo-oxygenase-2** are associated with a *lower risk* of serious upper gastro-intestinal side-effects than non-selective NSAIDs.

Recommendations are that NSAIDs associated with a low risk e.g. ibuprofen are *generally preferred*, to start at the *lowest recommended dose* and not to use more than one oral NSAID at a time. See also Cautions and Contra-indications, p. 703.

The combination of a NSAID and low-dose aspirin can increase the risk of gastro-intestinal side-effects; this combination should be used only if absolutely necessary and the patient should be monitored closely.

Other side-effects include hypersensitivity reactions (particularly rashes, angioedema, and bronchospasm—see below), headache, dizziness, nervousness, depression, drowsiness, insomnia, vertigo, hearing disturbances such as tinnitus, photosensitivity, and haematuria. Blood disorders have also occurred. Fluid retention may occur (rarely precipitating congestive heart failure); blood pressure may be raised.

#### Asthma

Any degree of worsening of asthma may be related to the ingestion of NSAIDs, either prescribed or (in the case of ibuprofen and others) purchased over the counter.

Renal failure may be provoked by NSAIDs, especially in patients with pre-existing renal impairment (**important**, see Renal impairment, above). Rarely, papillary necrosis or interstitial fibrosis associated with NSAIDs can lead to renal failure.

Hepatic damage, alveolitis, pulmonary eosinophilia, pancreatitis, visual disturbances, Stevens-Johnson syndrome, and toxic epidermal necrolysis are other rare side-effects. Induction of or exacerbation of colitis

or Crohn's disease has been reported. Aseptic meningitis has been reported rarely with NSAIDs—patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible.

**Overdose:** see Emergency Treatment of Poisoning, p. 35.

### ACECLOFENAC

**Indications** pain and inflammation in rheumatoid arthritis, osteoarthritis and ankylosing spondylitis

**Cautions** see notes above; avoid in acute porphyria (section 9.8.2)

**Contra-indications** see notes above

**Hepatic impairment** initially 100 mg daily; see also notes above

**Renal impairment** avoid in moderate to severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** manufacturer advises avoid; see also notes above

**Side-effects** see notes above

#### Dose

- 100 mg twice daily; **CHILD** not recommended

**Aceclofenac** (Non-proprietary) (PoM)

Tablets, aceclofenac 100 mg, net price 60-tab pack = £9.63. Label: 21

**Preservex**<sup>®</sup> (Almiral) (PoM)

Tablets, f/c, aceclofenac 100 mg, net price 60-tab pack = £9.63. Label: 21

### ACEMETACIN

(Glycolic acid ester of indometacin)

**Indications** pain and inflammation in rheumatic disease and other musculoskeletal disorders; postoperative analgesia

**Cautions** see under Indometacin and notes above

**Driving** Dizziness may affect performance of skilled tasks (e.g. driving)

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** manufacturer advises avoid; see also notes above

**Side-effects** see under Indometacin and notes above

#### Dose

- 120 mg daily in divided doses with food, increased if necessary to 180 mg daily; **CHILD** not recommended

**Emflex**<sup>®</sup> (Merck Serono) (PoM)

Capsules, yellow/orange, acemetacin 60 mg, net price 90-cap pack = £28.20. Label: 21, counselling, driving

### CELECOXIB

**Indications** pain and inflammation in osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis

**Cautions** see notes above; monitor blood pressure before and during treatment

**Contra-indications** see notes above; sulfonamide sensitivity; inflammatory bowel disease

**Hepatic impairment** halve initial dose in moderate impairment; see also notes above

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>; see also notes above

**Pregnancy** avoid (teratogenic in *animal* studies); see also notes above

**Breast-feeding** avoid—present in milk in *animal* studies; see also notes above

**Side-effects** see notes above; dyspnoea, influenza-like symptoms; *less commonly* stomatitis, palpitation, cerebral infarction, fatigue, paraesthesia, muscle cramps; *rarely* taste disturbance, alopecia; *very rarely* seizures; *also reported* chest pain

#### Dose

- Osteoarthritis, 200 mg daily in 1–2 divided doses, increased if necessary to max. 200 mg twice daily; **CHILD** not recommended
- Rheumatoid arthritis, 100 mg twice daily, increased if necessary to 200 mg twice daily; **CHILD** not recommended
- Ankylosing spondylitis, 200 mg daily in 1–2 divided doses, increased if necessary to max. 400 mg daily in 1–2 divided doses; **CHILD** not recommended

**Note** Discontinue if no improvement after 2 weeks on max. dose

**Celebrex**<sup>®</sup> (Pharmacia) (PoM)

**Capsules**, celecoxib 100 mg (white/blue), net price 60-cap pack = £21.55; 200 mg (white/gold), 30-cap pack = £21.55

## DEXIBUPROFEN

**Indications** pain and inflammation associated with osteoarthritis and other musculoskeletal disorders; mild to moderate pain and inflammation including dysmenorrhoea and dental pain

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** reduce initial dose; avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>; see also notes above

**Pregnancy** see notes above

**Breast-feeding** present in milk—but risk to infant minimal; see also notes above

**Side-effects** see notes above

#### Dose

- 600–900 mg daily in up to 3 divided doses; increased if necessary to max. 1.2 g daily (900 mg daily for dysmenorrhoea); max. single dose 400 mg (300 mg for dysmenorrhoea); **CHILD** not recommended

**Seractil**<sup>®</sup> (Genus) (PoM)

**Tablets**, f/c, dexibuprofen 300 mg, net price 60–tab pack = £9.47; 400 mg (scored) 60–tab pack = £9.97. Label: 21

## DEXKETOPROFEN

**Indications** short-term treatment of mild to moderate pain including dysmenorrhoea

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** reduce initial dose to max. 50 mg daily in mild to moderate impairment; see also notes above

**Renal impairment** reduce initial dose to 50 mg daily; avoid in moderate to severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** manufacturer advises avoid—no information available; see also notes above

**Side-effects** see notes above

#### Dose

- 12.5 mg every 4–6 hours or 25 mg every 8 hours; max. 75 mg daily; **ELDERLY** initially max. 50 mg daily; **CHILD** not recommended

**Keral**<sup>®</sup> (Menarini) (PoM)

**Tablets**, f/c, scored, dextketoprofen (as trometamol) 25 mg, net price 20-tab pack = £3.67, 50-tab pack = £9.18. Label: 22

## DICLOFENAC POTASSIUM

**Indications** pain and inflammation in rheumatic disease and other musculoskeletal disorders; acute gout; postoperative pain; migraine; fever in ear, nose, or throat infection in children

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** amount in milk too small to be harmful; see also notes above

**Side-effects** see notes above

#### Dose

- Rheumatic disease, musculoskeletal disorders, acute gout, 75–150 mg daily in 2–3 divided doses; **CHILD** over 14 years, 75–100 mg daily in 2–3 divided doses
- Postoperative pain, 75–150 mg daily in 2–3 divided doses; **CHILD** 9–14 years (body-weight 35 kg and over), up to 2 mg/kg (max. 100 mg) daily in 3 divided doses; **CHILD** over 14 years, 75–100 mg daily in 2–3 divided doses
- Migraine, 50 mg at onset, repeated after 2 hours if necessary then after 4–6 hours; max. 200 mg in 24 hours; **CHILD** not recommended
- Fever in ear, nose, or throat infection, **CHILD** over 9 years (body-weight 35 kg and over), up to 2 mg/kg (max. 100 mg) daily in 3 divided doses

**Diclofenac Potassium** (Non-proprietary) (PoM)

**Tablets**, diclofenac potassium 25 mg, net price 28-tab pack = £3.23; 50 mg, 28-tab pack = £6.18. Label: 21

**<sup>1</sup> Voltarol<sup>®</sup> Rapid** (Novartis) (PoM)

**Tablets**, s/c, diclofenac potassium 25 mg (red), net price 30-tab pack = £3.46; 50 mg (brown), 30-tab pack = £6.62. Label: 21

## DICLOFENAC SODIUM

**Indications** pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders; acute gout; postoperative pain

**Cautions** see notes above

1. 12.5 mg tablets can be sold to the public for the treatment of headache, dental pain, period pain, rheumatic and muscular pain, backache and the symptoms of cold and flu (including fever), in patients aged over 14 years subject to max. single dose of 25 mg, max. daily dose of 75 mg for max. 3 days, and max. pack size of 18 × 12.5 mg

**Contra-indications** see notes above; avoid suppositories in proctitis; avoid injections containing benzyl alcohol in neonates (see preparations below)

**Intravenous use** Additional contra-indications include concomitant NSAID or anticoagulant use (including low-dose heparins), history of haemorrhagic diathesis, history of confirmed or suspected cerebrovascular bleeding, operations with high risk of haemorrhage, history of asthma, moderate or severe renal impairment (see also Renal impairment below), hypovolaemia, dehydration;

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; avoid intravenous use if serum creatinine greater than 160 micromol/litre; see also notes above

**Pregnancy** see notes above

**Breast-feeding** amount in milk too small to be harmful; see also notes above

**Side-effects** see notes above; suppositories may cause rectal irritation; injection site reactions

### Dose

- By mouth, 75–150 mg daily in 2–3 divided doses
- By rectum in suppositories, 75–150 mg daily in divided doses
- Juvenile idiopathic arthritis, **CHILD** 6 months–18 years, by mouth, see *BNF for Children*
- Postoperative pain, **CHILD** 6 months–18 years, by rectum, see *BNF for Children*

### Diclofenac Sodium (Non-proprietary) (PoM)

Tablets, e/c, diclofenac sodium 25 mg, net price 84-tab pack = £1.25; 50 mg, 84-tab pack = £1.10. Label: 5, 25

**Brands include** *Defenac*<sup>®</sup>, *Dicloflex*<sup>®</sup>, *Diclozip*<sup>®</sup>, *Fenactol*<sup>®</sup>, *Flamrase*<sup>®</sup>

**Dental prescribing on NHS** Diclofenac Sodium Tablets may be prescribed

**Suppositories**, diclofenac sodium 100 mg, net price 10 = £3.03

**Brands include** *Econac*<sup>®</sup>

### Dyloject<sup>®</sup> (Therabel) (PoM)

Injection, diclofenac sodium 37.5 mg/mL, net price 2-mL vial = £4.80

**Note** May be difficult to obtain

**Dose by deep intramuscular injection** into the gluteal muscle, acute exacerbations of pain and postoperative pain, 75 mg once daily (twice daily in severe cases) for max. 2 days

Urteric colic, 75 mg then a further 75 mg after 30 minutes if necessary

**By intravenous injection** (in supervised settings), acute postoperative pain, 75 mg repeated after 4–6 hours if necessary; max. 150 mg in 24 hours for 2 days

Prevention of postoperative pain, 25–50 mg after surgery; further doses given after 4–6 hours if necessary; max. 150 mg in 24 hours for 2 days

**Note** The *Scottish Medicines Consortium* (p. 4) has advised (February 2008) that *Dyloject*<sup>®</sup> is accepted for restricted use within NHS Scotland for the treatment or prevention of postoperative pain by intravenous injection in supervised healthcare settings

### Voltarol<sup>®</sup> (Novartis) (PoM)

Tablets, e/c, diclofenac sodium 25 mg (yellow), net price 84-tab pack = £2.94; 50 mg (brown), 84-tab pack = £4.57. Label: 5, 25

**Dispersible tablets**, sugar-free, pink, diclofenac, equivalent to diclofenac sodium 50 mg, net price 21-tab pack = £6.19. Label: 13, 21

**Note** Voltarol Dispersible tablets are more suitable for short-term use in acute conditions for which treatment required for no more than 3 months (no information on use beyond 3 months)

**Injection**, diclofenac sodium 25 mg/mL, net price 3-mL amp = 83p

**Excipients** include benzyl alcohol (avoid in neonates unless there is no safer alternative, see Excipients, p. 2), propylene glycol

**Dose by deep intramuscular injection** into the gluteal muscle, acute exacerbations of pain and postoperative pain, 75 mg once daily (twice daily in severe cases) for max. 2 days; **CHILD** 2–18 years, see *BNF for Children* Urteric colic, 75 mg then a further 75 mg after 30 minutes if necessary

**By intravenous infusion** (in hospital setting), acute postoperative pain, 75 mg repeated if necessary after 4–6 hours; max. 150 mg in 24 hours for 2 days; **CHILD** 2–18 years, see *BNF for Children*

Prevention of postoperative pain, initially after surgery 25–50 mg over 15–60 minutes then 5 mg/hour; max. 150 mg in 24 hours for 2 days

**Suppositories**, diclofenac sodium 12.5 mg, net price 10 = 58p; 25 mg, 10 = £1.03; 50 mg, 10 = £1.70; 100 mg, 10 = £3.03

### Modified release

#### Diclox SR<sup>®</sup> (Galen) (PoM)

Capsules, m/r, yellow, diclofenac sodium 75 mg, net price 56-cap pack = £9.69. Label: 21, 25

**Dose ADULT** over 18 years, 1 capsule 1–2 times daily or 2 capsules once daily; **CHILD** 12–18 years see *BNF for Children*

#### Diclox Retard<sup>®</sup> (Galen) (PoM)

Capsules, m/r, diclofenac sodium 100 mg, net price 28-cap pack = £6.97. Label: 21, 25

**Dose ADULT** over 18 years, 1 capsule once daily; **CHILD** 12–18 years see *BNF for Children*

#### Motifene<sup>®</sup> 75 mg (Daiichi Sankyo) (PoM)

Capsules, e/c, m/r, diclofenac sodium 75 mg (enclosing e/c pellets containing diclofenac sodium 25 mg and m/r pellets containing diclofenac sodium 50 mg), net price 56-cap pack = £8.00. Label: 25

**Excipients** include propylene glycol (see Excipients, p. 2) **Dose ADULT** over 18 years, 1 capsule 1–2 times daily; **CHILD** 12–18 years see *BNF for Children*

#### Voltarol<sup>®</sup> 75 mg SR (Novartis) (PoM)

Tablets, m/r, f/c, pink, diclofenac sodium 75 mg, net price 28-tab pack = £6.46; 56-tab pack = £12.92. Label: 21, 25

**Dose ADULT** over 18 years, 1 tablet 1–2 times daily; **CHILD** 12–18 years see *BNF for Children*

**Note** Other brands of modified-release tablets containing diclofenac sodium 75 mg include *Defenac*<sup>®</sup> SR, *Dexomon*<sup>®</sup> 75 SR, *Dicloflex*<sup>®</sup> 75 SR, *Fenactol*<sup>®</sup> 75 mg SR, *Flamatak*<sup>®</sup> 75 MR, *Flamrase*<sup>®</sup> SR, *Flexotard*<sup>®</sup> MR 75, *Rheumatac*<sup>®</sup> Retard 75, *Rhumalgan*<sup>®</sup> CR, *Slofenac*<sup>®</sup> SR, *Volsaid*<sup>®</sup> Retard 75

#### Voltarol<sup>®</sup> Retard (Novartis) (PoM)

Tablets, m/r, f/c, red, diclofenac sodium 100 mg. Net price 28-tab pack = £9.47. Label: 21, 25

**Dose ADULT** over 18 years, 1 tablet once daily; **CHILD** 12–18 years see *BNF for Children*

**Note** Other brands of modified-release tablets containing diclofenac sodium 100 mg include *Defenac*<sup>®</sup> Retard, *Dexomon*<sup>®</sup> Retard 100, *Dicloflex*<sup>®</sup> Retard, *Fenactol*<sup>®</sup> Retard 100 mg, *Flamatak*<sup>®</sup> 100 MR, *Slofenac*<sup>®</sup> SR, *Volsaid*<sup>®</sup> Retard 100

### With misoprostol

For prescribing information on misoprostol, see section 1.3.4

#### Arthrotec<sup>®</sup> (Pharmacia) (PoM)

**Arthrotec<sup>®</sup> 50 tablets**, diclofenac sodium (in e/c core) 50 mg, misoprostol 200 micrograms, net price 60-tab pack = £11.98; Label: 21, 25

**Dose** prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid

arthritis or osteoarthritis, 1 tablet 2–3 times daily with food; **CHILD** not recommended

**Arthrotec® 75 tablets**, diclofenac sodium (in e/c core) 75 mg, misoprostol 200 micrograms, net price 60-tab pack = £15.83. Label: 21, 25

**Dose** prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis, 1 tablet twice daily with food; **CHILD** not recommended

**Note** The BNF recommends a higher starting dose of misoprostol for prophylaxis against NSAID-induced gastroduodenal ulceration than that provided by *Arthrotec®* (see section 1.3.4)

**Misofen®** (Morningside) (PoM)

**Tablets**, diclofenac sodium (in e/c core) 50 mg, misoprostol 200 micrograms, net price 60-tab pack = £11.98. Label: 21, 25

**Dose** prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis, 1 tablet 2–3 times daily with food; **CHILD** not recommended

**Tablets**, diclofenac sodium (in e/c core) 75 mg, misoprostol 200 micrograms, net price 60-tab pack = £15.83. Label: 21, 25

**Dose** prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis, 1 tablet twice daily with food; **CHILD** not recommended

**Note** The BNF recommends a higher starting dose of misoprostol for prophylaxis against NSAID-induced gastroduodenal ulceration than that provided by *Misofen®* (see section 1.3.4)

## Topical preparations

Section 10.3.2

## ETODOLAC

**Indications** pain and inflammation in rheumatoid arthritis and osteoarthritis

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** manufacturer advises avoid; see also notes above

**Side-effects** see notes above; also stomatitis, vasculitis, palpitation, dyspnoea, confusion, fatigue, paraesthesia, tremor, urinary frequency, dysuria, pyrexia, and pruritus

### Dose

- **ADULT** over 18 years, 300–600 mg daily in 1–2 divided doses

**Etodolac** (Non-proprietary) (PoM)

**Capsules**, etodolac 300 mg, net price 60-cap pack = £8.14

**Brands include** *Eccoxolac®*

## Modified release

**Etopan XL®** (Taro) (PoM)

**Tablets**, m/r, f/c, grey, etodolac 600 mg, net price 30-tab pack = £14.60. Label: 25

**Dose** 1 tablet daily; **CHILD** not recommended

**Lodine SR®** (Almirall) (PoM)

**Tablets**, m/r, f/c, light-grey, etodolac 600 mg, net price 30-tab pack = £15.50. Label: 25

**Dose** 1 tablet daily; **CHILD** not recommended

## ETORICOXIB

**Indications** pain and inflammation in osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis; acute gout

**Cautions** see notes above; also dehydration; monitor blood pressure before treatment, 2 weeks after initiation and periodically during treatment

**Contra-indications** see notes above; inflammatory bowel disease; uncontrolled hypertension (persistently above 140/90 mmHg)

**Hepatic impairment** max. 60 mg daily in mild impairment; max. 60 mg on alternate days or 30 mg once daily in moderate impairment; see also notes above

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>; see also notes above

**Pregnancy** manufacturer advises avoid (teratogenic in animal studies); see also notes above

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies; see also notes above

**Side-effects** see notes above; also palpitation, fatigue, influenza-like symptoms, ecchymosis; *less commonly* dry mouth, taste disturbance, mouth ulcer, appetite and weight change, atrial fibrillation, transient ischaemic attack, chest pain, flushing, cough, dyspnoea, epistaxis, anxiety, mental acuity impaired, paraesthesia, electrolyte disturbance, myalgia and arthralgia; *very rarely* confusion and hallucinations

### Dose

- Osteoarthritis, **ADULT** and **CHILD** over 16 years, 30 mg once daily, increased if necessary to 60 mg once daily
- Rheumatoid arthritis and ankylosing spondylitis, **ADULT** and **CHILD** over 16 years, 90 mg once daily
- Acute gout, **ADULT** and **CHILD** over 16 years, 120 mg once daily for max. 8 days

**Arcoxia®** (MSD) (PoM)

**Tablets**, f/c, etoricoxib 30 mg (blue-green), net price 28-tab pack = £13.99; 60 mg (dark green), 28-tab pack = £20.11; 90 mg (white), 28-tab pack = £22.96; 120 mg (pale green), 7-tab pack = £6.03, 28-tab pack = £24.11

## FENOPROFEN

**Indications** pain and inflammation in rheumatic disease and other musculoskeletal disorders; mild to moderate pain

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** amount too small to be harmful; see also notes above

**Side-effects** see notes above; upper respiratory-tract infection, nasopharyngitis, and cystitis also reported

### Dose

- 300–600 mg 3–4 times daily; max. 3 g daily; **CHILD** not recommended

**Fenopron® 300** (Typharm) (PoM)

**Tablets**, orange, fenopron (as calcium salt) 300 mg, net price 100-tab pack = £9.45 Label: 21

## FLURBIPROFEN

**Indications** pain and inflammation in rheumatic disease and other musculoskeletal disorders; mild to moderate pain including dysmenorrhoea; migraine; postoperative analgesia; sore throat (section 12.3.1)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** small amount present in milk—manufacturer advises avoid; see also notes above

**Side-effects** see notes above; also stomatitis; less commonly paraesthesia, confusion, hallucinations, and fatigue

### Dose

- **ADULT** and **CHILD** over 12 years, 150–200 mg daily in 2–4 divided doses, increased in acute conditions to 300 mg daily

- Dysmenorrhoea, **ADULT** and **CHILD** over 12 years, initially 100 mg, then 50–100 mg every 4–6 hours; max. 300 mg daily

**Flurbiprofen** (Non-proprietary) PoM

**Tablets**, flurbiprofen 50 mg, net price 100 = £10.27; 100 mg, 100 = £19.46. Label: 21

**Froben**<sup>®</sup> (Abbott Healthcare) PoM

**Tablets**, yellow, s/c, flurbiprofen 50 mg, net price 100 = £10.27; 100 mg, 100 = £19.46. Label: 21

## IBUPROFEN

**Indications** pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders; mild to moderate pain including dysmenorrhoea; postoperative analgesia; migraine; dental pain; fever with discomfort and pain in children; post-immunisation pyrexia (section 14.1)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** amount too small to be harmful but some manufacturers advise avoid (including topical use); see also notes above

**Side-effects** see notes above

### Dose

- **ADULT** and **CHILD** over 12 years, initially 300–400 mg 3–4 times daily; increased if necessary to max. 2.4 g daily; maintenance dose of 0.6–1.2 g daily may be adequate

- Pain and fever in children, **CHILD** 1–3 months, see *BNF for Children*; **CHILD** 3–6 months (body-weight over 5 kg), 50 mg 3 times daily (max. 30 mg/kg daily in 3–4 divided doses); **CHILD** 6 months–1 year, 50 mg 3–4 times daily (max. 30 mg/kg daily in 3–4 divided doses); **CHILD** 1–4 years, 100 mg 3 times daily (max. 30 mg/kg daily in 3–4 divided doses); **CHILD** 4–7 years, 150 mg 3 times daily (max. 30 mg/kg daily in 3–4 divided doses); **CHILD** 7–10 years, 200 mg 3 times daily (up to 30 mg/kg daily (max. 2.4 g) in 3–4 divided doses); **CHILD** 10–12 years, 300 mg 3 times daily (up to 30 mg/kg daily (max. 2.4 g) in 3–4 divided doses)

- Rheumatic disease in children (including juvenile idiopathic arthritis), **CHILD** 3 months–18 years (body-weight over 5 kg), 30–40 mg/kg (max. 2.4 g) daily in 3–4 divided doses; in systemic juvenile idiopathic arthritis up to 60 mg/kg (max. 2.4 g) daily (unlicensed) in 4–6 divided doses

**<sup>1</sup>Ibuprofen** (Non-proprietary) PoM

**Tablets**, coated, ibuprofen 200 mg, net price 84-tab pack = £3.08; 400 mg, 84-tab pack = £3.15; 600 mg, 84-tab pack = £6.93. Label: 21

**Brands include** *Arthrofen*<sup>®</sup>, *Ebufac*<sup>®</sup>, *Rimafen*<sup>®</sup>

**Dental prescribing on NHS** Ibuprofen Tablets may be prescribed

**Oral suspension**, ibuprofen 100 mg/5 mL, net price 100 mL = £1.37, 150 mL = £2.11, 500 mL = £8.88. Label: 21

**Note** Sugar-free versions are available and can be ordered by specifying 'sugar-free' on the prescription

**Brands include** *Calprofen*<sup>®</sup>, *Feverfen*<sup>®</sup>, *Nurofen*<sup>®</sup> for Children, *Orbifen*<sup>®</sup> for Children

**Dental prescribing on NHS** Ibuprofen Oral Suspension Sugar-free may be prescribed

**Brufen**<sup>®</sup> (Abbott Healthcare) PoM

**Tablets**, f/c, ibuprofen 200 mg, net price 100-tab pack = £3.92; 400 mg, 100-tab pack = £8.16; 600 mg, 100-tab pack = £12.24. Label: 21

**Syrup**, orange, ibuprofen 100 mg/5 mL, net price 500 mL (orange-flavoured) = £8.88. Label: 21

**Granules**, effervescent, ibuprofen 600 mg/sachet, net price 20-sachet pack = £6.80. Label: 13, 21

**Electrolytes** Na<sup>+</sup> approx. 6.5 mmol/sachet

### Modified release

**Brufen Retard**<sup>®</sup> (Abbott Healthcare) PoM

**Tablets**, m/r, ibuprofen 800 mg, net price 56-tab pack = £7.74. Label: 25, 27

**Dose** **ADULT** and **CHILD** over 12 years, 2 tablets daily as a single dose, preferably in the early evening, increased in severe cases to 3 tablets daily in 2 divided doses

### Topical preparations

Section 10.3.2

## INDOMETACIN

(Indomethacin)

**Indications** pain and moderate to severe inflammation in rheumatic disease and other acute musculoskeletal disorders; acute gout; dysmenorrhoea; premature labour (section 7.1.3)

**Cautions** see notes above; also epilepsy, parkinsonism, psychiatric disturbances; during prolonged therapy ophthalmic and blood examinations particularly advisable; avoid rectal administration in proctitis and haemorrhoids

**Driving** Dizziness may affect performance of skilled tasks (e.g. driving)

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** amount probably too small to be harmful—manufacturers advise avoid; see also notes above

**Side-effects** see notes above; rarely confusion, convulsions, psychiatric disturbances, syncope, blood

1. Can be sold to the public in certain circumstances

disorders (particularly thrombocytopenia), hyperglycaemia, peripheral neuropathy, intestinal strictures; *also reported* hyperkalaemia; suppositories may cause rectal irritation and occasional bleeding

#### Dose

- **By mouth**, rheumatic disease, 50–200 mg daily in divided doses; **CHILD** see *BNF for Children*  
Acute gout, 150–200 mg daily in divided doses  
Dysmenorrhoea, up to 75 mg daily
- **By rectum** in suppositories, 100 mg at night and in the morning if required; **CHILD** not recommended  
Combined oral and rectal treatment, max. total daily dose 150–200 mg

#### Indometacin (Non-proprietary) (PoM)

**Capsules**, indometacin 25 mg, net price 28-cap pack = £1.17; 50 mg, 28-cap pack = £1.22. Label: 21, counselling, driving, see above

**Suppositories**, indometacin 100 mg, net price 10 = £17.61. Counselling, driving, see above

#### Modified release

##### Indometacin m/r preparations (PoM)

**Capsules**, m/r, indometacin 75 mg. Label: 21, 25, counselling, driving, see above

**Brands include** *Indolar SR*<sup>®</sup>, *Pardelprin*<sup>®</sup>

**Dose** 75 mg 1–2 times daily (once daily in dysmenorrhoea); **CHILD** not recommended

#### Modified release

##### Oruviel<sup>®</sup> (Sanofi-Aventis) (PoM)

**Capsules**, m/r, enclosing white pellets, ketoprofen 100 mg (pink/purple), net price 56-cap pack = £23.93; 150 mg (pink), 28-cap pack = £13.66; 200 mg (pink/white), 28-cap pack = £23.85. Label: 21, 25

**Dose** 100–200 mg once daily with food; **CHILD** not recommended

**Note** Other brands of modified-release capsules containing ketoprofen 100 mg and 200 mg include *Ketocid*<sup>®</sup> 200 mg, *Ketovail*<sup>®</sup>, *Tiloket*<sup>®</sup> CR

#### With omeprazole

For prescribing information on omeprazole, see section 1.3.5

##### Axorid<sup>®</sup> (Meda) (PoM)

**Capsules**, m/r, ketoprofen 100 mg, omeprazole 20 mg (yellow/white), net price 30-cap pack = £13.80; ketoprofen 200 mg, omeprazole 20 mg (white), 30-cap pack = £13.80. Label: 21, 25

**Excipients** include propylene glycol (see Excipients, p. 2)

**Note** Capsules enclose microgranules containing modified-release ketoprofen and gastro-resistant omeprazole

**Dose** (expressed as ketoprofen) patients requiring ketoprofen for osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis, who are at risk of NSAID-associated duodenal or gastric ulcer or gastroduodenal erosions, **ADULT** and **CHILD** over 15 years, 100 mg (with omeprazole 20 mg) once daily increased to 200 mg (with omeprazole 20 mg) once daily depending on severity of symptoms

#### Topical preparations

Section 10.3.2

## KETOPROFEN

**Indications** pain and mild inflammation in rheumatic disease and other musculoskeletal disorders, and after orthopaedic surgery; acute gout; dysmenorrhoea

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** amount probably too small to be harmful but manufacturers advise avoid; see also notes above

**Side-effects** see notes above; suppositories may cause rectal irritation

#### Dose

- **By mouth**, rheumatic disease, 100–200 mg daily in 2–4 divided doses; **CHILD** not recommended  
Pain and dysmenorrhoea, 50 mg up to 3 times daily; **CHILD** not recommended
- **By rectum** in suppositories, rheumatic disease, 100 mg at bedtime; **CHILD** not recommended  
Combined oral and rectal treatment, max. total daily dose 200 mg

#### Ketoprofen (Non-proprietary) (PoM)

**Capsules**, ketoprofen 50 mg, net price 28-cap pack = £9.32; 100 mg, 56-cap pack = £6.66. Label: 21

#### Orudis<sup>®</sup> (Sanofi-Aventis) (PoM)

**Capsules**, ketoprofen 50 mg (green/purple), net price 112-cap pack = £15.14; 100 mg (pink), 56-cap pack = £15.49. Label: 21

**Suppositories**, ketoprofen 100 mg. Net price 10 = £6.65

## MEFENAMIC ACID

**Indications** pain and inflammation in rheumatoid arthritis and osteoarthritis; postoperative pain; mild to moderate pain; dysmenorrhoea and menorrhagia

**Cautions** see notes above; epilepsy; acute porphyria (section 9.8.2)

**Contra-indications** see notes above; inflammatory bowel disease

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** amount too small to be harmful but manufacturer advises avoid; see also notes above

**Side-effects** see notes above; also diarrhoea or rashes (withdraw treatment), stomatitis; *less commonly* paraesthesia and fatigue; *rarely* hypotension, palpitation, glucose intolerance, thrombocytopenia, haemolytic anaemia (positive Coombs' test), and aplastic anaemia

#### Dose

- **ADULT** over 18 years, 500 mg 3 times daily
- **CHILD** 12–18 years, acute pain including dysmenorrhoea, menorrhagia, 500 mg 3 times daily

#### Mefenamic Acid (Non-proprietary) (PoM)

**Capsules**, mefenamic acid 250 mg, net price 100-cap pack = £2.17. Label: 21

**Tablets**, mefenamic acid 500 mg, net price 28-tab pack = £1.66. Label: 21

**Suspension**, mefenamic acid 50 mg/5 mL, net price 125 mL = £79.98. Label: 21

**Excipients** include ethanol

**Ponstan**<sup>®</sup> (Chemidex) (PoM)

Capsules, blue/ivory, mefenamic acid 250 mg, net price 100-cap pack = £8.17. Label: 21

**Forté tablets**, yellow, mefenamic acid 500 mg, net price 100-tab pack = £15.72. Label: 21

**MELOXICAM**

**Indications** pain and inflammation in rheumatic disease; exacerbation of osteoarthritis (short-term); ankylosing spondylitis

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid if eGFR less than 25 mL/minute/1.73m<sup>2</sup>; see also notes above

**Pregnancy** see notes above

**Breast-feeding** present in milk in *animal* studies—manufacturer advises avoid; see also notes above

**Side-effects** see notes above

**Dose**

- **By mouth**, osteoarthritis, **ADULT** and **CHILD** over 16 years, 7.5 mg once daily, increased if necessary to max. 15 mg once daily  
Rheumatoid arthritis, ankylosing spondylitis, **ADULT** and **CHILD** over 16 years, 15 mg once daily, may be reduced to 7.5 mg once daily; **ELDERLY** 7.5 mg daily
- **CHILD** over 12 years, see *BNF for Children*

**Meloxicam** (Non-proprietary) (PoM)

**Tablets**, meloxicam 7.5 mg, net price 30-tab pack = £1.03; 15 mg, 30-tab pack = £1.13. Label: 21

**NABUMETONE**

**Indications** pain and inflammation in osteoarthritis and rheumatoid arthritis

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** manufacturer advises avoid; see also notes above

**Side-effects** see notes above

**Dose**

- 1 g at night; severe or persistent symptoms 0.5–1 g in morning and 1 g at night; **ELDERLY** 0.5–1 g daily; **CHILD** not recommended

**Nabumetone** (Non-proprietary) (PoM)

**Tablets**, nabumetone 500 mg, net price 56-tab pack = £8.55. Label: 21

**Relifex**<sup>®</sup> (Meda) (PoM)

**Tablets**, red, f /c, nabumetone 500 mg. Net price 56-tab pack = £6.18. Label: 21

**Suspension**, sugar-free, nabumetone 500 mg/5 mL. Net price 300-mL pack = £28.90. Label: 21

**NAPROXEN**

**Indications** pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders; dysmenorrhoea; acute gout

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>; see also notes above

**Pregnancy** see notes above

**Breast-feeding** amount too small to be harmful but manufacturer advises avoid; see also notes above

**Side-effects** see notes above

**Dose**

- Rheumatic disease, 0.5–1 g daily in 1–2 divided doses; **CHILD** 2–18 years, juvenile idiopathic arthritis, see *BNF for Children*
- Acute musculoskeletal disorders and dysmenorrhoea, 500 mg initially, then 250 mg every 6–8 hours as required; max. dose after first day 1.25 g daily; **CHILD** under 18 years, see *BNF for Children*
- Acute gout, 750 mg initially, then 250 mg every 8 hours until attack has passed; **CHILD** under 16 years not recommended

**<sup>1</sup>Naproxen** (Non-proprietary) (PoM)

**Tablets**, naproxen 250 mg, net price 28-tab pack = £1.15; 500 mg, 28-tab pack = £1.82. Label: 21

**Brands include** *Arthrofen*<sup>®</sup>

**Tablets**, e/c, naproxen 250 mg, net price 56-tab pack = £2.71; 375 mg, 56-tab pack = £6.42; 500 mg, 56-tab pack = £5.02. Label: 5, 25

**Naprosyn**<sup>®</sup> (Roche) (PoM)

**Tablets**, yellow, scored, naproxen 250 mg, net price 56-tab pack = £4.29; 500 mg, 56-tab pack = £8.56. Label: 21

**Tablets**, e/c, (*Naprosyn EC*<sup>®</sup>), naproxen 250 mg, net price 56-tab pack = £4.29; 375 mg, 56-tab pack = £6.42; 500 mg, 56-tab pack = £8.56. Label: 5, 25

**With esomeprazole**

For prescribing information on esomeprazole, see section 1.3.5

**Vimovo**<sup>®</sup> (AstraZeneca) (PoM)

**Tablets**, f/c, m/r, naproxen 500 mg, esomeprazole (as magnesium trihydrate) 20 mg, net price 60-tab pack = £14.95. Label: 22, 25

**Note** Naproxen component is gastro-resistant

**Dose** patients requiring naproxen for rheumatoid arthritis, rheumatoid arthritis, or ankylosing spondylitis, who are at risk of NSAID-associated duodenal or gastric ulcer and when treatment with lower doses of naproxen or other NSAIDs is ineffective, **ADULT** over 18 years, 1 tablet twice daily

**With misoprostol**

For prescribing information on misoprostol, see section 1.3.4

**Napratec**<sup>®</sup> (Pharmacia) (PoM)

**Combination pack**, 56 yellow scored tablets, naproxen 500 mg; 56 white scored tablets, misoprostol 200 micrograms. Net price = £23.76. Label: 21

**Dose** patients requiring naproxen for rheumatoid arthritis, osteoarthritis, or ankylosing spondylitis, with prophylaxis against NSAID-induced gastroduodenal ulceration, 1 naproxen 500-mg tablet and 1 misoprostol 200-microgram tablet taken together twice daily with food; **CHILD** not recommended

**Note** The BNF recommends a higher starting dose of misoprostol for prophylaxis against NSAID-induced gastroduodenal ulceration than that provided by *Napratec*<sup>®</sup> (see section 1.3.4)

1. Can be sold to the public for the treatment of primary dysmenorrhoea in women aged 15–50 years subject to max. single dose of 500 mg, max. daily dose of 750 mg for max. 3 days, and a max. pack size of 9 × 250 mg tablets

**PIROXICAM**

**Indications** rheumatoid arthritis, osteoarthritis, and ankylosing spondylitis (see also CHMP advice below)

**Cautions** see notes above and CHMP advice below

**Contra-indications** inflammatory bowel disease; see also notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** amount too small to be harmful; see also notes above

**Side-effects** see notes above

**Dose**

- **By mouth**, max. 20 mg once daily (see also CHMP advice below); **CHILD** 6–18 years, juvenile idiopathic arthritis, see *BNF for Children*

**CHMP advice****Piroxicam (June 2007)**

The CHMP has recommended restrictions on the use of piroxicam because of the increased risk of gastro-intestinal side effects and serious skin reactions. The CHMP has advised that:

- piroxicam should be initiated only by physicians experienced in treating inflammatory or degenerative rheumatic diseases
- piroxicam should not be used as first-line treatment
- in adults, use of piroxicam should be limited to the symptomatic relief of osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis
- piroxicam dose should not exceed 20 mg daily
- piroxicam should no longer be used for the treatment of acute painful and inflammatory conditions
- treatment should be reviewed 2 weeks after initiating piroxicam, and periodically thereafter
- concomitant administration of a gastro-protective agent (section 1.3) should be considered

**Note**

Topical preparations containing piroxicam are not affected by these restrictions

**Piroxicam** (Non-proprietary) **(PoM)**

**Capsules**, piroxicam 10 mg, net price 56-cap pack = £6.40; 20 mg, 28-cap pack = £7.16. Label: 21

**Dispersible tablets**, piroxicam 10 mg, net price 56-tab pack = £9.96; 20 mg, 28-tab pack = £32.41. Label: 13, 21

**Brexidol**<sup>®</sup> (Chiesi) **(PoM)**

**Tablets**, yellow, scored, piroxicam (as betadex) 20 mg, net price 30-tab pack = £13.82. Label: 21

**Dose** osteoarthritis, rheumatic disease and acute musculoskeletal disorders, 1 tablet daily (may be halved in elderly); **CHILD** not recommended

**Feldene**<sup>®</sup> (Pfizer) **(PoM)**

**Capsules**, (Feldene Melt<sup>®</sup>), piroxicam 10 mg (red/blue), net price 30-cap pack = £3.86; 20 mg (white), 30-cap pack = £7.71. Label: 21

**Tablets**, (Feldene Melt<sup>®</sup>), piroxicam 20 mg, net price 30-tab pack = £10.53. Label: 10, patient information leaflet, 21

**Excipients** include aspartame equivalent to phenylalanine 140 micrograms/tablet (section 9.4.1)

**Note** Feldene Melt<sup>®</sup> tablets can be taken by placing on tongue or by swallowing

**Topical preparations**

Section 10.3.2

**SULINDAC**

**Indications** pain and inflammation in rheumatic disease and other musculoskeletal disorders; acute gout

**Cautions** see notes above; also history of renal stones and ensure adequate hydration

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; jaundice with fever, cholestasis, hepatitis, hepatic failure; also urine discoloration occasionally reported

**Dose**

- 200 mg twice daily (may be reduced according to response); max. 400 mg daily; acute gout should respond within 7 days; limit treatment of peri-articular disorders to 7–10 days; **CHILD** not recommended

**Sulindac** (Non-proprietary) **(PoM)**

**Tablets**, sulindac 100 mg, net price 56-tab pack = £29.78; 200 mg, 56-tab pack = £38.29. Label: 21

**TENOXICAM**

**Indications** pain and inflammation in rheumatic disease and other musculoskeletal disorders

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** present in milk in *animal* studies; see also notes above

**Side-effects** see notes above

**Dose**

- **By mouth**, rheumatic disease, **ADULT** over 18 years, 20 mg daily

Acute musculoskeletal disorders, **ADULT** over 18 years, 20 mg daily for 7 days; max. duration of treatment 14 days (including treatment by intravenous or intramuscular injection)

- **By intravenous or intramuscular injection**, **ADULT** over 18 years, initial treatment for 1–2 days if oral administration not possible, 20 mg once daily

**Tenoxicam** (Non-proprietary) **(PoM)**

**Tablets**, f/c, tenoxicam 20 mg, net price 28-tab pack = £16.16. Label: 21

**Injection**, powder for reconstitution, tenoxicam, net price 20-mg vial = £3.98

**Mobiflex**<sup>®</sup> (Meda) **(PoM)**

**Tablets**, yellow, f/c, tenoxicam 20 mg, net price 30-tab pack = £13.42. Label: 21

**TIAPROFENIC ACID**

**Indications** pain and inflammation in rheumatic disease and other musculoskeletal disorders

**Cautions** see notes above

**Contra-indications** see notes above; also active bladder or prostate disease (or symptoms) and history of recurrent urinary-tract disorders—if urinary symptoms develop discontinue immediately and perform urine tests and culture; see also CSM advice below

**CSM advice**

Following reports of **severe cystitis** the CSM has recommended that tiaprofenic acid should not be given to patients with urinary-tract disorders and should be stopped if urinary symptoms develop. Patients should be advised to stop taking tiaprofenic acid and to report to their doctor promptly if they develop urinary-tract symptoms (such as increased frequency, nocturia, urgency, pain on urinating, or blood in urine)

**Hepatic impairment** reduce dose in mild or moderate impairment; see also notes above

**Renal impairment** reduce dose in mild or moderate impairment; avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** amount too small to be harmful; see also notes above

**Side-effects** see notes above

**Dose**

● **ADULT** over 18 years, 300 mg twice daily

**Surgam**<sup>®</sup> (Sanofi-Aventis) (PoM)

Tablets, tiaprofenic acid 300 mg, net price 56-tab pack = £14.95. Label: 21

**Aspirin**

**Aspirin** (section 4.7.1) has been used in high doses to treat rheumatoid arthritis, but other NSAIDs are now preferred.

**10.1.2 Corticosteroids**

**10.1.2.1 Systemic corticosteroids**

**10.1.2.2 Local corticosteroid injections**

**10.1.2.1 Systemic corticosteroids**

The general actions, uses, and cautions of corticosteroids are described in section 6.3. Short-term treatment with corticosteroids can help to rapidly improve symptoms of rheumatoid arthritis. Long-term treatment in rheumatoid arthritis should be considered only after evaluating the risks and all other treatment options have been considered. Corticosteroids can induce osteoporosis, and prophylaxis should be considered on long-term treatment (section 6.6).

In severe, possibly life-threatening, situations a high initial dose of corticosteroid is given to induce remission and the dose is then reduced gradually and discontinued altogether. Relapse may occur as the dose of corticosteroid is reduced, particularly if the reduction is too rapid. The tendency is therefore to increase the maintenance dose and consequently the patient becomes dependent on corticosteroids. For this reason pulse doses of corticosteroids (e.g. methylprednisolone up to 1 g intravenously on 3 consecutive days) are used to suppress highly active inflammatory disease while longer-term treatment with a disease-modifying drug is commenced.

**Prednisolone** 7.5 mg daily may reduce the rate of joint destruction in moderate to severe *rheumatoid arthritis* of less than 2 years' duration. The reduction in joint destruction must be distinguished from mere sympto-

matic improvement (which lasts only 6 to 12 months at this dose) and care should be taken to avoid increasing the dose above 7.5 mg daily. Evidence supports maintenance of this anti-erosive dose for 2–4 years only after which treatment should be tapered off to reduce long-term adverse effects.

A modified-release preparation of **prednisone** (section 6.3.2) is also available for the treatment of moderate to severe rheumatoid arthritis.

*Polymyalgia rheumatica* and *giant cell (temporal) arteritis* are always treated with corticosteroids. The usual initial dose of prednisolone in polymyalgia rheumatica is 10–15 mg daily and in giant cell arteritis 40–60 mg daily (the higher dose being used if visual symptoms occur). Treatment should be continued until remission of disease activity and doses are then reduced gradually to about 7.5–10 mg daily for maintenance. Relapse is common if therapy is stopped prematurely. Many patients require treatment for at least 2 years and in some patients it may be necessary to continue long-term low-dose corticosteroid treatment.

*Polyarteritis nodosa* and *polymyositis* are usually treated with corticosteroids. An initial dose of 60 mg of prednisolone daily is often used and reduced to a maintenance dose of 10–15 mg daily.

*Systemic lupus erythematosus* is treated with corticosteroids when necessary using a similar dosage regimen to that for polyarteritis nodosa and polymyositis (above). Patients with pleuritis, pericarditis, or other systemic manifestations will respond to corticosteroids. It may then be possible to reduce the dosage; alternate-day treatment is sometimes adequate, and the drug may be gradually withdrawn. In some mild cases corticosteroid treatment may be stopped after a few months. Many mild cases of systemic lupus erythematosus do not require corticosteroid treatment. Alternative treatment with anti-inflammatory analgesics, and possibly chloroquine or hydroxychloroquine, should be considered.

*Ankylosing spondylitis* should not be treated with long-term corticosteroids; rarely, pulse doses may be needed and may be useful in extremely active disease that does not respond to conventional treatment.

**10.1.2.2 Local corticosteroid injections**

Corticosteroids are injected locally for an anti-inflammatory effect. In inflammatory conditions of the joints, particularly in rheumatoid arthritis, they are given by *intra-articular injection* to relieve pain, increase mobility, and reduce deformity in one or a few joints; they can also provide symptomatic relief while waiting for DMARDs to take effect. Full aseptic precautions are essential; infected areas should be avoided. Occasionally an acute inflammatory reaction develops after an intra-articular or soft-tissue injection of a corticosteroid. This may be a reaction to the microcrystalline suspension of the corticosteroid used, but must be distinguished from sepsis introduced into the injection site.

Smaller amounts of corticosteroids may also be injected directly into soft tissues for the relief of inflammation in conditions such as *tennis or golfer's elbow* or *compression neuropathies*. In *tendinitis*, injections should be made into the tendon sheath and not directly into the tendon (due to the absence of a true tendon sheath and a high risk of rupture, the Achilles tendon should not be injected).

Hydrocortisone acetate or one of the synthetic analogues is generally used for local injection. Intra-articular corticosteroid injections can cause flushing and may affect the hyaline cartilage. Each joint should not usually be treated more than 4 times in one year.

Corticosteroid injections are also injected into soft tissues for the treatment of skin lesions (see section 13.4).

## LOCAL CORTICOSTEROID INJECTIONS

**Indications** local inflammation of joints and soft tissues (for details, consult product literature)

**Cautions** see notes above and consult product literature; see also section 6.3.2

**Contra-indications** see notes above and consult product literature; avoid injections containing benzyl alcohol in neonates (see preparations below)

**Side-effects** see notes above and consult product literature

### Dose

- See under preparations

### ■ Betamethasone

**Betnesol**<sup>®</sup> (RPH) (PoM)

**Injection**, betamethasone (as sodium phosphate) 4 mg/mL, net price 1-mL amp = £1.22.

### ■ Dexamethasone

**Dexamethasone** (Non-proprietary) (PoM)

**Injection**, dexamethasone (as sodium phosphate) 4 mg/mL, net price 1-mL amp = 91p, 2-mL vial = £1.27

**Dose by intra-articular injection** (for details consult product literature), 0.3–3 mg according to size; where appropriate may be repeated at intervals of 3–21 days according to response

**Injection**, dexamethasone (as sodium phosphate) 3.3 mg/mL, net price 1-mL amp = £1.14, 2-mL vial = £4.80

**Dose by intra-articular injection** (for details consult product literature), 0.33–3.3 mg according to size (by soft-tissue infiltration 1.7–5 mg); where appropriate may be repeated at intervals of 3–21 days

### ■ Hydrocortisone acetate

**Hydrocortistab**<sup>®</sup> (AMCo) (PoM)

**Injection** (aqueous suspension), hydrocortisone acetate 25 mg/mL, net price 1-mL amp = £6.87

**Dose by intra-articular injection** (for details consult product literature), 5–50 mg according to size; where appropriate may be repeated at intervals of 21 days; not more than 3 joints should be treated on any one day; CHILD 5–30 mg (divided)

### ■ Methylprednisolone acetate

**Depo-Medrone**<sup>®</sup> (Pharmacia) (PoM)

**Injection** (aqueous suspension), methylprednisolone acetate 40 mg/mL, net price 1-mL vial = £3.44; 2-mL vial = £6.18; 3-mL vial = £8.96

**Dose by intra-articular injection** (for details consult product literature), 4–80 mg, according to size; where appropriate may be repeated at intervals of 7–35 days; also for intraslesional injection

**Depo-Medrone**<sup>®</sup> with Lidocaine (Pharmacia) (PoM)

**Injection** (aqueous suspension), methylprednisolone acetate 40 mg, lidocaine hydrochloride 10 mg/mL, net price 1-mL vial = £3.94; 2-mL vial = £7.06

**Dose by intra-articular injection** (for details consult product literature), 4–80 mg, according to size; where appropriate may be repeated at intervals of 7–35 days

### ■ Prednisolone acetate

**Deltastab**<sup>®</sup> (AMCo) (PoM)

**Injection** (aqueous suspension), prednisolone acetate 25 mg/mL, net price 1-mL amp = £6.87

**Dose by intra-articular injection** (for details consult product literature), 5–25 mg according to size; not more than 3 joints should be treated on any one day; where appropriate may be repeated when relapse occurs  
For intramuscular injection, see section 6.3.2

### ■ Triamcinolone acetonide

**Adcortyl**<sup>®</sup> Intra-articular/Intradermal (Squibb) (PoM)

**Injection** (aqueous suspension), triamcinolone acetonide 10 mg/mL, net price 1-mL amp = 89p; 5-mL vial = £3.63

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

**Dose by intra-articular injection** (for details consult product literature), 2.5–15 mg according to size (for larger doses use *Kenalog*<sup>®</sup>); where appropriate may be repeated when relapse occurs; CHILD under 18 years see *BNF for Children*

**By intradermal injection**, (for details consult product literature): 2–3 mg; max. 5 mg at any one site (total max. 30 mg); where appropriate may be repeated at intervals of 1–2 weeks; CHILD under 6 years not recommended

### ■ Kenalog<sup>®</sup> Intra-articular/Intramuscular

(Squibb) (PoM)

**Injection** (aqueous suspension), triamcinolone acetonide 40 mg/mL, net price 1-mL vial = £1.49

**Dose by intra-articular injection** (for details consult product literature), 5–40 mg according to size; total max. 80 mg (for doses below 5 mg use *Adcortyl*<sup>®</sup> Intra-articular/Intradermal); where appropriate may be repeated when relapse occurs; CHILD under 18 years see *BNF for Children*  
For intramuscular injection, see section 6.3.2

## 10.1.3 Drugs that suppress the rheumatic disease process

Certain drugs such as those affecting the immune response can suppress the disease process in *rheumatoid arthritis* and *psoriatic arthritis*; gold, penicillamine, hydroxychloroquine, chloroquine, and sulfasalazine can also suppress the disease process in *rheumatoid arthritis* while sulfasalazine and possibly gold can suppress the disease process in *psoriatic arthritis*. Unlike NSAIDs, which are used only for symptom control, disease-modifying anti-rheumatic drugs (DMARDs) can affect the progression of disease but may require 2–6 months of treatment for a full therapeutic response. Response to DMARDs may allow the NSAID dose to be reduced or withdrawn. All patients with suspected inflammatory joint disease should be referred to a specialist as soon as possible to confirm diagnosis and evaluate disease activity; early initiation of DMARDs is recommended to control the signs and symptoms, and to limit joint damage.

**Choice** The choice of a disease-modifying anti-rheumatic drug should take into account co-morbidity and patient preference. Methotrexate, sulfasalazine, intramuscular gold, and penicillamine are similar in efficacy. However, **methotrexate** or **sulfasalazine** may be better tolerated.

A combination of **DMARDs** (including methotrexate and at least one other DMARD) and a short-term **corticosteroid** (section 10.1.2), should be given to patients with newly diagnosed active rheumatoid arthritis, ideally within 3 months of the onset of persistent symptoms. If the use of particular DMARDs is contra-

indicated and combination therapy is not possible, monotherapy with a suitable DMARD should be given and the dose rapidly increased until clinically effective. In patients with established and stable rheumatoid arthritis, cautiously reduce drug doses to the lowest that are clinically effective. Response to drug treatment often produces a reduction in requirements of both corticosteroids and other drugs.

**Gold** and **penicillamine** are effective in *palindromic rheumatism*. *Systemic* and *discoid lupus erythematosus* are sometimes treated with **chloroquine** or **hydroxychloroquine**.

If a disease-modifying anti-rheumatic drug does not lead to an objective benefit within 6 months, it should be replaced by a different one.

**Juvenile idiopathic arthritis** Many children with *juvenile idiopathic arthritis* (juvenile chronic arthritis) do not require disease-modifying antirheumatic drugs. Methotrexate is effective (see *BNF for Children*); sulfasalazine is an alternative (unlicensed indication) but it should be avoided in *systemic-onset juvenile idiopathic arthritis* (see *BNF for Children*). Gold and penicillamine are no longer used. For the role of cytokine modulators in *juvenile idiopathic arthritis*, see *BNF for Children*.

## Gold

Gold can be given as **sodium aurothiomalate** for active progressive rheumatoid arthritis; it must be given by deep intramuscular injection and the area gently massaged. A test dose of 10 mg must be given followed by doses of 50 mg at weekly intervals until there is definite evidence of remission. Benefit is not to be expected until about 300–500 mg has been given; it should be discontinued if there is no remission after 1 g has been given. In patients who do respond, the interval between injections is then gradually increased to 4 weeks and treatment is continued for up to 5 years after complete remission. If relapse occurs the dosage frequency may be immediately increased to 50 mg weekly and only once control has been obtained again should the dosage frequency be decreased; if no response is seen within 2 months, alternative treatment should be sought. It is important to avoid complete relapse since second courses of gold are not usually effective.

Sodium aurothiomalate should be discontinued in the presence of blood disorders, gastro-intestinal bleeding (associated with ulcerative enterocolitis), or unexplained proteinuria (associated with immune complex nephritis) which is repeatedly above 300 mg/litre. Urine tests and full blood counts (including total and differential white cell and platelet counts) must therefore be performed before starting treatment and before each intramuscular injection. Rashes with pruritus often occur after 2 to 6 months of treatment and may necessitate discontinuation.

## SODIUM AUROTHIOMALATE

**Indications** active progressive rheumatoid arthritis

**Cautions** see notes above; elderly, history of urticaria, eczema, colitis; monitor for pulmonary fibrosis with annual chest X-ray; **interactions:** Appendix 1 (sodium aurothiomalate)

**Counselling** Patients should be advised to seek prompt medical attention if diarrhoea, sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, metallic taste, rash, breathlessness, or cough develop

**Contra-indications** history of blood disorders or bone marrow aplasia, exfoliative dermatitis, systemic lupus erythematosus, necrotising enterocolitis, pulmonary fibrosis

**Hepatic impairment** caution in mild to moderate impairment, avoid in severe impairment

**Renal impairment** caution in mild to moderate impairment; avoid in severe impairment

**Pregnancy** manufacturer advises avoid but limited data suggests usually not necessary to withdraw if condition well controlled—consider reducing dose and frequency

**Breast-feeding** manufacturer advises avoid—present in milk; theoretical possibility of rashes and idiosyncratic reactions

**Side-effects** see notes above; also severe anaphylactic reactions; stomatitis, taste disturbances, colitis, hepatotoxicity with cholestatic jaundice, pulmonary fibrosis, peripheral neuropathy, mouth ulcers, proteinuria, blood disorders (sometimes sudden and fatal), nephrotic syndrome, gold deposits in eye, alopecia, and skin reactions (including, on prolonged parenteral treatment, irreversible pigmentation in sun-exposed areas)

### Dose

- **By deep intramuscular injection**, administered on expert advice, see notes above

**Myocrisin**<sup>®</sup> (Sanofi-Aventis) [PoM]

**Injection**, sodium aurothiomalate 20 mg/mL, net price 0.5-mL (10-mg) amp = £4.56; 100 mg/mL, 0.5-mL (50-mg) amp = £13.48. Label: 11, counselling, blood disorder symptoms

## Penicillamine

**Penicillamine** has a similar action to gold. More patients are able to continue treatment than with gold but side-effects are common.

Patients should be warned not to expect improvement for at least 6 to 12 weeks after treatment is initiated. Penicillamine should be discontinued if there is no improvement within 1 year.

Blood counts, including platelets, and urine examinations should be carried out before starting treatment and then every 1 or 2 weeks for the first 2 months then every 4 weeks to detect blood disorders and proteinuria (they should also be carried out in the week after any dose increase). A reduction in platelet count calls for discontinuation with subsequent re-introduction at a lower dosage and then, if possible, gradual increase. Proteinuria, associated with immune complex nephritis, occurs in up to 30% of patients, but may resolve despite continuation of treatment; treatment may be continued provided that renal function tests remain normal, oedema is absent, and the 24-hour urinary excretion of protein does not exceed 2 g.

Nausea may occur but is not usually a problem provided that penicillamine is taken before food or on retiring and that low initial doses are used and only gradually increased. Loss of taste can occur about 6 weeks after treatment is started but usually returns 6 weeks later irrespective of whether treatment is discontinued; mineral supplements are not recommended. Rashes are a common side-effect. Those that occur in the first few months of treatment disappear when the drug is stopped and treatment may then be re-introduced at a lower dose level and gradually increased.

Patients who are hypersensitive to penicillin may react rarely to penicillamine.

## PENICILLAMINE

**Indications** see notes above and under Dose

**Cautions** see notes above; concomitant nephrotoxic drugs (increased risk of toxicity); gold treatment (avoid concomitant use if adverse reactions to gold); **interactions:** Appendix 1 (penicillamine)

**Blood counts and urine tests** See notes above. Longer intervals may be adequate in cystinuria and Wilson's disease. Consider withdrawal if platelet count falls below  $120\,000/\text{mm}^3$  or white blood cells below  $2500/\text{mm}^3$  or if 3 successive falls within reference range (can restart at reduced dose when counts return to within reference range but permanent withdrawal necessary if recurrence of leucopenia or thrombocytopenia)

**Counselling** Warn patient to tell doctor promptly if sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, or rashes develop

**Contra-indications** lupus erythematosus

**Renal impairment** reduce dose and monitor renal function or avoid (consult product literature)

**Pregnancy** fetal abnormalities reported rarely; avoid if possible

**Breast-feeding** manufacturer advises avoid unless potential benefit outweighs risk—no information available

**Side-effects** (see also notes above) initially nausea, anorexia, fever; proteinuria, thrombocytopenia; rarely mouth ulceration, stomatitis, male and female breast enlargement, haematuria (withdraw immediately if cause unknown), alopecia, pseudoxanthoma elasticum, elastosis perforans, skin laxity; also reported pancreatitis, vomiting, cholestatic jaundice, pulmonary haemorrhage, bronchiolitis, pneumonitis, blood disorders including neutropenia, agranulocytosis, aplastic anaemia, haemolytic anaemia and leucopenia, nephrotic syndrome, glomerulonephritis, Goodpasture's syndrome, septic arthritis in patients with rheumatoid arthritis, lupus erythematosus, myasthenia gravis, polymyositis, rheumatoid arthritis, urticaria, dermatomyositis, pemphigus, Stevens-Johnson syndrome, late rashes (consider dose reduction)

### Dose

- Severe active rheumatoid arthritis, administered on expert advice, **ADULT** over 18 years, initially 125–250 mg daily for 1 month increased by similar amounts at intervals of not less than 4 weeks to usual maintenance of 500–750 mg daily in divided doses; max. 1.5 g daily; if remission sustained for 6 months, reduction of daily dose by 125–250 mg every 12 weeks may be attempted; **ELDERLY** initially up to 125 mg daily for 1 month increased by similar amounts at intervals of not less than 4 weeks; max. 1 g daily
- Wilson's disease, autoimmune hepatitis, and cystinuria, section 9.8.1

**Penicillamine** (Non-proprietary) (PoM)

**Tablets**, penicillamine 125 mg, net price 56-tab pack = £11.20; 250 mg, 56-tab pack = £21.89. Label: 6, 22, counselling, blood disorder symptoms (see above)

**Distamine**<sup>®</sup> (Alliance) (PoM)

**Tablets**, f/c, penicillamine 125 mg, net price 100-tab pack = £10.34; 250 mg, 100-tab pack = £17.78. Label: 6, 22, counselling, blood disorder symptoms (see above)

## Antimalarials

The antimalarial **hydroxychloroquine** is used to treat rheumatoid arthritis of moderate inflammatory activity; **chloroquine** is also licensed for treating inflammatory disorders but is used much less frequently and is generally reserved for use if other drugs have failed. Chloroquine and hydroxychloroquine are effective for mild systemic lupus erythematosus, particularly involving the skin and joints. These drugs should not be used for psoriatic arthritis.

Chloroquine and hydroxychloroquine are better tolerated than gold or penicillamine. Retinopathy (see below) rarely occurs provided that the recommended doses are not exceeded; in the elderly it is difficult to distinguish drug-induced retinopathy from changes of ageing.

**Mepacrine** (section 5.4.4) is sometimes used in discoid lupus erythematosus (unlicensed).

**Cautions** Manufacturers recommend regular ophthalmological examination but the evidence of practical value is unsatisfactory (see advice of the Royal College of Ophthalmologists, below). Chloroquine and hydroxychloroquine should be used with caution in neurological disorders (especially in those with a history of epilepsy), in severe gastro-intestinal disorders, in G6PD deficiency (section 9.1.5), in acute porphyria, and in the elderly (see also above). Chloroquine and hydroxychloroquine may exacerbate psoriasis and aggravate myasthenia gravis. Concurrent use of hepatotoxic drugs should be avoided; other **interactions:** Appendix 1 (chloroquine and hydroxychloroquine).

**Screening for ocular toxicity** A review group convened by the Royal College of Ophthalmologists has updated guidelines for screening to prevent ocular toxicity on long-term treatment with chloroquine and hydroxychloroquine (*Hydroxychloroquine and Ocular Toxicity: Recommendations on Screening 2009*). Chloroquine should be considered (for treating chronic inflammatory conditions) **only** if other drugs have failed. All patients taking chloroquine should receive ocular examination according to a protocol arranged locally between the prescriber and the ophthalmologist. The following recommendations relate to hydroxychloroquine, which is only rarely associated with toxicity.

### Before treatment:

- Assess renal and liver function (adjust dose if impaired)
- Ask patient about visual impairment (not corrected by glasses). If impairment or eye disease present, assessment by an optometrist is advised and any abnormality should be referred to an ophthalmologist
- Record near visual acuity of each eye (with glasses where appropriate) using a standard reading chart
- Initiate hydroxychloroquine treatment if no abnormality detected (at a dose not exceeding hydroxychloroquine sulfate 6.5 mg/kg daily)

### During treatment:

- Ask patient about visual symptoms and monitor visual acuity annually using the standard reading chart
- Refer to ophthalmologist if visual acuity changes or if vision blurred and warn patient to seek prescribing doctor's advice about stopping treatment

- A child treated for juvenile idiopathic arthritis should receive slit-lamp examination routinely to check for uveitis
- If long-term treatment is required (more than 5 years), individual arrangement should be agreed with the local ophthalmologist

### Important

To avoid excessive dosage in obese patients, the doses of hydroxychloroquine and chloroquine should be calculated on the basis of ideal body-weight. Ocular toxicity is unlikely if the dose of chloroquine phosphate does not exceed 4 mg/kg daily (equivalent to chloroquine base approx. 2.5 mg/kg daily)

**Hepatic impairment** Chloroquine and hydroxychloroquine should be used with caution in moderate to severe hepatic impairment.

**Pregnancy** It is not necessary to withdraw an anti-malarial drug during pregnancy if the rheumatic disease is well controlled; however, the manufacturer of hydroxychloroquine advises avoiding use.

**Breast-feeding** Chloroquine and hydroxychloroquine are present in breast milk and breast-feeding should be avoided when they are used to treat rheumatic disease.

**Side-effects** The side-effects of chloroquine and hydroxychloroquine include gastro-intestinal disturbances, headache and skin reactions (rashes, pruritus); those occurring less frequently include ECG changes, convulsions, visual changes, retinal damage (see above), keratopathy, ototoxicity, hair depigmentation, hair loss, and discoloration of skin, nails, and mucous membranes. Side-effects that occur rarely include blood disorders (including thrombocytopenia, agranulocytosis, and aplastic anaemia), mental changes (including emotional disturbances and psychosis), myopathy (including cardiomyopathy and neuromyopathy), angioedema, acute generalised exanthematous pustulosis, exfoliative dermatitis, Stevens-Johnson syndrome, photosensitivity, and hepatic damage; diffuse parenchymal lung disease, and drug rash with eosinophilia and systemic symptoms have also been reported. **Important:** very toxic in overdose—immediate advice from poisons centres essential (see also p. 39).

## CHLOROQUINE

**Indications** active rheumatoid arthritis, systemic and discoid lupus erythematosus; malaria (section 5.4.1)

**Cautions** see notes above

**Hepatic impairment** see notes above

**Renal impairment** manufacturer advises caution; reduce dose

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

### Dose

- Administered on expert advice, by mouth, **ADULT** over 18 years, chloroquine (base) 150 mg daily; max. 2.5 mg/kg daily based on ideal body-weight, see also recommendations above

**Note** Chloroquine base 150 mg = chloroquine sulfate 200 mg = chloroquine phosphate 250 mg (approx.).

### Preparations

Section 5.4.1

## HYDROXYCHLOROQUINE SULFATE

**Indications** active rheumatoid arthritis (including juvenile idiopathic arthritis), systemic and discoid lupus erythematosus; dermatological conditions caused or aggravated by sunlight

**Cautions** see notes above

**Hepatic impairment** see notes above

**Renal impairment** manufacturer advises caution and monitoring of plasma-hydroxychloroquine concentration in severe impairment

**Pregnancy** see notes above

**Breast-feeding** avoid—risk of toxicity in infant; see also notes above

**Side-effects** see notes above; also reported bronchospasm

### Dose

- Administered on expert advice, 200–400 mg daily (but not exceeding 6.5 mg/kg daily based on ideal body-weight, see also recommendations above); **CHILD** 1 month–18 years see *BNF for Children*

**Hydroxychloroquine** (Non-proprietary) **[POM]**

**Tablets**, hydroxychloroquine sulfate 200 mg, net price 60-tab pack = £4.96. Label: 21, counselling, see below

**Brands include** *Quinoric*<sup>®</sup>

**Counselling** Do not take antacids for at least 4 hours before or after hydroxychloroquine to reduce possible interference with hydroxychloroquine absorption

**Plaquenil**<sup>®</sup> (Sanofi-Aventis) **[POM]**

**Tablets**, f/c, hydroxychloroquine sulfate 200 mg, net price 60-tab pack = £5.15. Label: 21, counselling, see below

**Counselling** Do not take antacids for at least 4 hours before or after hydroxychloroquine to reduce possible interference with hydroxychloroquine absorption

## Drugs affecting the immune response

**Methotrexate** is a disease-modifying antirheumatic drug suitable for moderate to severe rheumatoid arthritis. **Azathioprine**, **ciclosporin**, **cyclophosphamide**, **leflunomide**, and the **cytokine modulators** are considered more toxic and they are used in cases that have not responded to other disease-modifying drugs.

**Methotrexate** is usually given in an initial dose of 7.5 mg by mouth once a week, adjusted according to response to a maximum of 15 mg once a week (occasionally 20 mg once a week). Regular full blood counts (including differential white cell count and platelet count), renal and liver function tests are required. In patients who experience mucosal or gastro-intestinal side-effects with methotrexate, folic acid 5 mg every week [unlicensed indication], on a different day from the methotrexate, may help to reduce the frequency of such side-effects.

**Azathioprine** is usually given in a dose of up to 2.5 mg/kg daily in divided doses. Blood counts are needed to detect possible neutropenia or thrombocytopenia (usually resolved by reducing the dose). Nausea, vomiting, and diarrhoea may occur, usually starting early during the course of treatment, and may necessitate withdrawal of the drug; herpes zoster infection may also occur.

**Leflunomide** acts on the immune system as a disease-modifying antirheumatic drug. Its therapeutic effect starts after 4–6 weeks and improvement may continue for a further 4–6 months. Leflunomide, which is similar

in efficacy to sulfasalazine and methotrexate, may be chosen when these drugs cannot be used. The active metabolite of leflunomide persists for a long period; active procedures to wash the drug out are required in case of serious adverse effects, or before starting treatment with another disease-modifying antirheumatic drug, or in men or women, before conception. Side-effects of leflunomide include bone-marrow toxicity; its immunosuppressive effects increase the risk of infection and malignancy.

**Ciclosporin** is licensed for severe active rheumatoid arthritis when conventional second-line therapy is inappropriate or ineffective. There is some evidence that ciclosporin may retard the rate of erosive progression and improve symptom control in those who respond only partially to methotrexate.

**Cyclophosphamide** (section 8.1.1) may be used at a dose of 1 to 1.5 mg/kg daily by mouth for rheumatoid arthritis with severe systemic manifestations [unlicensed indication]; it is toxic and regular blood counts (including platelet counts) should be carried out. Cyclophosphamide can also be given intravenously in a dose of 0.5 to 1 g (with prophylactic mesna) for *severe systemic rheumatoid arthritis* and for other connective tissue diseases (especially with active vasculitis), repeated initially at fortnightly then at monthly intervals (according to clinical response and haematological monitoring).

Drugs that affect the immune response are also used in the management of severe cases of *systemic lupus erythematosus* and other connective tissue disorders. They are often given in conjunction with corticosteroids for patients with severe or progressive renal disease. They may be used in cases of *polymyositis* that are resistant to corticosteroids. They are used for their corticosteroid-sparing effect in patients whose corticosteroid requirements are excessive. **Azathioprine** is usually used.

In the specialist management of psoriatic arthritis affecting peripheral joints, leflunomide, methotrexate, or azathioprine [unlicensed indication] may be used.

## AZATHIOPRINE

**Indications** see notes above; inflammatory bowel disease (section 1.5.3); autoimmune conditions and prophylaxis of transplantation rejection (section 8.2.1); severe refractory eczema [unlicensed indication] (section 13.5.3)

**Cautions** section 8.2.1

**Contra-indications** section 8.2.1

**Hepatic impairment** section 8.2.1

**Renal impairment** section 8.2.1

**Pregnancy** section 8.2.1

**Breast-feeding** section 8.2.1

**Side-effects** section 8.2.1

### Dose

- By mouth, initially, rarely more than 3 mg/kg daily, reduced according to response; maintenance 1–3 mg/kg daily; consider withdrawal if no improvement within 3 months

### Preparations

Section 8.2.1

## CICLOSPORIN

(Cyclosporin)

**Indications** severe active rheumatoid arthritis when conventional second-line therapy inappropriate or

ineffective; severe acute ulcerative colitis [unlicensed indication] (section 1.5.3); graft-versus-host disease (section 8.2.2); atopic dermatitis and psoriasis (section 13.5.3)

**Cautions** section 8.2.2

**Additional cautions in rheumatoid arthritis** *Contra-indicated* in abnormal renal function, uncontrolled hypertension (see also below), uncontrolled infections, and malignancy. Measure serum creatinine at least twice before treatment and monitor every 2 weeks for first 3 months, then every month for a further 3 months, then every 4–8 weeks depending on the stability of the disease, concomitant medication, and concomitant diseases, (or more frequently if dose increased or concomitant NSAIDs introduced or increased (see also *interactions*: Appendix 1 (ciclosporin)), reduce dose if serum creatinine increases more than 30% above baseline in more than 1 measurement; if above 50%, reduce dose by 50% (even if within normal range) and discontinue if reduction not successful within 1 month; monitor blood pressure (discontinue if hypertension develops that cannot be controlled by antihypertensive therapy); monitor hepatic function if concomitant NSAIDs given.

**Hepatic impairment** section 8.2.2

**Renal impairment** see Cautions above

**Pregnancy** see section 8.2.2

**Breast-feeding** section 8.2.2

**Side-effects** section 8.2.2

### Dose

- By mouth, administered in accordance with expert advice, initially 2.5 mg/kg daily in 2 divided doses, if necessary increased gradually after 6 weeks; max. 4 mg/kg daily (discontinue if response insufficient after 3 months); dose adjusted according to response for maintenance and treatment reviewed after 6 months (continue only if benefits outweigh risks); **CHILD** and under 18 years, not recommended **Important** For preparations and counselling and for advice on conversion between the preparations, see section 8.2.2

### Preparations

Section 8.2.2

## LEFLUNOMIDE

**Indications** (specialist use only) moderate to severe active rheumatoid arthritis; active psoriatic arthritis

**Cautions** impaired bone-marrow function including anaemia, leucopenia or thrombocytopenia (avoid if significant and due to causes other than rheumatoid arthritis); recent treatment with other hepatotoxic or myelotoxic disease-modifying antirheumatic drugs; washout procedures recommended for serious adverse effects or before switching to other disease-modifying antirheumatic drugs (consult product literature and see Washout Procedure, below); history of tuberculosis; exclude pregnancy before treatment; effective contraception **essential** during treatment and for at least 2 years after treatment in women and at least 3 months after treatment in men (plasma concentration monitoring required; waiting time before conception may be reduced with washout procedure—consult product literature and see Washout Procedure, below); monitor full blood count (including differential white cell count and platelet count) before treatment and every 2 weeks for 6 months then every 8 weeks; monitor liver function—see Hepatotoxicity, below; monitor blood pressure; **interactions**: Appendix 1 (leflunomide) **Hepatotoxicity** Potentially life-threatening hepatotoxicity reported usually in the first 6 months; monitor liver function before treatment and every 2 weeks for first 6 months then

every 8 weeks. Discontinue treatment (and institute washout procedure—consult product literature and see Washout Procedure below) or reduce dose according to liver-function abnormality; if liver-function abnormality persists after dose reduction, discontinue treatment and institute washout procedure

**Washout procedure** To aid drug elimination in case of serious adverse effect, or before starting another disease-modifying antirheumatic drug, or before conception (see also Pregnancy below), stop treatment and give *either* colestyramine 8 g 3 times daily for 11 days or activated charcoal 50 g 4 times daily for 11 days; the concentration of the active metabolite after washout should be less than 20 micrograms/litre (measured on 2 occasions 14 days apart) in men or women before conception—consult product literature. Procedure may be repeated as necessary

**Contra-indications** severe immunodeficiency; severe hypoproteinaemia; serious infection

**Hepatic impairment** avoid—active metabolite may accumulate; see also Cautions above

**Renal impairment** manufacturer advises avoid in moderate or severe impairment—no information available

**Pregnancy** avoid—active metabolite teratogenic in *animal* studies; effective contraception essential during treatment and for at least 2 years after treatment in women and at least 3 months after treatment in men (see also Cautions above)

**Breast-feeding** present in milk in *animal* studies—manufacturer advises avoid

**Side-effects** diarrhoea, nausea, vomiting, anorexia, oral mucosal disorders, abdominal pain; increased blood pressure; headache, dizziness, asthenia, paraesthesia; leucopenia; tenosynovitis; alopecia, rash, dry skin, pruritus; *less commonly* taste disturbance, anxiety, hyperlipidaemia, hypokalaemia, hypophosphataemia, anaemia, thrombocytopenia, and tendon rupture; *rarely* hepatitis, jaundice (see Hepatotoxicity, above), interstitial lung disease, severe infection, eosinophilia, and pancytopenia; *very rarely* pancreatitis, hepatic failure (see Hepatotoxicity, above), peripheral neuropathy, vasculitis, progressive multifocal leucoencephalopathy, Stevens-Johnson syndrome, and toxic epidermal necrolysis; hypouricaemia, reduced sperm count, and renal failure also reported; **important:** discontinue treatment and institute washout procedure (see Washout Procedure under Cautions) in case of serious side-effect

#### Dose

• Rheumatoid arthritis, **ADULT** over 18 years, initially 100 mg once daily for 3 days, then 10–20 mg once daily

• Psoriatic arthritis, **ADULT** over 18 years, initially 100 mg once daily for 3 days, then 20 mg once daily

**Leflunomide** (Non-proprietary) (PoM)

Tablets, leflunomide, 10 mg, net price 30-tab pack = £15.82; 20 mg, 30-tab pack = £16.76. Label: 4

**Arava**<sup>®</sup> (Sanofi-Aventis) (PoM)

Tablets, f/c, leflunomide 10 mg (white), net price 30-tab pack = £51.13; 20 mg (yellow), 30-tab pack = £61.36; 100 mg (white), 3-tab pack = £30.67. Label: 4

## METHOTREXATE

**Indications** see under dose; Crohn's disease [unlicensed indication] (section 1.5.3); malignant disease (section 8.1.3); psoriasis (section 13.5.3)

**Cautions** section 8.1; see Monitoring, Blood Count, Liver Toxicity, and Pulmonary Toxicity below; extreme caution in blood disorders (avoid if severe);

peptic ulceration, ulcerative colitis, diarrhoea and ulcerative stomatitis (withdraw if stomatitis develops—may be first sign of gastro-intestinal toxicity); risk of accumulation in pleural effusion or ascites—drain before treatment; acute porphyria (section 9.8.2); **interactions:** see below and Appendix 1 (methotrexate)

### Monitoring

In view of reports of blood dyscrasias (including fatalities) and liver cirrhosis with low-dose methotrexate patients should:

- have full blood count and renal and liver function tests before starting treatment and repeated every 1–2 weeks until therapy stabilised, thereafter patients should be monitored every 2–3 months<sup>1</sup>
- be advised to report all symptoms and signs suggestive of infection, especially sore throat

Treatment with folic acid (as calcium folinate, section 8.1) may be required in acute toxicity

**Blood count** Bone marrow suppression can occur abruptly; factors likely to increase toxicity include advanced age, renal impairment, and concomitant use with another anti-folate drug (e.g. trimethoprim). A clinically significant drop in white cell count or platelet count calls for immediate withdrawal of methotrexate and introduction of supportive therapy

**Liver toxicity** Liver cirrhosis reported. Treatment should not be started or should be discontinued if any abnormality of liver function tests or liver biopsy is present or develops during therapy. Abnormalities can return to normal within 2 weeks after which treatment may be recommenced if judged appropriate

**Pulmonary toxicity** Pulmonary toxicity may be a special problem in rheumatoid arthritis (patient to seek medical attention if dyspnoea, cough or fever); monitor for symptoms at each visit—discontinue if pneumonitis suspected.

**Aspirin and other NSAIDs** If aspirin or other NSAIDs are given concurrently the dose of methotrexate should be carefully monitored. Patients should be advised to avoid self-medication with over-the-counter aspirin or ibuprofen

**Contra-indications** see Cautions above; active infection and immunodeficiency syndromes

**Hepatic impairment** avoid—dose-related toxicity; see also Cautions above

**Renal impairment** reduce dose; risk of nephrotoxicity at high doses; avoid in severe impairment

**Pregnancy** avoid (teratogenic; fertility may be reduced during therapy but this may be reversible); effective contraception required during and for at least 3 months after treatment in men or women; see also section 8.1

**Breast-feeding** discontinue breast-feeding; present in milk

**Side-effects** section 8.1; also anorexia, abdominal discomfort, dyspepsia, gastro-intestinal ulceration and bleeding, diarrhoea, toxic megacolon, hepatotoxicity (see Cautions above); hypotension, pericarditis, pericardial tamponade; pulmonary oedema, pleuritic pain, pulmonary fibrosis, interstitial pneumonitis (see also Pulmonary Toxicity above); anaphylactic reactions, urticaria; dizziness, chills, fever, drowsiness, insomnia, malaise, headache, mood changes, neurotoxicity, confusion, paraesthesia; precipitation of diabetes; menstrual disturbances, vaginitis, cystitis, reduced libido, impotence; blood disorders; haematuria, dysuria, renal failure; osteoporosis, arthralgia, myalgia, vasculitis; conjunctivitis, visual disturbance; rash, pruritus, Stevens-Johnson syndrome, toxic epidermal necrolysis, photosensitivity, changes in nail and skin pigmentation, telan-

1. Local protocols for frequency of monitoring may vary

giectasia, acne, furunculosis, ecchymosis; injection-site reactions

#### Dose

- Moderate to severe active rheumatoid arthritis, **by mouth**, **ADULT** over 18 years, 7.5 mg once weekly, adjusted according to response; max. weekly dose 20 mg
- Severe active rheumatoid arthritis, **by subcutaneous** or **by intramuscular** or **by intravenous injection**, **ADULT** over 18 years, 7.5 mg once weekly, increased according to response by 2.5 mg weekly; max. weekly dose 25 mg
- **CHILD** under 18 years see *BNF for Children*

#### Important

Note that the above dose is a **weekly** dose. To avoid error with low-dose methotrexate, it is recommended that:

- the patient is carefully advised of the **dose** and **frequency** and the reason for taking methotrexate and any other prescribed medicine (e.g. folic acid);
- only one strength of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;
- the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;
- the patient is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort, and dark urine), and respiratory effects (e.g. shortness of breath).

#### Methotrexate treatment booklets

Methotrexate treatment booklets should be issued where appropriate.

In **England, Wales, and Northern Ireland**, they are available for purchase from:

3M Security Print and Systems Limited  
Gorse Street, Chadderton  
Oldham  
OL9 9QH

Tel: 0845 610 1112

GP practices can obtain supplies through their Local Area Team stores.

NHS Hospitals can order supplies from [www.nhsforms.co.uk](http://www.nhsforms.co.uk) or by emailing [nhsforms@mmm.com](mailto:nhsforms@mmm.com).

In **Scotland**, treatment booklets can be obtained by emailing [stockorders.dppas@apsgroup.co.uk](mailto:stockorders.dppas@apsgroup.co.uk).

These booklets include advice for adults taking oral methotrexate for inflammatory conditions, and a section for recording results of blood tests and dosage information.

#### Methotrexate (Non-proprietary) <sup>(PoM)</sup>

**Tablets**, yellow, methotrexate 2.5 mg, net price 24-tab pack = £2.22, 28-tab pack = £2.60. Counselling, dose, treatment booklet, NSAIDs

**Brands include** *Martrex*<sup>®</sup>

**Tablets**, yellow, methotrexate 10 mg, net price 100-tab pack = £37.06. Counselling, dose, treatment booklet, NSAIDs

#### Parenteral preparations

See also section 8.1.3

#### Metject<sup>®</sup> (Medac) <sup>(PoM)</sup>

**Injection**, prefilled syringe, methotrexate (as disodium salt) 50 mg/mL, net price 0.15 mL (7.5 mg) = £14.85, 0.2 mL (10 mg) = £15.29, 0.25 mL

(12.5 mg) = £16.50, 0.3 mL (15 mg) = £16.57, 0.35 mL (17.5 mg) = £17.50, 0.4 mL (20 mg) = £17.84, 0.45 mL (22.5 mg) = £18.45, 0.5 mL (25 mg) = £18.48, 0.55 mL (27.5 mg) = £18.89, 0.6 mL (30 mg) = £18.95

### Cytokine modulators

Cytokine modulators should be used under specialist supervision.

Adalimumab, certolizumab pegol, etanercept, golimumab, and infliximab inhibit the activity of tumour necrosis factor alpha (TNF- $\alpha$ ).

**Adalimumab** is licensed for moderate to severe active *rheumatoid arthritis* when response to other disease-modifying antirheumatic drugs (including methotrexate) has been inadequate (see also NICE guidance October 2007, p. 721 and August 2010, p. 721); it is also licensed for severe, active, and progressive disease in adults not previously treated with methotrexate. In the treatment of rheumatoid arthritis, adalimumab should be used in combination with methotrexate, but it can be given alone if methotrexate is inappropriate. Adalimumab is also licensed for the treatment of active and progressive *psoriatic arthritis* (see also NICE guidance, p. 721) and severe active *ankylosing spondylitis* (see also NICE guidance, p. 721) that have not responded adequately to other disease-modifying antirheumatic drugs. It is also licensed for the treatment of severe axial spondyloarthritis without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs. For the role of adalimumab in inflammatory bowel disease, see section 1.5.3. For the role of adalimumab in plaque psoriasis, see section 13.5.3. For the role of adalimumab in juvenile idiopathic arthritis see *BNF for Children*.

**Certolizumab pegol** is licensed for use in patients with moderate to severe active *rheumatoid arthritis* when response to disease-modifying antirheumatic drugs (including methotrexate) has been inadequate (see also NICE guidance, below). Certolizumab pegol can be used in combination with methotrexate, or as a monotherapy if methotrexate is not tolerated or is contra-indicated. Certolizumab pegol is also licensed for the treatment of severe active *ankylosing spondylitis* in patients who have had an inadequate response to, or are intolerant of NSAIDs. It is also licensed for the treatment of severe active *axial spondyloarthritis*, without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs.

#### NICE guidance

##### Certolizumab pegol for the treatment of rheumatoid arthritis (February 2010)

Certolizumab pegol is an option for the treatment of patients with rheumatoid arthritis only if:

- certolizumab pegol is used as described in the NICE guidance (October 2007) for other tumour necrosis factor (TNF) inhibitors, (see Adalimumab, Etanercept and Infliximab for the treatment of Rheumatoid Arthritis, below) *and*
- the manufacturer provides the first 12 weeks of certolizumab pegol (10 prefilled 200-mg syringes) free of charge to all patients starting treatment.

[www.nice.org.uk/TA186](http://www.nice.org.uk/TA186)

**Etanercept** is licensed for the treatment of moderate to severe active *rheumatoid arthritis* either alone or in

combination with methotrexate when the response to other disease-modifying antirheumatic drugs is inadequate and in severe, active and progressive *rheumatoid arthritis* in patients not previously treated with methotrexate (see also NICE guidance October 2007, p. 721 and August 2010, p. 721). It is also licensed for the treatment of active and progressive *psoriatic arthritis* inadequately responsive to other disease-modifying antirheumatic drugs (see also NICE guidance, p. 721), and for severe *ankylosing spondylitis* inadequately responsive to conventional therapy (see also NICE guidance, p. 721). For the role of etanercept in juvenile idiopathic arthritis see *BNF for Children*. For the role of etanercept in plaque psoriasis, see section 13.5.3.

**Golimumab** is licensed in combination with methotrexate for the treatment of moderate to severe active *rheumatoid arthritis* when response to disease-modifying antirheumatic drug (DMARD) therapy (including methotrexate) has been inadequate (see also NICE guidance below); it is also licensed in combination with methotrexate for patients with severe, active, and progressive *rheumatoid arthritis* not previously treated with methotrexate. Golimumab is also licensed for the treatment of active and progressive *psoriatic arthritis*, as monotherapy or in combination with methotrexate, when response to DMARD therapy has been inadequate (see also NICE guidance below); it is also licensed for the treatment of severe active *ankylosing spondylitis* when there is an inadequate response to conventional treatment (see also NICE guidance below).

The *Scottish Medicines Consortium* (p. 4) has advised (June 2012) that golimumab (*Simpsoni*<sup>®</sup>) is accepted for restricted use within NHS Scotland at a dose of 50 mg, alone or in combination with methotrexate, for the treatment of active and progressive *psoriatic arthritis* in adults whose disease has not responded to adequate trials of at least two standard DMARDs, administered either individually or in combination.

#### NICE guidance

##### Golimumab for the treatment of rheumatoid arthritis after the failure of previous disease-modifying antirheumatic drugs (June 2011)

Golimumab, in combination with methotrexate, is an option for the treatment of rheumatoid arthritis in adults who have had an inadequate response to conventional disease-modifying antirheumatic drugs (DMARDs) only, including methotrexate, if:

- golimumab is used as described in the NICE guidance (October 2007) for other tumour necrosis factor (TNF) inhibitors (see Adalimumab, etanercept, and infliximab for the treatment of rheumatoid arthritis, p. 721), and
- the manufacturer provides the 100-mg dose of golimumab at the same price as the 50-mg dose

Alternatively, golimumab, in combination with methotrexate, is an option for the treatment of rheumatoid arthritis in adults who have had an inadequate response to DMARDs including a TNF inhibitor, if:

- golimumab is used as described in the NICE guidance (August 2010) for other TNF inhibitors (see Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor, p. 721), and
- the manufacturer provides the 100-mg dose of golimumab at the same price as the 50-mg dose

[www.nice.org.uk/TA225](http://www.nice.org.uk/TA225)

#### NICE guidance

##### Golimumab for the treatment of psoriatic arthritis (April 2011)

Golimumab is an option for the treatment of active and progressive psoriatic arthritis in adults only if:

- golimumab is used as described in the NICE guidance (August 2010) for other tumour necrosis factor (TNF) inhibitors (see Etanercept, infliximab, and adalimumab for the treatment of psoriatic arthritis, p. 721), and
- the manufacturer provides the 100-mg dose of golimumab at the same price as the 50-mg dose

[www.nice.org.uk/TA220](http://www.nice.org.uk/TA220)

#### NICE guidance

##### Golimumab for the treatment of ankylosing spondylitis (August 2011)

Golimumab is an option for the treatment of severe, active ankylosing spondylitis in adults only if:

- Golimumab is used as described in the NICE guidance (May 2008) for adalimumab and etanercept (see Adalimumab, etanercept, and infliximab for the treatment of ankylosing spondylitis, p. 721), and
- the manufacturer provides the 100-mg dose of golimumab at the same price as the 50-mg dose

Patients who are already receiving golimumab for the treatment of severe, active ankylosing spondylitis who do not fulfil the criteria for treatment with adalimumab and etanercept, described in the NICE guidance (May 2008), can continue treatment until they and their specialist consider it appropriate to stop.

[www.nice.org.uk/TA233](http://www.nice.org.uk/TA233)

**Infliximab** is licensed for the treatment of active *rheumatoid arthritis* in combination with methotrexate when the response to other disease-modifying antirheumatic drugs, including methotrexate, is inadequate (see also NICE guidance October 2007, p. 721 and August 2010, p. 721); it is also licensed in combination with methotrexate for patients not previously treated with methotrexate or other DMARDs who have severe, active, and progressive *rheumatoid arthritis*. Infliximab is also licensed for the treatment of *ankylosing spondylitis*, in patients with severe axial symptoms who have not responded adequately to conventional therapy (but see also NICE guidance, p. 721) and in combination with methotrexate (or alone if methotrexate is not tolerated or is contra-indicated) for the treatment of active and progressive *psoriatic arthritis* which has not responded adequately to disease-modifying antirheumatic drugs (see also NICE guidance, p. 721).

**Rituximab** is licensed in combination with methotrexate for the treatment of severe active *rheumatoid arthritis* in patients whose condition has not responded adequately to other disease-modifying antirheumatic drugs (including one or more tumour necrosis factor inhibitors) or who are intolerant of them (see also NICE guidance, p. 721). For the role of rituximab in malignant disease, see section 8.2.3.

**NICE guidance****Adalimumab, etanercept, and infliximab for the treatment of rheumatoid arthritis (October 2007)**

The tumour necrosis factor alpha (TNF- $\alpha$ ) inhibitors adalimumab, etanercept, and infliximab are options for the treatment of adults with active rheumatoid arthritis who have failed to respond to at least 2 disease-modifying antirheumatic drugs (DMARDs), including methotrexate (unless contra-indicated). TNF- $\alpha$  inhibitors should be given in combination with methotrexate; however, when methotrexate cannot be used because of intolerance or contra-indications, adalimumab or etanercept can be given as monotherapy.

Adalimumab, etanercept, and infliximab should be withdrawn if response is not adequate within 6 months. Response to treatment should be monitored at least every 6 months in patients who respond initially; treatment should be withdrawn if response is not maintained. An alternative TNF- $\alpha$  inhibitor may be considered for patients in whom treatment is withdrawn because of intolerance before the initial 6-month assessment of efficacy.

Use of TNF- $\alpha$  inhibitors for the treatment of severe, active, and progressive rheumatoid arthritis in adults not previously treated with methotrexate or other DMARDs is not recommended.

[www.nice.org.uk/TA130](http://www.nice.org.uk/TA130)

**NICE guidance****Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010)**

Rituximab, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or are intolerant of, other disease-modifying antirheumatic drugs (DMARDs), including at least 1 tumour necrosis factor (TNF) inhibitor. Repeat courses of rituximab should be given no more frequently than every 6 months, and should only be continued if an adequate response is achieved and maintained.

Adalimumab, etanercept, infliximab, or abatacept, in combination with methotrexate, are options for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or have an intolerance of, other DMARDs including at least 1 TNF inhibitor, and who cannot use rituximab because of contra-indications or intolerance. In patients who cannot use methotrexate because of intolerance or contra-indications, adalimumab or etanercept can be given as monotherapy. Treatment should be continued only if there is adequate response. Patients should be monitored at least every 6 months.

[www.nice.org.uk/TA195](http://www.nice.org.uk/TA195)

**NICE guidance****Adalimumab, etanercept, and infliximab for the treatment of ankylosing spondylitis (May 2008)**

Adalimumab or etanercept are treatment options for adults with severe active ankylosing spondylitis whose disease satisfies specific criteria for diagnosis where there is confirmation of sustained active spinal disease, and where treatment with two or more NSAIDs taken sequentially at maximum tolerated or recommended doses for 4 weeks has failed to control symptoms.

Response to adalimumab or etanercept treatment should be assessed at 12-week intervals and continued only if response is adequate. If response to treatment is not maintained, a repeat assessment should be made after a further 6 weeks and treatment discontinued if there is an inadequate response. Patients who are intolerant of adalimumab or etanercept during the initial 12 weeks may receive the alternative TNF- $\alpha$  inhibitor (adalimumab or etanercept). However an alternative TNF- $\alpha$  inhibitor is not recommended in patients who fail to respond initially or fail to maintain an adequate response.

Infliximab is not recommended for the treatment of ankylosing spondylitis. Patients who are already receiving infliximab for the treatment of ankylosing spondylitis can continue treatment until they and their specialist consider it appropriate to stop.

See full NICE guidance for specific criteria to diagnose severe active ankylosing spondylitis, confirm sustained active spinal disease, and assess response to treatment.

[www.nice.org.uk/TA143](http://www.nice.org.uk/TA143)

**NICE guidance****Etanercept, infliximab, and adalimumab for the treatment of psoriatic arthritis (August 2010)**

Etanercept, infliximab, or adalimumab are recommended for the treatment of active and progressive psoriatic arthritis in adults who have peripheral arthritis with at least 3 tender joints and at least 3 swollen joints, and who have not responded adequately to at least 2 standard disease-modifying antirheumatic drugs (used alone or in combination).

Etanercept, infliximab, and adalimumab should be discontinued if there is an inadequate response at 12 weeks.

[www.nice.org.uk/TA199](http://www.nice.org.uk/TA199)

**Side-effects** Adalimumab, certolizumab pegol, etanercept, golimumab, infliximab, and rituximab have been associated with infections, sometimes severe, including tuberculosis, septicaemia, and hepatitis B reactivation. Other side-effects include nausea, abdominal pain, worsening heart failure, hypersensitivity reactions, fever, headache, depression, antibody formation (including lupus erythematosus-like syndrome), pruritus, injection-site reactions, and blood disorders (including anaemia, leucopenia, thrombocytopenia, pancytopenia, and aplastic anaemia).

**Abatacept** prevents the full activation of T-lymphocytes. It is licensed for moderate to severe active *rheumatoid arthritis* in combination with methotrexate, in

patients unresponsive to other disease-modifying anti-rheumatic drugs (including methotrexate or a tumour necrosis factor (TNF) inhibitor); see also NICE guidance (August 2010), p. 721 and (April 2013), below. For the role of abatacept in juvenile idiopathic arthritis see *BNF for Children*. Abatacept is not recommended for use in combination with TNF inhibitors.

The *Scottish Medicines Consortium* (p. 4) has advised (July 2013) that abatacept (*Orencia*<sup>®</sup>) is accepted for restricted use within NHS Scotland for adults with severe active rheumatoid arthritis, confirmed on at least two occasions, one month apart. This advice is contingent upon continuing availability of abatacept at the price agreed in the patient access scheme.

#### NICE guidance

##### Abatacept for the treatment of rheumatoid arthritis after the failure of conventional disease-modifying antirheumatic drugs (April 2013)

Abatacept, in combination with methotrexate, is an option for the treatment of highly active rheumatoid arthritis in adults who have had an inadequate response to at least two conventional disease-modifying antirheumatic drugs, including methotrexate, if:

- abatacept is used as described in the NICE guidance (October 2007) for other tumour necrosis factor (TNF) inhibitors (see Adalimumab, etanercept, and infliximab for the treatment of rheumatoid arthritis, and
- the manufacturer provides abatacept with the discount agreed in the patient access scheme

Patients already receiving abatacept for this indication, who do not fulfil the criteria for treatment should continue treatment until they and their specialist consider it appropriate to stop.

[www.nice.org.uk/TA280](http://www.nice.org.uk/TA280)

**Anakinra** inhibits the activity of interleukin-1. Anakinra (in combination with methotrexate) is licensed for the treatment of *rheumatoid arthritis* which has not responded to methotrexate alone; it is not, however, recommended for routine management of *rheumatoid arthritis*, see NICE guidance below.

The *Scottish Medicines Consortium* (p. 4) has advised (July 2002) that anakinra is **not** recommended for the treatment of rheumatoid arthritis within NHS Scotland.

#### NICE guidance

##### Anakinra for the treatment of rheumatoid arthritis (February 2009)

Anakinra is **not** recommended for the treatment of rheumatoid arthritis except when used in a controlled long-term clinical study. Patients who are already receiving anakinra for rheumatoid arthritis should continue treatment until they and their specialist consider it appropriate to stop.

**Belimumab** inhibits the activity of B-lymphocyte stimulator. Belimumab is licensed as adjunctive therapy in patients with active, autoantibody-positive systemic lupus erythematosus with a high degree of disease activity despite standard therapy. Infusion-related side-effects are reported commonly with belimumab, including severe or life-threatening hypersensitivity and infusion reactions. These occur predominantly during the first 2 infusions. Delay in the onset of acute hypersensitivity reactions has been observed; patients should remain under clinical supervision for several hours following at least the first 2 infusions. Premedication

with an antihistamine, with or without an antipyretic, may be considered.

**Tocilizumab** antagonises the actions of interleukin-6. Tocilizumab is licensed for use in patients with moderate to severe active *rheumatoid arthritis* when response to at least one disease-modifying antirheumatic drug or tumour necrosis factor inhibitor has been inadequate, or in those who are intolerant of these drugs. Tocilizumab can be used in combination with methotrexate, or as monotherapy if methotrexate is not tolerated or is contra-indicated (see also NICE guidance below). For the role of tocilizumab in juvenile idiopathic arthritis see *BNF for Children*.

The *Scottish Medicines Consortium* (p. 4) has advised (August 2012) that tocilizumab (*RoActemra*<sup>®</sup>) is accepted for restricted use within NHS Scotland as monotherapy in patients who are intolerant to methotrexate or where continued treatment with methotrexate is inappropriate, for the treatment of moderate to severe active rheumatoid arthritis in adults who have either responded inadequately to, or who were intolerant to, previous therapy with one or more disease-modifying anti-rheumatic drugs or tumour necrosis factor inhibitors, in accordance with the British Society for Rheumatology guidance on prescribing TNF- $\alpha$  blockers in adults with rheumatoid arthritis (2005).

#### NICE guidance

##### Tocilizumab for the treatment of rheumatoid arthritis (February 2012)

Tocilizumab, in combination with methotrexate, is recommended as an option for the treatment of rheumatoid arthritis in adults if:

- the disease has responded inadequately to disease-modifying anti-rheumatic drugs (DMARDs) and is used as described for tumour necrosis factor (TNF) inhibitor treatments (specifically the recommendations on disease activity and treatment) in the NICE guidance (October 2007) Adalimumab, etanercept and infliximab for the treatment of rheumatoid arthritis, p. 721 or
- the disease has responded inadequately to DMARDs and a TNF inhibitor and the patient cannot receive rituximab because of contra-indications or intolerance, and tocilizumab is used as described for TNF inhibitor treatments (specifically the recommendations on disease activity) in the NICE guidance (August 2010) Adalimumab, etanercept, infliximab, rituximab and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor, p. 721 or
- the disease has responded inadequately to one or more TNF inhibitor treatments and to rituximab
- and the manufacturer provides tocilizumab with the discount agreed as part of the patient access scheme.

Patients currently receiving tocilizumab for the treatment of rheumatoid arthritis who do not meet these criteria should have the option to continue treatment until they and their clinicians consider it appropriate to stop.

[www.nice.org.uk/TA247](http://www.nice.org.uk/TA247)

**Ustekinumab** inhibits the activity of interleukins 12 and 23. It is licensed for the treatment of active *psoriatic arthritis* (in combination with methotrexate or alone) in patients who have had an inadequate response to one or more disease-modifying antirheumatic drugs.

The *Scottish Medicines Consortium* (p. 4) has advised (February 2014) that ustekinumab (*Stelara*<sup>®</sup>) is accepted for restricted use within NHS Scotland either alone or in combination with methotrexate, for the treatment of active psoriatic arthritis in adults who have responded

inadequately to previous therapy with a non-biological disease-modifying anti-rheumatic drug, and failed on, or are unsuitable for, treatment with a TNF inhibitor.

## ABATACEPT

**Indications** see under Cytokine Modulators, above

**Cautions** predisposition to infection (screen for latent tuberculosis and viral hepatitis); do not initiate until active infections are controlled; children should be brought up to date with current immunisation schedule (section 14.1) before initiating therapy; progressive multifocal leucoencephalopathy—discontinue treatment if neurological symptoms present; elderly (increased risk of side-effects); **interactions:** Appendix 1 (abatacept)

**Contra-indications** severe infection (see also Cautions)

**Pregnancy** manufacturer advises avoid unless essential—effective contraception required during treatment and for 14 weeks after last dose

**Breast-feeding** present in milk in *animal* studies—manufacturer advises avoid breast-feeding during treatment and for 14 weeks after last dose

**Side-effects** abdominal pain, diarrhoea, dyspepsia, nausea, vomiting, stomatitis, flushing, hypertension, cough, dizziness, fatigue, headache, paraesthesia, infection, leucopenia, pain in extremities, conjunctivitis; *less commonly* gastritis, tachycardia, bradycardia, palpitation, hypotension, bronchospasm, dyspnoea, hyperhidrosis, weight gain, depression, anxiety, sleep disorder, menstrual disturbances, basal and squamous cell carcinoma, skin papilloma, thrombocytopenia, arthralgia, visual disturbance, dry eye, bruising, alopecia, dry skin, psoriasis; *also reported* lymphoma, lung cancer

### Dose

- Rheumatoid arthritis (see notes above), **by intravenous infusion**, **ADULT** over 18 years, body-weight less than 60 kg, 500 mg, repeated 2 weeks and 4 weeks after initial infusion, then every 4 weeks; body-weight 60–100 kg, 750 mg repeated 2 weeks and 4 weeks after initial infusion, then every 4 weeks; body-weight over 100 kg, 1 g repeated 2 weeks and 4 weeks after initial infusion, then every 4 weeks; **by subcutaneous injection** (following intravenous infusion loading dose), **ADULT** over 18 years, 125 mg given within a day of the loading dose, then 125 mg weekly

**Note** Patients who are unable to receive an infusion may initiate subcutaneous abatacept without receiving an intravenous loading dose

Polyarticular juvenile idiopathic arthritis **CHILD** 6–17 years, see *BNF for Children*

**Note** Review treatment if no response within 6 months

**Orencia**<sup>®</sup> (Bristol-Myers Squibb) (Pm)

**Intravenous infusion**, powder for reconstitution, abatacept, net price 250-mg vial = £302.40

**Electrolytes** Na<sup>+</sup> < 0.5 mmol/vial

**Injection**, abatacept, net price 125-mg pre-filled syringe = £302.40

## ADALIMUMAB

**Indications** see under Cytokine Modulators above; inflammatory bowel disease (section 1.5.3); psoriasis (section 13.5.3)

**Cautions** predisposition to infection; monitor for infection before, during, and for 4 months after treatment (see also Tuberculosis below); do not

initiate until active infections are controlled; discontinue if new serious infection develops; hepatitis B virus—monitor for active infection; children should be brought up to date with current immunisation schedule (section 14.1) before initiating therapy; mild heart failure (discontinue if symptoms develop or worsen—avoid in moderate or severe heart failure); demyelinating disorders (risk of exacerbation); history or development of malignancy; monitor for non-melanoma skin cancer before and during treatment, especially in patients with a history of PUVA treatment for psoriasis or extensive immunosuppressant therapy; **interactions:** Appendix 1 (adalimumab)

**Tuberculosis** Patients should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting adalimumab. Patients who have previously received adequate treatment for tuberculosis can start adalimumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting adalimumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with adalimumab. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop

**Blood disorders** Patients should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop

**Contra-indications** severe infection (see also Cautions)

**Pregnancy** avoid; manufacturer advises effective contraception required during treatment and for at least 5 months after last dose

**Breast-feeding** avoid; manufacturer advises avoid for at least 5 months after last dose

**Side-effects** see under Cytokine Modulators (p. 721) and Cautions above; also vomiting, dyspepsia, gastrointestinal haemorrhage, dizziness, hyperlipidaemia, hypertension, oedema, flushing, chest pain, tachycardia, cough, dyspnoea, mood changes, sleep disturbances, anxiety, paraesthesia, haematuria, renal impairment, benign tumours, skin cancer, electrolyte disturbances, hyperuricaemia, dehydration, musculoskeletal pain, eye disorders, rash, dermatitis, onycholysis, impaired healing; *less commonly* dysphagia, pancreatitis, cholelithiasis, hepatic steatosis, cholecystitis, arrhythmias, vascular occlusion, aortic aneurysm, interstitial lung disease, pneumonitis, tremor, neuropathy, erectile dysfunction, nocturia, malignancy (including solid tumours, lymphoma, and leukaemia), rhabdomyolysis, hearing loss, tinnitus; *rarely* autoimmune hepatitis, myocardial infarction, demyelinating disorders; *also reported* pulmonary embolism, pleural effusion, sarcoidosis, Stevens-Johnson syndrome, cutaneous vasculitis, new onset or worsening psoriasis

### Dose

- **By subcutaneous injection**, rheumatoid arthritis, **ADULT** over 18 years, 40 mg on alternate weeks; if necessary increased to 40 mg weekly in patients receiving adalimumab alone; review treatment if no response within 12 weeks

Psoriatic arthritis, ankylosing spondylitis, severe axial spondyloarthritis, **ADULT** over 18 years, 40 mg on alternate weeks; discontinue treatment if no response within 12 weeks

Polyarticular juvenile idiopathic arthritis, **CHILD** 2–18 years, see *BNF for Children*

**Humira®** (AbbVie) (PoM)

**Injection**, adalimumab, net price 40-mg prefilled pen or prefilled syringe = £352.14; 40 mg/0.8-mL vial = £352.14. Label: 10, alert card, counselling, tuberculosis and blood disorders

**ANAKINRA**

**Indications** see under Cytokine Modulators above

**Cautions** predisposition to infection; history of asthma (risk of serious infection); **interactions:** Appendix 1 (anakinra)

**Blood disorders** Neutropenia reported commonly. Monitor neutrophil count before treatment, then every month for 6 months, then every 3 months—discontinue if neutropenia develops. Patients should be instructed to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat, infection) develop

**Contra-indications** neutropenia

**Renal impairment** caution if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>; avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** manufacturer advises avoid; effective contraception must be used during treatment

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** injection-site reactions; headache; infections, neutropenia (see also Cautions), and antibody formation; *also reported* malignancy

**Dose**

- By **subcutaneous injection**, **ADULT** over 18 years, 100 mg once daily

**Kineret®** (Swedish Orphan) (PoM)

**Injection**, anakinra, net price 100-mg prefilled syringe = £26.23. Counselling, blood disorder symptoms

**BELIMUMAB**

**Indications** see under Cytokine Modulators above

**Cautions** predisposition to infection; do not initiate until active infections controlled; history or development of malignancy; **interactions:** Appendix 1 (belimumab)

**Renal impairment** caution in severe impairment—no information available

**Pregnancy** avoid unless essential; manufacturer advises adequate contraception during treatment and for at least 4 months after last dose

**Breast-feeding** avoid—present in milk in animal studies

**Side-effects** see notes above; also diarrhoea, nausea, hypersensitivity reactions, vomiting, depression, insomnia, migraine, infections, pyrexia, leucopenia, pain in extremities

**Dose**

- By **intravenous infusion**, **ADULT** over 18 years, 10 mg/kg, repeated 2 weeks and 4 weeks after initial infusion, then every 4 weeks; review treatment if no response within 6 months

**Benlysta®** (GSK) (PoM)

**Intravenous infusion**, powder for reconstitution, belimumab, net price 120-mg vial = £121.50; 400-mg vial = £405.00

**CERTOLIZUMAB PEGOL**

**Indications** see under Cytokine Modulators above

**Cautions** predisposition to infection; monitor for infection before, during, and for 5 months after treatment (see also Tuberculosis below); do not initiate until active infections are controlled; discontinue if new serious infection develops until infection controlled; hepatitis B virus—monitor for active infection; mild heart failure (discontinue if symptoms develop or worsen—avoid in moderate to severe heart failure); demyelinating CNS disorders (risk of exacerbation); history or development of malignancy; **interactions:** Appendix 1 (certolizumab pegol)

**Tuberculosis** Patients should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting certolizumab pegol. Patients who have previously received adequate treatment for tuberculosis can start certolizumab pegol but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting certolizumab pegol. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with certolizumab pegol. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop

**Blood disorders** Patients should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop

**Contra-indications** severe active infection (see also Cautions)

**Pregnancy** avoid; manufacturer advises adequate contraception during treatment and for at least 5 months after last dose

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk—no information available

**Side-effects** see under Cytokine Modulators (p. 721) and Cautions above; hypertension, sensory abnormalities, rash; *less commonly* ascites, cholestasis, gastrointestinal disorders (including perforation and ulcer), hepatic disorders, appetite disorders, cardiomyopathies (including heart failure), dyslipidaemia, syncope, oedema, dizziness, ischaemic coronary artery disorders, arrhythmias, asthma, pleural effusion, cough, peripheral neuropathy, tremor, anxiety, mood disorders, influenza-like illness, menstrual disorders, renal impairment, haematuria, malignancy (including solid tumours, lymphoma, and leukaemia), skin cancer, benign tumours, haemorrhage, electrolyte disorders, muscle disorders, visual disturbance, ocular inflammation, tinnitus, ecchymosis, impaired healing, alopecia, photosensitivity, acne, skin discoloration, nail disorders, new onset or worsening psoriasis, dermatitis; *rarely* cholelithiasis, splenomegaly, atrioventricular block, cerebrovascular accident, Raynaud's phenomenon, interstitial lung disease, impaired coordination, trigeminal neuralgia, seizures, thyroid disorders, sexual dysfunction, nephropathy; *also reported* multiple sclerosis

**Dose**

- By **subcutaneous injection**, rheumatoid arthritis, **ADULT** over 18 years, 400 mg, repeated 2 weeks and 4 weeks after initial injection, then 200 mg every 2 weeks; review treatment if no response within 12 weeks
- Severe ankylosing spondylitis, severe axial spondyloarthritis, **ADULT** over 18 years, 400 mg, repeated 2 weeks and 4 weeks after initial injection, then 200 mg

every 2 weeks or 400 mg every 4 weeks; review treatment if no response within 12 weeks

### Cimzia® (UCB Pharma) (PoM)

**Injection**, certolizumab pegol, net price 200-mg pre-filled syringe = £357.50. Label: 10, alert card, counselling, tuberculosis and blood disorders

## ETANERCEPT

**Indications** see under Cytokine Modulators above

**Cautions** predisposition to infection (avoid if predisposition to septicaemia); significant exposure to herpes zoster virus—interrupt treatment and consider varicella-zoster immunoglobulin; hepatitis B virus—monitor for active infection; monitor for worsening hepatitis C infection; children should be brought up to date with current immunisation schedule (section 14.1) before initiating therapy; heart failure (risk of exacerbation); history or increased risk of demyelinating disorders; history or development of malignancy; monitor for skin cancer before and during treatment, particularly in those at risk (including patients with psoriasis or a history of PUVA treatment); history of blood disorders; diabetes mellitus; **interactions:** Appendix 1 (etanercept)

**Tuberculosis** Patients should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting etanercept. Patients who have previously received adequate treatment for tuberculosis can start etanercept but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting etanercept. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with etanercept. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop

**Blood disorders** Patients should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop

**Contra-indications** active infection; avoid injections containing benzyl alcohol in neonates (see preparations below)

**Hepatic impairment** use with caution in moderate to severe alcoholic hepatitis

**Pregnancy** avoid—limited information available; manufacturer advises effective contraception required during treatment and for 3 weeks after last dose

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** see under Cytokine Modulators (p. 721); also *less commonly* interstitial lung disease, skin cancer, uveitis, rash, new onset or worsening psoriasis; *rarely* demyelinating disorders, seizures, lymphoma, Stevens-Johnson syndrome, vasculitis; *very rarely* toxic epidermal necrolysis; *also reported* appendicitis, gastritis, oesophagitis, inflammatory bowel disease, vomiting, diabetes mellitus, malignancy (including solid tumours and leukaemia), macrophage activation syndrome, and cutaneous ulcer

### Dose

- **By subcutaneous injection**, rheumatoid arthritis, psoriatic arthritis, ankylosing spondylitis, **ADULT** over 18 years, 25 mg twice weekly or 50 mg once weekly Juvenile idiopathic arthritis, **CHILD** 2–17 years, see *BNF for Children*

### Enbrel® (Pfizer) (PoM)

**Injection**, powder for reconstitution, etanercept, net price 25-mg vial (with solvent) = £89.38. Label: 10, alert card, counselling, tuberculosis and blood disorders

**Paediatric injection**, powder for reconstitution, etanercept, net price 10-mg vial (with solvent) = £35.75; 25-mg vial (with solvent) = £89.38. Label: 10, alert card, counselling, tuberculosis and blood disorders

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

**Injection**, etanercept, net price 25-mg prefilled syringe = £89.38; 50-mg prefilled pen or prefilled syringe = £178.75. Label: 10, alert card, counselling, tuberculosis and blood disorders

## GOLIMUMAB

**Indications** see under Cytokine Modulators above; ulcerative colitis (section 1.5.3)

**Cautions** predisposition to infection; monitor for infection before, during, and for 5 months after treatment (see also Tuberculosis below); do not initiate until active infections are controlled; discontinue if new serious infection develops until infection controlled; hepatitis B virus—monitor for active infection; mild heart failure (discontinue if symptoms develop or worsen); demyelinating disorders (risk of exacerbation); history or development of malignancy; **interactions:** Appendix 1 (golimumab)

**Tuberculosis** Patients should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting golimumab. Patients who have previously received adequate treatment for tuberculosis can start golimumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting golimumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with golimumab. Patients who have tested negative for latent tuberculosis, and those who are receiving or who have completed treatment for latent tuberculosis, should be monitored closely for symptoms of active infection. All patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop

**Blood disorders** Patients should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop

**Contra-indications** severe active infection (see also Cautions); moderate or severe heart failure

**Hepatic impairment** manufacturer advises caution—no information available

**Pregnancy** use only if essential; manufacturer advises adequate contraception during treatment and for at least 6 months after last dose

**Breast-feeding** manufacturer advises avoid during and for at least 6 months after treatment—present in milk in animal studies

**Side-effects** see under Cytokine Modulators (p. 721) and under Cautions above; also dyspepsia, hypertension, dizziness, asthenia; *less commonly* constipation, taste disturbance, gastritis, colitis, stomatitis, gastro-oesophageal reflux disease, cholelithiasis, hepatic disorders, hyperlipidaemia, arrhythmia, ischaemic coronary artery disorders, Raynaud's syndrome, heart failure, thrombosis, flushing, bronchospasm, interstitial lung disease, demyelinating disorders, insomnia, paraesthesia, hyperglycaemia,

thyroid disorders, menstrual disorders, malignancy (including lymphoma, melanoma), bone fractures, visual disturbance, eye irritation, new onset or worsening psoriasis, alopecia, dermatitis; *rarely* impaired wound healing

#### Dose

- **By subcutaneous injection, ADULT** over 18 years, 50 mg once a month on the same date each month, review treatment if no response after 3–4 doses; body-weight over 100 kg, if inadequate response to 3–4 doses of 50 mg once a month, dose can be increased to 100 mg once a month, review treatment if inadequate response to this higher dose after 3–4 doses

**Note** If dose administered more than 2 weeks late, subsequent doses should be administered on the new monthly due date

#### Simponi® (MSD) [PoM]

**Injection**, golimumab, net price 50-mg prefilled pen or prefilled syringe = £762.97; 100-mg prefilled pen = £1525.94. Label: 10, alert card, counselling, tuberculosis and blood disorders

## INFLIXIMAB

**Indications** see under Cytokine Modulators above; inflammatory bowel disease (section 1.5.3); psoriasis (section 13.5.3)

**Cautions** predisposition to infection; monitor for infection before, during, and for 6 months after treatment (see also Tuberculosis below); discontinue if new serious infection develops; hepatitis B virus—monitor for active infection; mild heart failure (discontinue if symptoms develop or worsen); demyelinating disorders (risk of exacerbation); history or development of malignancy; history of prolonged immunosuppressant or PUVA treatment in patients with psoriasis; **interactions:** Appendix 1 (infliximab)

**Tuberculosis** Patients should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting infliximab. Patients who have previously received adequate treatment for tuberculosis can start infliximab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting infliximab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with infliximab. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop

**Blood disorders** Patients should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop

**Hypersensitivity reactions** Hypersensitivity reactions (including fever, chest pain, hypotension, hypertension, dyspnoea, transient visual loss, pruritus, urticaria, serum sickness-like reactions, angioedema, anaphylaxis) reported during or within 1–2 hours after infusion (risk greatest during first or second infusion or in patients who discontinue other immunosuppressants). All patients should be observed carefully for 1–2 hours after infusion and resuscitation equipment should be available for immediate use. Prophylactic antipyretics, antihistamines, or hydrocortisone may be administered. Monitor for symptoms of delayed hypersensitivity if readministered after a prolonged period. Patients should be advised to keep Alert card with them at all times and seek medical advice if symptoms of delayed hypersensitivity develop

**Contra-indications** severe infections (see also under Cautions); moderate or severe heart failure

**Pregnancy** use only if essential; manufacturer advises adequate contraception during and for at least 6 months after last dose

**Breast-feeding** amount probably too small to be harmful

**Side-effects** see under Cytokine Modulators (p. 721) and under Cautions above; also constipation, diarrhoea, dyspepsia, gastro-intestinal haemorrhage, gastro-oesophageal reflux, flushing, hypotension, hypertension, palpitation, tachycardia, sleep disturbances, dizziness, paraesthesia, hypoaesthesia, arthralgia, myalgia, epistaxis, alopecia, rash, ecchymosis, hyperhidrosis, new onset or worsening psoriasis, dry skin; *less commonly* hepatitis, cholecystitis, intestinal perforation, pancreatitis, heart failure, arrhythmia, bradycardia, syncope, peripheral ischaemia, pleurisy, pulmonary oedema, amnesia, agitation, confusion, nervousness, neuropathy, seizures, vaginitis, eye disorders, bullous eruption, cheilitis, seborrhoea, impaired healing, rosacea, hyperkeratosis, abnormal skin pigmentation; *rarely* pericardial effusion, vasospasm, interstitial lung disease, leukaemia, lymphoma, demyelinating disorders, Stevens-Johnson syndrome, toxic epidermal necrolysis; *also reported* hepatic failure

#### Dose

- **By intravenous infusion**, rheumatoid arthritis (in combination with methotrexate), **ADULT** over 18 years, 3 mg/kg, repeated 2 weeks and 6 weeks after initial infusion, then every 8 weeks; if response inadequate after 12 weeks, dose may be increased in steps of 1.5 mg/kg every 8 weeks, up to max. 7.5 mg/kg every 8 weeks; alternatively, 3 mg/kg may be given every 4 weeks; discontinue if no response by 12 weeks of initial infusion or after dose adjustment
- **Ankylosing spondylitis, ADULT** over 18 years, 5 mg/kg, repeated 2 weeks and 6 weeks after initial infusion, then every 6–8 weeks; discontinue if no response by 6 weeks of initial infusion
- **Psoriatic arthritis** (in combination with methotrexate), **ADULT** over 18 years, 5 mg/kg, repeated 2 weeks and 6 weeks after initial infusion, then every 8 weeks

#### Remicade® (MSD) [PoM]

**Intravenous infusion**, powder for reconstitution, infliximab, net price 100-mg vial = £419.62. Label: 10, alert card, counselling, tuberculosis, blood disorders, and hypersensitivity reactions

## RITUXIMAB

**Indications** see under Cytokine Modulators above; malignant disease (section 8.2.3)

**Cautions** section 8.2.3, p. 623; predisposition to infection

**Alert card** Patients with rheumatoid arthritis should be provided with the patient alert card before administration

**Contra-indications** section 8.2.3, p. 622; severe infection

**Pregnancy** section 8.2.3, p. 625

**Breast-feeding** section 8.2.3, p. 625

**Side-effects** section 8.2.3, p. 622 and under Cytokine Modulators (p. 721); *also* dyspepsia; hypertension, hypotension; rhinitis, sore throat; asthenia, paraesthesia, migraine; arthralgia, muscle spasm; urticaria

#### Dose

- **By intravenous infusion, ADULT**, rheumatoid arthritis (in combination with methotrexate), 1 g, repeated 2 weeks after initial infusion
- Important** Patients should receive premedication before each infusion (consult product literature for details) and be provided with a patient alert card

#### Preparations

Section 8.2.3

## TOCILIZUMAB

**Indications** see under Cytokine Modulators above

**Cautions** predisposition to infection or history of recurrent or chronic infection; interrupt treatment if serious infection occurs; history of intestinal ulceration or diverticulitis; monitor hepatic transaminases every 4–8 weeks for first 6 months, then every 12 weeks; monitor neutrophil and platelet counts 4–8 weeks after starting treatment and then as indicated; low platelet or absolute neutrophil count (discontinue if absolute neutrophil count less than  $0.5 \times 10^9$ /litre or platelet count less than  $50 \times 10^3$ /microlitre); monitor lipid profile 4–8 weeks after starting treatment and then as indicated; monitor for demyelinating disorders; **interactions:** Appendix 1 (tocilizumab) **Tuberculosis** Patients should be evaluated for tuberculosis before treatment. Patients with latent tuberculosis should be treated with standard therapy (section 5.1.9) before starting tocilizumab

**Counselling** Patients should be advised to seek immediate medical attention if symptoms of infection occur, or if symptoms of diverticular perforation such as abdominal pain, haemorrhage, or fever accompanying change in bowel habits occur

**Contra-indications** severe active infection (see also Cautions); do not initiate if absolute neutrophil count less than  $2 \times 10^9$ /litre (see also Cautions)

**Hepatic impairment** manufacturer advises caution (see also Dose below)

**Renal impairment** manufacturer advises monitor renal function closely in moderate or severe impairment

**Pregnancy** manufacturer advises avoid unless essential (toxicity in *animal* studies); effective contraception required during and for 3 months after treatment

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk —no information available

**Side-effects** abdominal pain, mouth ulceration, gastritis, raised hepatic transaminases; dizziness, peripheral oedema, hypertension, hypercholesterolaemia; headache; infection (including upper respiratory-tract infection); antibody formation, hypersensitivity, leucopenia, neutropenia; rash, pruritus; *less commonly* gastric ulcer, gastro-intestinal perforation, hypertriglyceridaemia, hypothyroidism, nephrolithiasis, infusion related reactions, anaphylaxis, and thrombocytopenia also reported

### Dose

- Rheumatoid arthritis, by **intravenous infusion**, **ADULT** over 18 years, 8 mg/kg (max. 800 mg) once every 4 weeks; for details of dose adjustment in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count, consult product literature
- Juvenile idiopathic arthritis, **CHILD** 2–18 years, see *BNF for Children*

**RoActemra**<sup>®</sup> (Roche) PoM

Concentrate for intravenous infusion, tocilizumab 20 mg/mL, net price 4 mL (80-mg) vial = £102.40, 10 mL (200-mg) vial = £256.00, 20 mL (400-mg) vial = £512.00. Alert card, counselling, see above

## USTEKINUMAB

**Indications** see under Cytokine Modulators above; plaque psoriasis (section 13.5.3)

**Cautions** section 13.5.3, p. 804

**Important** See section 13.5.3, p. 804 for cautions on tuberculosis

**Contra-indications** section 13.5.3, p. 804

**Pregnancy** section 13.5.3, p. 804

**Breast-feeding** section 13.5.3, p. 804

**Side-effects** section 13.5.3, p. 804

### Dose

- By **subcutaneous injection**, **ADULT** over 18 years, body-weight under 100 kg, initially 45 mg, then 45 mg 4 weeks after initial dose, then 45 mg every 12 weeks; body-weight over 100 kg, initially 45–90 mg, then 45–90 mg 4 weeks after initial dose, then 45–90 mg every 12 weeks

**Note** Review treatment if no response within 28 weeks

### Preparations

Section 13.5.3

## Sulfasalazine

**Sulfasalazine** has a beneficial effect in suppressing the inflammatory activity of rheumatoid arthritis. Sulfasalazine may also be used by specialists, in the management of psoriatic arthritis affecting peripheral joints [unlicensed indication]. Side-effects include rashes, gastro-intestinal intolerance and, especially in patients with rheumatoid arthritis, occasional leucopenia, neutropenia, and thrombocytopenia. These haematological abnormalities occur usually in the first 3 to 6 months of treatment and are reversible on cessation of treatment. Close monitoring of full blood counts (including differential white cell count and platelet count) is necessary initially, and at monthly intervals during the first 3 months (liver function tests also being performed at monthly intervals for the first 3 months). Although the manufacturer recommends renal function tests, evidence of practical value is unsatisfactory.

## SULFASALAZINE

(Sulphasalazine)

**Indications** active rheumatoid arthritis; inflammatory bowel disease, see section 1.5.1 and notes above

**Cautions** see section 1.5.1 and notes above

**Blood disorders** Patients should be advised to report any unexplained bleeding, bruising, purpura, sore throat, fever or malaise. A blood count should be performed and the drug stopped immediately if there is suspicion of a blood dyscrasia.

**Contra-indications** see section 1.5.1 and notes above

**Hepatic impairment** section 1.5.1

**Renal impairment** section 1.5.1

**Pregnancy** section 1.5.1

**Breast-feeding** section 1.5.1

**Side-effects** see section 1.5.1 and notes above

### Dose

- By **mouth**, administered on expert advice, as enteric-coated tablets, initially 500 mg daily, increased by 500 mg at intervals of 1 week to a max. of 2–3 g daily in divided doses

**Sulfasalazine** (Non-proprietary) PoM

**Tablets**, e/c, sulfasalazine 500 mg, net price 112-tab pack = £8.07 Label: 5, 14, 25, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained  
**Brands include** *Sulazine EC*<sup>®</sup>

**Salazopyrin EN-Tabs**<sup>®</sup> (Pharmacia) PoM

**Tablets**, e/c, yellow, f/c, sulfasalazine 500 mg, net price 112-tab pack = £8.43. Label: 5, 14, 25, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained

## 10.1.4 Gout and cytotoxic-induced hyperuricaemia

It is important to distinguish drugs used for the treatment of acute attacks of gout from those used in the long-term control of the disease. The latter exacerbate and prolong the acute manifestations if started during an attack.

### Acute attacks of gout

Acute attacks of gout are usually treated with high doses of NSAIDs such as diclofenac, etoricoxib, indometacin, ketoprofen, naproxen, or sulindac (section 10.1.1). Colchicine is an alternative in patients in whom NSAIDs are contra-indicated. Aspirin is *not* indicated in gout. Allopurinol, febuxostat, and uricosurics are not effective in treating an acute attack and may prolong it indefinitely if started during the acute episode.

The use of colchicine is limited by the development of toxicity at higher doses, but it is of value in patients with heart failure since, unlike NSAIDs, it does not induce fluid retention; moreover, it can be given to patients receiving anticoagulants.

Oral or parenteral corticosteroids are an effective alternative in those who cannot tolerate NSAIDs or who are resistant to other treatments. Intra-articular injection of a corticosteroid can be used in acute mono-articular gout [unlicensed indication]. A corticosteroid by intramuscular injection can be effective in podagra.

Canakinumab, a recombinant monoclonal antibody, can be used for the symptomatic treatment of frequent gouty arthritis attacks (at least 3 in the previous 12 months). It is licensed for use in patients whose condition has not responded adequately to treatment with NSAIDs or colchicine, or who are intolerant of them.

### COLCHICINE

**Indications** acute gout; short-term prophylaxis during initial therapy with allopurinol and uricosuric drugs; prophylaxis of familial Mediterranean fever (recurrent polyserositis)

**Cautions** see notes above; also elderly; gastro-intestinal disease; cardiac disease; **interactions:** Appendix 1 (colchicine)

**Contra-indications** blood disorders

**Hepatic impairment** use with caution

**Renal impairment** reduce dose or increase dosage interval if eGFR 10–50 mL/minute/1.73 m<sup>2</sup>; avoid if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** avoid—teratogenicity in animal studies

**Breast-feeding** present in milk but no adverse effects reported; manufacturers advise caution

**Side-effects** nausea, vomiting, and abdominal pain; excessive doses may cause profuse diarrhoea, gastro-intestinal haemorrhage, rash, renal and hepatic damage; rarely peripheral neuritis, inhibition of spermatogenesis, myopathy, alopecia, and with prolonged treatment blood disorders

#### Dose

- Acute gout, 500 micrograms 2–4 times daily until symptoms relieved, max. 6 mg per course; course not to be repeated within 3 days

- Prevention of gout attacks during initial treatment with allopurinol or uricosuric drugs, 500 micrograms twice daily
- Prophylaxis of familial Mediterranean fever [unlicensed], 0.5–2 mg once daily

**Note** BNF doses may differ from those in the product literature

**Colchicine** (Non-proprietary) POM

Tablets, colchicine 500 micrograms, net price 100 = £36.23

### CANAKINUMAB

**Indications** acute gout; malignant disease (section 8.2.4)

**Cautions** section 8.2.4

**Contra-indications** section 8.2.4

**Hepatic impairment** section 8.2.4

**Renal impairment** section 8.2.4

**Pregnancy** section 8.2.4

**Breast-feeding** section 8.2.4

**Side-effects** section 8.2.4

#### Dose

- By subcutaneous injection, ADULT over 18 years, 150 mg as a single dose; may be repeated at least 12 weeks after initial response if symptoms recur

**Note** Patients who do not respond to initial dose should not be retreated

#### Preparations

Section 8.2.4

### Long-term control of gout

Frequent recurrence of acute attacks of gout, the presence of tophi, or signs of chronic gouty arthritis may call for the initiation of long-term ('interval') treatment. For long-term control of gout the formation of uric acid from purines may be reduced with the xanthine-oxidase inhibitors allopurinol or febuxostat; alternatively the uricosuric drug sulfapyrazone may be used to increase the excretion of uric acid in the urine. Treatment should be continued indefinitely to prevent further attacks of gout by correcting the hyperuricaemia. These drugs should never be started during an acute attack; they are usually started 1–2 weeks after the attack has settled. The initiation of treatment may precipitate an acute attack, and therefore an anti-inflammatory analgesic or colchicine should be used as a prophylactic and continued for at least one month after the hyperuricaemia has been corrected. However, if an acute attack develops during treatment, then the treatment should continue at the same dosage and the acute attack treated in its own right.

**Allopurinol** is widely used and is especially useful in patients with renal impairment or urate stones when uricosuric drugs cannot be used; it is *not* indicated for the treatment of asymptomatic hyperuricaemia. It can cause rashes.

**Febuxostat** is licensed for the treatment of chronic hyperuricaemia where urate deposition has already occurred; it is *not* indicated for patients in whom the rate of urate formation is greatly increased, such as in malignant disease or in Lesch-Nyhan syndrome.

**NICE guidance<sup>1</sup>****Febuxostat for the management of hyperuricaemia in patients with gout (December 2008)**

Febuxostat is recommended as an option for the management of chronic hyperuricaemia in gout only for patients who are intolerant of allopurinol or for whom allopurinol is contra-indicated.

For the purposes of this guidance, intolerance of allopurinol is defined as adverse effects that are sufficiently severe to warrant discontinuation, or to prevent full dose escalation for optimal effectiveness.

[www.nice.org.uk/TA164](http://www.nice.org.uk/TA164)

**Sulfapyrazone** can be used instead of allopurinol, or in conjunction with it in cases that are resistant to treatment.

**Probenecid** (available from 'special-order' manufacturers or specialist importing companies, see p. 1104) is a uricosuric drug used to prevent nephrotoxicity associated with cidofovir (section 5.3.2.2).

**Benzbromarone** (available from 'special-order' manufacturers or specialist importing companies, see p. 1104) is a uricosuric drug that can be used in patients with mild renal impairment.

Crystallisation of urate in the urine can occur with the uricosuric drugs and it is important to ensure an adequate urine output especially in the first few weeks of treatment. As an additional precaution the urine may be rendered alkaline.

Aspirin and other salicylates antagonise the uricosuric drugs; they do not antagonise allopurinol but are nevertheless *not* indicated in gout.

**ALLOPURINOL**

**Indications** prophylaxis of gout and of uric acid and calcium oxalate renal stones; prophylaxis of hyperuricaemia associated with cancer chemotherapy

**Cautions** administer prophylactic NSAID (*not* aspirin or salicylates) or colchicine until at least 1 month after hyperuricaemia corrected (usually for first 3 months) to avoid precipitating an acute attack; ensure adequate fluid intake (2–3 litres/day); for hyperuricaemia associated with cancer therapy, allopurinol treatment should be started before cancer therapy; **interactions:** Appendix 1 (allopurinol)

**Contra-indications** *not* a treatment for acute gout but continue if attack develops when already receiving allopurinol, and treat attack separately (see notes above)

**Hepatic impairment** reduce dose

**Renal impairment** max. 100 mg daily, increased only if response inadequate; in severe impairment, reduce daily dose below 100 mg, or increase dose interval; if facilities available, adjust dose to maintain plasma-oxipurinol concentration below 100 micromol/litre

**Pregnancy** toxicity not reported; manufacturer advises use only if no safer alternative and disease carries risk for mother or child

**Breast-feeding** present in milk—*not* known to be harmful

**Side-effects** rashes (*withdraw* therapy; if rash mild re-introduce cautiously but **discontinue** promptly if recurrence—hypersensitivity reactions occur rarely and include exfoliation, fever, lymphadenopathy, arthralgia, and eosinophilia resembling Stevens-Johnson syndrome or toxic epidermal necrolysis, vasculitis, hepatitis, renal impairment, and very rarely seizures); gastro-intestinal disorders; rarely malaise, headache, vertigo, drowsiness, visual and taste disturbances, hypertension, alopecia, hepatotoxicity, paraesthesia and neuropathy, gynaecomastia, blood disorders (including leucopenia, thrombocytopenia, haemolytic anaemia and aplastic anaemia)

**Dose**

- Initially 100 mg daily, preferably after food, then adjusted according to plasma or urinary uric acid concentration; usual maintenance dose in mild conditions 100–200 mg daily, in moderately severe conditions 300–600 mg daily, in severe conditions 700–900 mg daily; doses over 300 mg daily given in divided doses; **CHILD** under 15 years, (in neoplastic conditions, enzyme disorders) 10–20 mg/kg daily (max. 400 mg daily)

**Allopurinol** (Non-proprietary) **Ⓜ**

**Tablets**, allopurinol 100 mg, net price 28-tab pack = 97p; 300 mg, 28-tab pack = £1.00. Label: 8, 21, 27  
**Brands include** *Caplenal*<sup>®</sup>, *Cosuric*<sup>®</sup>, *Rimapurinol*<sup>®</sup>

**Zyloric**<sup>®</sup> (Aspen) **Ⓜ**

**Tablets**, allopurinol 100 mg, net price 100-tab pack = £10.19; 300 mg, 28-tab pack = £7.31. Label: 8, 21, 27

**FEBUXOSTAT**

**Indications** treatment of chronic hyperuricaemia in gout (but see also NICE guidance above)

**Cautions** administer prophylactic NSAID (*not* aspirin or salicylates) or colchicine for at least 6 months after starting febuxostat to avoid precipitating an acute attack; transplant recipients; monitor liver function tests before and periodically during treatment as indicated; thyroid disorders; ischaemic heart disease; congestive heart failure; **interactions:** Appendix 1 (febuxostat)

**Contra-indications** *not* a treatment for acute gout but continue if attack develops when already receiving febuxostat, and treat attack separately (see notes above)

**Hepatic impairment** max. 80 mg daily in mild impairment; no dose information available in moderate or severe impairment

**Renal impairment** use with caution if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>—no information available

**Pregnancy** manufacturer advises avoid—limited information available

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** gastro-intestinal disturbances, abnormal liver function tests, oedema, headache, rash; *less commonly* cholelithiasis, hyperlipidaemia, taste and smell disturbances, hypertension, chest pain, flushing, atrial fibrillation, ECG abnormalities, palpitation, dyspnoea, bronchitis, upper respiratory tract infection, cough, dizziness, paraesthesia, hypoaesthesia, hemiparesis, drowsiness, insomnia, appetite and weight change, diabetes mellitus, increased thyroid stimulating hormone, decreased libido, erectile dysfunction, haematuria, nephrolithiasis, increased

1. The *Scottish Medicines Consortium* issued similar advice in August 2010

urinary frequency, renal failure, proteinuria, myalgia, arthralgia, arthritis, muscle weakness, muscle spasm, bursitis, dermatitis; rarely pancreatitis, hepatitis, jaundice, thirst, asthenia, nervousness, tubulointerstitial nephritis, pancytopenia, thrombocytopenia, rhabdomyolysis, blurred vision, mouth ulceration, tinnitus

#### MHRA/CHM advice

#### Serious hypersensitivity reactions (June 2012)

There have been rare but serious reports of hypersensitivity reactions, including Stevens-Johnson syndrome and acute anaphylactic shock with febuxostat. Patients should be advised of the signs and symptoms of severe hypersensitivity; febuxostat must be stopped immediately if these occur (early withdrawal is associated with a better prognosis), and must not be restarted in patients who have ever developed a hypersensitivity reaction to febuxostat. Most cases occur during the first month of treatment; a prior history of hypersensitivity to allopurinol and/or renal disease may indicate potential hypersensitivity to febuxostat.

#### Dose

- **ADULT** over 18 years, 80 mg once daily, if after 2–4 weeks serum uric acid greater than 6 mg/100 mL, increase to 120 mg once daily

#### Adenuric® (Menarini) (POM)

Tablets, both yellow, f/c, febuxostat 80 mg, net price 28-tab pack = £24.36; 120 mg 28-tab pack = £24.36

## PROBENECID

**Indications** prevention of nephrotoxicity associated with cidofovir (section 5.3.2.2)

**Cautions** ensure adequate fluid intake (about 2–3 litres daily) and render urine alkaline if uric acid overload is high; peptic ulceration; transient false-positive Benedict's test; G6PD-deficiency (section 9.1.5); **interactions:** Appendix 1 (probenecid)

**Contra-indications** history of blood disorders, nephrolithiasis, acute gout attack; avoid aspirin and salicylates

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73m<sup>2</sup>

**Breast-feeding** present in milk

**Side-effects** gastro-intestinal disturbances; *less commonly* sore gums, flushing, headache, dizziness, urinary frequency, anaemia, alopecia; hepatic necrosis, hypersensitivity reactions (including anaphylaxis, pruritus, urticaria, fever, and Stevens-Johnson syndrome), nephrotic syndrome, haemolytic anaemia, leucopenia, and aplastic anaemia also reported

#### Dose

- Used with cidofovir, see section 5.3.2.2

#### Probenecid (Non-proprietary) (POM)

Tablets, probenecid 500 mg. Label: 12, 21, 27  
Available from 'special-order' manufacturers or specialist importing companies, see p. 1104

## SULFINPYRAZONE

(Sulphinpyrazone)

**Indications** gout prophylaxis, hyperuricaemia

**Cautions** see under Probenecid; regular blood counts advisable; cardiac disease (may cause salt and water retention); **interactions:** Appendix 1 (sulfinpyrazone)

**Contra-indications** see under Probenecid; avoid in hypersensitivity to NSAIDs

**Hepatic impairment** avoid in severe impairment

**Renal impairment** reduce dose; avoid in severe impairment

**Pregnancy** manufacturer advises caution—no information available

**Breast-feeding** no information available

**Side-effects** gastro-intestinal disturbances, occasionally allergic skin reactions, salt and water retention; rarely blood disorders, gastro-intestinal ulceration and bleeding, acute renal failure, raised liver enzymes, jaundice and hepatitis

#### Dose

- Initially 100–200 mg daily with food (or milk) increasing over 2–3 weeks to 600 mg daily (rarely 800 mg daily), continued until serum uric acid concentration normal then reduced for maintenance (maintenance dose may be as low as 200 mg daily)

#### Sulfinpyrazone (Non-proprietary) (POM)

Tablets, sulfinpyrazone 100 mg, net price 84-tab pack = £41.25; 200 mg, 84-tab pack = £79.00. Label: 12, 21

## Hyperuricaemia associated with cytotoxic drugs

**Allopurinol** is used to prevent hyperuricaemia associated with cytotoxic drugs—see section 8.1 (Hyperuricaemia) and Allopurinol above.

**Rasburicase** is licensed for the prophylaxis and treatment of acute hyperuricaemia, before and during initiation of chemotherapy, in patients with haematological malignancy and a high tumour burden at risk of rapid lysis.

## RASBURICASE

**Indications** prophylaxis and treatment of acute hyperuricaemia with initial chemotherapy for haematological malignancy

**Cautions** monitor closely for hypersensitivity; atopic allergies; may interfere with test for uric acid—consult product literature

**Contra-indications** G6PD deficiency (section 9.1.5)

**Pregnancy** manufacturer advises avoid—no information available

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** fever; *less commonly* nausea, vomiting, diarrhoea, headache, hypersensitivity reactions (including rash, bronchospasm and anaphylaxis); haemolytic anaemia, methaemoglobinaemia

#### Dose

- By **intravenous infusion**, 200 micrograms/kg once daily for up to 7 days according to plasma-uric acid concentration

**Fasturtec**<sup>®</sup> (Sanofi-Aventis) (PoM)

Intravenous infusion, powder for reconstitution, rasburicase, net price 1.5-mg vial (with solvent) = £69.46; 7.5-mg vial (with solvent) = £289.44

## 10.1.5 Other drugs for rheumatic diseases

### Glucosamine

**Glucosamine** is a natural substance found in mucopolysaccharides, mucoproteins, and chitin. It is licensed for symptomatic relief of mild to moderate osteoarthritis of the knee, but is not recommended. The mechanism of action is not understood and there is limited evidence to show it is effective.

The *Scottish Medicines Consortium* (p. 4) has advised (May 2008) that glucosamine (*Alateris*<sup>®</sup>) and (July 2011) glucosamine (*Glusartel*<sup>®</sup>) are **not** recommended for use within NHS Scotland for the symptomatic relief of mild to moderate osteoarthritis of the knee.

## GLUCOSAMINE

**Indications** symptomatic relief of mild to moderate osteoarthritis of the knee

**Cautions** impaired glucose tolerance (monitor blood-glucose concentration before treatment and periodically thereafter); predisposition to cardiovascular disease (monitor cholesterol); asthma; **interactions:** Appendix 1 (glucosamine)

**Contra-indications** shellfish allergy

**Pregnancy** manufacturers advise avoid—no information available

**Breast-feeding** manufacturers advise avoid—no information available

**Side-effects** nausea, abdominal pain, dyspepsia, flatulence, diarrhoea, constipation, drowsiness, headache, fatigue; *less commonly* flushing, rash, pruritus; *also reported* visual disturbances, hair loss

#### Dose

- See under preparations

#### Alateris<sup>®</sup> (Dee) (PoM)

Tablets, scored, glucosamine (as hydrochloride) 625 mg, net price 60-tab pack = £18.40

**Dose** ADULT over 18 years, 2 tablets once daily; review treatment if no benefit after 2–3 months

#### Dolenio<sup>®</sup> (Alissa) (PoM)

Tablets, f/c, scored, glucosamine sulfate (as sodium chloride) 1.5 g, net price 30-tab pack = £18.20

**Electrolytes** Na<sup>+</sup> 6.52 mmol/tablet

**Dose** ADULT over 18 years, 1 tablet once daily; review treatment if no benefit after 2–3 months

#### Glusartel<sup>®</sup> (HFA Healthcare) (PoM)

Oral powder, sugar-free, glucosamine sulfate (as sodium chloride) 1.5 g/sachet, net price 30-sachet pack = £18.40. Label: 13

**Electrolytes** Na<sup>+</sup> 6.6 mmol/sachet

**Excipients** include aspartame (section 9.4.1)

**Dose** ADULT over 18 years, 1 sachet (dissolved in at least 250 mL of water) once daily; review treatment if no benefit after 2–3 months

## 10.2 Drugs used in neuromuscular disorders

### 10.2.1 Drugs that enhance neuromuscular transmission

#### 10.2.2 Skeletal muscle relaxants

### 10.2.1 Drugs that enhance neuromuscular transmission

Anticholinesterases are used as first-line treatment in *ocular myasthenia gravis* and as an adjunct to immunosuppressant therapy for *generalised myasthenia gravis*.

Corticosteroids are used when anticholinesterases do not control symptoms completely. A second-line immunosuppressant such as azathioprine is frequently used to reduce the dose of corticosteroid.

Plasmapheresis or infusion of intravenous immunoglobulin [unlicensed indication] may induce temporary remission in severe relapses, particularly where bulbar or respiratory function is compromised or before thymectomy.

### Anticholinesterases

Anticholinesterase drugs enhance neuromuscular transmission in voluntary and involuntary muscle in *myasthenia gravis*. They prolong the action of acetylcholine by inhibiting the action of the enzyme acetylcholinesterase. Excessive dosage of these drugs can impair neuromuscular transmission and precipitate cholinergic crises by causing a depolarising block. This may be difficult to distinguish from a worsening myasthenic state.

Muscarinic side-effects of anticholinesterases include increased sweating, increased salivary and gastric secretions, increased gastro-intestinal and uterine motility, and bradycardia. These parasympathomimetic effects are antagonised by atropine.

**Neostigmine** produces a therapeutic effect for up to 4 hours. Its pronounced muscarinic action is a disadvantage, and simultaneous administration of an antimuscarinic drug such as atropine or propantheline may be required to prevent colic, excessive salivation, or diarrhoea. In severe disease neostigmine can be given every 2 hours. The maximum that most patients can tolerate is 180 mg daily.

**Pyridostigmine** is less powerful and slower in action than neostigmine but it has a longer duration of action. It is preferable to neostigmine because of its smoother action and the need for less frequent dosage. It is particularly preferred in patients whose muscles are weak on waking. It has a comparatively mild gastro-intestinal effect but an antimuscarinic drug may still be required. It is inadvisable to exceed a total daily dose of 450 mg in order to avoid acetylcholine receptor down-regulation; patients requiring doses exceeding 450 mg daily will usually require input from a specialised neuromuscular service. Immunosuppressant therapy is usually considered if the dose of pyridostigmine exceeds 360 mg daily.

Neostigmine is also used to reverse the actions of the non-depolarising neuromuscular blocking drugs (see section 15.1.6).

## NEOSTIGMINE

**Indications** myasthenia gravis; other indications (section 15.1.6)

**Cautions** asthma (*extreme* caution), bradycardia, arrhythmias, recent myocardial infarction, epilepsy, hypotension, parkinsonism, vagotonia, peptic ulceration, hyperthyroidism; atropine or other antidote to muscarinic effects may be necessary (particularly when neostigmine is given by injection), but not given routinely because it may mask signs of overdosage; **interactions:** Appendix 1 (parasympathomimetics)

**Contra-indications** intestinal or urinary obstruction

**Renal impairment** may need dose reduction

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** amount probably too small to be harmful

**Side-effects** nausea, vomiting, increased salivation, diarrhoea, abdominal cramps (more marked with higher doses); signs of overdosage include bronchoconstriction, increased bronchial secretions, lacrimation, excessive sweating, involuntary defaecation and micturition, miosis, nystagmus, bradycardia, heart block, arrhythmias, hypotension, agitation, excessive dreaming, and weakness eventually leading to fasciculation and paralysis

### Dose

- **By mouth**, neostigmine bromide 15–30 mg at suitable intervals throughout day, total daily dose 75–300 mg (but see also notes above); **NEONATE** 1–5 mg every 4 hours, half an hour before feeds; **CHILD** up to 6 years initially 7.5 mg, 6–12 years initially 15 mg, usual total daily dose 15–90 mg
- **By subcutaneous or intramuscular injection**, **ADULT** and **CHILD** over 12 years, neostigmine metilsulfate 1–2.5 mg at suitable intervals throughout day (usual total daily dose 5–20 mg); **NEONATE** 150 micrograms/kg every 6–8 hours 30 minutes before feeds, increased to max. 300 micrograms/kg every 4 hours, if necessary [unlicensed]; **CHILD** 1 month–12 years 200–500 micrograms as required

**Neostigmine** (Non-proprietary) <sup>(Pom)</sup>

Tablets, scored, neostigmine bromide 15 mg, net price 140 = £88.31

### Injection

Section 15.1.6

## PYRIDOSTIGMINE BROMIDE

**Indications** myasthenia gravis

**Cautions** see under Neostigmine; weaker muscarinic action

**Contra-indications** see under Neostigmine

**Renal impairment** reduce dose; excreted by kidney

**Pregnancy** see under Neostigmine

**Breast-feeding** see under Neostigmine

**Side-effects** see under Neostigmine

### Dose

- **By mouth**, 30–120 mg at suitable intervals throughout day, total daily dose 0.3–1.2 g (but see also notes above); **CHILD** under 18 years, see *BNF for Children*

**Mestinon**<sup>®</sup> (Meda) <sup>(Pom)</sup>

Tablets, scored, pyridostigmine bromide 60 mg, net price 200 = £45.57

## Immunosuppressant therapy

**Corticosteroids** (section 6.3) are established as treatment for myasthenia gravis; although they are commonly given on alternate days there is little evidence of benefit over daily administration. Corticosteroid treatment is usually initiated under in-patient supervision and all patients should receive osteoporosis prophylaxis (section 6.6).

In *generalised myasthenia gravis* small initial doses of prednisolone (10 mg on alternate days) are increased in steps of 10 mg on alternate days to 1–1.5 mg/kg (max. 100 mg) on alternate days. When given daily, prednisolone is started at 5 mg daily and then increased in steps of 5 mg daily to 60 mg daily or occasionally up to 80 mg daily (0.75–1 mg/kg daily). About 10% of patients experience a transient but very serious worsening of symptoms in the first 2–3 weeks, especially if the corticosteroid is started at a high dose. However, ventilated patients may be started on 1.5 mg/kg (max. 100 mg) on alternate days. Smaller doses of corticosteroid are usually required in *ocular myasthenia*. Once clinical remission has occurred (usually after 2–6 months), the dose of prednisolone should be reduced slowly to the minimum effective dose (usually 10–40 mg on alternate days).

In generalised myasthenia gravis **azathioprine** (section 8.2.1) is usually started at the same time as the corticosteroid and it allows a lower maintenance dose of the corticosteroid to be used; azathioprine is initiated at a dose of 0.5–1 mg/kg daily, which is increased over 3–4 weeks to 2–2.5 mg/kg daily. **Ciclosporin** (section 8.2.2), **methotrexate** (section 8.1.3), or **mycophenolate mofetil** (section 8.2.1) can be used in patients unresponsive or intolerant to other treatments [unlicensed indications].

## Acetylcholine-release enhancers

**Amifampridine** is licensed for the symptomatic treatment of Lambert-Eaton myasthenic syndrome (LEMS), a rare disorder of neuromuscular transmission.

The *Scottish Medicines Consortium* (p. 4) has advised (July 2012) that amifampridine phosphate (*Firdapse*<sup>®</sup>) is not recommended for use within NHS Scotland for the symptomatic treatment of Lambert-Eaton myasthenic syndrome (LEMS).

**Fampridine** is licensed for the improvement of walking in patients with multiple sclerosis who have a walking disability.

## AMIFAMPRIDINE

**Indications** (specialist use only) symptomatic treatment of Lambert-Eaton myasthenic syndrome

**Cautions** concomitant use of drugs that lower convulsive threshold; non-paraneoplastic form of Lambert-Eaton myasthenic syndrome; clinical and ECG monitoring required at treatment initiation and yearly thereafter

**Contra-indications** epilepsy; uncontrolled asthma; congenital QT syndromes; avoid concomitant use of drugs that prolong QT interval; avoid concomitant use of drugs with a narrow therapeutic index

**Hepatic impairment** use with caution; in mild impairment reduce initial dose to 10 mg daily in divided doses, increased in steps of 5 mg every 7 days; in moderate or severe impairment reduce initial dose to 5 mg daily in divided doses, increased in steps of 5 mg every 7 days

**Renal impairment** use with caution; in mild impairment reduce initial dose to 10 mg daily in divided doses, increased in steps of 5 mg every 7 days; in moderate or severe impairment reduce initial dose to 5 mg daily in divided doses, increased in steps of 5 mg every 7 days

**Pregnancy** manufacturer advises avoid—ensure effective contraception during treatment in men and women

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** gastro-intestinal disorders; paraesthesia; palpitations, arrhythmias, Raynaud's syndrome, cough, bronchial hypersecretion, exacerbation or precipitation of asthma, sleep disturbances, convulsions, anxiety, drowsiness, dizziness, weakness, headache, chorea, myoclonia, and blurred vision also reported

#### Dose

- **ADULT** over 18 years, initially 15 mg daily in 3 divided doses, increased in steps of 5 mg every 4–5 days, to max. 60 mg daily in 3–4 divided doses; max. single dose 20 mg

**Firdapse**<sup>®</sup> (BioMarin) ▼ (PoM)

Tablets, scored, amifampridine (as phosphate)

10 mg, net price 100-tab pack = £1815.00. Label: 3, 21

## FAMPRIDINE

**Indications** (specialist use only) improvement of walking disability in multiple sclerosis

**Cautions** predisposition to seizures including concomitant use of drugs that lower seizure threshold; symptomatic cardiac rhythm disorders, sinoatrial or atrioventricular conduction disorders; **interactions:** Appendix 1 (fampridine)

**Contra-indications** history of seizures (discontinue treatment if seizures occur)

**Renal impairment** avoid if eGFR less than 80 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** avoid—toxicity in animal studies

**Breast-feeding** avoid—no information available

**Side-effects** nausea, vomiting, constipation, dyspepsia, dyspnoea, pharyngolaryngeal pain, dizziness, headache, paraesthesia, tremor, malaise, insomnia, anxiety, urinary tract infection, back pain; *less commonly* seizures

#### Dose

- **ADULT** over 18 years, 10 mg every 12 hours; discontinue treatment if no improvement within 2 weeks

**Fampyra**<sup>®</sup> (Biogen) ▼ (PoM)

Tablets, f/c, m/r, fampridine 10 mg, net price 28-tab pack (2 × 14) = £181.00, 56-tab pack (4 × 14) = £362.00. Label: 23, 25

**Note** Dispense in original container (pack contains a desiccant) and discard any tablets remaining 7 days after opening

## 10.2.2 Skeletal muscle relaxants

The drugs described below are used for the relief of chronic muscle spasm or spasticity associated with multiple sclerosis or other neurological damage; they are not indicated for spasm associated with minor injuries. Baclofen, diazepam, and tizanidine act princi-

pally on the central nervous system. Dantrolene, has a peripheral site of action; cannabis extract has both a central and a peripheral action. Skeletal muscle relaxants differ in action from the muscle relaxants used in anaesthesia (section 15.1.5), which block transmission at the neuromuscular junction.

The underlying cause of spasticity should be treated and any aggravating factors (e.g. pressure sores, infection) remedied. Skeletal muscle relaxants are effective in most forms of spasticity except the rare alpha variety. The major disadvantage of treatment with these drugs is that reduction in muscle tone can cause a loss of splinting action of the spastic leg and trunk muscles and sometimes lead to an increase in disability.

**Baclofen** inhibits transmission at spinal level and also depresses the central nervous system. The dose should be increased slowly to avoid the major side-effects of sedation and muscular hypotonia (other adverse events are uncommon).

A **cannabis extract** containing dronabinol (delta-9-tetrahydrocannabinol) and cannabidiol is licensed as an adjunct treatment for moderate to severe spasticity associated with multiple sclerosis in patients who have not responded adequately to other skeletal muscle relaxants. The dose should be titrated over 2 weeks; response to treatment should be reviewed after 4 weeks and treatment stopped if an adequate response is not achieved.

**Dantrolene** acts directly on skeletal muscle and produces fewer central adverse effects making it a drug of choice. The dose should be increased slowly.

**Diazepam** can also be used. Sedation and occasionally extensor hypotonus are disadvantages. Other benzodiazepines also have muscle-relaxant properties. Muscle-relaxant doses of benzodiazepines are similar to anxiolytic doses (section 4.1.2).

**Tizanidine** is an alpha<sub>2</sub>-adrenoceptor agonist indicated for spasticity associated with multiple sclerosis or spinal cord injury.

## BACLOFEN

**Indications** chronic severe spasticity resulting from disorders such as multiple sclerosis or traumatic partial section of spinal cord

**Cautions** psychiatric illness, Parkinson's disease, cerebrovascular disease, elderly; respiratory impairment; epilepsy; history of peptic ulcer (avoid oral route in active peptic ulceration); diabetes; hypertonic bladder sphincter; avoid abrupt withdrawal (risk of hyperactive state, may exacerbate spasticity, and precipitate autonomic dysfunction including hyperthermia, psychiatric reactions and convulsions, see also under Withdrawal below); **interactions:** Appendix 1 (muscle relaxants)

**Withdrawal** Serious side-effects can occur on abrupt withdrawal; to minimise risk, discontinue by gradual dose reduction over at least 1–2 weeks (longer if symptoms occur)

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Specific cautions for intrathecal treatment** coagulation disorders; previous spinal fusion procedure; malnutrition (increased risk of post-surgical complications)

**Contra-indications**

**Specific contra-indications for intrathecal treatment** local or systemic infection

**Hepatic impairment** manufacturer advises use by mouth with caution

**Renal impairment** risk of toxicity—use smaller doses (e.g. 5 mg daily by mouth) and if necessary increase dosage interval; if eGFR less than 15 mL/minute/1.73m<sup>2</sup> manufacturer advises use by mouth only if potential benefit outweighs risk; excreted by kidney

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk (toxicity in *animal* studies)

**Breast-feeding** present in milk—amount probably too small to be harmful

**Side-effects** gastro-intestinal disturbances, dry mouth; hypotension, respiratory or cardiovascular depression; sedation, drowsiness, confusion, dizziness, ataxia, hallucinations, nightmares, headache, euphoria, insomnia, depression, anxiety, agitation, tremor; seizure; urinary disturbances; myalgia; visual disorders; rash, hyperhidrosis; rarely taste disturbances, abdominal pain, changes in hepatic function, paraesthesia, erectile dysfunction, dysarthria; very rarely hypothermia

#### Dose

- **By mouth, ADULT** over 18 years, initially 5 mg 3 times daily, gradually increased; usual maintenance dose up to 60 mg daily in divided doses (max. 100 mg daily); **CHILD** over 18 years, initially 300 micrograms/kg daily in 4 divided doses, increased gradually at weekly intervals until satisfactory response; usual maintenance dose 0.75–2 mg/kg daily in divided doses; **CHILD** up to 8 years, max. total daily dose 40 mg/day; **CHILD** 8–18 years, max. total daily dose 60 mg/day

**Note** Review treatment if no benefit within 6 weeks of achieving maximum dose

- **By intrathecal injection**, specialist use only, severe chronic spasticity unresponsive to oral antispastic drugs (or where side-effects of oral therapy unacceptable) or as alternative to ablative neurosurgical procedures, **ADULT** over 18 years, initial *test dose* 25–50 micrograms over at least 1 minute via catheter or lumbar puncture, increased in 25-microgram steps (not more often than every 24 hours) to max.

100 micrograms to determine appropriate dose, then *dose-titration phase*, most often using infusion pump (implanted into chest wall or abdominal wall tissues) to establish *maintenance dose* (ranging from 12 micrograms to 2 mg daily for spasticity of spinal origin or 22 micrograms to 1.4 mg daily for spasticity of cerebral origin) retaining some spasticity to avoid sensation of paralysis; **CHILD** 4–18 years (spasticity of cerebral or spinal origin only), initial *test dose* 25–50 micrograms then titrated as for **ADULT**, initial *maintenance dose* 25–200 micrograms daily, adjusted according to response

**Important** Consult product literature for details on test dose and titration—important to monitor patients closely in appropriately equipped and staffed environment during screening and immediately after pump implantation. Resuscitation equipment must be available for immediate use. Treatment with continuous pump-administered intrathecal baclofen should be initiated within 3 months of a satisfactory response to intrathecal baclofen testing.

**Baclofen** (Non-proprietary) (PoM)

**Tablets**, baclofen 10 mg, net price 84-tab pack = £1.67. Label: 2, 8, 21

**Oral solution**, baclofen 5 mg/5 mL, net price 300 mL = £4.48. Label: 2, 8, 21

**Brands include** Lyflex<sup>®</sup> (sugar-free)

**Intrathecal injection**, baclofen 50 micrograms/mL, net price 1-mL amp (for test dose) = £2.19; 500 micrograms/mL, 20-mL amp (for use with implantable pump) = £48.62; 2 mg/mL, 5-mL amp (for use with implantable pump) = £48.62

**Liorea<sup>®</sup>** (Novartis) (PoM)

**Tablets**, scored, baclofen 10 mg, net price 100-tab pack = £12.38. Label: 2, 8, 21

**Excipients** include gluten

**Liquid**, sugar-free, raspberry-flavoured, baclofen 5 mg/5 mL, net price 300 mL = £8.59. Label: 2, 8, 21

**Intrathecal injection**, baclofen 50 micrograms/mL, net price 1-mL amp (for test dose) = £2.63; 500 micrograms/mL, 20-mL amp (for use with implantable pump) = £58.34; 2 mg/mL, 5-mL amp (for use with implantable pump) = £58.34

## CANNABIS EXTRACT

**Indications** adjunct in moderate to severe spasticity in multiple sclerosis (specialist use only)

**Cautions** significant cardiovascular disease; history of epilepsy; monitor oral mucosa—interrupt treatment if lesions or persistent soreness; **interactions:** Appendix 1 (cannabis extract)

**Driving** May affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced

**Contra-indications** personal or family history of psychosis; history of other severe psychiatric disorder

**Hepatic impairment** manufacturer advises more frequent monitoring in significant impairment—possible risk of prolonged or enhanced effect

**Renal impairment** manufacturer advises more frequent monitoring in significant impairment—possible risk of prolonged or enhanced effect

**Pregnancy** manufacturer advises use only if potential benefit outweighs risks, and recommends effective contraception during and for 3 months after treatment in men and women

**Breast-feeding** avoid—present in milk

**Side-effects** increased or decreased appetite, taste disturbance, constipation, diarrhoea, nausea, vomiting, dry mouth, mouth ulcers, oral pain, dizziness, vertigo, malaise, depression, disorientation, dissociation, mood disturbance, amnesia, impaired attention, drowsiness, dysarthria, blurred vision; less commonly abdominal pain, oromucosal and tooth discoloration, stomatitis, palpitation, tachycardia, hypertension, pharyngitis, syncope, hallucinations, paranoia, delusions, suicidal thoughts; also reported anxiety, seizures

#### Dose

- Consult product literature

**Sativex<sup>®</sup>** (Bayer) (CD4-1)

**Oromucosal spray**, *Cannabis sativa* extract (containing dronabinol (delta-9-tetrahydrocannabinol) 27 mg and cannabidiol 25 mg/mL), net price 3 × 10-mL units = £375.00. Counselling, driving see above

**Excipients** include propylene glycol

## DANTROLENE SODIUM

**Indications** chronic severe spasticity of voluntary muscle; malignant hyperthermia (section 15.1.8)

**Cautions** impaired cardiac and pulmonary function; therapeutic effect may take a few weeks to develop—discontinue if no response within 6–8 weeks; **interactions:** Appendix 1 (muscle relaxants).

**Hepatotoxicity** Potentially life-threatening hepatotoxicity reported, usually if doses greater than 400 mg daily used, in females, patients over 30 years, if history of liver disorders, or concomitant use of hepatotoxic drugs; test liver function before and at intervals during therapy—discontinue if abnormal liver function tests or symptoms of liver disorder

(counselling, see below); re-introduce only if complete reversal of hepatotoxicity

**Counselling** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, dark urine, or pruritus develop

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Contra-indications** acute muscle spasm; avoid when spasticity is useful, for example, locomotion

**Hepatic impairment** avoid—may cause severe liver damage; injection may be used in an emergency for malignant hyperthermia

**Pregnancy** avoid use in chronic spasticity—embryotoxic in animal studies

**Breast-feeding** present in milk—manufacturer advises avoid use in chronic spasticity

**Side-effects** diarrhoea (withdraw if severe, discontinue treatment if recurs on re-introduction), nausea, vomiting, anorexia, hepatotoxicity (see above), abdominal pain; pericarditis; pleural effusion, respiratory depression; headache, drowsiness, dizziness, asthenia, fatigue, seizures, fever, chills; speech and visual disturbances; rash; *less commonly* dysphagia, constipation, exacerbation of cardiac insufficiency, tachycardia, erratic blood pressure, dyspnoea, depression, confusion, nervousness, insomnia, increased urinary frequency, urinary incontinence or retention, haematuria, crystalluria, and increased sweating

#### Dose

- Initially 25 mg daily, may be increased at weekly intervals to max. 100 mg 4 times daily; usual dose 75 mg 3 times daily; **CHILD** 5–18 years see *BNF for Children*

**Dantrium**<sup>®</sup> (SpePharm) (PoM)

**Capsules**, orange/brown, dantrolene sodium 25 mg, net price 100 = £16.87; 100 mg, 100 = £43.07.

Label: 2, counselling, driving, hepatotoxicity

## DIAZEPAM

**Indications** muscle spasm of varied aetiology, including tetanus; other indications (section 4.1.2, section 4.8, section 15.1.4.1)

**Cautions** section 4.1.2; special precautions for intravenous injection (section 4.8.2)

**Contra-indications** section 4.1.2

**Hepatic impairment** section 4.1.2

**Renal impairment** section 4.1.2

**Pregnancy** section 4.1.2

**Breast-feeding** section 4.1.2

**Side-effects** section 4.1.2; also hypotonia

#### Dose

- Muscle spasm, **by mouth**, 2–15 mg daily in divided doses, increased if necessary in spastic conditions to 60 mg daily according to response  
Cerebral spasticity in selected cases, **CHILD** 2–40 mg daily in divided doses

**By intramuscular or by slow intravenous injection** (into a large vein at a rate of not more than 5 mg/minute), in acute muscle spasm, 10 mg repeated if necessary after 4 hours

**Note** Only use intramuscular route when oral and intravenous routes not possible; emulsion formulation preferred for intravenous injection; special precautions for intravenous injection, see section 4.8.2

- Tetanus, **ADULT** and **CHILD**, **by intravenous injection** (emulsion preparation preferred), 100–300 micrograms/kg repeated every 1–4 hours; **by intravenous infusion** (or **by nasoduodenal tube**), 3–10 mg/kg over 24 hours, adjusted according to response

#### Preparations

Section 4.1.2

## TIZANIDINE

**Indications** spasticity associated with multiple sclerosis or spinal cord injury or disease

**Cautions** elderly; monitor liver function monthly for first 4 months and in those who develop unexplained nausea, anorexia or fatigue; concomitant administration of drugs that prolong QT interval; avoid abrupt withdrawal (risk of rebound hypertension and tachycardia, see under Withdrawal, below); **interactions:** Appendix 1 (muscle relaxants)

**Withdrawal** Rebound hypertension and tachycardia can occur on abrupt withdrawal; to minimise risk, discontinue gradually and monitor blood pressure

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Hepatic impairment** avoid in severe impairment; use in moderate impairment only if potential benefit outweighs risk

**Renal impairment** manufacturer advises caution

**Pregnancy** avoid (toxicity in animal studies)

**Breast-feeding** avoid (present in milk in animal studies)

**Side-effects** dry mouth, nausea, gastro-intestinal disturbance, altered liver enzymes (discontinue if persistently raised—consult product literature), hypotension, drowsiness, fatigue, dizziness; *less commonly* bradycardia; *also reported* hepatitis, liver failure, insomnia, hallucinations, confusion, convulsions, syncope, asthenia, blurred vision

#### Dose

- ADULT** over 18 years, initially 2 mg daily as a single dose increased according to response at intervals of at least 3–4 days in steps of 2 mg daily (and given in divided doses) usually up to 24 mg daily in 3–4 divided doses; max. 36 mg daily

**Tizanidine** (Non-proprietary) (PoM)

**Tablets**, tizanidine (as hydrochloride) 2 mg net price 120-tab pack = £17.25; 4 mg, 120-tab pack = £24.07. Label: 2, 8

**Zanaflex**<sup>®</sup> (TEVA UK) (PoM)

**Tablets**, scored, tizanidine (as hydrochloride) 2 mg, net price 120-tab pack = £30.41; 4 mg, 120-tab pack = £42.18. Label: 2, 8

## Other muscle relaxants

The clinical efficacy of methocarbamol and meprobamate (section 4.1.2) as muscle relaxants is **not** well established, although they have been included in compound analgesic preparations.

## METHOCARBAMOL

**Indications** short-term symptomatic relief of muscle spasm (but see notes above)

**Cautions interactions:** Appendix 1 (muscle relaxants)

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Contra-indications** coma or pre-coma, brain damage, epilepsy, myasthenia gravis

**Hepatic impairment** manufacturer advises caution; half-life may be prolonged

**Renal impairment** manufacturer advises caution

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk

**Breast-feeding** present in milk in *animal* studies—manufacturer advises caution

**Side-effects** nausea, vomiting, dyspepsia; hypersensitivity reactions (including urticaria, angioedema, anaphylaxis); fever, headache, drowsiness, dizziness, hypotension, bradycardia, confusion, amnesia, restlessness, anxiety, tremor, seizures; blurred vision, nasal congestion; rash, pruritus; leucopenia, cholestatic jaundice

#### Dose

- 1.5 g 4 times daily; may be reduced to 750 mg 3 times daily; **ELDERLY** up to 750 mg 4 times daily may be sufficient; **CHILD** not recommended

**Robaxin**<sup>®</sup> (Almiral) (PoM) 

750 Tablets, f/c, scored, methocarbamol 750 mg, net price 100 = £12.65. Label: 2

## Nocturnal leg cramps

**Quinine** salts (section 5.4.1), such as quinine sulfate 200–300 mg at bedtime, are effective in reducing the frequency of nocturnal leg cramps by about 25% in ambulatory patients; however, because of potential toxicity, quinine is not recommended for routine treatment and should not be used unless cramps cause regular disruption to sleep. Quinine should only be considered when cramps are very painful or frequent; when other treatable causes of cramp have been excluded; and when non-pharmacological treatments have not worked (e.g. passive stretching exercises). It may take up to 4 weeks for improvement to become apparent; if there is benefit, quinine treatment can be continued. Patients should be monitored closely during the early stages for adverse effects as well as for benefit. Treatment should be interrupted at intervals of approximately 3 months to assess the need for further quinine treatment. In patients taking quinine long term, a trial discontinuation may be considered. Quinine is toxic in overdose and accidental fatalities have occurred (see also below).

## QUININE

**Indications** see notes above; malaria (section 5.4.1)

**Cautions** see section 5.4.1 and notes above

**Contra-indications** section 5.4.1

**Pregnancy** section 5.4.1

**Breast-feeding** section 5.4.1

**Side-effects** section 5.4.1; **important:** very toxic in overdose—immediate advice from poison centres essential (see also p. 39)

#### Dose

- See notes above

#### Preparations

Section 5.4.1

## 10.3 Drugs for the treatment of soft-tissue disorders and topical pain relief

### 10.3.1 Enzymes

### 10.3.2 Rubefacients, topical NSAIDs, capsaicin, and poultices

## Extravasation

Local guidelines for the management of extravasation should be followed where they exist or specialist advice sought.

Extravasation injury follows leakage of drugs or intravenous fluids from the veins or inadvertent administration into the subcutaneous or subdermal tissue. It must be dealt with **promptly** to prevent tissue necrosis.

Acidic or alkaline preparations and those with an osmolarity greater than that of plasma can cause extravasation injury; excipients including alcohol and polyethylene glycol have also been implicated. Cytotoxic drugs commonly cause extravasation injury. In addition, certain patients such as the very young and the elderly are at increased risk. Those receiving anticoagulants are more likely to lose blood into surrounding tissues if extravasation occurs, while those receiving sedatives or analgesics may not notice the early signs or symptoms of extravasation.

**Prevention of extravasation** Precautions should be taken to avoid extravasation; ideally, drugs likely to cause extravasation injury should be given through a central line and patients receiving repeated doses of hazardous drugs peripherally should have the cannula resited at regular intervals. Attention should be paid to the manufacturers' recommendations for administration. Placing a glyceryl trinitrate patch (section 2.6.1) distal to the cannula may improve the patency of the vessel in patients with small veins or in those whose veins are prone to collapse.

Patients should be asked to report any pain or burning at the site of injection immediately.

**Management of extravasation** If extravasation is suspected the infusion should be stopped immediately but the cannula should not be removed until after an attempt has been made to aspirate the area (through the cannula) in order to remove as much of the drug as possible. Aspiration is sometimes possible if the extravasation presents with a raised bleb or blister at the injection site and is surrounded by hardened tissue, but it is often unsuccessful if the tissue is soft or soggy. **Corticosteroids** are usually given to treat inflammation, although there is little evidence to support their use in extravasation. Hydrocortisone or dexamethasone (section 6.3.2) can be given either locally by subcutaneous injection or intravenously at a site distant from the injury. **Antihistamines** (section 3.4.1) and **analgesics** (section 4.7) may be required for symptom relief.

The management of extravasation beyond these measures is not well standardised and calls for specialist advice. Treatment depends on the nature of the offending substance; one approach is to localise and neutralise the substance whereas another is to spread and dilute it.

The first method may be appropriate following extravasation of vesicant drugs and involves administration of an antidote (if available) and the application of cold compresses 3–4 times a day (consult specialist literature for details of specific antidotes). Spreading and diluting the offending substance involves infiltrating the area with physiological saline, applying warm compresses, elevating the affected limb, and administering **hyaluronidase** (section 10.3.1). A saline flush-out technique (involving flushing the subcutaneous tissue with physiological saline) may be effective but requires specialist advice. Hyaluronidase should **not** be administered following extravasation of vesicant drugs (unless it is either specifically indicated or used in the saline flush-out technique). **Dextrazoxane** (section 8.1) is licensed for the treatment of anthracycline-induced extravasation.

## 10.3.1 Enzymes

### Collagenase

**Collagenases** are proteolytic enzymes that are derived from the fermentation of *Clostridium histolyticum* and have the ability to break down collagen. A preparation containing a mixture of two collagenases is licensed for the treatment of Dupuytren's contracture; the preparation should be injected into a palpable cord with a contracture of a metacarpophalangeal joint or proximal interphalangeal joint.

The *Scottish Medicines Consortium* (p. 4) has advised (April 2012) that collagenase *Clostridium histolyticum* (**Xiapex**<sup>®</sup>) is accepted for restricted use within NHS Scotland as an alternative to limited fasciectomy, for the treatment of Dupuytren's contracture of moderate severity (as defined by the British Society for Surgery of the Hand) in patients with a palpable cord and up to two affected joints per hand, who are suitable for limited fasciectomy, but for whom percutaneous needle fasciectomy is not considered a suitable treatment option.

### COLLAGENASE

**Indications** Dupuytren's contracture in patients with a palpable cord

**Cautions** coagulation disorders or use of anticoagulants

**Contra-indications** avoid injecting into other structures containing collagen (e.g. tendons, nerves, and blood vessels)—risk of tendon rupture or ligament damage

**Pregnancy** manufacturer advises avoid

**Breast-feeding** systemic absorption by mother negligible

**Side-effects** paraesthesia, hypoaesthesia, burning sensation, lymphadenopathy, arthralgia, myalgia, joint swelling, injection site reactions, ecchymosis, hyperhidrosis; *less commonly* complex regional pain syndrome, monoplegia, tremor, crepitus, muscle spasm and weakness, tendon rupture, ligament injury, wound dehiscence

#### Dose

- **By intralesional injection** into palpable cord, **ADULT** over 18 years, 580 micrograms; if necessary repeat at intervals of approx. 4 weeks; max. 3 injections per

cord; max. 8 injections in total; only one cord may be treated at a time

**Note** reconstitution and injected volumes vary with site of injection—consult product literature

**Xiapex**<sup>®</sup> (Auxilium) ▼ (PoM)

**Injection**, powder for reconstitution, collagenase *Clostridium histolyticum*, net price 900-microgram vial (with solvent) = £650.00

### Hyaluronidase

**Hyaluronidase** is used to render the tissues more readily permeable to injected fluids, e.g. for introduction of fluids by subcutaneous infusion (termed hypodermoclysis).

### HYALURONIDASE

**Indications** enhance permeation of subcutaneous or intramuscular injections, local anaesthetics and subcutaneous infusions; promote resorption of excess fluids and blood

**Cautions** infants or elderly (control speed and total volume and avoid overhydration especially in renal impairment)

**Contra-indications** do not apply direct to cornea; avoid sites where infection or malignancy; not for anaesthesia in unexplained premature labour; not to be used to reduce swelling of bites or stings; not for intravenous administration; not to be used to enhance the absorption and dispersion of dopamine and/or alpha-adrenoceptor agonists

**Side-effects** oedema; *rarely* local irritation, infection, bleeding, bruising; occasional severe allergy (including anaphylaxis)

#### Dose

- With subcutaneous or intramuscular injection, 1500 units dissolved directly in solution to be injected (ensure compatibility)
- With local anaesthetics, 1500 units mixed with local anaesthetic solution (ophthalmology, 15 units/mL)
- Hypodermoclysis, 1500 units dissolved in 1 mL water for injections or 0.9% sodium chloride injection, administered before start of 500–1000 mL infusion fluid
- Extravasation (see notes above) or haematoma, 1500 units dissolved in 1 mL water for injections or 0.9% sodium chloride injection, infiltrated into affected area (as soon as possible after extravasation)

**Hyalase**<sup>®</sup> (Wockhardt) (PoM)

**Injection**, powder for reconstitution, hyaluronidase (ovine). Net price 1500-unit amp = £7.60

## 10.3.2 Rubefacients, topical NSAIDs, capsaicin, and poultices

**Rubefacients** act by counter-irritation. Pain, whether superficial or deep-seated, is relieved by any method that itself produces irritation of the skin. Topical rubefacient preparations may contain nicotine and salicylate compounds, essential oils, capsaicin, and camphor. The evidence available does not support the use of topical rubefacients in acute or chronic musculoskeletal pain.

## Topical NSAIDs

The use of a NSAID by mouth is effective for relieving musculoskeletal pain. **Topical NSAIDs** (e.g. felbinac, ibuprofen, ketoprofen, and piroxicam) may provide some relief of pain in musculoskeletal conditions; they can be considered as an adjunctive treatment in knee or hand osteoarthritis (see section 10.1).

**Cautions** Apply with gentle massage only. Avoid contact with eyes, mucous membranes, and inflamed or broken skin; discontinue if rash develops. Hands should be washed immediately after use. Not for use with occlusive dressings. Topical application of large amounts can result in systemic effects (see section 10.1.1), including hypersensitivity and asthma (renal disease has also been reported). Not generally suitable for children. Patient packs carry a **warning** to avoid during pregnancy or breast-feeding.

**Hypersensitivity** For NSAID hypersensitivity and asthma warning, see p. 703 and p. 704

**Photosensitivity** Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity. Patients using preparations containing ketoprofen should be advised not to expose area treated to sunbeds or sunlight (even on a bright but cloudy day) during, and for two weeks after stopping treatment; treated areas should be protected with clothing.

### Non-proprietary preparations

#### Ibuprofen (Non-proprietary)

Gel, ibuprofen 5%, net price 30 g = £1.28, 50 g = £2.11, 100 g = £4.22. Counselling, photosensitivity, see above  
**Dose** apply up to 3 times daily

#### Ketoprofen (Non-proprietary) (PoM)

Gel, ketoprofen 2.5%, net price 30 g = £4.47, 50 g = £1.64, 100 g = £3.28. Counselling, photosensitivity, see above  
**Dose** apply 2–4 times daily for up to 7 days (usual max. 15 g daily)

#### Piroxicam (Non-proprietary) (PoM)

Gel, piroxicam 0.5%, net price 60 g = £2.83; 112 g = £5.28. Counselling, photosensitivity, see above  
**Dose** apply 3–4 times daily

### Proprietary preparations

#### Feldene® (Pfizer) (PoM)

Gel, piroxicam 0.5%, net price 60 g = £6.00; 112 g = £9.41 (also 7.5 g starter pack, hosp. only). Counselling, photosensitivity, see above  
**Excipients** include benzyl alcohol, propylene glycol  
**Dose** apply 3–4 times daily; therapy should be reviewed after 4 weeks

#### <sup>1</sup>Fenbid® Forte Gel (AMCo) (PoM)

Gel, ibuprofen 10%, net price 100 g = £4.00. Counselling, photosensitivity, see above  
**Excipients** include benzyl alcohol  
**Dose** apply up to 4 times daily; therapy should be reviewed after 14 days

#### Ibugel® Forte (Derma) (PoM)

**Forte gel**, ibuprofen 10%, net price 100 g = £5.79. Counselling, photosensitivity, see above  
**Excipients** none as listed in section 13.1.3  
**Dose** apply up to 3 times daily

#### <sup>1</sup>Oruvail® (Sanofi-Aventis) (PoM)

Gel, ketoprofen 2.5%, net price 100 g = £6.84. Counselling, photosensitivity, see above  
**Excipients** include fragrance  
**Dose** apply 2–4 times daily for up to 7 days (usual recommended dose 15 g daily)

#### Powergel® (Menarini) (PoM)

Gel, ketoprofen 2.5%, net price 50 g = £3.06; 100 g = £5.89. Counselling, photosensitivity, see above  
**Excipients** include fragrance  
**Dose** apply 2–3 times daily for up to max. 10 days

#### Traxam® (AMCo) (PoM)

**Foam**, felbinac 3.17%. Net price 100 g = £8.41. Label: 15, counselling, photosensitivity, see above  
**Excipients** include ceteostearyl alcohol  
**Gel**, felbinac 3%. Net price 100 g = £8.03. Counselling, photosensitivity, see above  
**Excipients** none as listed in section 13.1.3  
**Dose** apply 2–4 times daily; max. 25 g daily; therapy should be reviewed after 14 days  
**Note** Felbinac is an active metabolite of the NSAID fenbufen

#### <sup>2</sup>Voltarol Emulgel® (Novartis) (PoM)

Gel, diclofenac diethylammonium salt 1.16% (equivalent to diclofenac sodium 1%), net price 20 g (hosp. only) = £1.55; 100 g = £5.63. Counselling, photosensitivity, see above  
**Excipients** include propylene glycol, fragrance  
**Dose** apply 3–4 times daily; therapy should be reviewed after 14 days (or after 28 days for osteoarthritis)

#### Voltarol Gel Patch® (Novartis) (PoM)

**Gel patch**, diclofenac epolamine (equivalent to 140 mg diclofenac sodium per patch), net price 10-patch pack = £14.09. Counselling, photosensitivity, see above  
**Excipients** include hydroxybenzoates (parabens), propylene glycol  
**Dose** **ADULT** and **CHILD** over 15 years, ankle sprain, apply 1 patch daily for up to 3 days; epicondylitis, apply 1 patch twice daily for up to 14 days

## Capsaicin

A preparation containing capsaicin 0.025% can be considered as an adjunct in hand or knee osteoarthritis (see section 10.1). It may need to be used for 1–2 weeks before pain is relieved.

A capsaicin 0.075% cream is licensed for the symptomatic relief of postherpetic neuralgia (section 4.7.3) after lesions have healed, and for the relief of painful diabetic neuropathy (section 6.1.5).

A self-adhesive patch containing capsaicin 8% is licensed for the treatment of peripheral neuropathic pain in non-diabetic patients.

The *Scottish Medicines Consortium* (p. 4) has advised (January 2011) that capsaicin 179 mg (8%) patch (*Qutenza*®) is accepted for restricted use within NHS Scotland for the treatment of postherpetic neuralgia in patients who have not achieved adequate pain relief from, or who have not tolerated conventional first and second-line treatments. Treatment should be under the supervision of a specialist in pain management.

1. Smaller pack sizes available on sale to the public

2. Various pack sizes available on sale to the public

**Zacin**<sup>®</sup> (TEVA UK) (PoM)

**Cream**, capsaicin 0.025%, net price 45 g = £17.71.

**Excipients** include benzyl alcohol, cetyl alcohol

**Cautions** avoid contact with eyes, inflamed or broken skin; wash hands immediately after use (or wash hands 30 minutes after application if hands treated); not to be used under tight bandages; avoid hot shower or bath just before or after application (burning sensation enhanced); avoid inhalation of vapours

**Side-effects** transient burning sensation during initial treatment (particularly if too much used or if administered less than 4 times daily); *rarely* cough, sneezing, eye irritation; dyspnoea and exacerbation of asthma also reported

**Dose** symptomatic relief in osteoarthritis, apply sparingly 4 times daily (not more often than every 4 hours)

**Axsain**<sup>®</sup> (TEVA UK) (PoM)

**Cream**, capsaicin 0.075%, net price 45 g = £14.58.

**Excipients** include benzyl alcohol, cetyl alcohol

**Cautions** avoid contact with eyes, inflamed or broken skin; wash hands immediately after use (or wash hands 30 minutes after application if hands treated); not to be used under tight bandages; avoid hot shower or bath just before or after application (burning sensation enhanced); avoid inhalation of vapours

**Side-effects** transient burning sensation during initial treatment (particularly if too much used or if administered less than 3–4 times daily); *rarely* cough, sneezing, eye irritation; dyspnoea and exacerbation of asthma also reported

**Dose** post-herpetic neuralgia (**important:** after lesions have healed), apply sparingly up to 3–4 times daily (not more often than every 4 hours)

Painful diabetic neuropathy, under specialist supervision, apply sparingly 3–4 times daily (not more often than every 4 hours) for 8 weeks then review

**Qutenza**<sup>®</sup> (Astellas) (PoM)

**Patches**, self-adhesive, capsaicin 179 mg (8%), net price 1 × 280 cm<sup>2</sup> patch (with cleansing gel) = £210.00.

**Excipients** include butylated hydroxyanisole in cleansing gel (see section 13.1.3)

**Cautions** avoid holding near eyes or mucous membranes; avoid contact with inflamed or broken skin, the face, scalp or in proximity to mucous membranes; monitor blood pressure during treatment procedure; uncontrolled hypertension; recent cardiovascular events

**Side-effects** application site reactions including transient burning, erythema, pruritus; *less commonly* nausea; peripheral oedema, first degree AV block, tachycardia, palpitations, hypertension; cough, throat irritation; hypoaesthesia, burning sensation, dysgeusia; pain in extremities, muscle spasm; eye irritation; pruritus

**Dose** peripheral neuropathic pain in non-diabetic patients, applied under supervision of a physician, consult product literature

**Note** Nitrile gloves to be worn while handling patches and cleaning treatment areas (latex gloves do not provide adequate protection)

**Poultices****Kaolin Poultice** 

**Poultice**, heavy kaolin 52.7%, thymol 0.05%, boric acid 4.5%, peppermint oil 0.05%, methyl salicylate 0.2%, glycerol 42.5%. Net price 200 g = £2.76

**Dose** warm and apply directly or between layers of muslin; avoid application of overheated poultice

**Kaolin Poultice K/L Pack**<sup>®</sup> (K/L) 

**Kaolin poultice** Net price 4 × 100-g pouches = £6.40

## 11.1 Administration of drugs to the eye

Drugs are most commonly administered to the eye by topical application as eye drops or eye ointments. When a higher drug concentration is required within the eye, a local injection may be necessary, see Other Preparations, below.

Eye-drop dispenser devices are available to aid the instillation of eye drops from plastic bottles and some are prescribable on the NHS (consult Drug Tariff—see Appliances and Reagents, p. 1092 for links to online Drug Tariffs). Product-specific devices may be supplied by manufacturers—consult individual manufacturers for information. They are particularly useful for the elderly, visually impaired, arthritic, or otherwise physically limited patients.

**Eye drops and eye ointments** Eye drops are generally instilled into the pocket formed by gently pulling down the lower eyelid and keeping the eye closed for as long as possible after application; one drop is all that is needed. Instillation of more than one drop should be discouraged because it may increase systemic side-effects. A small amount of eye ointment is applied similarly; the ointment melts rapidly and blinking helps to spread it.

When two different eye-drop preparations are used at the same time of day, dilution and overflow may occur when one immediately follows the other. The patient should therefore leave an interval of at least 5 minutes between the two; the interval should be extended when eye drops with a prolonged contact time, such as gels and suspensions, are used. Eye ointment should be applied after drops.

Systemic effects may arise from absorption of drugs into the general circulation from conjunctival vessels or from the nasal mucosa after the excess preparation has drained down through the tear ducts. The extent of systemic absorption following ocular administration is highly variable; nasal drainage of drugs is associated with eye drops much more often than with eye ointments. Pressure on the lacrimal punctum for at least a minute after applying eye drops reduces nasolacrimal drainage and therefore decreases systemic absorption from the nasal mucosa.

After using eye drops or eye ointments, patients should be warned not to drive or perform other skilled tasks until vision is clear.

For warnings relating to eye drops and contact lenses, see section 11.9.

**Eye lotions** These are solutions for the irrigation of the conjunctival sac. They act mechanically to flush out irritants or foreign bodies as a first-aid treatment. Sterile sodium chloride 0.9% solution (section 11.8.1) is usually used. Clean water will suffice in an emergency.

**Ophthalmic Specials** The Royal College of Ophthalmologists and the UK Ophthalmic Pharmacy Group have produced the Ophthalmic Specials Gui-

dance to help prescribers and pharmacists manage and restrict the use of unlicensed eye preparations. 'Specials' should only be prescribed in situations where a licensed product is not suitable for a patient's needs. The Ophthalmic Specials Guidance can be accessed on the Royal College of Ophthalmologists website ([www.rcophth.ac.uk](http://www.rcophth.ac.uk)). The guidance will be reviewed every six months to ensure the most accurate and up-to-date information is available.

**Other preparations** Subconjunctival injection may be used to administer anti-infective drugs, mydriatics, or corticosteroids for conditions not responding to topical therapy; intracameral and intravitreal routes can also be used to administer certain drugs, for example antibacterials. These injections should only be used under specialist supervision.

Drugs such as antimicrobials and corticosteroids may be administered systemically to treat susceptible eye conditions.

**Preservatives and sensitisers** Information on preservatives and on substances identified as skin sensitisers (see section 13.1.3) is provided under Excipients statements in preparation entries. Very rarely, cases of corneal calcification have been reported with the use of phosphate-containing eye drops in patients with significantly damaged corneas—consult product literature for further information.

## 11.2 Control of microbial contamination

Preparations for the eye should be sterile when issued. Care should be taken to avoid contamination of the contents during use.

Eye drops in multiple-application containers for *domestic use* should not be used for more than 4 weeks after first opening (unless otherwise stated by the manufacturer).

Multiple application eye drops for use in *hospital wards* are normally discarded 1 week after first opening—local practice may vary. Individual containers should be provided for each patient. A separate container should be supplied for each eye only if there are special concerns about contamination. Containers used before an eye operation should be discarded at the time of the operation and fresh containers supplied postoperatively. A fresh supply should also be provided upon discharge from hospital; in specialist ophthalmology units, it may be acceptable to issue containers that have been dispensed to the patient on the day of discharge.

In *out-patient departments* single-application containers should be used; if multiple-application containers are used, they should be discarded after single patient use within one clinical session.

In *eye surgery* single-application containers should be used if possible; if a multiple-application container is used, it should be discarded after single use. Preparations used during intra-ocular procedures and others that may penetrate into the anterior chamber must be isotonic and without preservatives and buffered if necessary to a neutral pH. Specially formulated fluids should be used for intra-ocular surgery; intravenous infusion preparations are not usually suitable for this purpose (Hartmann's solution may be used in some ocular surgery). For all surgical procedures, a previously unopened container is used for each patient.

## 11.3 Anti-infective eye preparations

### 11.3.1 Antibacterials

### 11.3.2 Antifungals

### 11.3.3 Antivirals

**Eye infections** Most acute superficial eye infections can be treated topically. Blepharitis and conjunctivitis are often caused by staphylococci; keratitis and endophthalmitis may be bacterial, viral, or fungal.

Bacterial *blepharitis* is treated by application of an antibacterial eye ointment to the conjunctival sac or to the lid margins. Systemic treatment may occasionally be required and is usually undertaken after culturing organisms from the lid margin and determining their antimicrobial sensitivity; antibiotics such as the tetracyclines given for 3 months or longer may be appropriate.

Most cases of acute bacterial conjunctivitis are self-limiting; where treatment is appropriate, antibacterial eye drops or an eye ointment are used. A poor response might indicate viral or allergic conjunctivitis.

*Corneal ulcer* and *keratitis* require specialist treatment and may call for hospital admission for intensive therapy.

*Endophthalmitis* is a medical emergency which also calls for specialist management and requires intravitreal administration of antimicrobials; concomitant systemic treatment is required in some cases. Surgical intervention, such as vitrectomy, is sometimes indicated.

### 11.3.1 Antibacterials

Bacterial eye infections are generally treated topically with eye drops and eye ointments. Systemic administration is sometimes appropriate in blepharitis.

**Chloramphenicol** has a broad spectrum of activity and is the drug of choice for *superficial eye infections*. Chloramphenicol eye drops are well tolerated and the recommendation that chloramphenicol eye drops should be avoided because of an increased risk of aplastic anaemia is not well founded.

Other antibacterials with a broad spectrum of activity include the quinolones, **ciprofloxacin**, **levofloxacin**, **moxifloxacin**, and **ofloxacin**; the aminoglycosides, **gentamicin** and **tobramycin** are also active against a wide variety of bacteria. Gentamicin, tobramycin, quinolones (except moxifloxacin), and **polymyxin B** are effective for infections caused by *Pseudomonas aeruginosa*.

**Ciprofloxacin** eye drops are licensed for *corneal ulcers*; intensive application (especially in the first 2 days) is required throughout the day and night.

**Azithromycin** eye drops are licensed for trachomatous conjunctivitis caused by *Chlamydia trachomatis* and for purulent bacterial conjunctivitis. *Trachoma* which results from chronic infection with *Chlamydia trachomatis* can be treated with azithromycin by mouth [unlicensed indication].

**Fusidic acid** is useful for staphylococcal infections.

**Propamidine isetionate** is of little value in bacterial infections but is used by specialists to treat the rare, but

potentially sight-threatening, condition of *acanthamoeba keratitis* [unlicensed indication] (see also section 11.9).

**Cefuroxime** can be administered by intracameral injection for the prophylaxis of endophthalmitis following cataract surgery, see section 11.8.2.

**With corticosteroids** Many antibacterial preparations also incorporate a corticosteroid but such mixtures should **not** be used unless a patient is under close specialist supervision. In particular they should not be prescribed for undiagnosed 'red eye' which is sometimes caused by the herpes simplex virus and may be difficult to diagnose (section 11.4).

**Administration** Frequency of application depends on the severity of the infection and the potential for irreversible ocular damage; antibacterial eye preparations are usually administered as follows:

- *Eye drops*, apply 1 drop at least every 2 hours then reduce frequency as infection is controlled and continue for 48 hours after healing;
- *Eye ointment*, apply *either* at night (if eye drops used during the day) or 3–4 times daily (if eye ointment used alone).

## AZITHROMYCIN DIHYDRATE

**Indications** see notes above

**Side-effects** ocular discomfort (including pruritus, burning), blurred vision; *less commonly* eyelid eczema, eyelid erythema, eyelid oedema, conjunctival hyperaemia, keratitis

### Dose

- Apply twice daily for 3 days; review if no improvement after 3 days

### Single use

**Azyter**<sup>®</sup> (Spectrum Thea) (POM)

*Eye drops*, azithromycin dihydrate 1.5%, net price 6 × 0.25-g = £6.99

## CHLORAMPHENICOL

**Indications** see notes above

**Pregnancy** avoid unless essential—no information on topical use but risk of 'neonatal grey-baby syndrome' with oral use in third trimester

**Breast-feeding** avoid unless essential—*theoretical* risk of bone-marrow toxicity

**Side-effects** transient stinging; see also notes above

### Dose

- See Administration in notes above

**Chloramphenicol** (Non-proprietary) (POM)

*Eye drops*, chloramphenicol 0.5%. Net price 10 mL = £1.44

*Eye ointment*, chloramphenicol 1%. Net price 4 g = £1.63

**Note** Chloramphenicol 0.5% eye drops (in max. pack size 10 mL) and 1% eye ointment (in max. pack size 4 g) can be sold to the public for treatment of acute bacterial conjunctivitis in adults and children over 2 years; max. duration of treatment 5 days

**Chloromycetin**<sup>®</sup> (AMCo) (POM)

*Redidrops* (= eye drops), chloramphenicol 0.5%. Net price 5 mL = £1.65; 10 mL = 90p

**Excipients** include phenylmercuric acetate

*Ophthalmic ointment* (= eye ointment), chloramphenicol 1%. Net price 4 g = £1.08

### Single use

**Minims**<sup>®</sup> Chloramphenicol (Bausch & Lomb) (POM)

*Eye drops*, chloramphenicol 0.5%. Net price 20 × 0.5 mL = £10.53

## CIPROFLOXACIN

**Indications** superficial bacterial infections, see notes above; corneal ulcers

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises caution

**Side-effects** taste disturbance, ocular discomfort, ocular hyperaemia, corneal deposits (reversible after completion of treatment); *less commonly* nausea, headache, keratopathy, corneal infiltrates, corneal staining, photophobia, blurred vision, eyelid disorders (including oedema, exfoliation, erythema), eye irritation (including pain, swelling, pruritus, dryness), increased lacrimation, conjunctival hyperaemia; *rarely* diarrhoea, abdominal pain, dizziness, keratitis, corneal disorders including corneal epithelium defect, eye hypoaesthesia, asthenopia, diplopia, ear pain, paranasal sinus hypersecretion, rhinitis, dermatitis

### Dose

- Superficial bacterial infection, **ADULT** and **CHILD** apply *eye drops* 4 times daily; in severe infection apply every 2 hours during waking hours for 2 days, then 4 times daily; max. duration of treatment 21 days

**ADULT** and **CHILD** over 1 year, apply 1.25 cm *eye ointment* 3 times daily for 2 days, then twice daily for 5 days

- Corneal ulcer, **ADULT** and **CHILD** apply *eye drops* throughout day and night, day 1 apply every 15 minutes for 6 hours then every 30 minutes, day 2 apply every hour, days 3–14 apply every 4 hours; max. duration of treatment 21 days

**ADULT** and **CHILD** over 1 year, apply *eye ointment* throughout day and night; apply 1.25 cm ointment every 1–2 hours for 2 days, then every 4 hours for next 12 days

**Ciloxan**<sup>®</sup> (Alcon) (POM)

*Ophthalmic solution* (= eye drops), ciprofloxacin (as hydrochloride) 0.3%. Net price 5 mL = £4.70

**Excipients** include benzalkonium chloride

*Eye ointment*, ciprofloxacin (as hydrochloride) 0.3%. Net price 3.5 g = £5.22

## FUSIDIC ACID

**Indications** see notes above

### Dose

- See under preparation below

**Fucithalmic**<sup>®</sup> (LEO) (POM)

*Eye drops*, m/r, fusidic acid 1% in gel basis (liquifies on contact with eye). Net price 5 g = £2.69

**Excipients** include benzalkonium chloride, disodium edetate

**Dose** apply twice daily

## GENTAMICIN

**Indications** see notes above

### Dose

- See Administration in notes above

**Genticin**<sup>®</sup> (AMCo) (POM)

*Drops* (for ear or eye), gentamicin (as sulfate) 0.3%. Net price 10 mL = £2.13

**Excipients** include benzalkonium chloride

## LEVOFLOXACIN

**Indications** see notes above

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk

**Side-effects** ocular burning, visual disturbances; *less commonly* headache, ocular discomfort (including itching, pain, and dryness), conjunctival follicles, lid oedema, lid erythema, photophobia, rhinitis

### Dose

- **ADULT** and **CHILD** over 1 year, apply every 2 hours (max. 8 times daily) for the first 2 days, then 4 times daily for 3 days

**Oftaquix**<sup>®</sup> (Kestrel Ophthalmics) (POM)

**Eye drops**, levofloxacin 0.5%, net price 5 mL = £6.95

**Excipients** include benzalkonium chloride

**Unit dose eye drops**, levofloxacin 0.5%, net price 30 × 0.5-mL single use units = £17.95

## MOXIFLOXACIN

**Indications** see notes above

**Cautions** not recommended for neonates

**Side-effects** taste disturbances, ocular discomfort (including pain, irritation and dryness), hyperaemia; *less commonly* vomiting, headache, paraesthesia, corneal disorders (including keratitis, erosion, and staining), conjunctival haemorrhage, eyelid erythema, visual disturbances, nasal discomfort, pharyngolaryngeal pain; *also reported* nausea, palpitation, dyspnoea, dizziness, raised intra-ocular pressure, photophobia, rash, pruritus

### Dose

- **ADULT** and **CHILD** over 1 month, apply 3 times daily (continue treatment for 2–3 days after infection improves; review if no improvement within 5 days)

**Moxivig**<sup>®</sup> (Alcon) (POM)

**Eye drops**, moxifloxacin (as hydrochloride) 0.5%, net price 5 mL = £9.80

## OFLOXACIN

**Indications** see notes above

**Cautions** corneal ulcer or epithelial defect (risk of corneal perforation)

**Pregnancy** manufacturer advises use only if benefit outweighs risk; systemic quinolones have caused arthropathy in *animal* studies

**Breast-feeding** manufacturer advises avoid

**Side-effects** ocular discomfort and irritation; *also reported* facial oedema, keratitis, visual disturbances, photophobia, increased lacrimation, ocular oedema, dry eyes, ocular hyperaemia

### Dose

- **ADULT** and **CHILD** over 1 year, apply every 2–4 hours for the first 2 days, then reduce frequency to 4 times daily (max. 10 days treatment)

**Excilin**<sup>®</sup> (Allergan) (POM)

**Ophthalmic solution** (= eye drops), ofloxacin 0.3%. Net price 5 mL = £2.17

**Excipients** include benzalkonium chloride

## PROPAMIDINE ISETIONATE

**Indications** local treatment of infections (but see notes above)

**Pregnancy** manufacturer advises avoid unless essential—no information available

**Breast-feeding** manufacturer advises avoid unless essential—no information available

**Side-effects** eye pain and irritation

### Dose

- See preparations

**Brolene**<sup>®</sup> (Sanofi-Aventis)

**Eye drops**, propamidine isetionate 0.1%. Net price 10 mL = £2.80

**Excipients** include benzalkonium chloride

**Dose** apply up to 4 times daily

**Eye ointment**, dibrompropamidine isetionate 0.15%. Net price 5 g = £2.92

**Dose** apply 1–2 times daily

**Golden Eye**<sup>®</sup> (Typharm)

**Eye drops**, propamidine isetionate 0.1%, net price 10 mL = £3.26

**Excipients** include benzalkonium chloride

**Dose** apply up to 4 times daily

**Eye ointment**, dibrompropamidine isetionate 0.15%, net price 5 g = £3.49

**Dose** apply 1–2 times daily

## TOBRAMYCIN

**Indications** see notes above

### Dose

- **ADULT** and **CHILD** over 1 year, apply twice daily for 6–8 days; in severe infection, apply 4 times daily on the first day, then twice daily for 5–7 days

**Tobravisc**<sup>®</sup> (Alcon) (POM)

**Eye drops**, tobramycin 0.3%, net price 5 mL = £4.74

**Excipients** include benzododecinium bromide

## 11.3.2 Antifungals

Fungal infections of the cornea are rare but can occur after agricultural injuries, especially in hot and humid climates. Orbital mycosis is rarer, and when it occurs it is usually because of direct spread of infection from the paranasal sinuses. Increasing age, debility, or immunosuppression can encourage fungal proliferation. The spread of infection through blood occasionally produces metastatic endophthalmitis.

Many different fungi are capable of producing ocular infection; they can be identified by appropriate laboratory procedures.

Antifungal preparations for the eye are not generally available. Treatment will normally be carried out at specialist centres, but requests for information about supplies of preparations not available commercially should be addressed to the Strategic Health Authority (or equivalent), or to the nearest hospital ophthalmology unit, or to Moorfields Eye Hospital, 162 City Road, London EC1V 2PD (tel. (020) 7253 3411) or [www.moorfields.nhs.uk](http://www.moorfields.nhs.uk)

### 11.3.3 Antivirals

Herpes simplex infections producing, for example, dendritic corneal ulcers can be treated with **aciclovir** or **ganciclovir**. Aciclovir eye ointment is used in combination with systemic treatment for ophthalmic zoster (section 5.3.2.1).

Slow-release ocular implants containing **ganciclovir** (available on a named-patient basis from specialist importing companies, see p. 1104) may be inserted surgically to treat immediate sight-threatening CMV retinitis. Local treatments do not protect against systemic infection or infection in the other eye. For systemic treatment of CMV retinitis, see section 5.3.2.2.

#### ACICLOVIR

(Acyclovir)

**Indications** local treatment of herpes simplex infections

**Side-effects** local irritation and inflammation, superficial punctate keratopathy; *rarely* blepharitis; *very rarely* hypersensitivity reactions including angioedema

#### Dose

- Apply 1 cm ointment 5 times daily (continue for at least 3 days after complete healing)

**Zovirax**<sup>®</sup> (GSK) (PoM)

Eye ointment, aciclovir 3%, net price 4.5 g = £9.34

#### GANCICLOVIR

**Indications** local treatment of herpes simplex infections

**Side-effects** burning sensation, tingling, superficial punctate keratitis

#### Dose

- Apply 5 times daily until healing complete, then apply 3 times daily for a further 7 days

**Virgan**<sup>®</sup> (Spectrum Thea) (PoM)

Ophthalmic gel, ganciclovir 0.15%, net price 5 g = £19.99

**Excipients** include benzalkonium chloride

## 11.4 Corticosteroids and other anti-inflammatory preparations

### 11.4.1 Corticosteroids

### 11.4.2 Other anti-inflammatory preparations

#### 11.4.1 Corticosteroids

Corticosteroids administered locally to the eye or given by mouth are effective for treating anterior segment inflammation, including that which results from surgery.

*Topical corticosteroids* are applied frequently for the first 24–48 hours; once inflammation is controlled, the frequency of application is reduced. They should normally only be used under expert supervision; three main dangers are associated with their use:

- a 'red eye', when the diagnosis is unconfirmed, may be due to herpes simplex virus, and a corticosteroid

may aggravate the condition, leading to corneal ulceration, with possible damage to vision and even loss of the eye. Bacterial, fungal, and amoebic infections pose a similar hazard;

- 'steroid glaucoma' can follow the use of corticosteroid eye preparations in susceptible individuals;
- a 'steroid cataract' can follow prolonged use.

Other side-effects of ocular corticosteroids include thinning of the cornea and sclera.

Combination products containing a corticosteroid with an anti-infective drug are sometimes used after ocular surgery to reduce inflammation and prevent infection; use of combination products is otherwise rarely justified.

*Systemic corticosteroids* (section 6.3.2) may be useful for ocular conditions. The risk of producing a 'steroid cataract' increases with the dose and duration of corticosteroid use.

#### BETAMETHASONE

**Indications** local treatment of inflammation (short-term)

**Cautions** see notes above

**Side-effects** see notes above

#### Dose

- Apply eye drops every 1–2 hours until controlled then reduce frequency; apply eye ointment 2–4 times daily or at night when used with eye drops

**Betnesol**<sup>®</sup> (Focus) (PoM)

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%, net price 10 mL = £2.32

**Excipients** include benzalkonium chloride, disodium edetate

**Eye ointment**, betamethasone sodium phosphate 0.1%, net price 3 g = £1.41

**Vistamethasone**<sup>®</sup> (Martindale) (PoM)

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%, net price 5 mL = £1.02; 10 mL = £1.16

**Excipients** include benzalkonium chloride

#### With neomycin

**Betnesol-N**<sup>®</sup> (RPH) (PoM) 

**Drops** (for ear, eye, or nose), see section 12.1.1

**Dose** apply up to 6 times daily

#### DEXAMETHASONE

**Indications** local treatment of inflammation (short-term)

**Cautions** see notes above

**Side-effects** see notes above

#### Dose

- Apply eye drops every 30–60 minutes until controlled then reduce frequency to 4–6 times daily

**Maxidex**<sup>®</sup> (Alcon) (PoM)

**Eye drops**, dexamethasone 0.1%, net price 5 mL = £1.42; 10 mL = £2.80

**Excipients** include benzalkonium chloride, disodium edetate, polysorbate 80

**Single use****Dexafree**<sup>®</sup> (Spectrum Thea) **(PoM)****Eye drops**, dexamethasone phosphate (as sodium phosphate) 0.1%, net price 20 × 0.4 mL = £9.70**Excipients** include disodium edetate**Dropodex**<sup>®</sup> (Moorfields) **(PoM)****Eye drops**, dexamethasone (as sodium phosphate) 0.1%, net price 20 × 0.4 mL = £9.75**Excipients** include disodium edetate**Minims**<sup>®</sup> **Dexamethasone** (Bausch & Lomb) **(PoM)****Eye drops**, dexamethasone sodium phosphate 0.1%, net price 20 × 0.5 mL = £10.98**Excipients** include disodium edetate**With antibacterials****Maxitrol**<sup>®</sup> (Alcon) **(PoM)****Eye drops**, dexamethasone 0.1%, neomycin sulfate 3500 units/g, polymyxin B sulfate 6000 units/mL, net price 5 mL = £1.68**Excipients** include benzalkonium chloride, polysorbate 20**Eye ointment**, dexamethasone 0.1%, neomycin sulfate 3500 units/g, polymyxin B sulfate 6000 units/g, net price 3.5 g = £1.44**Excipients** include hydroxybenzoates (parabens), wool fat  
**Dose** apply 3–4 times daily *or* at night when used with eye drops**Sofradex**<sup>®</sup> (Sanofi-Aventis) **(PoM)****Drops** (for ear or eye), see section 12.1.1**Tobradex**<sup>®</sup> (Alcon) **(PoM)****Eye drops**, dexamethasone 0.1%, tobramycin 0.3%, net price 5 mL = £5.37**Excipients** include benzalkonium chloride, disodium edetate**FLUOROMETHOLONE****Indications** local treatment of inflammation (short-term)**Cautions** see notes above**Side-effects** see notes above**Dose**

- **ADULT** and **CHILD** over 2 years, apply every hour for 24–48 hours, then reduce frequency to 2–4 times daily

**FML**<sup>®</sup> (Allergan) **(PoM)****Ophthalmic suspension** (= eye drops), fluorometholone 0.1%, polyvinyl alcohol (*Liquifilm*<sup>®</sup>) 1.4%, net price 5 mL = £1.71; 10 mL = £2.95**Excipients** include benzalkonium chloride, disodium edetate, polysorbate 80**LOTEPREDNOL ETABONATE****Indications** treatment of post-operative inflammation following ocular surgery**Cautions** see notes above**Side-effects** see notes above**Dose**

- Apply 4 times daily starting 24 hours after surgery; max. duration of treatment 14 days

**Lotemax**<sup>®</sup> (Bausch & Lomb) **(PoM)****Ophthalmic suspension** (= eye drops), loteprednol etabonate 0.5%, net price 5 mL = £5.50**Excipients** include benzalkonium chloride, disodium edetate**PREDNISOLONE****Indications** local treatment of inflammation (short-term)**Cautions** see notes above**Side-effects** see notes above**Dose**

- Apply every 1–2 hours until controlled then reduce frequency

**Predsol**<sup>®</sup> (Focus) **(PoM)****Drops** (for ear or eye), prednisolone sodium phosphate 0.5%, net price 10 mL = £2.00**Excipients** include benzalkonium chloride, disodium edetate**Pred Forte**<sup>®</sup> (Allergan) **(PoM)****Eye drops**, prednisolone acetate 1%, net price 5 mL = £1.52; 10 mL = £3.05**Excipients** include benzalkonium chloride, disodium edetate, polysorbate 80**Single use****Minims**<sup>®</sup> **Prednisolone Sodium Phosphate** (Bausch & Lomb) **(PoM)****Eye drops**, prednisolone sodium phosphate 0.5%, net price 20 × 0.5 mL = £11.28**Excipients** include disodium edetate**RIMEXOLONE****Indications** local treatment of inflammation (short-term)**Cautions** see notes above**Side-effects** see notes above**Dose**

- Postoperative inflammation, apply 4 times daily for 2 weeks, beginning 24 hours after surgery
- Steroid-responsive inflammation, apply at least 4 times daily for up to 4 weeks
- Uveitis, apply every hour during daytime in week 1, then every 2 hours in week 2, then 4 times daily in week 3, then twice daily for first 4 days of week 4, then once daily for remaining 3 days of week 4

**Vexol**<sup>®</sup> (Alcon) **(PoM)****Eye drops**, rimexolone 1%, net price 5 mL = £5.66**Excipients** include benzalkonium chloride, disodium edetate, polysorbate 80**Intravitreal corticosteroids**

An intravitreal implant containing **dexamethasone** (*Ozurdex*<sup>®</sup>) is licensed for the treatment of adults with macular oedema following either branch retinal vein occlusion or central retinal vein occlusion; it is also licensed for the treatment of adult patients with inflammation of the posterior segment of the eye presenting as non-infectious uveitis. It should be administered by specialists experienced in the use of intravitreal injections.

The *Scottish Medicines Consortium*, (p. 4) has advised (May 2012) that dexamethasone intravitreal implant (*Ozurdex*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the treatment of adults with macular oedema (i) following central retinal vein occlusion, and (ii) with branch retinal vein occlusion who are not clinically suitable for laser treatment, including patients with dense macular haemorrhage, or patients who have received and failed on previous laser treatment.

**NICE guidance****Dexamethasone intravitreal implant for the treatment of macular oedema secondary to retinal vein occlusion (July 2011)**

Dexamethasone intravitreal implant is recommended as an option for the treatment of macular oedema following central retinal vein occlusion.

Dexamethasone intravitreal implant is also recommended as an option for the treatment of macular oedema following branch retinal vein occlusion when:

- treatment with laser photocoagulation has not been beneficial, or
- treatment with laser photocoagulation is not considered suitable because of the extent of macular haemorrhage.

[www.nice.org.uk/TA229](http://www.nice.org.uk/TA229)

An intravitreal implant containing **fluocinolone acetonide** (*Iluvien*<sup>®</sup>) is licensed for the treatment of visual impairment associated with chronic diabetic macular oedema which is insufficiently responsive to available therapies. It should be administered by specialists experienced in the use of intravitreal injections.

The *Scottish Medicines Consortium*, (p. 4) has advised (February 2014) that fluocinolone acetonide intravitreal implant (*Iluvien*<sup>®</sup>) is recommended for restricted use within NHS Scotland for the treatment of vision impairment associated with chronic diabetic macular oedema, considered insufficiently responsive to available therapies, only in patients in whom the affected eye is pseudophakic (has an artificial lens after cataract surgery), and retreatment would take place only if the patient had previously responded to treatment with fluocinolone acetonide and subsequently best corrected visual acuity had deteriorated to less than 20/32.

**NICE guidance****Fluocinolone acetonide intravitreal implant for treating chronic diabetic macular oedema after an inadequate response to prior therapy (November 2013)**

Fluocinolone acetonide intravitreal implant is recommended as an option for treating chronic diabetic macular oedema that is insufficiently responsive to available therapies only if:

- the implant is to be used in an eye with an intra-ocular (pseudophakic lens) and
- the manufacturer provides fluocinolone acetonide intravitreal implant with the discount agreed in the patient access scheme.

[www.nice.org.uk/TA301](http://www.nice.org.uk/TA301)

**DEXAMETHASONE**

**Indications** see notes above—specialist use only

**Cautions** monitor intra-ocular pressure and for signs of ocular infection; history of ocular herpes simplex; posterior capsule tear or iris defect (risk of implant migration into the anterior chamber); retinal vein occlusion with significant retinal ischaemia; concomitant administration of anticoagulant or antiplatelet drugs

**Contra-indications** active or suspected ocular or peri-ocular infection; uncontrolled advanced glaucoma; rupture of the posterior lens capsule in patients with aphakia or anterior chamber intra-ocular lens

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—no information available

**Breast-feeding** manufacturer advises avoid unless potential benefit outweighs risk—no information available

**Side-effects** headache, raised intra-ocular pressure, vitreous detachment, retinal detachment, blepharitis, eyelid pruritus, cataract, visual disturbance; also reported glaucoma, ocular infection (including endophthalmitis), corneal oedema

**Dose**

- By intravitreal injection, 700 micrograms into the affected eye

**Note** Concurrent administration to both eyes not recommended. For further information on administration and repeat dosing, consult product literature

**Ozurdex**<sup>®</sup> (Allergan) ▼ (PoM)

Intravitreal implant, dexamethasone 700 micrograms in disposable applicator, net price = £870.00

**FLUOCINOLONE ACETONIDE**

**Indications** see notes above—specialist use only

**Cautions** raised baseline intra-ocular pressure (monitor intra-ocular pressure closely); monitor for raised intra-ocular pressure, retinal detachment, endophthalmitis, vitreous haemorrhage or detachment within 2–7 days following the procedure; monitor intra-ocular pressure at least every 3 months thereafter (for approximately 36 months); concomitant administration of anticoagulant or antiplatelet drugs (higher incidence of conjunctival haemorrhage)

**Contra-indications** pre-existing glaucoma; active or suspected ocular or peri-ocular infection

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—no information available

**Breast-feeding** manufacturer advises avoid unless essential

**Side-effects** cataract, raised intra-ocular pressure, vitreous floaters, glaucoma, ocular discomfort, vitreous haemorrhage, conjunctival haemorrhage, blurred vision, reduced visual acuity; less commonly headache, endophthalmitis, retinal vascular occlusion, optic nerve disorder, maculopathy, optic atrophy, conjunctival ulcer, iris neovascularisation or adhesions, retinal exudates, vitreous degeneration or detachment, posterior capsule opacification, ocular hyperaemia, sclera thinning, eye discharge or pruritus

**Dose**

- By intravitreal injection, 190 micrograms into the affected eye

**Note** Concurrent administration to both eyes not recommended. For further information on administration and repeat dosing, consult product literature

**Iluvien**<sup>®</sup> (Alimera) (PoM)

Intravitreal implant, fluocinolone acetonide 190 micrograms in a disposable applicator, net price = £5500.00

**11.4.2 Other anti-inflammatory preparations**

Other preparations used for the topical treatment of inflammation and allergic conjunctivitis include antihistamines, lodoxamide, and sodium cromoglicate.

Eye drops containing antihistamines, such as **antazoline** (with xylometazoline as *Otrivine-Antistin*<sup>®</sup>),

azelastine, epinastine, ketotifen, and olopatadine, can be used for allergic conjunctivitis.

**Sodium cromoglicate** (sodium cromoglycate) and **nedocromil sodium** eye drops can be useful for vernal keratoconjunctivitis and other allergic forms of conjunctivitis.

**Lodoxamide** eye drops are used for allergic conjunctival conditions including seasonal allergic conjunctivitis.

**Diclofenac** eye drops (section 11.8.2) and **emedastine** eye drops are also licensed for seasonal allergic conjunctivitis.

Non-steroidal anti-inflammatory eye drops (section 11.8.2) are used for the prophylaxis and treatment of inflammation of the eye following surgery or laser treatment.

## ANTAZOLINE SULFATE

**Indications** allergic conjunctivitis

**Side-effects** transient stinging; *also reported* blurred vision, mydriasis, eye irritation

**Otrivine-Antistin**<sup>®</sup> (Spectrum Thea)

**Eye drops**, antazoline sulfate 0.5%, xylometazoline hydrochloride 0.05%. Net price 10 mL = £2.35

**Excipients** include benzalkonium chloride, disodium edetate

**Cautions** hypertension; hyperthyroidism; diabetes mellitus; angle-closure glaucoma; phaeochromocytoma; cardiovascular disease; urinary retention; **interactions:** Appendix 1 (antihistamines and sympathomimetics)

**Dose** **ADULT** and **CHILD** over 12 years apply 2–3 times daily (max. 7 days)

**Note** Xylometazoline is a sympathomimetic; absorption of antazoline and xylometazoline may result in systemic side-effects and the possibility of interaction with other drugs

## AZELASTINE HYDROCHLORIDE

**Indications** allergic conjunctivitis

**Side-effects** mild transient irritation; bitter taste reported

**Dose**

- Seasonal allergic conjunctivitis, **ADULT** and **CHILD** over 4 years, apply twice daily, increased if necessary to 4 times daily

- Perennial conjunctivitis, **ADULT** and **CHILD** over 12 years, apply twice daily, increased if necessary to 4 times daily; max. duration of treatment 6 weeks

**Optilast**<sup>®</sup> (Meda) **(PoM)**

**Eye drops**, azelastine hydrochloride 0.05%. Net price 8 mL = £6.40

**Excipients** include benzalkonium chloride, disodium edetate

## EMEDASTINE

**Indications** seasonal allergic conjunctivitis

**Side-effects** transient burning or stinging; blurred vision, local oedema, keratitis, irritation, dry eye, lacrimation, corneal infiltrates (discontinue) and staining; photophobia; headache, and rhinitis occasionally reported

**Dose**

- ADULT** and **CHILD** over 3 years, apply twice daily

**Emadine**<sup>®</sup> (Alcon) **(PoM)**

**Eye drops**, emedastine 0.05% (as difumate), net price 5 mL = £7.31

**Excipients** include benzalkonium chloride

## EPINASTINE HYDROCHLORIDE

**Indications** seasonal allergic conjunctivitis

**Side-effects** burning; *less commonly* taste disturbance, headache, conjunctival hyperaemia, dry eye, eye pruritus, visual disturbance, increased lacrimation, eye pain, nasal irritation, rhinitis

**Dose**

- ADULT** and **CHILD** over 12 years, apply twice daily; max. duration of treatment 8 weeks

**Relestat**<sup>®</sup> (Allergan) **(PoM)**

**Eye drops**, epinastine hydrochloride 500 micrograms/mL, net price 5 mL = £9.90

**Excipients** include benzalkonium chloride, disodium edetate

## KETOTIFEN

**Indications** seasonal allergic conjunctivitis

**Side-effects** transient burning or stinging, punctate corneal epithelial erosion; *less commonly* dry eye, subconjunctival haemorrhage, photophobia; headache, drowsiness, skin reactions, and dry mouth also reported

**Dose**

- ADULT** and **CHILD** over 3 years, apply twice daily

**Zaditen**<sup>®</sup> (Spectrum Thea) **(PoM)**

**Eye drops**, ketotifen (as fumarate) 250 micrograms/mL, net price 5 mL = £7.80

**Excipients** include benzalkonium chloride

## LODOXAMIDE

**Indications** allergic conjunctivitis

**Side-effects** burning, stinging, itching, blurred vision, tear production disturbance, and ocular discomfort; *less commonly* flushing, nasal dryness, dizziness, drowsiness, headache, blepharitis and keratitis

**Dose**

- ADULT** and **CHILD** over 4 years, apply 4 times daily; improvement of symptoms may sometimes require treatment for up to 4 weeks

**Alomide**<sup>®</sup> (Alcon) **(PoM)**

**Ophthalmic solution** (= eye drops), lodoxamide 0.1% (as trometamol). Net price 10 mL = £5.21

**Excipients** include benzalkonium chloride, disodium edetate

**Note** Lodoxamide 0.1% eye drops can be sold to the public for treatment of allergic conjunctivitis in adults and children over 4 years

## NEDOCROMIL SODIUM

**Indications** allergic conjunctivitis; seasonal keratoconjunctivitis

**Side-effects** burning and stinging; distinctive taste reported

**Dose**

- Seasonal and perennial conjunctivitis, **ADULT** and **CHILD** over 6 years, apply twice daily increased if necessary to 4 times daily; max. 12 weeks treatment for seasonal allergic conjunctivitis

- Seasonal keratoconjunctivitis, **ADULT** and **CHILD** over 6 years, apply 4 times daily

**Rapiti**<sup>®</sup> (Sanofi-Aventis) **(PoM)**

**Eye drops**, nedocromil sodium 2%. Net price 5 mL = £2.86

**Excipients** include benzalkonium chloride, disodium edetate

**OLOPATADINE****Indications** seasonal allergic conjunctivitis**Side-effects** local irritation; less commonly keratitis, dry eye, local oedema, photophobia; headache, asthenia, dizziness; dry nose also reported**Dose**

- **ADULT** and **CHILD** over 3 years, apply twice daily; max. duration of treatment 4 months

**Opatanol**<sup>®</sup> (Alcon) (PoM)

**Eye drops**, olopatadine (as hydrochloride) 1 mg/mL, net price 5 mL = £4.68

**Excipients** include benzalkonium chloride**SODIUM CROMOGLICATE**

(Sodium cromoglycate)

**Indications** allergic conjunctivitis; seasonal keratoconjunctivitis**Side-effects** burning and stinging**Dose**

- **ADULT** and **CHILD** apply eye drops 4 times daily

**Sodium Cromoglicate** (Non-proprietary) (PoM)

**Eye drops**, sodium cromoglicate 2%. Net price 13.5 mL = £1.67

Brands include *Hay-Crom*<sup>®</sup> *Aqueous*, *Opticrom*<sup>®</sup> *Aqueous*, *Vividrin*<sup>®</sup>

**Note** Sodium cromoglicate 2% eye drops can be sold to the public (in max. pack size of 10 mL) for treatment of acute seasonal and perennial allergic conjunctivitis

**Single use****Catacrum**<sup>®</sup> (Moorfields)

**Eye drops**, sodium cromoglicate 2%, net price 30 × 0.3 mL = £8.99

**11.5 Mydriatics and cycloplegics**

Antimuscarinics dilate the pupil and paralyse the ciliary muscle; they vary in potency and duration of action.

Short-acting, relatively weak mydriatics, such as **tropicamide** 0.5% (action lasts for 4–6 hours), facilitate the examination of the fundus of the eye. **Cyclopentolate** 1% (action up to 24 hours) or **atropine** (action up to 7 days) are preferable for producing cycloplegia for refraction in young children.

Mydriatics and cycloplegics are used in the treatment of anterior uveitis, usually as an adjunct to corticosteroids (section 11.4.1). Atropine is used in anterior uveitis mainly to prevent posterior synechiae and to relieve ciliary spasm; cyclopentolate or **homatropine** (action up to 3 days) can also be used and may be preferred because they have a shorter duration of action.

**Phenylephrine** is used for mydriasis in diagnostic or therapeutic procedures; mydriasis occurs within 60–90 minutes and lasts up to 5–7 hours.

**Cautions** Darkly pigmented iris is more resistant to pupillary dilatation and caution should be exercised to avoid overdosage. Mydriasis can precipitate acute angle-closure glaucoma in a few patients, usually aged over 60 years and hypermetropic (long-sighted), who are predisposed to the condition because of a shallow anterior chamber. Phenylephrine may interact with systemically administered monoamine-oxidase inhibitors; other **interactions**: Appendix 1 (sympathomimetics).

**Driving** Patients should be warned not to drive until vision is clear after mydriasis.

**Side-effects** Ocular side-effects of mydriatics and cycloplegics include transient stinging and raised intra-ocular pressure; on prolonged administration, local irritation, hyperaemia, oedema and conjunctivitis can occur. Contact dermatitis can occur with the antimuscarinic mydriatic drugs, especially atropine.

Systemic side-effects of atropine and cyclopentolate can occur, particularly in children and the elderly; see section 1.2 for systemic side-effects of antimuscarinic drugs.

**Antimuscarinics****ATROPINE SULFATE****Indications** see notes above**Cautions** risk of systemic effects in infants under 3 months; see also notes above**Side-effects** see notes above**Atropine** (Non-proprietary) (PoM)

**Eye drops**, atropine sulfate 0.5%, net price 10 mL = £19.00; 1%, 10 mL = £13.25

**Single use****Minims**<sup>®</sup> **Atropine Sulphate** (Bausch & Lomb) (PoM)

**Eye drops**, atropine sulfate 1%. Net price 20 × 0.5 mL = £14.46

**CYCLOPENTOLATE HYDROCHLORIDE****Indications** see notes above**Cautions** see notes above**Side-effects** see notes above**Mydrilate**<sup>®</sup> (Intrapharm) (PoM)

**Eye drops**, cyclopentolate hydrochloride 0.5%, net price 5 mL = £6.73; 1%, 5 mL = £6.73

**Excipients** include benzalkonium chloride**Single use****Minims**<sup>®</sup> **Cyclopentolate Hydrochloride** (Bausch & Lomb) (PoM)

**Eye drops**, cyclopentolate hydrochloride 0.5% and 1%. Net price 20 × 0.5 mL (both) = £9.95

**HOMATROPINE HYDROBROMIDE****Indications** see notes above**Cautions** see notes above**Side-effects** see notes above**Homatropine** (Non-proprietary) (PoM)

**Eye drops**, homatropine hydrobromide, available from 'special-order' manufacturers, p. 1104

**TROPICAMIDE****Indications** see notes above**Cautions** see notes above**Side-effects** see notes above**Mydriacyl**<sup>®</sup> (Alcon) (PoM)

**Eye drops**, tropicamide 0.5%, net price 5 mL = £1.29; 1%, 5 mL = £1.60

**Excipients** include benzalkonium chloride, disodium edetate

### Single use

#### Minims® Tropicamide (Bausch & Lomb) (PoM)

Eye drops, tropicamide 0.5% and 1%. Net price 20 × 0.5 mL (both) = £10.00

### With phenylephrine

See under Phenylephrine Hydrochloride

## Sympathomimetics

### PHENYLEPHRINE HYDROCHLORIDE

**Indications** mydriasis; see also notes above

**Cautions** corneal epithelial damage; ocular hyperaemia; susceptibility to angle-closure glaucoma; diabetes (avoid in long standing diabetes); cerebral arteriosclerosis; asthma; see also notes above

**Contra-indications** 10% strength in children and elderly; cardiovascular disease; hypertension; aneurysms; thyrotoxicosis

**Pregnancy** use only if potential benefit outweighs risk

**Breast-feeding** use only if potential benefit outweighs risk—no information available

**Side-effects** see notes above; also blurred vision, photophobia; systemic effects include palpitations, tachycardia, extrasystoles, arrhythmias, hypertension; also reported coronary artery spasm, myocardial infarction (usually after use of 10% strength in patients with pre-existing cardiovascular disease)

#### Dose

- **ADULT** apply 1 drop before procedure; dose may be repeated after 60 minutes if necessary; **CHILD** apply 1 drop before procedure

### Single use

#### Minims® Phenylephrine Hydrochloride (Bausch & Lomb)

Eye drops, phenylephrine hydrochloride 2.5%, net price 20 × 0.5 mL = £10.93; 10%, 20 × 0.5 mL = £10.93

**Excipients** include disodium edetate, sodium metabisulfite

**Note** A drop of topical anaesthetic may be applied to the eye a few minutes before using phenylephrine to prevent stinging

### With tropicamide

For prescribing information on tropicamide, see notes above

#### Mydriaser® (Spectrum Thea) (PoM)

Ophthalmic insert, phenylephrine hydrochloride 5.4 mg, tropicamide 280 micrograms, net price 1 unit = £4.20

**Dose** for pre-operative mydriasis, or for diagnostic procedures when monotherapy insufficient, **ADULT** over 18 years, apply 1 insert into the lower conjunctival sac up to max. 2 hours before procedure; remove insert within 30 minutes of satisfactory mydriasis, and within 2 hours of application

**Note** Patients with severe dry eyes may require a drop of saline to improve insert tolerance

## 11.6 Treatment of glaucoma

Glaucoma describes a group of disorders characterised by a loss of visual field associated with cupping of the optic disc and optic nerve damage. While glaucoma is generally associated with raised intra-ocular pressure, it can occur when the intra-ocular pressure is within the normal range.

The most common form of glaucoma is primary open-angle glaucoma (chronic open-angle glaucoma), where drainage of the aqueous humour through the trabecular meshwork is restricted. The condition is often asymptomatic, but the patient may present with significant loss of visual-field. Patients with ocular hypertension are at high risk of developing primary open-angle glaucoma.

Drugs that reduce intra-ocular pressure by different mechanisms are available for managing ocular hypertension and glaucoma. A topical beta-blocker or a prostaglandin analogue is usually the drug of first choice for the treatment of ocular hypertension. A prostaglandin analogue should be used to manage patients with early or moderate primary open-angle glaucoma. After checking compliance and eye drop instillation technique, it may be necessary to combine these drugs or add others, such as sympathomimetics, carbonic anhydrase inhibitors, or miotics to control intra-ocular pressure.

**Acute angle-closure glaucoma** Acute angle-closure glaucoma occurs when the outflow of aqueous humour from the eye is obstructed by bowing of the iris against the trabecular meshwork; it is a medical emergency that requires urgent reduction of intra-ocular pressure to prevent loss of vision. Patients with acute angle-closure glaucoma should be referred immediately for specialist ophthalmology assessment and treatment.

Standard antiglaucoma therapy is used if supplementary treatment is required after iridotomy, iridectomy, laser treatment, or drainage surgery in either primary open-angle or acute angle-closure glaucoma.

### Beta-blockers

Topical application of a beta-blocker to the eye reduces intra-ocular pressure effectively in *primary open-angle glaucoma*, probably by reducing the rate of production of aqueous humour. Administration by mouth also reduces intra-ocular pressure but this route is not used since side-effects may be troublesome.

Beta-blockers used as eye drops include **betaxolol**, **carteolol**, **levobunolol**, and **timolol**.

#### Cautions, contra-indications, and side-effects

Systemic absorption can follow topical application to the eyes; therefore, eye drops containing a beta-blocker are contra-indicated in patients with bradycardia, heart block, or uncontrolled heart failure. **Important:** for a warning to avoid in asthma see below. Beta-blocker eye drops should be used with caution in patients with corneal diseases. Consider also other cautions, contra-indications, and side-effects of beta-blockers (p. 102). Local side-effects of eye drops include ocular stinging, burning, pain, itching, erythema, dry eyes and allergic reactions including anaphylaxis and blepharoconjunctivitis; occasionally corneal disorders have been reported.

**Important** Beta-blockers, even those with apparent cardioselectivity, should not be used in patients with asthma or a history of obstructive airways disease, unless no alternative treatment is available. In such cases the risk of inducing bronchospasm should be appreciated and appropriate precautions taken.

**Interactions** Since systemic absorption may follow topical application the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind. See also Appendix 1 (beta-blockers).

## BETAXOLOL

**Indications** see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

### Dose

- Apply twice daily

**Betaxolol** (Non-proprietary) (PoM)

**Eye drops**, solution, betaxolol (as hydrochloride) 0.5%, net price 5 mL = £1.90

**Excipients** may include benzalkonium chloride, disodium edetate

**Betoptic**<sup>®</sup> (Alcon) (PoM)

**Ophthalmic solution** (= eye drops), betaxolol (as hydrochloride) 0.5%, net price 5 mL = £1.90

**Excipients** include benzalkonium chloride, disodium edetate

**Ophthalmic suspension** (= eye drops), betaxolol (as hydrochloride) 0.25%, net price 5 mL = £2.66

**Excipients** include benzalkonium chloride, disodium edetate

**Unit dose eye drop suspension**, betaxolol (as hydrochloride) 0.25%, net price 50 × 0.25 mL = £13.77

## CARTEOLOL HYDROCHLORIDE

**Indications** see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

### Dose

- Apply twice daily

**Teoptic**<sup>®</sup> (Spectrum Thea) (PoM)

**Eye drops**, carteolol hydrochloride 1%, net price 5 mL = £7.60; 2%, 5 mL = £8.40

**Excipients** include benzalkonium chloride

## LEVOBUNOLOL HYDROCHLORIDE

**Indications** see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above; anterior uveitis occasionally reported

### Dose

- Apply once or twice daily

**Levobunolol** (Non-proprietary) (PoM)

**Eye drops**, levobunolol hydrochloride 0.5%. Net price 5 mL = £1.85

**Excipients** may include benzalkonium chloride, disodium edetate, sodium metabisulfite

**Betagan**<sup>®</sup> (Allergan) (PoM)

**Eye drops**, levobunolol hydrochloride 0.5%, polyvinyl alcohol (*Liquifilm*<sup>®</sup>) 1.4%. Net price 5-mL = £1.85

**Excipients** include benzalkonium chloride, disodium edetate, sodium metabisulfite

**Unit dose eye drops**, levobunolol hydrochloride 0.5%, polyvinyl alcohol (*Liquifilm*<sup>®</sup>) 1.4%. Net price 30 × 0.4 mL = £9.98

**Excipients** include disodium edetate

## TIMOLOL

**Indications** see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

### Dose

- Apply twice daily; long-acting preparations, apply once daily

**Timolol** (Non-proprietary) (PoM)

**Eye drops**, timolol (as maleate) 0.25%, net price 5 mL = £1.30; 0.5%, 5 mL = £1.22

**Timoptol**<sup>®</sup> (MSD) (PoM)

**Eye drops**, in *Ocumeter*<sup>®</sup> metered-dose unit, timolol (as maleate) 0.25%, net price 5 mL = £3.12; 0.5%, 5 mL = £3.12

**Excipients** include benzalkonium chloride

**Unit dose eye drops**, timolol (as maleate) 0.25%, net price 30 × 0.2 mL = £8.45; 0.5%, 30 × 0.2 mL = £9.65

### Once-daily preparations

**Timoptol**<sup>®</sup>-LA (MSD) (PoM)

**Ophthalmic gel-forming solution** (= eye drops), timolol (as maleate) 0.25%, net price 2.5 mL = £3.12; 0.5%, 2.5 mL = £3.12

**Excipients** include benzododecinium bromide

**Dose** apply once daily

**Tiopex**<sup>®</sup> (Spectrum Thea) (PoM)

**Unit dose eye gel** (= eye drops), timolol (as maleate) 0.1%, net price 30 × 0.4 g = £7.49

**Dose** apply once daily, in the morning

**Note** The *Scottish Medicines Consortium* (p. 4) has advised (February 2014) that timolol gel eye drops (*Tiopex*<sup>®</sup>) are accepted for restricted use within NHS Scotland for the reduction of elevated intraocular pressure in patients with ocular hypertension or chronic open angle glaucoma who have proven sensitivity to preservatives.

## Prostaglandin analogues and prostamides

The prostaglandin analogues **latanoprost**, **tafluprost**, and **travoprost**, and the synthetic prostamide, **bimatoprost**, increase uveoscleral outflow and subsequently reduce intra-ocular pressure. They are used to reduce intra-ocular pressure in ocular hypertension or open-angle glaucoma.

**Cautions** Use with caution in patients with aphakia, pseudophakia with torn posterior lens capsule or ante-

rior chamber lenses, and in those with known risk factors for cystoid macular oedema, iritis, uveitis, or a history of significant ocular viral infections. Care is also needed in patients with COPD, asthma or compromised respiratory function. There is no experience of use in inflammatory ocular conditions, neovascular, angle-closure glaucoma, congenital glaucoma, or narrow-angle glaucoma. For use in contact lens wearers see Contact Lenses, p. 763.

**Counselling** Before initiating treatment, patients should be warned of a possible change in eye colour as an increase in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair can also occur, and patients should also be advised to avoid repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.

**Side-effects** Side-effects of prostaglandin analogues and prostamides include changes in blood pressure, headache, ocular discomfort, conjunctival disorders, brown pigmentation particularly in those with mixed-colour irides, blepharitis, pigmentation of periocular skin, eyelash and vellus hair changes, reduced visual acuity, photophobia, punctate keratitis, transient punctate epithelial erosion, corneal erosion; they may also cause, darkening, thickening and lengthening of eye lashes. Less frequent side-effects include dizziness, asthenopia, and skin rash. There have been rare reports of arthralgia, myalgia, iritis, uveitis, macular oedema, facial oedema, and darkening of palpebral skin. Very rarely chest pain, palpitation, exacerbation of angina, and periorbital changes resulting in deepening of the eyelid sulcus have occurred. Dyspnoea, asthma, exacerbation of asthma and COPD have also been reported.

## BIMATOPROST

**Indications** raised intra-ocular pressure in open-angle glaucoma; ocular hypertension

**Cautions** see notes above; also predisposition to hypotension or bradycardia

**Hepatic impairment** use with caution in moderate to severe impairment—no information available

**Renal impairment** use with caution—no information available

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid—present in milk in *animal* studies

**Side-effects** see notes above; also nausea, bradycardia, malaise, retinal haemorrhage, blepharospasm, eyelid retraction, reactivation of previous corneal infiltrates or ocular infection

### Dose

• **ADULT** over 18 years, apply once daily, preferably in the evening

**Lumigan**<sup>®</sup> (Allergan) (PoM)

**Eye drops**, bimatoprost 100 micrograms/mL, net price 3 mL = £12.43, triple pack (3 × 3 mL) = £37.29; 300 micrograms/mL, 3 mL = £10.30, triple pack (3 × 3 mL) = £30.90. Counselling, see Prostaglandin Analogues and Prostamides, above  
**Excipients** include benzalkonium chloride

### Single use

**Lumigan**<sup>®</sup> (Allergan) (PoM)

**Eye drops**, bimatoprost 300 micrograms/mL, net price 30 × 0.4 mL = £13.75. Counselling, see Prostaglandin Analogues and Prostamides, above

**Note** The *Scottish Medicines Consortium* (p. 4) has advised (March 2013) that bimatoprost 300 micrograms/mL preservative-free eye drops (**Lumigan**<sup>®</sup> single-dose eye drops) are accepted for restricted use within NHS Scotland for the reduction of elevated intra-ocular pressure in chronic open-angle glaucoma and ocular hypertension (as monotherapy or as adjunctive therapy to beta-blockers) in adults who have proven sensitivity to benzalkonium chloride.

### With timolol

For prescribing information on timolol, see section 11.6. Beta-blockers

**Ganfort**<sup>®</sup> (Allergan) (PoM)

**Eye drops**, bimatoprost 300 micrograms/mL, timolol (as maleate) 5 mg/mL, net price 3-mL = £13.95, triple pack (3 × 3 mL) = £37.59. Counselling, see Prostaglandin Analogues and Prostamides, above

**Excipients** include benzalkonium chloride

**Dose** for raised intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate, **ADULT** over 18 years, apply once daily

### Single use

**Ganfort**<sup>®</sup> (Allergan) (PoM)

**Eye drops**, bimatoprost 300 micrograms/mL, timolol (as maleate) 5 mg/mL, net price 30 × 0.4 mL = £17.50. Counselling, see Prostaglandin Analogues and Prostamides, above

**Dose** for raised intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate, **ADULT** over 18 years, apply once daily

**Note** The *Scottish Medicines Consortium*, p. 4 has advised (October 2013) that **Ganfort**<sup>®</sup> unit dose eye drops are accepted for restricted use within NHS Scotland for the reduction of intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension insufficiently responsive to topical beta-blockers or prostaglandin analogues who have proven sensitivity to preservatives

## LATANOPROST

**Indications** raised intra-ocular pressure in open-angle glaucoma; ocular hypertension

**Cautions** see notes above; peri-operative period of cataract surgery; do not use within 5 minutes of thiomersal-containing preparations

**Contra-indications** active herpes simplex keratitis; history of recurrent herpetic keratitis associated with prostaglandin analogues

**Pregnancy** manufacturer advises avoid

**Breast-feeding** may be present in milk—manufacturer advises avoid

**Side-effects** see notes above; *also reported* nasopharyngitis, pyrexia, (both in children), iris cyst

### Dose

• Apply once daily, preferably in the evening

**Latanoprost** (Non-proprietary) (PoM)

**Eye drops**, latanoprost 50 micrograms/mL, net price 2.5 mL = £1.77. Counselling, see Prostaglandin Analogues and Prostamides, above

**Excipients** may include benzalkonium chloride

**Xalatan**<sup>®</sup> (Pfizer) (PoM)

**Eye drops**, latanoprost 50 micrograms/mL, net price 2.5 mL = £12.48. Counselling, see Prostaglandin Analogues and Prostamides, above  
**Excipients** include benzalkonium chloride

### Single use

#### Monopost® (Spectrum Thea) (PoM)

**Eye drops**, latanoprost 50 micrograms/mL, net price 30 × 0.2 mL = £8.49, 90 × 0.2 mL = £25.47. Counselling, see Prostaglandin Analogues and Prostaglandins, p. 751

**Note** The *Scottish Medicines Consortium*, p. 4 has advised (June 2013) that *Monopost*® is accepted for restricted use within NHS Scotland for the reduction of elevated intra-ocular pressure in patients with open-angle glaucoma and ocular hypertension who have proven sensitivity to benzalkonium chloride

### With timolol

For prescribing information on timolol, see section 11.6, Beta-blockers

#### Latanoprost with Timolol (Non-proprietary) (PoM)

**Eye drops**, latanoprost 50 micrograms, timolol (as maleate) 5 mg/mL, net price 2.5 mL = £4.28. Counselling, see Prostaglandin Analogues and Prostaglandins, p. 751

**Excipients** may include benzalkonium chloride

**Dose** for raised intra-ocular pressure in patients with open-angle glaucoma and ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate, **ADULT** over 18 years, apply once daily

#### Xalacom® (Pharmacia) (PoM)

**Eye drops**, latanoprost 50 micrograms, timolol (as maleate) 5 mg/mL, net price 2.5 mL = £14.32. Counselling, see Prostaglandin Analogues and Prostaglandins, p. 751

**Excipients** include benzalkonium chloride

**Dose** for raised intra-ocular pressure in patients with open-angle glaucoma and ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate, **ADULT** over 18 years, apply once daily

## T AFLUPROST

**Indications** raised intra-ocular pressure in open-angle glaucoma; ocular hypertension

**Cautions** see notes above

**Hepatic impairment** use with caution—no information available

**Renal impairment** use with caution—no information available

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies

**Breast-feeding** manufacturer advises avoid—present in milk in *animal* studies

**Side-effects** see notes above

#### Dose

• **ADULT** over 18 years, apply once daily, preferably in the evening

#### Saflutan® (MSD) (PoM)

**Unit dose eye drops**, tafluprost 15 micrograms/mL, net price 30 × 0.3 mL = £17.41. Counselling, see Prostaglandin Analogues and Prostaglandins, p. 751

**Excipients** include disodium edetate

## T RAVOPROST

**Indications** raised intra-ocular pressure in open-angle glaucoma; ocular hypertension

**Cautions** see notes above

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies

**Breast-feeding** present in milk in *animal* studies; manufacturer advises avoid

**Side-effects** see notes above; also dry mouth, dysgeusia, peptic ulcer reactivation, gastro-intestinal disorders, constipation, bradycardia, oropharyngeal pain, cough, dysphonia, nasal congestion, throat irritation, malaise, herpes simplex, photopsia, mydriasis, cataract; also reported vertigo, tinnitus

#### Dose

• **ADULT** over 18 years, apply once daily, preferably in the evening

#### Travatan® (Alcon) (PoM)

**Eye drops**, travoprost 40 micrograms/mL, net price 2.5 mL = £10.95. Counselling, see Prostaglandin Analogues and Prostaglandins, p. 751

**Excipients** include propylene glycol

### With timolol

For prescribing information on timolol, see section 11.6, Beta-blockers

#### DuoTrav® (Alcon) (PoM)

**Eye drops**, travoprost 40 micrograms, timolol (as maleate) 5 mg/mL, net price 2.5 mL = £13.95, triple pack (3 × 2.5 mL) = £39.68. Counselling, see Prostaglandin Analogues and Prostaglandins, p. 751

**Excipients** include propylene glycol

**Dose** for raised intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate, **ADULT** over 18 years, apply once daily

## Sympathomimetics

**Brimonidine**, a selective  $\alpha_2$ -adrenoceptor agonist, is thought to lower intra-ocular pressure by reducing aqueous humour formation and increasing uveoscleral outflow. It is licensed for the reduction of intra-ocular pressure in open-angle glaucoma or ocular hypertension in patients for whom beta-blockers are inappropriate; it may also be used as adjunctive therapy when intra-ocular pressure is inadequately controlled by other antiglaucoma therapy.

**Apraclonidine** (section 11.8.2) is another  $\alpha_2$ -adrenoceptor agonist that lowers intra-ocular pressure by reducing aqueous humour formation. Eye drops containing apraclonidine 0.5% are used short-term to delay laser treatment or surgery in patients with glaucoma not adequately controlled by another drug; eye drops containing 1% are used for control of intra-ocular pressure after anterior segment laser surgery.

## BRIMONIDINE TARTRATE

**Indications** raised intra-ocular pressure, see notes above

**Cautions** severe cardiovascular disease; cerebral or coronary insufficiency, Raynaud's syndrome, thromboangiitis obliterans, postural hypotension, depression; children 2–12 years (increased risk of drowsiness); **interactions:** Appendix 1 (brimonidine)

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving)

**Contra-indications** neonate or child under 2 years

**Hepatic impairment** manufacturer advises use with caution

**Renal impairment** manufacturer advises use with caution

**Pregnancy** manufacturer advises use only if benefit outweighs risk

**Breast-feeding** manufacturer advises avoid

**Side-effects** dry mouth, gastro-intestinal disturbances, taste disturbances, upper respiratory symptoms, headache, drowsiness, dizziness, malaise, ocular disturbances (including hyperaemia, burning, stinging, pruritus, pain and dryness), visual disturbances, eyelid inflammation, photophobia, corneal erosion and staining, conjunctival disturbances (including blanching, follicles, and infection); *less commonly* palpitation, arrhythmia, bradycardia, tachycardia, depression, nasal dryness; *rarely* dyspnoea; *very rarely* hypertension, hypotension, syncope, insomnia, iritis, miosis

#### Dose

- Apply twice daily

#### Brimonidine Tartrate (Non-proprietary) (PoM)

**Eye drops**, brimonidine tartrate 0.2%, net price 5 mL = £2.00

**Brands include** *Brymont*<sup>®</sup>

**Excipients** may include benzalkonium chloride

#### Allhagan<sup>®</sup> (Allergan) (PoM)

**Eye drops**, brimonidine tartrate 0.2%, net price 5 mL = £6.85

**Excipients** include benzalkonium chloride

#### ▲ With timolol

For prescribing information on timolol, see section 11.6, Beta-blockers

#### Combigan<sup>®</sup> (Allergan) (PoM)

**Eye drops**, brimonidine tartrate 0.2%, timolol (as maleate) 0.5%, net price 5-mL = £10.00

**Excipients** include benzalkonium chloride

**Dose** for raised intra-ocular pressure in open-angle glaucoma and for ocular hypertension when beta-blocker alone not adequate, apply twice daily

## Carbonic anhydrase inhibitors and systemic drugs

The **carbonic anhydrase inhibitors**, acetazolamide, brinzolamide, and dorzolamide, reduce intra-ocular pressure by reducing aqueous humour production. Systemic use also produces weak diuresis.

**Acetazolamide** is given by mouth or by intravenous injection (intramuscular injections are painful because of the alkaline pH of the solution). It is used as an adjunct to other treatment for reducing intra-ocular pressure. Acetazolamide is a sulfonamide derivative; blood disorders, rashes, and other sulfonamide-related side-effects occur occasionally—patients should be told to report any unusual skin rash. It is not generally recommended for long-term use; if electrolyte disturbances and metabolic acidosis occur, these can be corrected by administering potassium bicarbonate (as effervescent potassium tablets, section 9.2.1.3).

**Dorzolamide** and **brinzolamide** are topical carbonic anhydrase inhibitors. They are licensed for use in patients resistant to beta-blockers or those in whom beta-blockers are contra-indicated. They are used alone or as an adjunct to a topical beta-blocker. Brinzolamide can also be used as an adjunct to a prostaglandin analogue. Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

The **osmotic diuretics**, intravenous hypertonic **mannitol** (section 2.2.5) or **glycerol** by mouth are useful short-term ocular hypotensive drugs.

## ACETAZOLAMIDE

**Indications** reduction of intra-ocular pressure in open-angle glaucoma, secondary glaucoma, and perioperatively in angle-closure glaucoma; diuresis (section 2.2.7); epilepsy

**Cautions** not generally recommended for prolonged use, but if given, monitor blood count and plasma-electrolyte concentrations; pulmonary obstruction and impaired alveolar ventilation (risk of acidosis); elderly; diabetes mellitus; renal calculi; avoid extravasation at injection site (risk of necrosis); **interactions:** Appendix 1 (diuretics)

**Contra-indications** hypokalaemia, hyponatraemia, hyperchloraemic acidosis; adrenocortical insufficiency; long-term administration in chronic angle-closure glaucoma; sulfonamide hypersensitivity

**Hepatic impairment** manufacturer advises avoid

**Renal impairment** avoid—risk of metabolic acidosis

**Pregnancy** manufacturer advises avoid, especially in first trimester (toxicity in *animal studies*)

**Breast-feeding** amount too small to be harmful

**Side-effects** see notes above; also nausea, vomiting, diarrhoea, taste disturbance, loss of appetite, paraesthesia, flushing, headache, dizziness, fatigue, irritability, excitement, ataxia, depression, thirst, polyuria, reduced libido; *less commonly* melaena, drowsiness, confusion, hearing disturbances, fever, glycosuria, metabolic acidosis and electrolyte disturbances on long-term therapy, haematuria, crystalluria, renal and ureteric colic, renal lesions or calculi, renal failure, blood disorders, bone marrow suppression, rash (including Stevens-Johnson syndrome and toxic epidermal necrosis); *rarely* fulminant hepatic necrosis, hepatitis, cholestatic jaundice, flaccid paralysis, convulsions, photosensitivity; *also reported* transient myopia

#### Dose

- Glaucoma, **by mouth** or **by intravenous injection**, 0.25–1 g daily in divided doses
- Epilepsy, **by mouth** or **by intravenous injection**, 0.25–1 g daily in divided doses; **CHILD** 8–30 mg/kg daily, max. 750 mg daily

**Note** Dose by **intramuscular injection**, as for intravenous injection but preferably avoided because of alkalinity

#### Diamox<sup>®</sup> (AMCo) (PoM)

**Tablets**, acetazolamide 250 mg. Net price 112-tab pack = £15.22. Label: 3

**Injection**, powder for reconstitution, acetazolamide (as sodium salt). Net price 500-mg vial = £14.76

#### ▲ Modified release

#### Diamox<sup>®</sup> SR (AMCo) (PoM)

**Capsules**, m/r, orange, enclosing orange f/c pellets, acetazolamide 250 mg. Net price 30-cap pack = £16.66 Label: 3, 25

**Dose** glaucoma, 1–2 capsules daily

## BRINZOLAMIDE

**Indications** reduction of intra-ocular pressure in ocular hypertension and open-angle glaucoma *either* as adjunct to beta-blockers or prostaglandin analogues or used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated

**Cautions** systemic absorption follows topical application; renal tubular immaturity or abnormality; **interactions:** Appendix 1 (brinzolamide)

**Contra-indications** hyperchloraemic acidosis; sulfonamide hypersensitivity

**Hepatic impairment** manufacturer advises avoid

**Renal impairment** see Cautions above; also avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** avoid—toxicity in animal studies

**Breast-feeding** use only if benefit outweighs risk

**Side-effects** see notes above; also taste disturbances, dry mouth, headache, ocular disturbances (including corneal erosion, corneal oedema, photophobia, and reduced visual acuity); *less commonly* nausea, vomiting, diarrhoea, dyspepsia, oesophagitis, flatulence, oral hypoaesthesia and paraesthesia, chest pain, bradycardia, palpitation, dyspnoea, cough, upper respiratory tract congestion, pharyngitis, depression, sleep disturbances, nervousness, malaise, drowsiness, amnesia, dizziness, paraesthesia, sinusitis, decreased libido, erectile dysfunction, renal pain, epistaxis, nasal dryness, throat irritation, tinnitus, alopecia; *also reported* arrhythmia, tachycardia, hypertension, peripheral oedema, asthma, tremor, vertigo, rhinitis, dermatitis, erythema

#### Dose

- Apply twice daily increased to max. 3 times daily if necessary

**Azopt**<sup>®</sup> (Alcon) (PoM)

**Eye drops**, brinzolamide 10 mg/mL, net price 5 mL = £6.92

**Excipients** include benzalkonium chloride, disodium edetate

#### With timolol

For prescribing information on timolol, see section 11.6, Beta blockers

**Azarga**<sup>®</sup> (Alcon) (PoM)

**Ophthalmic suspension** (= eye drops), brinzolamide 10 mg, timolol (as maleate) 5 mg/mL, net price 5 mL = £11.05

**Excipients** include benzalkonium chloride, disodium edetate

**Dose** for raised intra-ocular pressure in open-angle glaucoma or ocular hypertension when beta-blocker alone not adequate, **ADULT** over 18 years apply twice daily

**Side-effects** see notes above; also nausea, bitter taste, headache, asthenia, ocular irritation, blurred vision, lacrimation, conjunctivitis, superficial punctuate keratitis, eyelid inflammation; *less commonly* iridocyclitis; *rarely* dry mouth, dizziness, paraesthesia, urolithiasis, eyelid crusting, transient myopia, corneal oedema, epistaxis, throat irritation, contact dermatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis

#### Dose

- Used alone, apply 3 times daily
- With topical beta-blocker, apply twice daily

**Dorzolamide** (Non-proprietary) (PoM)

**Eye drops**, dorzolamide (as hydrochloride) 2%, net price 5 mL = £1.99

**Excipients** may include benzalkonium chloride

**Brands include** Dorzant<sup>®</sup>

**Trusopt**<sup>®</sup> (MSD) (PoM)

**Ophthalmic solution** (= eye drops), in *Ocumer*<sup>®</sup>

*Plus* metered-dose unit, dorzolamide (as hydrochloride) 2%, net price 5 mL = £6.33

**Excipients** include benzalkonium chloride

**Unit dose eye drops**, dorzolamide (as hydrochloride) 2%, net price 60 × 0.2 mL = £24.18

#### With timolol

For prescribing information on timolol, see section 11.6, Beta-blockers

**Dorzolamide with Timolol** (Non-proprietary) (PoM)

**Eye drops**, dorzolamide (as hydrochloride) 2%, timolol (as maleate) 0.5%, net price 5 mL = £2.90

**Excipients** may include benzalkonium chloride

**Cosopt**<sup>®</sup> (MSD) (PoM)

**Ophthalmic solution** (= eye drops), in *Ocumer*<sup>®</sup>

*Plus* metered-dose unit, dorzolamide (as hydrochloride) 2%, timolol (as maleate) 0.5%, net price 5 mL = £10.05

**Excipients** include benzalkonium chloride

**Unit dose eye drops**, dorzolamide (as hydrochloride) 2%, timolol (as maleate) 0.5%, net price 60 × 0.2 mL = £28.59

## DORZOLAMIDE

**Indications** raised intra-ocular pressure in ocular hypertension, open-angle glaucoma, pseudo-exfoliative glaucoma *either* as adjunct to beta-blocker or used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated

**Cautions** systemic absorption follows topical application; history of renal calculi; chronic corneal defects, low endothelial cell count, history of intra-ocular surgery; **interactions:** Appendix 1 (dorzolamide)

**Contra-indications** hyperchloraemic acidosis, sulfonamide hypersensitivity

**Hepatic impairment** manufacturer advises caution—no information available

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** manufacturer advises avoid—toxicity in animal studies

**Breast-feeding** manufacturer advises avoid—no information available

## Miotics

Miotics act by opening the inefficient drainage channels in the trabecular meshwork.

**Pilocarpine**, a miotic, is not commonly used for the treatment of primary open-angle glaucoma because side-effects, such as pupil miosis, are poorly tolerated. It is used mainly in the treatment of primary angle-closure glaucoma and in some secondary glaucomas.

**Cautions** A darkly pigmented iris may require a higher concentration of the miotic or more frequent administration and care should be taken to avoid over-dosage. Retinal detachment has occurred in susceptible individuals and those with retinal disease; therefore fundus examination is advised before starting treatment with a miotic. Care is also required in conjunctival or corneal damage. Intra-ocular pressure and visual fields should be monitored in those with chronic simple glaucoma and those receiving long-term treatment with a miotic. Miotics should be used with caution in patients with peptic ulceration, gastro-intestinal spasm, cardiac disease, hypertension, hypotension, marked vasomotor

instability, asthma, epilepsy, Parkinson's disease, hyperthyroidism, and urinary-tract obstruction.

**Counselling** Blurred vision may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting

**Contra-indications** Miotics are contra-indicated in conditions where pupillary constriction is undesirable such as acute iritis, anterior uveitis and some forms of secondary glaucoma. They should be avoided in acute inflammatory disease of the anterior segment.

**Pregnancy** Miotics should be avoided during pregnancy unless the potential benefit outweighs risk—limited information available.

**Breast-feeding** Miotics should be avoided during breast-feeding unless the potential benefit outweighs risk—no information available.

**Side-effects** Ciliary spasm leads to headache and browache which may be more severe in the initial 2–4 weeks of treatment (a particular disadvantage in patients under 40 years of age). Ocular side-effects include burning, itching, smarting, blurred vision, conjunctival vascular congestion, myopia, lens changes with chronic use, vitreous haemorrhage, and pupillary block. Systemic side-effects (see under Parasympathomimetics, section 7.4.1) are rare following application to the eye.

## PILOCARPINE

**Indications** see notes above; dry mouth (section 12.3.5)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

### Dose

- Apply up to 4 times daily; long-acting preparations, see under preparations below

**Pilocarpine Hydrochloride** (Non-proprietary) (PoM)

**Eye drops**, pilocarpine hydrochloride 1%, net price 10 mL = £2.28; 2%, 10 mL = £2.63; 4%, 10 mL = £3.35

**Excipients** may include benzalkonium chloride

### Single use

**Minims® Pilocarpine Nitrate** (Bausch & Lomb) (PoM)

**Eye drops**, pilocarpine nitrate 2%, net price 20 × 0.5 mL = £11.48

## 11.7 Local anaesthetics

Oxybuprocaine and tetracaine are widely used topical local anaesthetics. Proxymetacaine causes less initial stinging and is useful for children. Oxybuprocaine or a combined preparation of lidocaine and fluorescein is used for tonometry. Tetracaine produces a more profound anaesthesia and is suitable for use before minor surgical procedures, such as the removal of corneal sutures. It has a temporary disruptive effect on the corneal epithelium. Lidocaine (section 15.2), with or without adrenaline (epinephrine), is injected into the eyelids for minor surgery. Local anaesthetics should never be used for the management of ocular symptoms.

Local anaesthetic eye drops should be avoided in pre-term neonates because of the immaturity of the metabolic enzyme system.

## LIDOCAINE HYDROCHLORIDE

(Lignocaine hydrochloride)

**Indications** local anaesthetic

**Minims® Lidocaine and Fluorescein** (Bausch & Lomb) (PoM)

**Eye drops**, lidocaine hydrochloride 4%, fluorescein sodium 0.25%. Net price 20 × 0.5 mL = £11.24

## OXYBUPROCAINE HYDROCHLORIDE

(Benoxinate hydrochloride)

**Indications** local anaesthetic

**Minims® Oxybuprocaine Hydrochloride** (Bausch & Lomb) (PoM)

**Eye drops**, oxybuprocaine hydrochloride 0.4%. Net price 20 × 0.5 mL = £9.72

## PROXYMETACAINE HYDROCHLORIDE

**Indications** local anaesthetic

**Minims® Proxymetacaine** (Bausch & Lomb) (PoM)

**Eye drops**, proxymetacaine hydrochloride 0.5%. Net price 20 × 0.5 mL = £11.05

## TETRACAINE HYDROCHLORIDE

(Amethocaine hydrochloride)

**Indications** local anaesthetic

**Minims® Tetracaine Hydrochloride** (Bausch & Lomb) (PoM)

**Eye drops**, tetracaine hydrochloride 0.5% and 1%. Net price 20 × 0.5 mL (both) = £9.73

## 11.8 Miscellaneous ophthalmic preparations

**11.8.1 Tear deficiency, ocular lubricants, and astringents**

**11.8.2 Ocular diagnostic and peri-operative preparations and photodynamic treatment**

Certain eye drops, e.g. amphotericin, ceftazidime, cefuroxime, colistimethate sodium, desferrioxamine, dexamethasone, gentamicin, and vancomycin can be prepared aseptically from material supplied for injection.

Botulinum toxin type A preparations are licensed for the treatment of blepharospasm (*Botox*®, *Dysport*®, and *Xeomin*®) and for the temporary improvement of moderate to severe wrinkles between the eyebrows in adults under 65 years (*Azzalure*®, *Bocouture*®, *Botox*®, and *Vistabel*®), see section 4.9.3; preparations are not interchangeable and should be used under specialist supervision.

### 11.8.1 Tear deficiency, ocular lubricants, and astringents

Chronic soreness of the eyes associated with reduced or abnormal tear secretion (e.g. in Sjögren's syndrome) often responds to tear replacement therapy or pilocarpine given by mouth (section 12.3.5). The severity

of the condition and patient preference will often guide the choice of preparation.

**Hypromellose** is the traditional choice of treatment for tear deficiency. It may need to be instilled frequently (e.g. hourly) for adequate relief. Ocular surface mucin is often abnormal in tear deficiency and the combination of hypromellose with a mucolytic such as **acetylcysteine** can be helpful.

The ability of **carbomers** to cling to the eye surface may help reduce frequency of application to 4 times daily.

**Polyvinyl alcohol** increases the persistence of the tear film and is useful when the ocular surface mucin is reduced.

**Sodium hyaluronate** eye drops are also used in the management of tear deficiency.

**Sodium chloride 0.9%** drops are sometimes useful in tear deficiency, and can be used as 'comfort drops' by contact lens wearers, and to facilitate lens removal. They are also used to irrigate the eye. Special presentations of sodium chloride 0.9% and other irrigation solutions are used routinely for intra-ocular surgery. **Sodium chloride 5%** eye drops are used for the short-term treatment of corneal oedema.

Eye ointments containing a **paraffin** can be used to lubricate the eye surface, especially in cases of recurrent corneal epithelial erosion. They may cause temporary visual disturbance and are best suited for application before sleep. Ointments should not be used during contact lens wear.

## ACETYLCYSTEINE

**Indications** tear deficiency, impaired or abnormal mucus production

### Dose

- Apply 3–4 times daily

**Ilube**<sup>®</sup> (Moorfields) (POM)

**Eye drops**, acetylcysteine 5%, hypromellose 0.35%. Net price 10 mL = £10.09

**Excipients** include benzalkonium chloride, disodium edetate

## CARBOMERS

(Polyacrylic acid)

**Note** Synthetic high molecular weight polymers of acrylic acid cross-linked with either allyl ethers of sucrose or allyl ethers of pentaerythritol

**Indications** dry eyes including keratoconjunctivitis sicca, unstable tear film

### Dose

- Apply 3–4 times daily or as required

**Carbomer Gel** (Non-proprietary)

**Gel** (= eye drops), carbomer 980 (polyacrylic acid) 0.2%, net price 10 g = £2.80

**Excipients** include disodium edetate

**Artelac<sup>®</sup> Nighttime Gel** (Bausch & Lomb)

**Gel** (= eye drops), carbomer 2 mg, net price 10 g = £2.96

**Clinitas Gel<sup>®</sup>** (Alltacor)

**Gel** (= eye drops), carbomer 980 (polyacrylic acid) 0.2%, net price 10 g = £1.49

**GelTears<sup>®</sup>** (Bausch & Lomb)

**Gel** (= eye drops), carbomer 980 (polyacrylic acid) 0.2%, net price 10 g = £2.80

**Excipients** include benzalkonium chloride

**Liquivisc<sup>®</sup>** (Spectrum Thea)

**Gel** (= eye drops), carbomer 974P (polyacrylic acid) 0.25%, net price 10 g = £4.50

**Excipients** include benzalkonium chloride

**Lumecare<sup>®</sup> Carbomer Gel** (Medicom)

**Gel** (= eye drops), carbomer 980 (polyacrylic acid) 0.2%, net price 10 g = £2.10

**Excipients** include cetrimide

**Viscotears<sup>®</sup>** (Alcon)

**Liquid gel** (= eye drops), carbomer 980 (polyacrylic acid) 0.2%, net price 10 g = £1.59

**Excipients** include cetrimide

### Single use

**Viscotears<sup>®</sup>** (Alcon)

**Liquid gel** (= eye drops), carbomer 980 (polyacrylic acid) 0.2%, net price 30 × 0.6-mL single-dose units = £5.42

## CARMELLOSE SODIUM

**Indications** dry eye conditions

### Dose

- Apply as required

**Carbomelle** (Non-proprietary)

**Eye drops**, carbomelle sodium 0.5%, net price 10 mL = £7.49

**Carmize<sup>®</sup>** (Aspire)

**Eye drops**, carbomelle sodium 0.5%, net price 10 mL = £7.49

**Optive<sup>®</sup>** (Allergan)

**Eye drops**, carbomelle sodium 0.5%, glycerol, net price 10 mL = £7.49

**Optive<sup>®</sup> Plus** (Allergan)

**Eye drops**, carbomelle sodium 0.5%, glycerol 1%, castor oil 0.25%, net price 10 mL = £7.49

### Single use

**Carbomelle** (Non-proprietary)

**Eye drops**, carbomelle sodium 0.5%, net price 30 × 0.4 mL = £5.75; 1%, 30 × 0.4 mL = £3.00

**Carmize<sup>®</sup>** (Aspire)

**Eye drops**, carbomelle sodium 0.5%, net price 30 × 0.4 mL = £5.75; 90 × 0.4 mL = £15.53; 1%, 30 × 0.4 mL = £3.00, 60 × 0.4 mL = £6.00

**Celluvisc<sup>®</sup>** (Allergan)

**Eye drops**, carbomelle sodium 0.5%, net price 30 × 0.4 mL = £4.80; 90 × 0.4 mL = £15.53; 1%, 30 × 0.4 mL = £3.00, 60 × 0.4 mL = £10.99

**Melopthal<sup>®</sup>** (Martindale)

**Eye drops**, carbomelle sodium 0.5%, net price 30 × 0.4 mL = £5.75; 1%, 30 × 0.4 mL = £3.00

**Note** Each unit is resealable and may be used for up to 12 hours

## HYDROXYETHYLCELLULOSE

**Indications** tear deficiency

**Minims<sup>®</sup> Artificial Tears** (Bausch & Lomb)

**Eye drops**, hydroxyethylcellulose 0.44%, sodium chloride 0.35%. Net price 20 × 0.5 mL = £8.97

## HYPROMELLOSE

### Indications

tear deficiency  
**Note** The Royal Pharmaceutical Society has stated that where it is not possible to ascertain the strength of hypromellose prescribed, the prescriber should be contacted to clarify the strength intended.

### Hypromellose (Non-proprietary)

**Eye drops**, hypromellose 0.3%, net price 10 mL = £1.05

**Excipients** may include benzalkonium chloride

**Brands include** Lumecare<sup>®</sup> Hypromellose, Mandanol<sup>®</sup>

### Artelac<sup>®</sup> (Bausch & Lomb)

**Eye drops**, hypromellose 0.32%, net price 10 mL = £4.99

**Excipients** include cetrimide, disodium edetate

### Isopto Alkaline<sup>®</sup> (Alcon)

**Eye drops**, hypromellose 1%, net price 10 mL = 94p

**Excipients** include benzalkonium chloride

### Isopto Plain<sup>®</sup> (Alcon)

**Eye drops**, hypromellose 0.5%, net price 10 mL = 81p

**Excipients** include benzalkonium chloride

### Tear-Lac<sup>®</sup> (Scope Ophthalmics)

**Eye drops**, hypromellose 0.3%, net price 10 mL = £5.75

### Tears Naturale<sup>®</sup> (Alcon)

**Eye drops**, hypromellose 0.3%, dextran '70' 0.1%, net price 15 mL = £1.89

**Excipients** include benzalkonium chloride, disodium edetate

### Single use

#### Artelac<sup>®</sup> SDU (Bausch & Lomb)

**Eye drops**, hypromellose 0.32%, net price 30 × 0.5 mL = £16.95, 60 × 0.5 mL = £32.85

#### Hydromoor<sup>®</sup> (Moorfields)

**Eye drops**, hypromellose 0.3%, net price 30 × 0.4 mL = £5.75

#### Lumecare<sup>®</sup> Preservative Free Tear Drops (Medicom)

**Eye drops**, hypromellose 0.3%, net price 30 × 0.5 mL = £5.72

#### Tears Naturale<sup>®</sup> Single Dose (Alcon)

**Eye drops**, hypromellose 0.3%, dextran '70' 0.1%, net price 28 × 0.4 mL = £13.26

## LIQUID PARAFFIN

### Indications

dry eye conditions

#### Lacri-Lube<sup>®</sup> (Allergan)

**Eye ointment**, white soft paraffin 57.3%, liquid paraffin 42.5%, wool alcohols 0.2%. Net price 3.5 g = £2.51, 5 g = £3.32

#### VitA-PoS<sup>®</sup> (Scope Ophthalmics)

**Eye ointment**, retinol palmitate 250 units/g, white soft paraffin, light liquid paraffin, liquid paraffin, wool fat, net price 5 g = £2.75

## MACROGOLS

(Polyethylene glycols)

### Indications

dry eye conditions  
**Dose**  
 • Apply as required

### Systane<sup>®</sup> (Alcon)

**Eye drops**, polyethylene glycol 400 0.4%, propylene glycol 0.3%, hydroxypropyl guar, net price 10 mL = £4.66

### Systane<sup>®</sup> Ultra (Alcon)

**Eye drops**, polyethylene glycol 400 0.4%, propylene glycol 0.3%, hydroxypropyl guar, sorbitol, net price 10 mL = £6.69

### Single use

#### Systane<sup>®</sup> (Alcon)

**Eye drops**, polyethylene glycol 400 0.4%, propylene glycol 0.3%, hydroxypropyl guar, net price 28 × 0.8 mL = £4.66

#### Systane<sup>®</sup> Ultra (Alcon)

**Eye drops**, polyethylene glycol 400 0.4%, propylene glycol 0.3%, hydroxypropyl guar, sorbitol, net price 30 × 0.7 mL = £6.69

## PARAFFIN, YELLOW, SOFT

### Indications

see notes above

### Simple Eye Ointment

**Ointment**, liquid paraffin 10%, wool fat 10%, in yellow soft paraffin. Net price 4 g = £3.43

## POLYVINYL ALCOHOL

### Indications

tear deficiency

#### Liquifilm Tears<sup>®</sup> (Allergan)

**Ophthalmic solution** (= eye drops), polyvinyl alcohol 1.4%, net price 15 mL = £1.93

**Excipients** include benzalkonium chloride, disodium edetate

#### Sno Tears<sup>®</sup> (Bausch & Lomb)

**Eye drops**, polyvinyl alcohol 1.4%. Net price 10 mL = £1.06

**Excipients** include benzalkonium chloride, disodium edetate

### Single use

#### Liquifilm Tears<sup>®</sup> (Allergan)

**Ophthalmic solution** (= eye drops), polyvinyl alcohol 1.4%, povidone 0.6%, net price 30 × 0.4 mL = £5.35

## SODIUM CHLORIDE

### Indications

see notes above

### Sodium Chloride 0.9% Solutions

See section 13.11.1

### Balanced Salt Solution<sup>Ⓜ</sup>

**Solution** (sterile), sodium chloride 0.64%, sodium acetate 0.39%, sodium citrate 0.17%, calcium chloride 0.048%, magnesium chloride 0.03%, potassium chloride 0.075%

For intra-ocular or topical irrigation during surgical procedures

### Single use

#### Minims<sup>®</sup> Saline (Bausch & Lomb)

**Eye drops**, sodium chloride 0.9%. Net price 20 × 0.5 mL = £7.14

**NaCl<sup>®</sup> 5%** (Essential)

Eye drops, Sodium chloride 5%, net price 20 × 0.45 mL = £73.58

**SODIUM HYALURONATE**

**Indications** dry eye conditions

**Dose**

- Apply as required

**Artelac Rebalance<sup>®</sup>** (Bausch & Lomb)

Eye drops, sodium hyaluronate 0.15%, net price 10 mL = £4.00

**Blink<sup>®</sup> Intensive Tears** (AMO)

Eye drops, sodium hyaluronate 0.2%, polyethylene glycol 400 0.25%, net price 10 mL = £2.97

**Hyabak<sup>®</sup>** (Spectrum Thea)

Eye drops, sodium hyaluronate 0.15%, net price 10 mL = £7.99

**Hyo-Care<sup>®</sup>** (Scope Ophthalmics)

Eye drops, sodium hyaluronate 0.1%, dexpantenol 2%, net price 10 mL = £10.30

**Hyo-Forte<sup>®</sup>** (Scope Ophthalmics)

Eye drops, sodium hyaluronate 0.2%, net price 10 mL = £9.50

**Hyo-Tear<sup>®</sup>** (Scope Ophthalmics)

Eye drops, sodium hyaluronate 0.1%, net price 10 mL = £8.50

**Lumecare<sup>®</sup> Sodium Hyaluronate** (Medicom)

Eye drops, sodium hyaluronate 0.15%, net price 10 mL = £3.97

**Optive<sup>®</sup> Fusion** (Allergan)

Eye drops, Sodium hyaluronate 0.1%, carmellose sodium 0.5%, glycerol 0.9%, net price 10 mL = £7.49

**Oxyal<sup>®</sup>** (Kestrel Ophthalmics)

Eye drops, sodium hyaluronate 0.15%, net price 10 mL = £4.15

**Vismed<sup>®</sup> Gel Multi** (TRB Chemedica)

Eye drops, sodium hyaluronate 0.3%, net price 10 mL = £7.95

**Vismed<sup>®</sup> Multi** (TRB Chemedica)

Eye drops, sodium hyaluronate 0.18%, net price 10 mL = £6.81

**Single use****Artelac<sup>®</sup> Splash** (Bausch & Lomb)

Eye drops, sodium hyaluronate 0.2%, net price 30 × 0.5 mL = £7.00, 60 × 0.5 mL = £11.20

**Blink<sup>®</sup> Intensive Tears** (AMO)

Eye drops, sodium hyaluronate 0.2%, polyethylene glycol 400, net price 20 × 0.4 mL = £2.97

**Clinitas<sup>®</sup>** (Altacor)

Eye drops, sodium hyaluronate 0.4%, net price 30 × 0.5 mL = £5.70

**Note** Each unit is resealable and may be used for up to 12 hours

**Lubristil<sup>®</sup>** (Moorfields)

Eye drops, sodium hyaluronate 0.15%, net price 20 × 0.3 mL = £4.99

**Lubristil<sup>®</sup> Gel** (Moorfields)

Eye drops, sodium hyaluronate 0.15%, xanthan gum 1%, net price 20 × 0.4 mL = £6.49

**Ocusan<sup>®</sup>** (Agepha)

Eye drops, sodium hyaluronate 0.2%, net price 20 × 0.5 mL = £5.31

**Vismed<sup>®</sup>** (TRB Chemedica)

Eye drops, sodium hyaluronate 0.18%, net price 20 × 0.3 mL = £5.10

**Vismed<sup>®</sup> Gel** (TRB Chemedica)

Eye drops, sodium hyaluronate 0.3%, net price 20 × 0.45 mL = £5.98

**SOYBEAN OIL**

**Indications** dry eye conditions

**Dose**

- Apply up to 4 times daily

**Emustil<sup>®</sup>** (Moorfields)

Eye drops, soybean oil 7%, natural phospholipids 3%, net price 20 × 0.3 mL = £6.22

**11.8.2 Ocular diagnostic and peri-operative preparations and photodynamic treatment****Ocular diagnostic preparations**

**Fluorescein sodium** is used in diagnostic procedures and for locating damaged areas of the cornea due to injury or disease.

**FLUORESCIN SODIUM**

**Indications** detection of lesions and foreign bodies

**Minims<sup>®</sup> Fluorescein Sodium** (Bausch & Lomb)

Eye drops, fluorescein sodium 1% or 2%. Net price 20 × 0.5 mL (both) = £8.52

**With local anaesthetic**

Section 11.7

**Ocular peri-operative drugs**

Drugs used to prepare the eye for surgery, drugs that are injected into the anterior chamber at the time of surgery, and those used after eye surgery, are included here.

**Cefuroxime**, administered by intra-ocular injection into the anterior chamber of the eye (intracameral use), is used for the prophylaxis of endophthalmitis after cataract surgery.

Non-steroidal anti-inflammatory eye drops such as **diclofenac**, **flurbiprofen**, **ketorolac**, and **nepafenac**, are used for the prophylaxis and treatment of inflammation, pain, and other symptoms associated with ocular surgery or laser treatment of the eye. **Bromfenac** is used for the treatment of postoperative inflammation following cataract surgery. Diclofenac and flurbiprofen are also used to prevent miosis during ocular surgery.

**Apraclonidine**, an alpha<sub>2</sub>-adrenoreceptor agonist, reduces intra-ocular pressure possibly by reducing the production of aqueous humour. It is used to control increases in intra-ocular pressure associated with ocular surgery and as short-term treatment to reduce intra-ocular pressure prior to surgery.

**Acetylcholine**, administered into the anterior chamber of the eye during surgery, rapidly produces miosis which

lasts approximately 20 minutes. If prolonged miosis is required, it can be applied again.

Intra-ocular **sodium hyaluronate** and balanced salt solution (section 11.8.1) are used during surgical procedures on the eye.

**Povidone-iodine** is used for peri-ocular and conjunctival antiseptics before ocular surgery to support post-operative infection control.

## ACETYLCHOLINE CHLORIDE

**Indications** cataract surgery, penetrating keratoplasty, iridectomy, and other anterior segment surgery requiring rapid complete miosis

**Cautions** gastro-intestinal spasm, peptic ulcer; heart failure; asthma; hyperthyroidism; urinary-tract obstruction; parkinsonism

**Pregnancy** avoid unless potential benefit outweighs risk—no information available

**Breast-feeding** avoid unless potential benefit outweighs risk—no information available

**Side-effects** rarely bradycardia, hypotension, breathing difficulty, sweating, flushing

**Miochol-E**<sup>®</sup> (Bausch & Lomb) **[PoM]**

**Intra-ocular irrigation**, powder for reconstitution, acetylcholine chloride 10 mg/mL (1%) when reconstituted, net price 20-mg vial (with solvent) = £7.28

**Miphtel**<sup>®</sup> (SD Healthcare) **[PoM]**

**Intra-ocular irrigation**, powder for reconstitution, acetylcholine chloride 10 mg/mL (1%) when reconstituted, net price 20-mg vial (with solvent) = £7.28

## APRACLONIDINE

**Note** Apraclonidine is a derivative of clonidine

**Indications** control of intra-ocular pressure

**Cautions** history of angina, severe coronary insufficiency, recent myocardial infarction, heart failure, cerebrovascular disease, vasovagal attack, hypertension; Parkinson's syndrome; Raynaud's syndrome; thromboangiitis obliterans; depression; monitor intra-ocular pressure and visual fields; loss of effect may occur over time; suspend treatment if reduction in vision occurs in end-stage glaucoma; monitor for excessive reduction in intra-ocular pressure following peri-operative use; **interactions:** Appendix 1 (apraclonidine)

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving)

**Contra-indications** history of severe or unstable and uncontrolled cardiovascular disease

**Hepatic impairment** manufacturer advises caution

**Renal impairment** use with caution in chronic renal failure

**Pregnancy** manufacturer advises avoid—no information available

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** taste disturbance, conjunctivitis, dry eye, ocular intolerance (withdraw if eye pruritus, ocular hyperaemia, increased lacrimation, or oedema of the eyelids and conjunctiva occur), rhinitis; *less commonly* chest pain, asthma, dyspnoea, throat irritation, nervousness, irritability, impaired co-ordination, myalgia, mydriasis, keratitis, keratopathy, photophobia, visual impairment, corneal erosion and infiltrates, blepharospasm, blepharitis, eyelid ptosis or retraction, con-

junctival vascular disorders, rhinorrhoea, parosmia; since absorption may follow topical application, systemic effects (see Clonidine, section 2.5.2) may occur

### Dose

• See under preparations below

**lopidine**<sup>®</sup> (Alcon) **[PoM]**

**Ophthalmic solution** (= eye drops), apraclonidine 1% (as hydrochloride), net price 12 × 2 single use 0.25-mL units = £77.81

**Dose** control or prevention of postoperative elevation of intra-ocular pressure after anterior segment laser surgery, apply 1 drop 1 hour before laser procedure then 1 drop immediately after completion of procedure; **CHILD** not recommended

**lopidine 0.5% ophthalmic solution** (= eye drops), apraclonidine 0.5% (as hydrochloride), net price 5 mL = £10.88

**Excipients** include benzalkonium chloride

**Dose** short-term adjunctive treatment of chronic glaucoma in patients not adequately controlled by another drug (see note below), apply 1 drop 3 times daily usually for max. 1 month; **CHILD** not recommended

**Note** May not provide additional benefit if patient already using two drugs that suppress the production of aqueous humour

## BROMFENAC

**Indications** postoperative inflammation following cataract surgery

**Yellox**<sup>®</sup> (Bausch & Lomb) **[PoM]**

**Eye drops**, bromfenac (as sodium sesquihydrate) 0.09%, net price 5 mL = £8.50

**Excipients** include benzalkonium chloride, disodium edetate, sulfites

## CEFUROXIME

**Indications** prophylaxis of endophthalmitis after cataract surgery

**Cautions** severe risk of infection; complicated cataracts or combined operations with cataract surgery; severe thyroid disease; reduced corneal endothelial cells (less than 2000)

### Dose

• By **intracameral injection**, **ADULT** over 18 years, 1 mg into the anterior chamber of the eye at the end of cataract surgery

**Note** For information on administration, consult product literature

**Aprokam**<sup>®</sup> (Spectrum Thea) **[PoM]**

**Injection for intracameral use**, powder for reconstitution, cefuroxime (as sodium) 10 mg/mL when reconstituted with 5 mL sodium chloride 0.9%, net price 50-mg vial = £7.95

## DICLOFENAC SODIUM

**Indications** inhibition of intra-operative miosis during cataract surgery (but does not possess intrinsic mydriatic properties); postoperative inflammation in cataract surgery, strabismus surgery or argon laser trabeculoplasty; pain in corneal epithelial defects after photorefractive keratectomy, radial keratotomy or accidental trauma; seasonal allergic conjunctivitis (section 11.4.2)

**Voltarol® Ophtha Multidose** (Spectrum Thea) (PoM)  
Eye drops, diclofenac sodium 0.1%, net price 5 mL = £6.68

**Excipients** include benzalkonium chloride, disodium edetate, propylene glycol

#### Single use

**Voltarol® Ophtha** (Spectrum Thea) (PoM)  
Eye drops, diclofenac sodium 0.1%, net price pack of 5 single-dose units = £4.00, 40 single-dose units = £32.00

## FLURBIPROFEN SODIUM

**Indications** inhibition of intra-operative miosis (but does not possess intrinsic mydriatic properties); anterior segment inflammation following postoperative and post-laser trabeculoplasty when corticosteroids contra-indicated

**Ocufen®** (Allergan) (PoM)  
Ophthalmic solution (= eye drops), flurbiprofen sodium 0.03%, polyvinyl alcohol (*Liquifilm*®) 1.4%, net price 40 × 0.4 mL = £37.15

## KETOROLAC TROMETAMOL

**Indications** prophylaxis and reduction of inflammation and associated symptoms following ocular surgery

**Acular®** (Allergan) (PoM)  
Eye drops, ketorolac trometamol 0.5%, net price 5 mL = £3.00  
**Excipients** include benzalkonium chloride, disodium edetate

## NEPAFENAC

**Indications** prophylaxis and treatment of postoperative pain and inflammation associated with cataract surgery; reduction in the risk of postoperative macular oedema associated with cataract surgery in diabetic patients

**Cautions** avoid sunlight; discontinue immediately if evidence of corneal epithelial breakdown

**Side-effects** punctuate keratitis; *less commonly* nausea, headache, corneal epithelium defect, iritis, keratitis, corneal deposits, choroidal effusion, ocular discomfort, blurred vision, dry eye, allergic conjunctivitis, eye pruritus, increased lacrimation, photophobia, conjunctival hyperaemia; *also reported* dizziness, impaired corneal healing, corneal opacity, reduced visual acuity, eye swelling, dermatochalasis

**Nevanac®** (Alcon) (PoM)  
Ophthalmic suspension (= eye drops), nepafenac 1 mg/mL, net price 5 mL = £14.92  
**Excipients** include benzalkonium chloride, disodium edetate

## POVIDONE-IODINE

**Indications** cutaneous peri-ocular and conjunctival antisepsis before ocular surgery

**Contra-indications** concomitant use with ocular antimicrobial drugs, and ocular formulations containing mercury-based preservatives; preterm neonates

**Side-effects** *rarely* conjunctival hyperaemia, superficial punctuate keratitis; *also reported* residual yellow coloration of the conjunctiva, cytotoxicity on mucous

membranes and deep tissue, hypothyroidism in neonates

#### Dose

- Apply eye drops, leave for 2 minutes, then irrigate thoroughly with sodium chloride 0.9%

**Minims® Povidone Iodine** (Bausch & Lomb) (PoM)  
Eye drops, povidone-iodine 5%, net price 20 × 0.4 mL = £16.00

## Subfoveal choroidal neovascularisation

**Aflibercept**, **pegaptanib** and **ranibizumab** are vascular endothelial growth factor inhibitors licensed for the treatment of neovascular (wet) age-related macular degeneration. Aflibercept is also licensed for the treatment of macular oedema secondary to central retinal vein occlusion; ranibizumab is also licensed for the treatment of visual impairment due to diabetic macular oedema, macular oedema secondary to branch or central retinal vein occlusion, and choroidal neovascularisation secondary to pathologic myopia. Ranibizumab can be administered concomitantly with laser photocoagulation for the treatment of diabetic macular oedema and for macular oedema secondary to branch retinal vein occlusion. They are given by intravitreal injection by specialists experienced in the management of this condition. There is a potential risk of arterial thromboembolic events and non-ocular haemorrhage following the intravitreal injection of vascular endothelial growth factor inhibitors. Endophthalmitis can occur after intravitreal injections—patients should be advised to report any signs of infection immediately.

The *Scottish Medicines Consortium* (p. 4) has advised (May 2007) that ranibizumab (*Lucentis*®) is accepted for use within NHS Scotland for the treatment of neovascular (wet) age-related macular degeneration. The *Scottish Medicines Consortium* (p. 4) has also advised (October 2011 and April 2013) that ranibizumab (*Lucentis*®) is accepted for use within NHS Scotland for the treatment of macular oedema secondary to branch or central retinal vein occlusion, and (November 2012) for restricted use for the treatment of visual impairment due to diabetic macular oedema in adults with best corrected visual acuity 75 Early Treatment Diabetic Retinopathy Study letters or less at baseline, and (October 2013) for the treatment of visual impairment due to choroidal neovascularisation secondary to pathologic myopia in adults; SMC advice is contingent upon the continuing availability of ranibizumab at the price agreed in the patient access scheme.

#### NICE guidance

**Aflibercept solution for injection for treating wet age-related macular degeneration (July 2013)**

Aflibercept solution for injection is recommended as an option for treating wet age-related macular degeneration only if:

- it is used in accordance with the recommendations for ranibizumab in NICE TA 155 and
- the manufacturer provides aflibercept solution for injection with the discount agreed in the patient access scheme.

[www.nice.org.uk/TA294](http://www.nice.org.uk/TA294)

**NICE guidance****Aflibercept for treating visual impairment caused by macular oedema secondary to central retinal vein occlusion (February 2014)**

Aflibercept solution for injection is recommended as an option for treating visual impairment caused by macular oedema secondary to central retinal vein occlusion only if the manufacturer provides aflibercept solution for injection with the discount agreed in the patient access scheme.

[www.nice.org.uk/TA305](http://www.nice.org.uk/TA305)

**NICE guidance****Ranibizumab and pegaptanib for the treatment of age-related macular degeneration (updated May 2012)**

Ranibizumab is recommended for the treatment of wet age-related macular degeneration if all of the following apply:

- the best corrected visual acuity is between 6/12 and 6/96;
- there is no permanent structural damage to the central fovea;
- the lesion size is less than or equal to 12 disc areas in greatest linear dimension;
- there is evidence of recent disease progression;
- the manufacturer provides ranibizumab with the discount agreed in the patient access scheme (as revised in 2012).

Ranibizumab should only be continued in patients who maintain adequate response to therapy.

Pegaptanib is not recommended for the treatment of wet age-related macular degeneration; patients currently receiving pegaptanib for any lesion type can continue therapy until they and their specialist consider it appropriate to stop.

[www.nice.org.uk/TA155](http://www.nice.org.uk/TA155)

**NICE guidance****Ranibizumab for the treatment of diabetic macular oedema (February 2013)**

Ranibizumab is recommended as an option for the treatment of visual impairment due to diabetic macular oedema only if:

- the eye has a central retinal thickness of 400 micrometres or more at the start of treatment **and**
- the manufacturer provides ranibizumab with the discount agreed in the patient access scheme (as revised in 2012).

Patients currently receiving ranibizumab for treating visual impairment due to diabetic macular oedema whose disease does not meet the criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA274](http://www.nice.org.uk/TA274)

**NICE guidance****Ranibizumab for the treatment of visual impairment caused by macular oedema secondary to retinal vein occlusion (May 2013)**

Ranibizumab is recommended as an option for treating visual impairment caused by macular oedema:

- following central retinal vein occlusion **or**
- following branch retinal vein occlusion only if treatment with laser photocoagulation has not been beneficial, or when laser photocoagulation is not suitable because of the extent of macular haemorrhage **and**
- only if the manufacturer provides ranibizumab with the discount agreed in the patient access scheme revised in the context of NICE technology appraisal guidance 274.

[www.nice.org.uk/TA283](http://www.nice.org.uk/TA283)

**NICE guidance****Ranibizumab for treating choroidal neovascularisation associated with pathological myopia (November 2013)**

Ranibizumab is recommended as an option for treating visual impairment due to choroidal neovascularisation secondary to pathological myopia when the manufacturer provides ranibizumab with the discount agreed in the patient access scheme.

[www.nice.org.uk/TA298](http://www.nice.org.uk/TA298)

**Verteporfin** is licensed for use in the photodynamic treatment of age-related macular degeneration associated with predominantly classic subfoveal choroidal neovascularisation *or* with pathological myopia (see NICE guidance below). Following intravenous infusion, verteporfin is activated by local irradiation using non-thermal red light to produce cytotoxic derivatives. Only specialists experienced in the management of these conditions should use it.

**NICE guidance****Verteporfin photodynamic therapy for wet age-related macular degeneration (September 2003)**

Photodynamic therapy is recommended for wet age-related macular degeneration with a confirmed diagnosis of classic (no occult) subfoveal choroidal neovascularisation and best-corrected visual acuity of 6/60 or better.

Photodynamic therapy is **not** recommended for wet age-related macular degeneration with predominantly classic but partly occult subfoveal choroidal neovascularisation *except* in clinical studies.

[www.nice.org.uk/TA68](http://www.nice.org.uk/TA68)

**AFLIBERCEPT**

**Indications** see notes above—specialist use only

**Cautions** see notes above; also monitor intra-ocular pressure following injection; patients at risk of retinal pigment epithelial tear

**Contra-indications** ocular or periocular infection; severe intra-ocular inflammation; clinical signs of irreversible ischaemic visual function loss

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk and recommends women use effective contraception during and for at least 3 months after treatment

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** see notes above; also conjunctival haemorrhage, vitreous haemorrhage, corneal erosion, eye pain, retinal pigment epithelium tear, retinal degeneration, cataract formation, corneal abrasion or oedema, raised intra-ocular pressure, blurred vision, vitreous floaters, vitreous detachment, foreign body sensation in eye, increased lacrimation, eyelid oedema, ocular hyperaemia; *less commonly* retinal tear, retinal detachment, lenticular opacities, corneal epithelium defect, eyelid irritation, iritis, iridocyclitis, anterior chamber flare; *rarely* vitritis, uveitis

#### Dose

- Neovascular (wet) age-related macular degeneration, **by intravitreal injection, ADULT** over 18 years, 2 mg into the affected eye once a month for 3 months, then every 2 months thereafter; review treatment frequency after 12 months
- Macular oedema secondary to central retinal vein occlusion, **by intravitreal injection, ADULT** over 18 years, 2 mg into the affected eye once a month; monitor visual and anatomic outcomes monthly; continue treatment until visual and anatomic outcomes are stable for 3 monthly assessments (discontinue treatment if no improvement in visual and anatomic outcomes after initial 3 injections); if necessary subsequent doses may be given at least 1 month apart

**Note** For further information on administration, consult product literature

**Eylea**<sup>®</sup> (Bayer) ▼ (PoM)

**Solution for intravitreal injection**, aflibercept 40 mg/mL, net price 0.1-mL vial = £816.00

## PEGAPTANIB SODIUM

**Indications** see notes above—specialist use only

**Cautions** see notes above; also monitor intra-ocular pressure (transient increase may occur following injection, and small, sustained increases reported after repeated dosing); monitor for vitreous haemorrhage and for signs of ocular infection for 2 weeks following injection

**Contra-indications** ocular or periocular infection

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** see notes above; also rhinorrhoea; headache; eye pain, anterior chamber inflammation, raised intra-ocular pressure, punctate keratitis, vitreous floaters, cataract, conjunctival and retinal haemorrhage, local oedema, conjunctivitis, corneal dystrophy, dry eye, eye discharge, eye irritation, macular degeneration, mydriasis, periorbital haematoma, photophobia, flashing lights, vitreous disorders; *less commonly* vomiting, dyspepsia, palpitation, chest pain, hypertension, aortic aneurysm, influenza-like symptoms, nightmares, depression, back pain, asthenopia, blepharitis, corneal deposits, vitreous haemorrhage, chalazion, retinal exudates, eyelid ptosis, decreased intra-ocular pressure, injection-site reactions, retinal detachment, occlusion of retinal blood vessels, ectropion, eye movement disorder, pupillary disorder, iritis, optic nerve cupping, nasopharyngitis, deafness, vertigo, eczema, changes in hair colour, rash, pruritus, night sweats

#### Dose

- **By intravitreal injection, ADULT** over 18 years, 300 micrograms once every 6 weeks into the affected eye

**Note** For further information on administration, consult product literature. Review treatment if no benefit after 2 consecutive injections

**Macugen**<sup>®</sup> (Pfizer) (PoM)

**Solution for intravitreal injection**, pegaptanib (as sodium salt), net price 300-microgram prefilled syringe = £514.00

## RANIBIZUMAB

**Indications** see notes above—specialist use only

**Cautions** see notes above; also history of stroke or transient ischaemic attack; patients at risk of retinal pigment epithelial tear; monitor intra-ocular pressure, perfusion of the optic nerve head, and for signs of ocular infection following injection; retinal detachment or macular hole—discontinue treatment if rhegmatogenous retinal detachment or stage 3 or 4 macular hole develops; diabetic macular oedema due to type 1 diabetes (limited information available); previous intravitreal injections; active systemic infection; proliferative diabetic retinopathy; uncontrolled hypertension; diabetic patients with HbA<sub>1c</sub> over 12%

**Contra-indications** ocular or periocular infection; severe intra-ocular inflammation; signs of irreversible ischaemic visual function loss in patients with retinal vein occlusion

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk and recommends women use effective contraception during and for at least 3 months after treatment

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** see notes above; also nausea, headache, nasopharyngitis, cough, anxiety, anaemia, urinary tract infection, arthralgia, raised intra-ocular pressure, visual disturbance, conjunctival, retinal, and vitreous disorders, ocular discomfort, eye haemorrhage, uveitis, iritis, blepharitis, iridocyclitis, cataract, posterior capsule opacification, punctate keratitis, anterior chamber flare, conjunctivitis, photopsia, photophobia, eyelid oedema, allergic skin reactions; *less commonly* blindness, hypopyon, hyphaema, keratopathy, corneal disorders, iris adhesion

#### Dose

- Neovascular (wet) age-related macular degeneration, **by intravitreal injection, ADULT** over 18 years, 500 micrograms once a month into the affected eye; monitor visual acuity monthly; continue treatment until visual acuity is stable for 3 consecutive months; thereafter monitor visual acuity monthly; if necessary subsequent doses may be given at least 1 month apart
- Diabetic macular oedema, macular oedema secondary to retinal vein occlusion, **by intravitreal injection, ADULT** over 18 years, 500 micrograms once a month into the affected eye; monitor visual acuity monthly; continue treatment until visual acuity is stable for 3 consecutive months (discontinue treatment if no improvement in visual acuity after initial 3 injections); thereafter monitor visual acuity monthly; if necessary subsequent doses may be given at least 1 month apart
- Choroidal neovascularisation secondary to pathologic myopia, **by intravitreal injection, ADULT** over 18 years,

initially 500 micrograms as a single injection into the affected eye; monitor for disease activity monthly for first 2 months, then at least every 3 months thereafter during the first year, then as required; if necessary subsequent doses may be given at least 1 month apart

- Concomitant treatment of diabetic macular oedema, or macular oedema secondary to branch retinal vein occlusion, with laser photocoagulation, **by intravitreal injection, ADULT**, 500 micrograms at least 30 minutes after laser photocoagulation

**Note** For further information on administration, consult product literature

**Lucentis**<sup>®</sup> (Novartis) ▼ (PoM)

**Solution for intravitreal injection**, ranibizumab  
10 mg/mL, net price 0.23-mL vial = £742.17

## VERTEPORFIN

**Indications** see notes above—specialist use only

**Cautions** photosensitivity—avoid exposure of unprotected skin and eyes to bright light during infusion and for 48 hours afterwards; concomitant use with other photosensitising drugs; biliary obstruction; avoid extravasation

**Contra-indications** acute porphyria

**Hepatic impairment** use with caution in moderate impairment; avoid in severe impairment

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk (teratogenic in *animal* studies)

**Breast-feeding** no information available—manufacturer advises avoid breast-feeding for 48 hours after administration

**Side-effects** nausea, hypercholesterolaemia, malaise, back pain, photosensitivity, visual disturbances (including reduced visual acuity, flashing lights, visual-field defects), *less commonly* hypertension, hyperaesthesia, pyrexia, retinal detachment, subretinal, retinal or vitreous haemorrhage, *rarely* retinal or choroidal vessel non-perfusion; *also reported* chest pain, myocardial infarction, vasovagal reactions, macular oedema, retinal oedema

### Dose

- **By intravenous infusion** over 10 minutes, 6 mg/m<sup>2</sup>

**Note** For information on administration and light activation, consult product literature

**Visudyne**<sup>®</sup> (Novartis) (PoM)

**Injection**, powder for reconstitution, verteporfin, net price 15-mg vial = £850.00

**Excipients** include butylated hydroxytoluene

## Vitreomacular traction

Ocriplasmin is licensed for the treatment of vitreomacular traction, including when associated with a macular hole of diameter less than or equal to 400 microns. It is given by intravitreal injection by specialists experienced in the management of this condition.

### NICE guidance

#### Ocriplasmin for treating vitreomacular traction (October 2013)

Ocriplasmin is recommended as an option for treating vitreomacular traction in adults, only if:

- an epiretinal membrane is not present **and**
- they have a stage II full-thickness macular hole with a diameter of 400 microns or less **and/or**
- they have severe symptoms.

[www.nice.org.uk/TA297](http://www.nice.org.uk/TA297)

## OCRIPLASMIN

**Indications** see notes above—specialist use only

**Cautions** monitor intra-ocular pressure, visual acuity, and for signs of intra-ocular inflammation or infection following injection; non-proliferative diabetic retinopathy; history of uveitis (including severe active inflammation); significant eye trauma

**Contra-indications** active or suspected ocular or periocular infection; large diameter macular hole (> 400 microns); high myopia; aphakia; history of rhegmatogenous retinal detachment; lens zonule instability; recent ocular surgery or intra-ocular injection (including laser therapy); proliferative diabetic retinopathy; ischaemic retinopathies; retinal vein occlusions; exudative age-related macular degeneration; vitreous haemorrhage

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—no information available

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk—no information available

**Side-effects** conjunctival, retinal, and vitreous disorders, reduced visual acuity, raised intra-ocular pressure, macular hole, macular degeneration, macular oedema, metamorphopsia, eyelid oedema, anterior chamber cell or flare, iritis, photopsia, ocular hyperaemia, abnormal retinograph, ocular discomfort, photophobia, chromatopsia, retinal pigment epitheliopathy; *less commonly* transient blindness, lens subluxation, scotoma, visual field defect, diplopia, hyphaema, miosis, unequal pupils, corneal abrasion, anterior chamber inflammation, eye inflammation

### Dose

- **By intravitreal injection, ADULT** over 18 years, 125 micrograms as a single dose into the affected eye
- Note** Concurrent administration to both eyes not recommended. For further information on administration, consult product literature

**Jetrea**<sup>®</sup> (Alcon) ▼ (PoM)

**Concentrate for solution for intravitreal injection**, ocriplasmin 2.5 mg/mL, net price 0.2-mL vial = £2500.00

## 11.9 Contact lenses

For cosmetic reasons many people prefer to wear contact lenses rather than spectacles; contact lenses are also sometimes required for medical indications. Visual defects are corrected by either rigid ('hard' or gas permeable) lenses or soft (hydrogel or silicone hydrogel) lenses; soft lenses are the most popular type, because they are initially the most comfortable, but they may not give the best vision. Lenses should usually be worn for a specified number of hours each day and removed for sleeping. The risk of infectious and non-infectious keratitis is increased by extended continuous contact lens wear, which is not recommended, except when medically indicated.

Contact lenses require meticulous care. Poor compliance with directions for use, and with daily cleaning and disinfection, can result in complications including ulcerative keratitis or conjunctivitis. One-day disposable lenses, which are worn only once and therefore require no disinfection or cleaning, are becoming increasingly popular.

*Acanthamoeba keratitis*, a painful and sight-threatening condition, is associated with ineffective lens cleaning and disinfection, the use of contaminated lens cases, or tap water coming into contact with the lenses. The condition is especially associated with the use of soft lenses (including frequently replaced lenses) and should be treated by specialists.

**Contact lenses and drug treatment** Special care is required in prescribing eye preparations for contact lens users. Some drugs and preservatives in eye preparations can accumulate in hydrogel lenses and may induce toxic reactions. Therefore, unless medically indicated, the lenses should be removed before instillation of the eye preparation and not worn during the period of treatment. Alternatively, unpreserved drops can be used. Eye drops may, however, be instilled while patients are wearing rigid corneal contact lenses. Ointment preparations should never be used in conjunction with contact lens wear; oily eye drops should also be avoided.

Many drugs given systemically can also have adverse effects on contact lens wear. These include oral contraceptives (particularly those with a higher oestrogen content), drugs which reduce blink rate (e.g. anxiolytics, hypnotics, antihistamines, and muscle relaxants), drugs which reduce lacrimation (e.g. antihistamines, antimuscarinics, phenothiazines and related drugs, some beta-blockers, diuretics, and tricyclic antidepressants), and drugs which increase lacrimation (including ephedrine and hydralazine). Other drugs that may affect contact lens wear are isotretinoin (can cause conjunctival inflammation), aspirin (salicylic acid appears in tears and can be absorbed by contact lenses—leading to irritation), and rifampicin and sulfasalazine (can discolour lenses).

# 12 Ear, nose, and oropharynx

<b>12.1</b>	<b>Drugs acting on the ear</b>	<b>765</b>
12.1.1	Otitis externa	765
12.1.2	Otitis media	767
12.1.3	Removal of ear wax	768
<b>12.2</b>	<b>Drugs acting on the nose</b>	<b>768</b>
12.2.1	Drugs used in nasal allergy	769
12.2.2	Topical nasal decongestants	771

12.3.3	Lozenges and sprays	776
12.3.4	Mouthwashes, gargles, and dentifrices	776
12.3.5	Treatment of dry mouth	777

This chapter also includes advice on the drug management of the following:

- allergic rhinitis, p. 769
- nasal polyps, p. 769
- oropharyngeal infections, p. 775
- periodontitis, p. 773

## 12.1 Drugs acting on the ear

- 12.1.1 Otitis externa
- 12.1.2 Otitis media
- 12.1.3 Removal of ear wax

### 12.1.1 Otitis externa

Otitis externa is an inflammatory reaction of the meatal skin. It is important to exclude an underlying chronic otitis media before treatment is commenced. Many cases recover after thorough cleansing of the external ear canal by suction or dry mopping. A frequent problem in resistant cases is the difficulty in applying lotions and ointments satisfactorily to the relatively inaccessible affected skin. The most effective method is to introduce a ribbon gauze dressing or sponge wick soaked with **corticosteroid** ear drops or with an astringent such as **aluminium acetate** solution. When this is not practical, the ear should be gently cleansed with a probe covered in cotton wool and the patient encouraged to lie with the affected ear uppermost for ten minutes after the canal has been filled with a liberal quantity of the appropriate solution.

If infection is present, a topical anti-infective which is not used systemically (such as **neomycin** or **clioquinol**) may be used, but for only about a week as excessive use may result in fungal infections; these may be difficult to treat and require expert advice. Sensitivity to the anti-infective or solvent may occur and resistance to anti-bacterials is a possibility with prolonged use. Aluminium acetate ear drops are also effective against bacterial infection and inflammation of the ear. **Chloramphenicol** may be used but the ear drops contain propylene glycol and cause hypersensitivity reactions in about 10% of patients. Solutions containing an anti-infective and a corticosteroid (such as *Locorten-Vioform*<sup>®</sup>) are used for treating cases where infection is present with inflammation and eczema.

In view of reports of ototoxicity, manufacturers contraindicate treatment with topical **aminoglycosides** or **polymyxins** in patients with a perforated tympanic membrane (eardrum) or patent grommet. However, some specialists do use these drops cautiously in the presence of a perforation or patent grommet in patients with chronic suppurative otitis media (section 12.1.2) and when other measures have failed for otitis externa; treatment should be considered only by specialists in the following circumstance:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;
- patients should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances.

A solution of **acetic acid** 2% acts as an antifungal and antibacterial in the external ear canal. It may be used to treat mild otitis externa but in severe cases an anti-inflammatory preparation with or without an anti-infective drug is required. A proprietary preparation containing acetic acid 2% (*EarCalm*® spray) is on sale to the public.

For severe pain associated with otitis externa, a simple analgesic, such as **paracetamol** (section 4.7.1) or **ibuprofen** (section 10.1.1), can be used. A systemic antibacterial (Table 1, section 5.1) can be used if there is spreading cellulitis or if the patient is systemically unwell. When a resistant staphylococcal infection (a boil) is present in the external auditory meatus, **flucloxacillin** is the drug of choice; **ciprofloxacin** (or an aminoglycoside) may be needed in pseudomonal infections which may occur if the patient has diabetes or is immunocompromised.

The skin of the pinna adjacent to the ear canal is often affected by eczema. Topical corticosteroid creams and ointments (section 13.4) are then required, but prolonged use should be avoided.

## Astringent preparations

### ALUMINIUM ACETATE

**Indications** inflammation in otitis externa (see notes above)

#### Dose

- Insert into meatus or apply on a ribbon gauze dressing or sponge wick which should be kept saturated with the ear drops

**Aluminium Acetate** (Non-proprietary)

**Ear drops** 13%, aluminium sulfate 2.25 g, calcium carbonate 1 g, tartaric acid 450 mg, acetic acid (33%) 2.5 mL, purified water 7.5 mL

Available from manufacturers of 'special order' products

**Ear drops** 8%, dilute 8 parts aluminium acetate ear drops (13%) with 5 parts purified water. Must be freshly prepared

## Anti-inflammatory preparations

### Corticosteroids

Topical corticosteroids are used to treat inflammation and eczema in otitis externa.

**Cautions** Prolonged use of topical corticosteroid ear preparations should be avoided.

**Contra-indications** Corticosteroid ear preparations should be avoided in the presence of an untreated ear infection. If infection is present, the corticosteroid should be used in combination with a suitable anti-infective (see notes above).

**Side-effects** Local sensitivity reactions may occur.

### BETAMETHASONE SODIUM PHOSPHATE

**Indications** eczematous inflammation in otitis externa (see notes above)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Betnesol**® (RPH) (PoM)

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%. Net price 10 mL = £2.32

**Excipients** include benzalkonium chloride, disodium edetate

**Dose** ear, apply 2–3 drops every 2–3 hours; reduce frequency when relief obtained; **eye**, section 11.4.1; **nose**, section 12.2.1

**Vistamethasone**® (Martindale) (PoM)

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%. Net price 5 mL = £1.02; 10 mL = £1.16

**Excipients** include benzalkonium chloride, disodium edetate

**Dose** ear, apply 2–3 drops every 3–4 hours; reduce frequency when relief obtained; **eye**, section 11.4.1; **nose**, section 12.2.1

#### With antibacterial

**Betnesol-N**® (RPH) (PoM)

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%, neomycin sulfate 0.5%. Net price 10 mL = £2.39

**Excipients** include benzalkonium chloride, disodium edetate

**Dose** ear, apply 2–3 drops 3–4 times daily; **eye**, section 11.4.1; **nose**, section 12.2.3

### DEXAMETHASONE

**Indications** eczematous inflammation in otitis externa (see notes above)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

#### With antibacterial

**Otomize**® (Forest) (PoM)

**Ear spray**, dexamethasone 0.1%, neomycin sulfate 3250 units/mL, glacial acetic acid 2%. Net price 5-mL pump-action aerosol unit = £3.50

**Excipients** include hydroxybenzoates (parabens)

**Dose** ADULT and CHILD over 2 years, apply 1 metered spray 3 times daily

**Sofradex**® (Sanofi-Aventis) (PoM) 

**Drops** (for ear or eye), dexamethasone (as sodium metasulphobenzate) 0.05%, framycetin sulfate 0.5%, gramicidin 0.005%. Net price 10 mL = £6.25

**Excipients** include polysorbate 80

**Dose** ear, apply 2–3 drops 3–4 times daily; **eye**, section 11.4.1

### FLUMETASONE PIVALATE

(Flumetasone Pivalate)

**Indications** eczematous inflammation in otitis externa (see notes above)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

#### With antibacterial

**Locorten-Vioform**® (AMCo) (PoM)

**Ear drops**, flumetasone pivalate 0.02%, clioquinol 1%. Net price 7.5 mL = £1.76

**Contra-indications** iodine sensitivity

**Dose** ADULT and CHILD over 2 years apply 2–3 drops into the ear twice daily for 7–10 days

**Note** Clioquinol stains skin and clothing

## HYDROCORTISONE

**Indications** eczematous inflammation in otitis externa (see notes above)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

### With antibacterial

**Gentisone**<sup>®</sup> HC (AMCo) 

Ear drops, hydrocortisone acetate 1%, gentamicin 0.3% (as sulfate). Net price 10 mL = £4.76

**Excipients** include benzalkonium chloride, disodium edetate

**Dose** ear, apply 2–4 drops 3–4 times daily and at night

## PREDNISOLONE SODIUM PHOSPHATE

**Indications** eczematous inflammation in otitis externa (see notes above)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Predsol**<sup>®</sup> (RPH) 

Drops (for ear or eye), prednisolone sodium phosphate 0.5%. Net price 10 mL = £2.00

**Excipients** include benzalkonium chloride, disodium edetate

**Dose** ear, apply 2–3 drops every 2–3 hours; reduce frequency when relief obtained; eye, section 11.4.1

## Anti-infective preparations

### CHLORAMPHENICOL

**Indications** bacterial infection in otitis externa (but see notes above)

**Cautions** avoid prolonged use (see notes above)

**Side-effects** high incidence of sensitivity reactions to vehicle

**Chloramphenicol** (Non-proprietary) 

Ear drops, chloramphenicol in propylene glycol, net price 5%, 10 mL = £33.40; 10%, 10 mL = £19.52

**Dose** ear, apply 2–3 drops 2–3 times daily

### CLIOQUINOL

**Indications** mild bacterial or fungal infections in otitis externa (see notes above)

**Cautions** avoid prolonged use (see notes above); manufacturer advises avoid in perforated tympanic membrane (but used by specialists for short periods)

**Side-effects** local sensitivity; stains skin and clothing

### With corticosteroid

**Locorten-Vioform**<sup>®</sup> see Flumetasone, p. 766

### CLOTRIMAZOLE

**Indications** fungal infection in otitis externa (see notes above)

**Side-effects** occasional local irritation or sensitivity

**Canesten**<sup>®</sup> (Bayer Consumer Care)

Solution, clotrimazole 1% in polyethylene glycol 400 (macrogol 400). Net price 20 mL = £2.30

**Dose** ear, apply 2–3 times daily continuing for at least 14 days after disappearance of infection; skin, section 13.10.2

## FRAMYCETIN SULFATE

**Indications** bacterial infection in otitis externa (see notes above)

**Cautions** avoid prolonged use (see notes above)

**Contra-indications** perforated tympanic membrane (see p. 765)

**Side-effects** local sensitivity

### With corticosteroid

**Sofradex**<sup>®</sup> see Dexamethasone, p. 766

## GENTAMICIN

**Indications** bacterial infection in otitis externa (see notes above)

**Cautions** avoid prolonged use (see notes above)

**Contra-indications** perforated tympanic membrane (but see also p. 765 and section 12.1.2)

**Side-effects** local sensitivity

**Genticin**<sup>®</sup> (AMCo) 

Drops (for ear or eye), gentamicin 0.3% (as sulfate). Net price 10 mL = £2.13

**Excipients** include benzalkonium chloride

**Dose** ear, apply 2–3 drops 3–4 times daily and at night; eye, section 11.3.1

### With corticosteroid

**Gentisone**<sup>®</sup> HC see Hydrocortisone, above

## NEOMYCIN SULFATE

**Indications** bacterial infection in otitis externa (see notes above)

**Cautions** avoid prolonged use (see notes above)

**Contra-indications** perforated tympanic membrane (see p. 765)

**Side-effects** local sensitivity

### With corticosteroid

**Betnesol-N**<sup>®</sup> see Betamethasone, p. 766

**Otomize**<sup>®</sup> see Dexamethasone, p. 766

## 12.1.2 Otitis media

**Acute otitis media** Acute otitis media is the commonest cause of severe aural pain in small children. Many infections, especially those accompanying coryza, are caused by viruses. Most uncomplicated cases resolve without antibacterial treatment and a **simple analgesic**, such as paracetamol, may be sufficient. In children without systemic features, a **systemic antibacterial** (Table 1, section 5.1) may be started after 72 hours if there is no improvement, or earlier if there is deterioration, if the patient is systemically unwell, if the patient is at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis), if mastoiditis is present, or in children under 2 years of age with bilateral otitis media. Perforation of the tympanic membrane in patients with *acute otitis media* usually heals spontaneously without treatment; if there is no improvement, e.g. pain or discharge persists, a systemic antibacterial (Table 1, section 5.1) can be given. Topical treatment of acute otitis media is ineffective and there is no place for drops containing a local anaesthetic.

**Otitis media with effusion** Otitis media with effusion (glue ear) occurs in about 10% of children and in 90% of children with cleft palates. Systemic antibacterials are not usually required. If glue ear persists for more than a month or two, the child should be referred for assessment and follow up because of the risk of long-term hearing impairment which can delay language development. Untreated or resistant glue ear may be responsible for some types of *chronic otitis media*.

**Chronic otitis media** Opportunistic organisms are often present in the debris, keratin, and necrotic bone of the middle ear and mastoid in patients with chronic otitis media. The mainstay of treatment is thorough cleansing with aural microsuction which may completely resolve long-standing infection. Local cleansing of the meatal and middle ear may be followed by treatment with a sponge wick or ribbon gauze dressing soaked with corticosteroid ear drops or with an astringent such as aluminium acetate solution; this is particularly beneficial for discharging ears or infections of the mastoid cavity. An antibacterial ear ointment may also be used. Acute exacerbations of chronic infection may also require systemic treatment with amoxicillin (or erythromycin if penicillin-allergic); treatment is adjusted according to the results of sensitivity testing.

In view of reports of ototoxicity, manufacturers contraindicate topical treatment with ototoxic antibacterials in the presence of a tympanic perforation or patent grommet. **Ciprofloxacin** or **ofloxacin** eye drops used in the ear [unlicensed use] or ear drops [both unlicensed; available from 'special-order' manufacturers or specialist importing companies, see p. 1104] are an effective alternative to such ototoxic ear drops for chronic otitis media in patients with perforation of the tympanic membrane.

However, some specialists do use ear drops containing **aminoglycosides** or **polymyxins** [unlicensed indications] cautiously in patients with chronic suppurative otitis media and a perforation of the tympanic membrane, if the otitis media has failed to settle with systemic antibacterials; treatment should be considered only by **specialists** in the following circumstance:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;
- patients should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances. It is considered that the pus in the middle ear associated with otitis media also carries a risk of ototoxicity.

### 12.1.3 Removal of ear wax

Wax is a normal bodily secretion which provides a protective film on the meatal skin and need only be removed if it causes hearing loss or interferes with a proper view of the ear drum.

Wax can be softened using simple remedies such as **olive oil** ear drops or **almond oil** ear drops; **sodium bicarbonate** ear drops are also effective, but may cause

dryness of the ear canal. If the wax is hard and impacted, the drops can be used twice daily for several days and this may reduce the need for mechanical removal of the wax. The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear. Some proprietary preparations containing organic solvents can irritate the meatal skin, and in most cases the simple remedies indicated above are just as effective and less likely to cause irritation. Docusate sodium or urea-hydrogen peroxide are ingredients in a number of proprietary preparations for softening ear wax.

If necessary, wax may be removed by irrigation with water (warmed to body temperature). Ear irrigation is generally best avoided in young children, in patients unable to co-operate with the procedure, in those with otitis media in the last six weeks, in otitis externa, in patients with cleft palate, a history of ear drum perforation, or previous ear surgery. A person who has hearing in one ear only should not have that ear irrigated because even a very slight risk of damage is unacceptable in this situation.

#### **Almond Oil** (Non-proprietary)

**Ear drops**, almond oil in a suitable container  
Allow to warm to room temperature before use

#### **Olive Oil** (Non-proprietary)

**Ear drops**, olive oil in a suitable container  
Allow to warm to room temperature before use

#### **Sodium Bicarbonate** (Non-proprietary)

**Ear drops**, sodium bicarbonate 5%, net price 10 mL = £1.25

#### **Cerumol**<sup>®</sup> (Thornton & Ross)

**Ear drops**, chlorobutanol 5%, arachis (peanut) oil 57.3%. Net price 11 mL = £2.05

#### **Exterol**<sup>®</sup> (Dermal)

**Ear drops**, urea-hydrogen peroxide complex 5% in glycerol. Net price 8 mL = £1.75

#### **Molcer**<sup>®</sup> (Wallace Mfg)

**Ear drops**, docusate sodium 5%. Net price 15 mL = £8.08

**Excipients** include propylene glycol

#### **Otex**<sup>®</sup> (DDD)

**Ear drops**, urea-hydrogen peroxide 5%. Net price 8 mL = £2.89

#### **Waxsol**<sup>®</sup> (Meda)

**Ear drops**, docusate sodium 0.5%. Net price 10 mL = £1.95

## 12.2 Drugs acting on the nose

### 12.2.1 Drugs used in nasal allergy

### 12.2.2 Topical nasal decongestants

### 12.2.3 Nasal preparations for infection

Rhinitis is often self-limiting but bacterial sinusitis may require treatment with antibacterials (Table 1, section 5.1). There are few indications for nasal sprays and drops except in allergic rhinitis and perennial rhinitis (section 12.2.1). Many nasal preparations contain sympathomimetic drugs which may damage the nasal cilia (section 12.2.2). **Sodium chloride 0.9%** solution may be used as a douche or 'sniff' following endonasal surgery.

**Nasal polyps** Short-term use of corticosteroid nasal drops helps to shrink nasal polyps; to be effective, the drops must be administered with the patient in the 'head down' position. A short course of a systemic corticosteroid (section 6.3.2) may be required initially to shrink large polyps. A corticosteroid nasal spray can be used to maintain the reduction in swelling and also for the initial treatment of small polyps.

### 12.2.1 Drugs used in nasal allergy

Mild allergic rhinitis is controlled by **antihistamines** (see also section 3.4.1) or topical **nasal corticosteroids**; systemic nasal decongestants are of doubtful value (section 3.10). Topical nasal decongestants can be used for a short period to relieve congestion and allow penetration of a topical nasal corticosteroid.

More persistent symptoms and nasal congestion can be relieved by topical nasal **corticosteroids**; **sodium cromoglicate** is an alternative, but may be less effective. The topical antihistamine **azelastine** is useful for controlling breakthrough symptoms in allergic rhinitis. Topical antihistamines are considered less effective than topical corticosteroids but probably more effective than cromoglicate. In seasonal allergic rhinitis (e.g. hay fever), treatment should begin 2 to 3 weeks before the season commences and may have to be continued for several months; continuous treatment may be required for years in perennial rhinitis.

**Montelukast** (section 3.3.2) is less effective than topical nasal corticosteroids; montelukast can be used in patients with seasonal allergic rhinitis and concomitant asthma.

Sometimes allergic rhinitis is accompanied by vasomotor rhinitis. In this situation, the addition of topical nasal ipratropium bromide (section 12.2.2) can reduce watery rhinorrhoea.

Very disabling symptoms occasionally justify the use of **systemic corticosteroids** for short periods (section 6.3), for example, in students taking important examinations. They may also be used at the beginning of a course of treatment with a corticosteroid spray to relieve severe mucosal oedema and allow the spray to penetrate the nasal cavity.

**Pregnancy** If a pregnant woman cannot tolerate the symptoms of allergic rhinitis, treatment with nasal beclomethasone, budesonide, fluticasone, or sodium cromoglicate may be considered.

## Antihistamines

### AZELASTINE HYDROCHLORIDE

**Indications** allergic rhinitis

**Side-effects** irritation of nasal mucosa; bitter taste (if applied incorrectly); *very rarely* hypersensitivity reactions including rash, pruritus, and urticaria

**Rhinolast**<sup>®</sup> (Meda) (PoM)

**Nasal spray**, azelastine hydrochloride 140 micrograms (0.14 mL)/metered spray. Net price 22 mL (157-spray unit with metered pump) = £10.46

**Excipients** include sodium edetate

**Dose ADULT and CHILD** over 5 years, 140 micrograms (1 spray) into each nostril twice daily

**Note** Preparations of azelastine hydrochloride can be sold to the public for nasal administration in aqueous form (other

than by aerosol) if supplied for the treatment of seasonal allergic rhinitis or perennial allergic rhinitis in adults and children over 5 years, subject to max. single dose of 140 micrograms per nostril, max. daily dose of 280 micrograms per nostril, and a pack size limit of 36 doses

## Corticosteroids

Nasal preparations containing corticosteroids (beclomethasone, betamethasone, budesonide, fluticasone, mometasone, and triamcinolone) have a useful role in the prophylaxis and treatment of allergic rhinitis (see notes above).

**Cautions** Corticosteroid nasal preparations should be avoided in the presence of untreated nasal infections, and also after nasal surgery (until healing has occurred); they should also be avoided in pulmonary tuberculosis. Patients transferred from systemic corticosteroids may experience exacerbation of some symptoms. Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; for cautions and side-effects of systemic corticosteroids, see section 6.3.2. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays. The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered.

**Side-effects** Local side-effects include dryness, irritation of nose and throat, and epistaxis. Nasal ulceration has been reported, but occurs commonly with nasal preparations containing fluticasone furoate or mometasone furoate. Nasal septal perforation (usually following nasal surgery) occurs very rarely. Raised intra-ocular pressure or glaucoma may occur rarely. Headache, smell and taste disturbances may also occur. Hyperactivity, sleep disturbances, anxiety, depression, and aggression have been reported particularly in children. Hypersensitivity reactions, including bronchospasm, have been reported.

## BECLOMETASONE DIPROPIONATE

(Beclomethasone Dipropionate)

**Indications** prophylaxis and treatment of allergic and vasomotor rhinitis

**Cautions** see notes above

**Side-effects** see notes above

### Dose

- **ADULT and CHILD** over 6 years, 100 micrograms (2 sprays) into each nostril twice daily; max. total 400 micrograms (8 sprays) daily; when symptoms controlled, dose reduced to 50 micrograms (1 spray) into each nostril twice daily

**Beclomethasone** (Non-proprietary) (PoM)

**Nasal spray**, beclomethasone dipropionate 50 micrograms/metered spray. Net price 200-spray unit = £2.12

**Brands include** *Nasobec Aqueous*<sup>®</sup>

**Note** Preparations of beclomethasone dipropionate can be sold to the public for nasal administration as a nasal spray if supplied for the prevention and treatment of allergic rhinitis in adults over 18 years subject to max. single dose of 100 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. 3 months, and a pack size of 20 mg

**Beconase<sup>®</sup>** (A&H) **[PoM]**

**Nasal spray** (aqueous suspension), beclomethasone dipropionate 50 micrograms/metered spray. Net price 200-spray unit with applicator = £2.19  
**Excipients** include benzalkonium chloride, polysorbate 80

**BETAMETHASONE SODIUM PHOSPHATE**

**Indications** non-infected inflammatory conditions of nose

**Cautions** see notes above

**Side-effects** see notes above

**Betneso<sup>®</sup>** (RPH) **[PoM]**

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%, net price 10 mL = £2.32  
**Excipients** include benzalkonium chloride, disodium edetate  
**Dose** nose, 2–3 drops into each nostril 2–3 times daily; ear, section 12.1.1; eye, section 11.4.1

**Vistamethasone<sup>®</sup>** (Martindale) **[PoM]**

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%. Net price 5 mL = £1.02, 10 mL = £1.16  
**Excipients** include benzalkonium chloride, disodium edetate  
**Dose** nose, 2–3 drops into each nostril twice daily; ear, section 12.1.1; eye, section 11.4.1

**BUDESONIDE**

**Indications** prophylaxis and treatment of allergic and vasomotor rhinitis; nasal polyps

**Cautions** see notes above; **interactions:** Appendix 1 (corticosteroids)

**Side-effects** see notes above

**Dose**

- See preparations

**Budesonide** (Non-proprietary) **[PoM]**

**Nasal spray**, budesonide 100 micrograms/metered spray, net price 100-spray unit = £5.90  
**Dose** rhinitis, **ADULT** and **CHILD** over 12 years, 200 micrograms (2 sprays) into each nostril once daily in the morning or 100 micrograms (1 spray) into each nostril twice daily; when control achieved reduce to 100 micrograms (1 spray) into each nostril once daily  
 Nasal polyps, **ADULT** and **CHILD** over 12 years, 100 micrograms (1 spray) into each nostril twice daily for up to 3 months  
**Note** Preparations of budesonide can be sold to the public for nasal administration as a nasal spray if supplied for the prevention and treatment of seasonal allergic rhinitis in adults over 18 years subject to max. single dose of 200 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. period of 3 months, and a pack size of 10 mg

**Rhinocort Aqua<sup>®</sup>** (AstraZeneca) **[PoM]**

**Nasal spray**, budesonide 64 micrograms/metered spray. Net price 120-spray unit = £3.49  
**Excipients** include disodium edetate, polysorbate 80, potassium sorbate  
**Dose** rhinitis, **ADULT** and **CHILD** over 12 years, 128 micrograms (2 sprays) into each nostril once daily in the morning or 64 micrograms (1 spray) into each nostril twice daily; when control achieved reduce to 64 micrograms (1 spray) into each nostril once daily; max. duration of treatment 3 months  
 Nasal polyps, **ADULT** and **CHILD** over 12 years, 64 micrograms (1 spray) into each nostril twice daily for up to 3 months

**FLUTICASONE PROPIONATE**

**Indications** prophylaxis and treatment of allergic rhinitis and perennial rhinitis; nasal polyps

**Cautions** see notes above; **interactions:** Appendix 1 (corticosteroids)

**Side-effects** see notes above

**Dose**

- Rhinitis, 100 micrograms (2 sprays) into each nostril once daily, preferably in the morning, increased to max. twice daily if required; when control achieved reduce to 50 micrograms (1 spray) into each nostril once daily; **CHILD** 4–11 years, 50 micrograms (1 spray) into each nostril once daily, preferably in the morning, increased to max. twice daily if required
- Nasal polyps, see *Flixonase Nasule<sup>®</sup>* below

**Flixonase<sup>®</sup>** (A&H) **[PoM]**

**Aqueous nasal spray**, fluticasone propionate 50 micrograms/metered spray. Net price 150-spray unit with applicator = £11.01

**Excipients** include benzalkonium chloride, polysorbate 80  
**Note** Preparations of fluticasone propionate can be sold to the public for nasal administration (other than by pressurised nasal spray) if supplied for the prevention and treatment of allergic rhinitis in adults over 18 years, subject to max. single dose of 100 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. 3 months, and a pack size of 3 mg

**Flixonase Nasule<sup>®</sup>** (A&H) **[PoM]**

**Nasal drops**, fluticasone propionate 400 micrograms/unit dose, net price 28 × 0.4-mL units = £12.99

**Excipients** include polysorbate 20

**Dose** nasal polyps, **ADULT** and **ADOLESCENT** over 16 years, 200 micrograms (approx. 6 drops) into each nostril once or twice daily; consider alternative treatment if no improvement after 4–6 weeks

**Nasofan<sup>®</sup>** (TEVA UK) **[PoM]**

**Aqueous nasal spray** fluticasone propionate 50 micrograms/metered spray. Net price 150-spray unit = £8.04

**Excipients** include benzalkonium chloride, polysorbate 80

**With azelastine hydrochloride****Dymista<sup>®</sup>** (Meda) **[PoM]**

**Nasal spray**, fluticasone propionate 50 micrograms, azelastine hydrochloride 137 micrograms/metered spray, net price 120-spray unit = £18.91

**Excipients** include benzalkonium chloride, polysorbate 80

**Dose** moderate to severe seasonal and perennial allergic rhinitis, if monotherapy with antihistamine or corticosteroid is inadequate, **ADULT** and **CHILD** over 12 years, 1 spray into each nostril twice daily

**Fluticasone furoate****Avamys<sup>®</sup>** (GSK) **[PoM]**

**Nasal spray**, fluticasone furoate 27.5 micrograms/metered spray, net price 120-spray unit = £6.44

**Excipients** include benzalkonium chloride, disodium edetate, polysorbate 80

**Dose** prophylaxis and treatment of allergic rhinitis, **ADULT** and **CHILD** over 12 years, 55 micrograms (2 sprays) into each nostril once daily; when control achieved reduce to minimum effective dose, 27.5 micrograms (1 spray) into each nostril once daily may be sufficient; **CHILD** 6–12 years, 27.5 micrograms (1 spray) into each nostril once daily, increased if necessary to 55 micrograms (2 sprays) into each nostril once daily; when control achieved reduce to 27.5 micrograms (1 spray) into each nostril once daily

## MOMETASONE FUROATE

**Indications** prophylaxis and treatment of allergic rhinitis; nasal polyps

**Cautions** see notes above

**Side-effects** see notes above

### Dose

- Rhinitis, **ADULT** and **CHILD** over 12 years, 100 micrograms (2 sprays) into each nostril once daily, increased if necessary to max. 200 micrograms (4 sprays) into each nostril once daily; when control achieved reduce to 50 micrograms (1 spray) into each nostril once daily
- Nasal polyps, **ADULT** over 18 years, 100 micrograms (2 sprays) into each nostril once daily, increased if necessary after 5–6 weeks to 100 micrograms (2 sprays) into each nostril twice daily (consider alternative treatment if no improvement after further 5–6 weeks); reduce to the lowest effective dose when control achieved

**Mometasone** (Non-proprietary) PoM

**Nasal spray**, mometasone furoate 50 micrograms/ metered spray, net price 140-spray unit = £7.60

**Excipients** include benzalkonium chloride, polysorbate 80

**Nasonex**<sup>®</sup> (MSD) PoM

**Nasal spray**, mometasone furoate 50 micrograms/ metered spray, net price 140-spray unit = £7.68

**Excipients** include benzalkonium chloride, polysorbate 80

## TRIAMCINOLONE ACETONIDE

**Indications** prophylaxis and treatment of allergic rhinitis

**Cautions** see notes above

**Side-effects** see notes above

**Nasacort**<sup>®</sup> (Sanofi-Aventis) PoM

**Aqueous nasal spray**, triamcinolone acetonide 55 micrograms/metered spray. Net price 120-spray unit = £7.39

**Excipients** include benzalkonium chloride, disodium edetate, polysorbate 80

**Dose** **ADULT** and **CHILD** over 12 years, 110 micrograms (2 sprays) into each nostril once daily; when control achieved, reduce to 55 micrograms (1 spray) into each nostril once daily; **CHILD** 6–12 years, 55 micrograms (1 spray) into each nostril once daily, increased if necessary to 110 micrograms (2 sprays) into each nostril once daily; when control achieved, reduce to 55 micrograms (1 spray) into each nostril once daily; max. duration of treatment 3 months; **CHILD** 2–6 years see *BNF for Children*

**Note** Preparations of triamcinolone acetonide can be sold to the public for nasal administration as a non-pressurised nasal spray if supplied for the symptomatic treatment of seasonal allergic rhinitis in adults over 18 years, subject to max. daily dose of 110 micrograms per nostril for max. 3 months, and a pack size of 3.575 mg

## Cromoglicate

## SODIUM CROMOGLICATE

(Sodium Cromoglycate)

**Indications** prophylaxis of allergic rhinitis

**Side-effects** local irritation; rarely transient bronchospasm

**Rynacrom**<sup>®</sup> (Sanofi-Aventis)

**4% aqueous nasal spray**, sodium cromoglicate 4% (5.2 mg/spray). Net price 22 mL (150-spray unit with pump) = £17.07

**Excipients** include benzalkonium chloride, disodium edetate

**Dose** **ADULT** and **CHILD**, 1 spray into each nostril 2–4 times daily

## 12.2.2 Topical nasal decongestants

The nasal mucosa is sensitive to changes in atmospheric temperature and humidity and these alone may cause slight nasal congestion. The nose and nasal sinuses produce a litre of mucus in 24 hours and much of this finds its way silently into the stomach via the nasopharynx. Slight changes in the nasal airway, accompanied by an awareness of mucus passing along the nasopharynx causes some patients to be inaccurately diagnosed as suffering from chronic sinusitis. These symptoms are particularly noticeable in the later stages of the common cold. **Sodium chloride** 0.9% given as nasal drops or spray may relieve nasal congestion by helping to liquefy mucous secretions.

Inhalation of **warm moist air** is useful in the treatment of symptoms of acute infective conditions. The addition of volatile substances such as menthol and eucalyptus may encourage the use of warm moist air (section 3.8).

Symptoms of nasal congestion associated with vasomotor rhinitis and the common cold can be relieved by the short-term use (usually not longer than 7 days) of decongestant nasal drops and sprays. These all contain sympathomimetic drugs which exert their effect by vasoconstriction of the mucosal blood vessels which in turn reduces oedema of the nasal mucosa. They are of limited value because they can give rise to a rebound congestion (rhinitis medicamentosa) on withdrawal, due to a secondary vasodilatation with a subsequent temporary increase in nasal congestion. This in turn tempts the further use of the decongestant, leading to a vicious cycle of events. **Ephedrine nasal drops** is the safest sympathomimetic preparation and can give relief for several hours. The more potent sympathomimetic drugs oxymetazoline and xylometazoline are more likely to cause a rebound effect. Sympathomimetics may cause a hypertensive crisis if used during treatment with a monoamine-oxidase inhibitor including moclobemide.

The CHM/MHRA has stated that non-prescription cough and cold medicines containing ephedrine, oxymetazoline, or xylometazoline can be considered for up to 5 days in children aged 6–12 years after basic principles of best care have been tried; these medicines should not be used in children under 6 years of age (section 3.9.1).

Non-allergic watery rhinorrhoea often responds well to treatment with the antimuscarinic **ipratropium bromide**.

Systemic nasal decongestants—see section 3.10.

**Sinusitis and oral pain** Sinusitis affecting the maxillary antrum can cause pain in the upper jaw. Where this is associated with blockage of the opening from the sinus into the nasal cavity, it may be helpful to relieve the congestion with inhalation of warm moist air (section 3.8) or with **ephedrine nasal drops** (see above). For antibacterial treatment of sinusitis, see Table 1, section 5.1.

## Sympathomimetics

### EPHEDRINE HYDROCHLORIDE

**Indications** nasal congestion

**Cautions** see section 3.1.1.2 and notes above; also avoid excessive or prolonged use; **interactions:** Appendix 1 (sympathomimetics)

**Pregnancy** see section 3.1.1.2

**Breast-feeding** see section 3.1.1.2

**Side-effects** local irritation, nausea, headache; after excessive use tolerance with diminished effect, rebound congestion; cardiovascular effects also reported

#### Dose

- See below

#### <sup>1</sup>Ephedrine (Non-proprietary)

**Nasal drops**, ephedrine hydrochloride 0.5%, net price 10 mL = £1.49; 1%, 10 mL = £1.54

**Note** The BP directs that if no strength is specified 0.5% drops should be supplied

**Dose ADULT** and **CHILD** over 12 years, 1–2 drops into each nostril up to 4 times daily when required, max. duration 7 days

**Dental prescribing on NHS** Ephedrine nasal drops may be prescribed

### XYLOMETAZOLINE HYDROCHLORIDE

**Indications** nasal congestion

**Cautions** see under Ephedrine Hydrochloride section 3.1.1.2 and notes above; also angle-closure glaucoma; avoid excessive or prolonged use

**Pregnancy** manufacturer advises avoid

**Breast-feeding** manufacturer advises caution—no information available

**Side-effects** see under Ephedrine Hydrochloride and notes above; also reported transient visual disturbances; in small children, also restlessness, sleep disturbances, and hallucinations (discontinue treatment)

#### Dose

- See below

#### Xylometazoline (Non-proprietary)

**Nasal drops**, xylometazoline hydrochloride 0.1%, net price 10 mL = £2.10

**Brands include** *Otradrops*<sup>®</sup>, *Otrivine*<sup>®</sup> 

**Dose** 2–3 drops into each nostril 2–3 times daily when required; max. duration 7 days; not recommended for children under 12 years

**Paediatric nasal drops**, xylometazoline hydrochloride 0.05%, net price 10 mL = £1.91

**Brands include** *Otradrops*<sup>®</sup>, *Otrivine*<sup>®</sup> 

**Dose CHILD** 6–12 years 1–2 drops into each nostril 1–2 times daily when required; max. duration 5 days

**Nasal spray**, xylometazoline hydrochloride 0.1%, net price 10 mL = £2.10

**Brands include** *Otrivine*<sup>®</sup> , *Otrivine*<sup>®</sup> Allergy Relief

**Dose** 1 spray into each nostril 1–3 times daily when required; max. duration 7 days; not recommended for children under 12 years

1. Can be sold to the public provided no more than 180 mg of ephedrine base (or salts) are supplied at one time, and pseudoephedrine salts are not supplied at the same time; for conditions that apply to supplies made at the request of a patient, see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition)

## Antimuscarinic

### IPRATROPIUM BROMIDE

**Indications** rhinorrhoea associated with allergic and non-allergic rhinitis

**Cautions** see section 3.1.2; avoid spraying near eyes

**Side-effects** epistaxis, nasal dryness, and irritation; less frequently nausea, headache, and pharyngitis; *very rarely* antimuscarinic effects such as gastrointestinal motility disturbances, palpitations, and urinary retention

#### Dose

- **ADULT** and **CHILD** over 12 years, 42 micrograms (2 sprays) into each nostril 2–3 times daily

**Rinatec**<sup>®</sup> (Boehringer Ingelheim) 

**Nasal spray 0.03%**, ipratropium bromide 21 micrograms/metered spray. Net price 180-dose unit = £6.54

**Excipients** include benzalkonium chloride, disodium edetate

## 12.2.3 Nasal preparations for infection

There is **no** evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis or sinusitis; for elimination of nasal staphylococci, see below.

Systemic treatment of sinusitis—see Table 1 section 5.1.

**Betnesol-N**<sup>®</sup> (RPH)  

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%, neomycin sulfate 0.5%. Net price 10 mL = £2.39

**Excipients** include benzalkonium chloride, disodium edetate

**Dose nose**, 2–3 drops into each nostril 2–3 times daily; **eye**, section 11.4.1; **ear**, section 12.1.1

## Nasal staphylococci

Elimination of organisms such as staphylococci from the nasal vestibule can be achieved by the use of a cream containing **chlorhexidine** and **neomycin** (*Naseptin*<sup>®</sup>), but re-colonisation frequently occurs. Coagulase-positive staphylococci are present in the noses of 40% of the population.

A nasal ointment containing **mupirocin** is also available; it should probably be held in reserve for resistant cases. In hospital or in care establishments, mupirocin nasal ointment should be reserved for the eradication (in both patients and staff) of nasal carriage of meticillin-resistant *Staphylococcus aureus* (MRSA). The ointment should be applied 3 times daily for 5 days and a sample taken 2 days after treatment to confirm eradication. The course may be repeated if the sample is positive (and the throat is not colonised). To avoid the development of resistance, the treatment course should not exceed 7 days and the course should not be repeated on more than one occasion. If the MRSA strain is mupirocin-resistant or does not respond after 2 courses, consider alternative products such as chlorhexidine and neomycin cream.

**Bactroban Nasal**® (GSK) (PoM)

**Nasal ointment**, mupirocin 2% (as calcium salt) in white soft paraffin basis. Net price 3 g = £3.54

**Dose** for eradication of nasal carriage of staphylococci, including methicillin-resistant *Staphylococcus aureus* (MRSA), apply 2–3 times daily to the inner surface of each nostril

**Naseptin**® (Alliance) (PoM)

**Cream**, chlorhexidine hydrochloride 0.1%, neomycin sulfate 0.5%, net price 15 g = £1.90

**Excipients** include arachis (peanut) oil, cetostearyl alcohol  
**Dose** for eradication of nasal carriage of staphylococci, apply to nostrils 4 times daily for 10 days; for preventing nasal carriage of staphylococci, apply to nostrils twice daily

## 12.3 Drugs acting on the oropharynx

- 12.3.1 **Drugs for oral ulceration and inflammation**
- 12.3.2 **Oropharyngeal anti-infective drugs**
- 12.3.3 **Lozenges and sprays**
- 12.3.4 **Mouthwashes, gargles, and dentifrices**
- 12.3.5 **Treatment of dry mouth**

### 12.3.1 Drugs for oral ulceration and inflammation

Ulceration of the oral mucosa may be caused by trauma (physical or chemical), recurrent aphthae, infections, carcinoma, dermatological disorders, nutritional deficiencies, gastro-intestinal disease, haematopoietic disorders, and drug therapy (see also Chemotherapy-induced mucositis and myelosuppression, section 8.1). It is important to establish the diagnosis in each case as the majority of these lesions require specific management in addition to local treatment. Local treatment aims to protect the ulcerated area, to relieve pain, to reduce inflammation, or to control secondary infection. Patients with an unexplained mouth ulcer of more than 3 weeks' duration require urgent referral to hospital to exclude oral cancer.

**Simple mouthwashes** A saline mouthwash (section 12.3.4) may relieve the pain of traumatic ulceration. The mouthwash is made up with warm water and used at frequent intervals until the discomfort and swelling subsides.

**Antiseptic mouthwashes** Secondary bacterial infection may be a feature of any mucosal ulceration; it can increase discomfort and delay healing. Use of **chlorhexidine** mouthwash (section 12.3.4) is often beneficial and may accelerate healing of recurrent aphthae.

**Corticosteroids** Topical corticosteroid therapy may be used for some forms of oral ulceration. In the case of aphthous ulcers it is most effective if applied in the 'prodromal' phase.

Thrush or other types of candidiasis are recognised complications of corticosteroid treatment.

**Hydrocortisone oromucosal tablets** are allowed to dissolve next to an ulcer and are useful in recurrent aphthae and erosive lichenoid lesions.

**Beclometasone dipropionate** inhaler 50–100 micrograms sprayed twice daily on the oral mucosa is used to manage oral ulceration [unlicensed indication]. Alternatively, **betamethasone** soluble tablets dissolved in water can be used as a mouthwash to treat oral ulceration [unlicensed indication].

Systemic corticosteroid therapy (section 6.3.2) is reserved for severe conditions such as pemphigus vulgaris.

**Local analgesics** Local analgesics have a limited role in the management of oral ulceration. When applied topically their action is of a relatively short duration so that analgesia cannot be maintained continuously throughout the day. The main indication for a topical local analgesic is to relieve the pain of otherwise intractable oral ulceration particularly when it is due to major aphthae. For this purpose lidocaine 5% ointment or lozenges containing a local anaesthetic are applied to the ulcer. Lidocaine 10% solution as spray (section 15.2) can be applied thinly to the ulcer [unlicensed indication] using a cotton bud. When local anaesthetics are used in the mouth care must be taken not to produce anaesthesia of the pharynx before meals as this might lead to choking.

**Benzydamine** and **Flurbiprofen** are non-steroidal anti-inflammatory drugs (NSAIDs). Benzydamine mouthwash or spray may be useful in reducing the discomfort associated with a variety of ulcerative conditions. It has also been found to be effective in reducing the discomfort of post-irradiation mucositis. Some patients find the full-strength mouthwash causes some stinging and, for them, it should be diluted with an equal volume of water. Flurbiprofen lozenges are licensed for the relief of sore throat.

**Choline salicylate** is a derivative of salicylic acid and has some analgesic action. The dental gel may provide relief for recurrent aphthae, but excessive application or confinement under a denture irritates the mucosa and can itself cause ulceration.

**Other preparations** Doxycycline rinsed in the mouth may be of value for recurrent aphthous ulceration.

**Periodontitis** Low-dose doxycycline (*Periostat*®) is used as an adjunct to scaling and root planning for the treatment of periodontitis; a low dose of doxycycline reduces collagenase activity without inhibiting bacteria associated with periodontitis. For anti-infectives used in the treatment of destructive (refractory) forms of periodontal disease, see section 12.3.2 and Table 1, section 5.1. For mouthwashes used for oral hygiene and plaque inhibition, see section 12.3.4.

## BENZDAMINE HYDROCHLORIDE

**Indications** painful inflammatory conditions of oropharynx

**Side-effects** occasional numbness or stinging; rarely hypersensitivity reactions

### Dose

- As a mouthwash (benzydamine hydrochloride 0.15%), **ADULT** and **CHILD** over 13 years, rinse or gargle, using 15 mL (dilute with an equal volume of water if stinging occurs) every 1½–3 hours as required, usually for not more than 7 days
- As an oromucosal spray (benzydamine hydrochloride 0.15%), **ADULT** and **CHILD** over 12 years,

4–8 sprays onto affected area every 1½–3 hours;  
**CHILD** under 6 years 1 spray per 4 kg body-weight to  
 max. 4 sprays every 1½–3 hours; 6–12 years 4 sprays  
 every 1½–3 hours

#### **Benzydamine hydrochloride** (Non-proprietary)

**Mouthwash**, benzydamine hydrochloride 0.15%, net  
 price 300 mL = £6.45

**Brands include** *Oroze*®

**Oromucosal spray**, benzydamine hydrochloride  
 0.15%, net price 30 mL = £4.24

**Brands include** *Oroze*®

**Dental prescribing on NHS** Benzydamine Oromucosal  
 Spray 0.15% may be prescribed

#### **Diffiam**® (Meda)

**Mouthwash (oral rinse)**, green, benzydamine hydro-  
 chloride 0.15%, net price 200 mL (*Diffiam*® *Sore*  
*Throat Rinse*) = £4.64; 300 mL = £6.50

**Dental prescribing on NHS** May be prescribed as  
 Benzydamine Mouthwash 0.15%

**Oromucosal spray**, benzydamine hydrochloride  
 0.15%, net price 30-mL unit = £4.24

## CORTICOSTEROIDS

**Indications** oral and perioral lesions

**Contra-indications** untreated oral infection

**Side-effects** occasional exacerbation of local infec-  
 tion; thrush or other candidal infections

#### **Betamethasone** (Non-proprietary) (PoM)

**Soluble tablets**, betamethasone 500 micrograms (as  
 sodium phosphate), net price 100-tab pack =

£19.52. Label: 10, 13, counselling, administration

**Dose** oral ulceration, [unlicensed indication] **ADULT** and  
**CHILD** over 12 years, 500 micrograms dissolved in 20 mL  
 water and rinsed around the mouth 4 times daily; not to  
 be swallowed

**Dental prescribing on NHS** Betamethasone Soluble  
 Tablets 500 micrograms may be prescribed

#### **Hydrocortisone** (Non-proprietary)

**Mucoadhesive buccal tablets** (= oromucosal  
 tablets), hydrocortisone 2.5 mg (as sodium succinate).  
 Net price 20 = £4.24

**Dose** **ADULT** and **CHILD** over 12 years, 1 lozenge 4 times  
 daily, allowed to dissolve slowly in the mouth in contact  
 with the ulcer; **CHILD** under 12 years, only on medical  
 advice

**Dental prescribing on NHS** May be prescribed as  
 Hydrocortisone Oromucosal Tablets

## DOXYCYCLINE

**Indications** see preparations; other indications (sec-  
 tion 5.1.3)

**Cautions** section 5.1.3; monitor for superficial fungal  
 infection, particularly if predisposition to oral candi-  
 diasis

**Contra-indications** section 5.1.3

**Hepatic impairment** section 5.1.3

**Renal impairment** section 5.1.3

**Pregnancy** section 5.1.3

**Breast-feeding** section 5.1.3

**Side-effects** section 5.1.3; fungal superinfection

#### **Dose**

• See preparations

**Note** Doxycycline stains teeth; avoid in children under 12  
 years of age

#### **Periostat**® (Alliance) (PoM)

**Tablets**, f/c, doxycycline (as hyclate) 20 mg, net  
 price 56-tab pack = £17.30. Label: 6, 11, 27, coun-  
 selling, posture

**Dose** periodontitis (as an adjunct to gingival scaling and  
 root planing), 20 mg twice daily for 3 months; **CHILD** under  
 12 years not recommended

**Counselling** Tablets should be swallowed whole with  
 plenty of fluid (at least 100 mL), while sitting or standing

**Dental prescribing on NHS** May be prescribed as  
 Doxycycline Tablets 20 mg

**Note** May be difficult to obtain

#### Local application

For recurrent aphthous ulceration, a 100 mg doxycy-  
 cline dispersible tablet can be stirred into a small  
 amount of water then rinsed around the mouth for 2–  
 3 minutes 4 times daily usually for 3 days; it should  
 preferably not be swallowed [unlicensed indication].

## FLURBIPROFEN

**Indications** relief of sore throat

**Cautions** section 10.1.1

**Contra-indications** section 10.1.1

**Hepatic impairment** section 10.1.1

**Renal impairment** section 10.1.1

**Pregnancy** section 10.1.1

**Breast-feeding** section 10.1.1

**Side-effects** taste disturbance, mouth ulcers (move  
 lozenge around mouth); see also section 10.1.1

#### **Strefen**® (Reckitt Benckiser)

**Lozenges**, flurbiprofen 8.75 mg, net price 16 = £2.58

**Dose** **ADULT** and **CHILD** over 12 years, allow 1 lozenge to  
 dissolve slowly in the mouth every 3–6 hours, max. 5  
 lozenges in 24 hours, for max. 3 days

## LOCAL ANAESTHETICS

**Indications** relief of pain in oral lesions

**Cautions** avoid prolonged use; hypersensitivity; avoid  
 anaesthesia of the pharynx before meals—risk of  
 choking

**Hepatic impairment** see Lidocaine section 2.3.2

**Renal impairment** see Lidocaine section 2.3.2

**Pregnancy** see Lidocaine section 15.2

**Breast-feeding** see Lidocaine section 2.3.2

#### **Lidocaine** (Non-proprietary)

**Ointment**, lidocaine 5% in a water-miscible basis,  
 net price 15 g = £6.18

**Dose** rub sparingly and gently on affected areas

**Dental prescribing on NHS** Lidocaine 5% Ointment may  
 be prescribed

#### **Xylocaïne**® (AstraZeneca)

**Spray** (= pump spray), lidocaine 10% (100 mg/g)  
 supplying 10 mg lidocaine/spray; 500 spray doses  
 per container. Net price 50-mL bottle = £6.29

**Dose** apply thinly to the ulcer [unlicensed indication]  
 using a cotton bud

**Dental prescribing on NHS** May be prescribed as  
 Lidocaine Spray 10%

#### Preparations on sale to the public

Many mouth ulcer preparations, throat lozenges, and  
 throat sprays on sale to the public contain a **local**  
**anaesthetic**. To identify the active ingredients in such  
 preparations, consult the product literature of the  
 manufacturer.

**Note** The correct proprietary name should be ascertained—  
 many products have very similar names but different active  
 ingredients

## SALICYLATES

**Indications** mild oral and perioral lesions

**Cautions** not to be applied to dentures—leave at least 30 minutes before re-insertion of dentures; frequent application, especially in children, may give rise to salicylate poisoning

**Contra-indications** children under 16 years

**Reye's syndrome** The CHM has advised that topical oral pain relief products containing salicylate salts should not be used in children under 16 years, as a cautionary measure due to the theoretical risk of Reye's syndrome

**Side-effects** transient local burning sensation

### Choline salicylate

#### Choline Salicylate Dental Gel, BP

Oral gel, choline salicylate 8.7% in a flavoured gel basis, net price 15 g = £2.26

**Brands include** *Bonjela*® (sugar-free)

**Dose** ADULT and CHILD over 16 years, apply ½-inch of gel with gentle massage not more often than every 3 hours

**Dental prescribing on NHS** Choline Salicylate Dental Gel may be prescribed

### Salicylic acid

**Pyralvex**® (Meda)

Oral paint, brown, rhubarb extract (anthraquinone glycosides 0.5%), salicylic acid 1%. Net price 10 mL with brush = £3.25

**Dose** ADULT and CHILD over 16 years, apply 3–4 times daily; max. duration 7 days

**Note** May cause temporary discolouration of teeth and oral mucosa

## 12.3.2 Oropharyngeal anti-infective drugs

The most common cause of a sore throat is a viral infection which does not benefit from anti-infective treatment. Streptococcal sore throats require systemic penicillin therapy (Table 1, section 5.1). Acute ulcerative gingivitis (Vincent's infection) responds to systemic metronidazole (section 5.1.11).

Preparations administered in the dental surgery for the local treatment of periodontal disease include gels of metronidazole (*Elyzol*®, Colgate-Palmolive) and of minocycline (*Dentomycin*®, Blackwell).

### Oropharyngeal fungal infections

Fungal infections of the mouth are usually caused by *Candida* spp. (candidiasis or candidosis). Different types of oropharyngeal candidiasis are managed as follows:

**Thrush** Acute pseudomembranous candidiasis (thrush), is usually an acute infection but it may persist for months in patients receiving inhaled corticosteroids, cytotoxics or broad-spectrum antibacterials. Thrush also occurs in patients with serious systemic disease associated with reduced immunity such as leukaemia, other malignancies, and HIV infection. Any predisposing condition should be managed appropriately. When thrush is associated with corticosteroid inhalers, rinsing the mouth with water (or cleaning a child's teeth) immediately after using the inhaler may avoid the problem. Treatment with nystatin or miconazole may be needed. Fluconazole (section 5.2.1) is effective for unresponsive infections or if a topical antifungal drug cannot be used or if the patient has dry mouth. Topical therapy may not be adequate in immunocompromised

patients and an oral triazole antifungal is preferred (section 5.2.1).

**Acute erythematous candidiasis** Acute erythematous (atrophic) candidiasis is a relatively uncommon condition associated with corticosteroid and broad-spectrum antibacterial use and with HIV disease. It is usually treated with fluconazole (section 5.2.1).

**Denture stomatitis** Patients with denture stomatitis (chronic atrophic candidiasis), should cleanse their dentures thoroughly and leave them out as often as possible during the treatment period. To prevent recurrence of the problem, dentures should not normally be worn at night. New dentures may be required if these measures fail despite good compliance.

**Miconazole** oral gel can be applied to the fitting surface of the denture before insertion (for short periods only). Denture stomatitis is not always associated with candidiasis and other factors such as mechanical or chemical irritation, bacterial infection, or rarely allergy to the dental base material, may be the cause.

**Chronic hyperplastic candidiasis** Chronic hyperplastic candidiasis (candidal leucoplakia) carries an increased risk of malignancy; biopsy is essential—this type of candidiasis may be associated with varying degrees of dysplasia, with oral cancer present in a high proportion of cases. Chronic hyperplastic candidiasis is treated with a systemic antifungal such as fluconazole (section 5.2.1) to eliminate candidal overgrowth. Patients should avoid the use of tobacco.

**Angular cheilitis** Angular cheilitis (angular stomatitis) is characterised by soreness, erythema and fissuring at the angles of the mouth. It is commonly associated with denture stomatitis but may represent a nutritional deficiency or it may be related to orofacial granulomatosis or HIV infection. Both yeasts (*Candida* spp.) and bacteria (*Staphylococcus aureus* and beta-haemolytic streptococci) are commonly involved as interacting, infective factors. A reduction in facial height related to ageing and tooth loss with maceration in the deep occlusive folds that may subsequently arise, predisposes to such infection. While the underlying cause is being identified and treated, it is often helpful to apply miconazole cream (see p. 819) or sodium fusidate ointment (see p. 817); if the angular cheilitis is unresponsive to treatment, miconazole and hydrocortisone cream or ointment (see p. 788) can be used.

**Immunocompromised patients** For advice on prevention of fungal infections in immunocompromised patients see p. 403.

**Drugs used in oropharyngeal candidiasis** Nystatin is not absorbed from the gastro-intestinal tract and is applied locally (as a suspension) to the mouth for treating local fungal infections. Miconazole is applied locally (as an oral gel) in the mouth but it is absorbed to the extent that potential interactions need to be considered. Miconazole also has some activity against Gram-positive bacteria including streptococci and staphylococci. Fluconazole (section 5.2.1) is given by mouth for infections that do not respond to topical therapy or when topical therapy cannot be used. It is reliably absorbed and effective. Itraconazole (section 5.2.1) can be used for fluconazole-resistant infections.

If candidal infection fails to respond to 1 to 2 weeks of treatment with antifungal drugs the patient should be sent for investigation to eliminate the possibility of

underlying disease. Persistent infection may also be caused by reinfection from the genito-urinary or gastro-intestinal tract. Infection can be eliminated from these sources by appropriate anticandidal therapy; the patient's partner may also require treatment to prevent reinfection.

For the role of antiseptic mouthwashes in the prevention of oral candidiasis in immunocompromised patients and treatment of denture stomatitis, see section 12.3.4.

## MICONAZOLE

**Indications** see preparations

**Cautions** avoid in acute porphyria (section 9.8.2);

**interactions:** Appendix 1 (antifungals, imidazole)

**Contra-indications** with oral gel, impaired swallowing reflex in infants, first 5–6 months of life of an infant born preterm

**Hepatic impairment** avoid

**Pregnancy** manufacturer advises avoid if possible—  
toxicity at high doses in animal studies

**Breast-feeding** manufacturer advises caution—no  
information available

**Side-effects** nausea, vomiting; rash; with buccal tablets, abdominal pain, taste disturbance, burning sensation at application site, pruritus, and oedema; with oral gel, very rarely diarrhoea (usually on long-term treatment), hepatitis, toxic epidermal necrolysis, and Stevens-Johnson syndrome

### Dose

- See preparations

#### **Daktarin**<sup>®</sup> (Janssen) (PoM)

Oral gel, sugar-free, orange-flavoured, miconazole 24 mg/mL (20 mg/g). Net price 15-g tube = £2.97, 80-g tube = £4.38. Label: 9, counselling, hold in mouth, after food

**Dose** prevention and treatment of oral candidiasis, by mouth, ADULT and CHILD over 2 years, 2.5 mL 4 times daily after meals, retain near oral lesions before swallowing (dental prostheses should be removed at night and brushed with gel); CHILD under 2 years see *BNF for Children*

Prevention and treatment of intestinal candidiasis, by mouth, ADULT and CHILD over 4 months, 5 mg/kg 4 times daily; max. 250 mg (10 mL) 4 times daily

**Note** Treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared

**Dental prescribing on NHS** May be prescribed as Miconazole Oromucosal Gel

### Buccal preparation

#### **Loramyc**<sup>®</sup> (Therabel) (PoM)

Mucoadhesive buccal tablets, white-yellow, miconazole 50 mg, net price 14-tab pack = £52.12. Label: 10, counselling, administration

**Dose** oropharyngeal candidiasis in immunocompromised ADULT, 50 mg daily preferably taken in the morning for 7 days; if no improvement, continue treatment for a further 7 days

**Counselling** Place rounded side of tablet on upper gum above an incisor tooth and hold upper lip firmly over the gum for 30 seconds using a finger. If tablet detaches within 6 hours, replace with a new tablet. With each dose, use alternate sides of the gum

**Note** The Scottish Medicines Consortium (p. 4) has advised (January 2011) that miconazole mucoadhesive buccal tablets (*Loramyc*<sup>®</sup>) are not recommended for use within NHS Scotland.

1. 15-g tube can be sold to the public

## NYSTATIN

**Indications** oral and perioral fungal infections

**Side-effects** oral irritation and sensitisation, nausea reported

### Dose

- Treatment, ADULT and CHILD, 100 000 units 4 times daily after food, usually for 7 days (continued for 48 hours after lesions have resolved)

**Note** Unlicensed for treating candidiasis in NEONATE

#### **Nystatin** (Non-proprietary) (PoM)

Oral suspension, nystatin 100 000 units/mL, net price 30 mL = £20.46. Label: 9, counselling, use of pipette, hold in mouth, after food

**Dental prescribing on NHS** Nystatin Oral Suspension may be prescribed

#### **Nystan**<sup>®</sup> (Squibb) (PoM)

Oral suspension, yellow, nystatin 100 000 units/mL, net price 30 mL with pipette = £1.80. Label: 9, counselling, use of pipette, hold in mouth, after food

## Oropharyngeal viral infections

The management of primary herpetic gingivostomatitis is a soft diet, adequate fluid intake, and analgesics as required, including local use of **benzydamine** (section 12.3.1). The use of chlorhexidine mouthwash (section 12.3.4) will control plaque accumulation if toothbrushing is painful and will also help to control secondary infection in general.

In the case of severe herpetic stomatitis, a systemic antiviral such as aciclovir is required (section 5.3.2.1). Valaciclovir and famciclovir are suitable alternatives for oral lesions associated with herpes zoster. Aciclovir and valaciclovir are also used for the prevention of frequently recurring herpes simplex lesions of the mouth, particularly when implicated in the initiation of erythema multiforme. See section 13.10.3 for the treatment of labial herpes simplex infections.

## 12.3.3 Lozenges and sprays

There is no convincing evidence that antiseptic lozenges and sprays have a beneficial action and they sometimes irritate and cause sore tongue and sore lips. Some of these preparations also contain local anaesthetics which relieve pain but may cause sensitisation.

## 12.3.4 Mouthwashes, gargles, and dentifrices

Superficial infections of the mouth are often helped by warm mouthwashes which have a mechanical cleansing effect and cause some local hyperaemia. However, to be effective, they must be used frequently and vigorously. A warm saline mouthwash is ideal and can be prepared either by dissolving half a teaspoonful of salt in a glassful of warm water or by diluting **compound sodium chloride mouthwash** with an equal volume of warm water.

Mouthwashes containing an oxidising agent, such as **hydrogen peroxide**, may be useful in the treatment of acute ulcerative gingivitis (Vincent's infection) since the organisms involved are anaerobes. It also has a mechanical cleansing effect arising from frothing when in contact with oral debris.

**Chlorhexidine** is an effective antiseptic which has the advantage of inhibiting plaque formation on the teeth. It does not, however, completely control plaque deposition and is not a substitute for effective toothbrushing. Moreover, chlorhexidine preparations do not penetrate significantly into stagnation areas and are therefore of little value in the control of dental caries or of periodontal disease once pocketing has developed. Chlorhexidine mouthwash is used in the treatment of denture stomatitis. It is also used in the prevention of oral candidiasis in immunocompromised patients. Chlorhexidine mouthwash reduces the incidence of alveolar osteitis following tooth extraction. Chlorhexidine mouthwash should not be used for the prevention of endocarditis in patients undergoing dental procedures.

Chlorhexidine can be used as a mouthwash, spray or gel for secondary infection in mucosal ulceration and for controlling gingivitis, as an adjunct to other oral hygiene measures. These preparations may also be used instead of toothbrushing where there is a painful periodontal condition (e.g. primary herpetic stomatitis) or if the patient has a haemorrhagic disorder, or is disabled. Chlorhexidine preparations are of little value in the control of acute necrotising ulcerative gingivitis.

There is no convincing evidence that gargles are effective.

## CHLORHEXIDINE GLUCONATE

**Indications** see under preparations below

**Side-effects** mucosal irritation (if desquamation occurs, discontinue treatment or dilute mouthwash with an equal volume of water); taste disturbance; reversible brown staining of teeth, and of silicate or composite restorations; tongue discoloration; parotid gland swelling and hypersensitivity (including anaphylaxis) reported

**Note** Chlorhexidine gluconate may be incompatible with some ingredients in toothpaste; rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing product

**Chlorhexidine** (Non-proprietary)

**Mouthwash**, chlorhexidine gluconate 0.2%, net price 300 mL = £3.45

**Dose** oral hygiene and plaque inhibition, oral candidiasis, gingivitis, and management of aphthous ulcers, rinse mouth with 10 mL for about 1 minute twice daily

Denture stomatitis, cleanse and soak dentures in mouthwash solution for 15 minutes twice daily

**Corsodyl**<sup>®</sup> (GSK Consumer Healthcare)

**Dental gel**, chlorhexidine gluconate 1%. Net price 50 g = £1.21

**Dose** oral hygiene and plaque inhibition and gingivitis, brush on the teeth once or twice daily

Oral candidiasis and management of aphthous ulcers, apply to affected areas once or twice daily

**Dental prescribing on NHS** May be prescribed as Chlorhexidine Gluconate Gel

**Mouthwash**, chlorhexidine gluconate 0.2%, net price 300 mL (original or mint) = £2.28, 600 mL (mint) = £3.85; alcohol-free, 300 mL (mint) = £2.73

**Dose** oral hygiene and plaque inhibition, oral candidiasis, gingivitis, and management of aphthous ulcers, rinse mouth with 10 mL for about 1 minute twice daily

Denture stomatitis, cleanse and soak dentures in mouthwash solution for 15 minutes twice daily

**Dental prescribing on NHS** May be prescribed as Chlorhexidine Mouthwash

**Oral spray**, chlorhexidine gluconate 0.2% (mint-flavoured). Net price 60 mL = £4.10

**Dose** oral hygiene and plaque inhibition, oral candidiasis, gingivitis, and management of aphthous ulcers, apply as required to tooth, gingival, or ulcer surfaces using up to 12 actuations (approx. 0.14 mL/actuation) twice daily

**Dental prescribing on NHS** May be prescribed as Chlorhexidine Oral Spray

## With chlorbutanol

**Eludril**<sup>®</sup> (Fabre)

**Mouthwash** or *gargle*, chlorhexidine gluconate 0.1%, chlorbutanol 0.5% (mint-flavoured), net price 90 mL = £1.36, 250 mL = £2.83, 500 mL = £5.06

**Dose** oral hygiene and plaque inhibition, **ADULT** and **CHILD** over 6 years, use 10–15 mL (diluted with lukewarm water in measuring cup provided) 2–3 times daily

Denture disinfection, soak previously cleansed dentures in mouthwash (diluted with 2 volumes of water) for 60 minutes

## HEXETIDINE

**Indications** oral hygiene

**Side-effects** local irritation; *very rarely* taste disturbance and transient anaesthesia

**Oraldene**<sup>®</sup> (McNeil)

**Mouthwash** or *gargle*, red or blue-green (mint-flavoured), hexetidine 0.1%. Net price 100 mL = £1.43; 200 mL = £2.21

**Dose** **ADULT** and **CHILD** over 6 years, use 15 mL undiluted 2–3 times daily

## HYDROGEN PEROXIDE

**Indications** oral hygiene, see notes above

**Side-effects** hypertrophy of papillae of tongue on prolonged used

**Hydrogen Peroxide Mouthwash, BP**

**Mouthwash**, consists of Hydrogen Peroxide Solution 6% (= approx. 20 volume) BP

**Dose** rinse the mouth for 2–3 minutes with 15 mL diluted in half a tumblerful of warm water 2–3 times daily

**Dental prescribing on NHS** Hydrogen Peroxide Mouthwash may be prescribed

**Peroxyl**<sup>®</sup> (Colgate-Palmolive)

**Mouthwash**, hydrogen peroxide 1.5%, net price 300 mL = £2.94

**Dose** rinse the mouth with 10 mL for about 1 minute up to 4 times daily (after meals and at bedtime)

## SODIUM CHLORIDE

**Indications** oral hygiene, see notes above

**Sodium Chloride Mouthwash, Compound, BP**

**Mouthwash**, sodium bicarbonate 1%, sodium chloride 1.5% in a suitable vehicle with a peppermint flavour.

**Dose** extemporaneous preparations should be prepared according to the following formula: sodium chloride 1.5 g, sodium bicarbonate 1 g, concentrated peppermint emulsion 2.5 mL, double-strength chloroform water 50 mL, water to 100 mL.

To be diluted with an equal volume of warm water

**Dental prescribing on NHS** Compound Sodium Chloride Mouthwash may be prescribed

## 12.3.5 Treatment of dry mouth

Dry mouth (xerostomia) may be caused by drugs with antimuscarinic (anticholinergic) side-effects (e.g. anti-spasmodics, tricyclic antidepressants, and some antipsychotics), by diuretics, by irradiation of the head and

neck region or by damage to or disease of the salivary glands. Patients with a persistently dry mouth may develop a burning or scalded sensation and have poor oral hygiene; they may develop increased dental caries, periodontal disease, intolerance of dentures, and oral infections (particularly candidiasis). Dry mouth may be relieved in many patients by simple measures such as frequent sips of cool drinks or sucking pieces of ice or sugar-free fruit pastilles. Sugar-free chewing gum stimulates salivation in patients with residual salivary function.

**Artificial saliva** can provide useful relief of dry mouth. A properly balanced artificial saliva should be of a neutral pH and contain electrolytes (including fluoride) to correspond approximately to the composition of saliva. The acidic pH of some artificial saliva products may be inappropriate. Of the proprietary preparations, *Aquoral*<sup>®</sup>, *Biotène Oralbalance*<sup>®</sup> gel or *Xerotin*<sup>®</sup> can be used for any condition giving rise to a dry mouth. *BioXtra*<sup>®</sup>, *Glandosane*<sup>®</sup>, *Saliva Orthana*<sup>®</sup>, and *Saliveze*<sup>®</sup>, have ACBS approval for dry mouth associated only with radiotherapy or sicca syndrome. *Salivix*<sup>®</sup> pastilles, which act locally as salivary stimulants, are also available for any condition leading to a dry mouth and *SST* tablets may be prescribed for dry mouth in patients with salivary gland impairment (and patent salivary ducts).

**Pilocarpine** tablets are licensed for the treatment of xerostomia following irradiation for head and neck cancer and for dry mouth and dry eyes (xerophthalmia) in Sjögren's syndrome. They are effective only in patients who have some residual salivary gland function, and therefore should be withdrawn if there is no response.

## Local treatment

### **Aquoral**<sup>®</sup> (Sinclair IS)

**Oral spray**, oxidised glycerol triesters, silicon dioxide, flavouring agents, net price 40-mL bottle = £9.85

**Excipients** include aspartame (see section 9.4.1)

**Dose** symptomatic treatment of dry mouth, 1 spray onto the inside of each cheek 3–4 times daily

**Dental Prescribing on NHS** *Aquoral*<sup>®</sup> Oral Spray may be prescribed as Artificial Saliva Protective Spray

### **AS Saliva Orthana**<sup>®</sup> (AS Pharma)

**Oral spray**, gastric mucin (porcine) 3.5%, xylitol 2%, sodium fluoride 4.2 mg/litre, with preservatives and flavouring agents, pH neutral. Net price 50-mL bottle = £4.92; 500-mL refill = £34.27

**Dose** ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome, spray 2–3 times onto oral and pharyngeal mucosa, when required

**Dental prescribing on NHS** *AS Saliva Orthana*<sup>®</sup> Oral Spray may be prescribed

**Lozenges**, mucin 65 mg, xylitol 59 mg, in a sorbitol basis, pH neutral. Net price 30-lozenge pack = £3.50

**Dose** ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome, allow 1 lozenge to dissolve slowly in the mouth when required

**Note** *AS Saliva Orthana*<sup>®</sup> lozenges do not contain fluoride

**Dental prescribing on NHS** *AS Saliva Orthana*<sup>®</sup> Lozenges may be prescribed

### **Biotène Oralbalance**<sup>®</sup> (GSK)

**Saliva replacement gel**, lactoperoxidase, lactoferrin, lysozyme, glucose oxidase, xylitol in a gel basis, net price 50-g tube = £4.46

**Dose** symptomatic treatment of dry mouth, apply to gums and tongue as required

**Note** Avoid use with toothpastes containing detergents (including foaming agents)

**Dental prescribing on NHS** *Biotène Oralbalance*<sup>®</sup> Saliva Replacement Gel may be prescribed as Artificial Saliva Gel

### **BioXtra**<sup>®</sup> (RIS Products)

**Gel**, lactoperoxidase, lactoferrin, lysozyme, whey colostrum, xylitol and other ingredients, net price 40-mL tube = £3.94, 50-mL spray = £3.94

**Dose** ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome, apply to oral mucosa as required

**Dental prescribing on NHS** *BioXtra*<sup>®</sup> Gel may be prescribed

### **Glandosane**<sup>®</sup> (Fresenius Kabi)

**Aerosol spray**, carmellose sodium 500 mg, sorbitol 1.5 g, potassium chloride 60 mg, sodium chloride 42.2 mg, magnesium chloride 2.6 mg, calcium chloride 7.3 mg, and dipotassium hydrogen phosphate 17.1 mg/50 g, pH 5.75. Net price 50-mL unit (neutral, lemon or peppermint flavoured) = £5.38

**Dose** ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome, spray onto oral and pharyngeal mucosa as required

**Dental prescribing on NHS** *Glandosane*<sup>®</sup> Aerosol Spray may be prescribed

### **Saliveze**<sup>®</sup> (Wyvern)

**Oral spray**, carmellose sodium (sodium carboxymethylcellulose), calcium chloride, magnesium chloride, potassium chloride, sodium chloride, and dibasic sodium phosphate, pH neutral. Net price 50-mL bottle (mint-flavoured) = £3.50

**Dose** ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome, 1 spray onto oral mucosa as required

**Dental prescribing on NHS** *Saliveze*<sup>®</sup> Oral Spray may be prescribed

### **Salivix**<sup>®</sup> (Galen)

**Pastilles**, sugar-free, reddish-amber, acacia, malic acid and other ingredients. Net price 50-pastille pack = £3.55

**Dose** symptomatic treatment of dry mouth, suck 1 pastille when required

**Dental prescribing on NHS** *Salivix*<sup>®</sup> Pastilles may be prescribed as Artificial Saliva Pastilles

### **SST** (Medac)

**Tablets**, sugar-free, citric acid, malic acid and other ingredients in a sorbitol base, net price 100-tab pack = £4.86

**Dose** symptomatic treatment of dry mouth in patients with impaired salivary gland function and patent salivary ducts, allow 1 tablet to dissolve slowly in the mouth when required

**Dental prescribing on NHS** May be prescribed as Saliva Stimulating Tablets

### **Xerotin**<sup>®</sup> (SpePharm)

**Oral spray**, sugar-free, water, sorbitol, carmellose (carboxymethylcellulose), potassium chloride, sodium chloride, potassium phosphate, magnesium chloride, calcium chloride and other ingredients, pH neutral. Net price 100-mL unit = £6.86

**Dose** symptomatic treatment of dry mouth, spray as required

**Dental prescribing on NHS** *Xerotin*<sup>®</sup> Oral Spray may be prescribed as Artificial Saliva Oral Spray

## Systemic treatment

### PILOCARPINE HYDROCHLORIDE

**Indications** xerostomia following irradiation for head and neck cancer (see also notes above); dry mouth and dry eyes in Sjögren's syndrome

**Cautions** asthma and chronic obstructive pulmonary disease (avoid if uncontrolled, see Contra-indications), cardiovascular disease (avoid if uncontrolled); cholelithiasis or biliary-tract disease, peptic ulcer, risk of increased urethral smooth muscle tone and renal colic; maintain adequate fluid intake to avoid dehydration associated with excessive sweating; cognitive or psychiatric disturbances; susceptibility to angle-closure glaucoma; **interactions:** Appendix 1 (parasympathomimetics)

**Counselling** Blurred vision or dizziness may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting

**Contra-indications** uncontrolled asthma and chronic obstructive pulmonary disease (increased bronchial secretions and increased airways resistance); uncontrolled cardiorenal disease; acute iritis

**Hepatic impairment** reduce initial oral dose in moderate or severe cirrhosis

**Renal impairment** manufacturer advises caution with tablets

**Pregnancy** avoid—smooth muscle stimulant; toxicity in *animal* studies

**Breast-feeding** manufacturer advises avoid—present in milk in *animal* studies

**Side-effects** dyspepsia, diarrhoea, abdominal pain, nausea, vomiting, constipation; flushing, hypertension, palpitation, headache, dizziness, asthenia, influenza-like symptoms, sweating; increased urinary frequency; visual disturbances, lacrimation, ocular pain, conjunctivitis; rhinitis; rash, pruritus; *less commonly* flatulence, urinary urgency

#### Dose

- Xerostomia following irradiation for head and neck cancer, 5 mg 3 times daily with or immediately after meals (last dose always with evening meal); if tolerated but response insufficient after 4 weeks, may be increased to max. 30 mg daily in divided doses; max. therapeutic effect normally within 4–8 weeks; discontinue if no improvement after 2–3 months; **CHILD** not recommended
- Dry mouth and dry eyes in Sjögren's syndrome, 5 mg 4 times daily (with meals and at bedtime); if tolerated but response insufficient, may be increased to max. 30 mg daily in divided doses; discontinue if no improvement after 2–3 months; **CHILD** not recommended

**Salagen**<sup>®</sup> (Novartis) **(POM)**

Tablets, f/c, pilocarpine hydrochloride 5 mg. Net price 84-tab pack = £41.14. Label: 21, 27, counselling, driving

For information on wound management products and elasticated garments, see Appendix 5, p. 1061.

The British Association of Dermatologists list of preferred unlicensed dermatological preparations (specials) is available at [www.bad.org.uk/specials](http://www.bad.org.uk/specials).

## 13.1 Management of skin conditions

- 13.1.1** Vehicles
- 13.1.2** Suitable quantities for prescribing
- 13.1.3** Excipients and sensitisation

### 13.1.1 Vehicles

Both vehicle and active ingredients are important in the treatment of skin conditions; the vehicle alone may have more than a mere placebo effect. The vehicle affects the degree of hydration of the skin, has a mild anti-inflammatory effect, and aids the penetration of active drug.

**Applications** are usually viscous solutions, emulsions, or suspensions for application to the skin (including the scalp) or nails.

**Collodions** are painted on the skin and allowed to dry to leave a flexible film over the site of application.

**Creams** are emulsions of oil and water and are generally well absorbed into the skin. They may contain an antimicrobial preservative unless the active ingredient or basis is intrinsically bactericidal and fungicidal. Generally, creams are cosmetically more acceptable than ointments because they are less greasy and easier to apply.

**Gels** consist of active ingredients in suitable hydrophilic or hydrophobic bases; they generally have a high water content. Gels are particularly suitable for application to the face and scalp.

**Lotions** have a cooling effect and may be preferred to ointments or creams for application over a hairy area. Lotions in alcoholic basis can sting if used on broken skin. *Shake lotions* (such as calamine lotion) contain insoluble powders which leave a deposit on the skin surface.

**Ointments** are greasy preparations which are normally anhydrous and insoluble in water, and are more occlusive than creams. They are particularly suitable for chronic, dry lesions. The most commonly used ointment bases consist of soft paraffin or a combination of soft, liquid, and hard paraffin. Some ointment bases have both *hydrophilic and lipophilic* properties; they may have occlusive properties on the skin surface, encourage hydration, and also be miscible with water; they often have a mild anti-inflammatory effect. *Water-soluble ointments* contain macrogols which are freely soluble in water and are therefore readily washed off; they have a limited but useful role where ready removal is desirable.

**Pastes** are stiff preparations containing a high proportion of finely powdered solids such as zinc oxide and starch suspended in an ointment. They are used for circumscribed lesions such as those which occur in lichen simplex, chronic eczema, or psoriasis. They are less occlusive than ointments and can be used to protect inflamed, lichenified, or excoriated skin.

**Dusting powders** are used only rarely. They reduce friction between opposing skin surfaces. Dusting powders should not be applied to moist areas because they can cake and abrade the skin. Talc is a lubricant but it does not absorb moisture; it can cause respiratory irritation. Starch is less lubricant but absorbs water.

**Dilution** The BP directs that creams and ointments should **not** normally be diluted but that should dilution be necessary care should be taken, in particular, to prevent microbial contamination. The appropriate diluent should be used and heating should be avoided during mixing; excessive dilution may affect the stability of some creams. Diluted creams should normally be used within 2 weeks of preparation.

### 13.1.2 Suitable quantities for prescribing

#### Suitable quantities of dermatological preparations to be prescribed for specific areas of the body

Area of body	Creams and Ointments	Lotions
Face	15–30 g	100 mL
Both hands	25–50 g	200 mL
Scalp	50–100 g	200 mL
Both arms or both legs	100–200 g	200 mL
Trunk	400 g	500 mL
Groins and genitalia	15–25 g	100 mL

These amounts are usually suitable for an adult for twice daily application for 1 week. The recommendations do **not** apply to corticosteroid preparations—for suitable quantities of corticosteroid preparations, see section 13.4.

### 13.1.3 Excipients and sensitisation

Excipients in topical products rarely cause problems. If a patch test indicates allergy to an excipient, products containing the substance should be avoided (see also Anaphylaxis, p. 209). The following excipients in topical preparations are associated, rarely, with sensitisation; the presence of these excipients is indicated in the entries for topical products. See also Excipients, under General Guidance, p. 2.

Beeswax	Imidurea
Benzyl alcohol	Isopropyl palmitate
Butylated hydroxyanisole	<i>N</i> -(3-Chloroallyl)hexamine chloride (quaternium 15)
Butylated hydroxytoluene	Polysorbates
Cetostearyl alcohol (including cetyl and stearyl alcohol)	Propylene glycol
Chlorocresol	Sodium metabisulfite
Edetic acid (EDTA)	Sorbic acid
Ethylenediamine	Wool fat and related substances including lanolin <sup>1</sup>
Fragrances	
Hydroxybenzoates (parabens)	

## 13.2 Emollient and barrier preparations

### 13.2.1 Emollients

### 13.2.2 Barrier preparations

**Borderline substances** The preparations marked 'ACBS' are regarded as drugs when prescribed in accordance with the advice of the Advisory Committee on Borderline Substances for the clinical conditions listed. Prescriptions issued in accordance with this advice and endorsed 'ACBS' will normally not be investigated. See Appendix 2 for listing by clinical condition.

### 13.2.1 Emollients

#### 13.2.1.1 Emollient bath and shower preparations

**Emollients** soothe, smooth and hydrate the skin and are indicated for all dry or scaling disorders. Their effects are short-lived and they should be applied frequently even after improvement occurs. They are useful in dry and eczematous disorders, and to a lesser extent in psoriasis (section 13.5.2). The choice of an appropriate emollient will depend on the severity of the condition, patient preference, and the site of application. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis. Ointments may exacerbate acne and folliculitis. Some ingredients rarely cause sensitisation (section 13.1.3) and this should be suspected if an eczematous reaction

1. Purified versions of wool fat have reduced the problem

occurs. The use of aqueous cream as a leave-on emollient may increase the risk of skin reactions, particularly in eczema.

#### Fire hazard with paraffin-based emollients

Emulsifying ointment or 50% Liquid Paraffin and 50% White Soft Paraffin Ointment in contact with dressings and clothing is easily ignited by a naked flame. The risk is greater when these preparations are applied to large areas of the body, and clothing or dressings become soaked with the ointment. Patients should be told to keep away from fire or flames, and not to smoke when using these preparations. The risk of fire should be considered when using large quantities of any paraffin-based emollient.

Preparations such as **aqueous cream** (section 13.2.1.1) and **emulsifying ointment** can be used as soap substitutes for hand washing and in the bath; the preparation is rubbed on the skin before rinsing off completely. The addition of a bath oil (section 13.2.1.1) may also be helpful.

Preparations containing an antibacterial (section 13.10) should be avoided unless infection is present or is a frequent complication.

**Urea** is a keratin softener and hydrating agent used in the treatment of dry, scaling conditions (including ichthyosis) and may be useful in elderly patients. It is occasionally used with other topical agents such as corticosteroids to enhance penetration of the skin.

#### Non-proprietary emollient preparations

##### Emulsifying Ointment, BP

**Ointment**, emulsifying wax 30%, white soft paraffin 50%, liquid paraffin 20%, net price 500 g = £2.12  
**Excipients** include cetostearyl alcohol

##### Hydrous Ointment, BP

**Ointment**, (oily cream), dried magnesium sulfate 0.5%, phenoxyethanol 1%, wool alcohols ointment 50%, in freshly boiled and cooled purified water, net price 500 g = £4.89

##### Liquid and White Soft Paraffin Ointment, NPF

**Ointment**, liquid paraffin 50%, white soft paraffin 50%, net price 500 g = £2.21

##### Paraffin, White Soft, BP

White petroleum jelly, net price 100 g = 50p

##### Paraffin, Yellow Soft, BP

Yellow petroleum jelly, net price 100 g = 54p

#### Proprietary emollient preparations

##### Aquamax<sup>®</sup> (Dermato Logical)

**Cream**, light liquid paraffin 8%, white soft paraffin 20%, phenoxyethanol 1%, net price 100 g = £1.89, 500 g = £3.99  
**Excipients** include cetostearyl alcohol, polysorbate 60  
For dry skin conditions

##### Aquamol<sup>®</sup> (Thornton & Ross)

**Cream**, containing liquid paraffin, white soft paraffin, net price 50 g = £1.22, 500-g pump pack = £6.40  
**Excipients** include cetostearyl alcohol, chlorocresol  
For dry skin conditions

##### Aveeno<sup>®</sup> (J&J)

**Cream**, colloidal oatmeal in emollient basis, net price 100 mL = £3.97, 300-mL pump pack = £6.80

**Excipients** include benzyl alcohol, cetyl alcohol, isopropyl palmitate  
ACBS: For endogenous and exogenous eczema, xeroderma, ichthyosis, and senile pruritus (pruritus of the elderly) associated with dry skin

**Lotion**, colloidal oatmeal in emollient basis, net price 500 mL = £6.66

**Excipients** include benzyl alcohol, cetyl alcohol, isopropyl palmitate, stearyl alcohol  
ACBS: as for *Aveeno<sup>®</sup> Cream*

##### Cetaben<sup>®</sup> (Genus)

**Emollient cream**, white soft paraffin 13.2%, light liquid paraffin 10.5%, net price 50-g pump pack = £1.40, 150-g pump pack = £3.98, 500-g pump pack = £5.99, 1.05-kg pump pack = £11.62

**Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens)  
For inflamed, damaged, dry or chapped skin including eczema

##### Dermamist<sup>®</sup> (Alliance)

**Spray application**, white soft paraffin 10% in a basis containing liquid paraffin, fractionated coconut oil, net price 250-mL pressurised aerosol unit = £5.97  
**Excipients** none as listed in section 13.1.3

For dry skin conditions including eczema, ichthyosis, pruritus of the elderly

**Note** Flammable

##### Diprobase<sup>®</sup> (MSD)

**Cream**, cetomacrogol 2.25%, cetostearyl alcohol 7.2%, liquid paraffin 6%, white soft paraffin 15%, water-miscible basis used for *Diprosone<sup>®</sup>* cream, net price 50 g = £1.28; 500-g pump pack = £6.32

**Excipients** include cetostearyl alcohol, chlorocresol  
For dry skin conditions

**Ointment**, liquid paraffin 5%, white soft paraffin 95%, basis used for *Diprosone<sup>®</sup>* ointment, net price 50 g = £1.28, 500 g = £5.99

**Excipients** none as listed in section 13.1.3  
For dry skin conditions

##### Doublebase<sup>®</sup> (Dermal)

**Gel**, isopropyl myristate 15%, liquid paraffin 15%, net price 100 g = £2.65, 500 g = £5.83

**Excipients** none as listed in section 13.1.3

For dry, chapped, or itchy skin conditions

**Dayleve Gel**, isopropyl myristate 15%, liquid paraffin 15%, net price 100 g = £2.65, 500-g pump pack = £6.29

**Excipients** none as listed in section 13.1.3  
For dry, chapped, or itchy skin conditions

##### E45<sup>®</sup> (Reckitt Benckiser)

**Cream**, light liquid paraffin 12.6%, white soft paraffin 14.5%, hypoallergenic anhydrous wool fat (hypoallergenic lanolin) 1% in self-emulsifying monostearin, net price 50 g = £1.61, 125 g = £2.90, 350 g = £5.17, 500-g pump pack = £5.62

**Excipients** include cetyl alcohol, hydroxybenzoates (parabens)  
For dry skin conditions

**Lotion**, light liquid paraffin 4%, cetomacrogol, white soft paraffin 10%, hypoallergenic anhydrous wool fat (hypoallergenic lanolin) 1% in glyceryl monostearate, net price 200 mL = £2.40, 500-mL pump pack = £4.50

**Excipients** include isopropyl palmitate, hydroxybenzoates (parabens), benzyl alcohol  
ACBS: for symptomatic relief of dry skin conditions, such as those associated with atopic eczema and contact dermatitis

**Emollin**<sup>®</sup> (C D Medical)

**Spray**, liquid paraffin 50%, white soft paraffin 50% in aerosol basis, net price 150 mL = £3.97, 240 mL = £6.35

**Excipients** none as listed in section 13.1.3

For dry skin conditions

**Epaderm**<sup>®</sup> (Mölnlycke)

**Cream**, yellow soft paraffin 15%, liquid paraffin 10%, emulsifying wax 5%, net price 50-g pump pack = £1.70, 500-g pump pack = £6.95

**Excipients** include cetostearyl alcohol, chlorocresol

For use as an emollient or soap substitute

**Ointment**, emulsifying wax 30%, yellow soft paraffin 30%, liquid paraffin 40%, net price 125 g = £3.85, 500 g = £6.53, 1 kg = £12.02

**Excipients** include cetostearyl alcohol

For use as an emollient or soap substitute

**Hydromol**<sup>®</sup> (Alliance)

**Cream**, sodium pidolate 2.5%, liquid paraffin 13.8%, net price 50 g = £2.19, 100 g = £4.09, 500 g = £11.92

**Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens)

For dry skin conditions

**Ointment**, yellow soft paraffin 30%, emulsifying wax 30%, liquid paraffin 40%, net price 125 g = £2.88, 500 g = £4.89, 1 kg = £9.09

**Excipients** include cetostearyl alcohol

For use as an emollient, bath additive, or soap substitute

**Lipobase**<sup>®</sup> (Astellas)

**Cream**, fatty cream basis used for *Locoid Lipocream*<sup>®</sup>, net price 50 g = £1.46

**Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens)

For dry skin conditions, also for use during treatment with topical corticosteroid and as diluent for *Locoid Lipocream*<sup>®</sup>

**Oilatum**<sup>®</sup> (Stiefel)

**Cream**, light liquid paraffin 6%, white soft paraffin 15%, net price 50 g = £1.63, 150 g = £2.46, 500-mL pump pack = £4.99, 1.05-litre pump pack = £9.98

**Excipients** include benzyl alcohol, cetostearyl alcohol

For dry skin conditions

**Oilatum Junior Cream**, light liquid paraffin 6%, white soft paraffin 15%, net price 150 g = £3.38, 350 mL = £4.65, 500 mL = £4.99, 1.05-litre pump pack = £9.98

**Excipients** include benzyl alcohol, cetostearyl alcohol

For dry skin conditions

**QV**<sup>®</sup> (Sound Opinion)

**Cream**, glycerol 10%, light liquid paraffin 10%, white soft paraffin 5%, net price 100 g = £2.04, 500 g = £5.86, 1.05-kg pump pack = £11.94

**Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens)

For dry skin conditions including eczema, psoriasis, ichthyosis, pruritus

**Intensive ointment**, light liquid paraffin 50.5%, white soft paraffin 20%, net price 450 g = £5.65

**Excipients** include cetostearyl alcohol

For dry skin conditions including eczema, psoriasis, ichthyosis, pruritus

**Lotion**, white soft paraffin 5%, net price 250 mL = £3.14, 500-mL pump pack = £5.24

**Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens)

For dry skin conditions including eczema, psoriasis, ichthyosis, pruritus

**Ultrabase**<sup>®</sup> (Derma UK)

**Cream**, water-miscible, containing liquid paraffin and white soft paraffin, net price 50 g = £1.40, 500-g pump pack = £4.80

**Excipients** include fragrance, hydroxybenzoates (parabens), disodium edetate, stearyl alcohol

For dry skin conditions

**Unguentum M**<sup>®</sup> (Almirall)

**Cream**, containing saturated neutral oil, liquid paraffin, white soft paraffin, net price 50 g = £1.41, 100 g = £2.78, 200-mL pump pack = £5.50, 500 g = £8.48

**Excipients** include cetostearyl alcohol, polysorbate 40, propylene glycol, sorbic acid

For dry skin conditions and nappy rash

**ZeroAQS**<sup>®</sup> (Thornton & Ross)

**Cream**, macrogol cetostearyl ether 1.8%, liquid paraffin 6%, white soft paraffin 15%, net price 100 g = £1.65, 500 g = £3.29

**Excipients** include cetostearyl alcohol, chlorocresol

For use as an emollient or soap substitute

**Zerobase**<sup>®</sup> (Thornton & Ross)

**Cream**, liquid paraffin 11%, net price 50 g = £1.04, 500-g pump pack = £5.26

**Excipients** include cetostearyl alcohol, chlorocresol

For dry skin conditions

**Zerocream**<sup>®</sup> (Thornton & Ross)

**Cream**, liquid paraffin 12.6%, white soft paraffin 14.5%, net price 50 g = £1.17, 500-g pump pack = £4.08

**Excipients** include cetyl alcohol, hydroxybenzoates (parabens), lanolin anhydrous

For dry skin conditions

**Zeroderm**<sup>®</sup> (Thornton & Ross)

**Ointment**, liquid paraffin 40%, white soft paraffin 30%, net price 125 g = £2.41, 500 g = £4.10

**Excipients** include cetostearyl alcohol, polysorbate 60

For dry skin conditions

**Zeroguent**<sup>®</sup> (Thornton & Ross)

**Cream**, light liquid paraffin 8%, white soft paraffin 4%, refined soya bean oil 5%, net price 100 g = £2.33, 500 g = £6.99

**Excipients** include cetostearyl alcohol, polysorbate 40, propylene glycol, sorbic acid

For dry skin conditions

**Preparations containing urea****Aquadrate**<sup>®</sup> (Alliance)

**Cream**, urea 10%, net price 100 g = £4.37

**Excipients** none as listed in section 13.1.3

**Dose** for dry, scaling and itching skin, apply thinly twice daily

**Balneum**<sup>®</sup> (Almirall)

**Cream**, urea 5%, ceramide 0.1%, net price 50-g pump pack = £2.85, 500-g pump pack = £9.97

**Excipients** include cetostearyl alcohol, polysorbates, propylene glycol

**Dose** for dry skin conditions, apply twice daily

**Balneum Plus Cream**, urea 5%, lauramcrogols 3%, net price 100 g = £3.29, 500-g pump pack = £14.99

**Excipients** include benzyl alcohol, polysorbates

**Dose** for dry, scaling and itching skin, apply twice daily

**Calmurid**<sup>®</sup> (Galderma)

**Cream**, urea 10%, lactic acid 5%, net price 100 g = £9.27, 500-g pump pack = £35.70

**Excipients** none as listed in section 13.1.3

**Dose** for dry, scaling and itching skin, apply a thick layer for 3–5 minutes, massage into area, and remove excess, usually twice daily. Use half-strength cream for 1 week if stinging occurs

**Note** Can be diluted with aqueous cream (life of diluted cream 14 days)

**Dermatonics Once Heel Balm**® (Dermatonics)

**Cream**, urea 25%, net price 75 mL = £3.60, 200 mL = £8.50

**Excipients** include beeswax, lanolin

**Dose** for dry skin on soles of feet, **ADULT** and **CHILD** over 12 years, apply once daily

**E45<sup>®</sup> Itch Relief Cream** (Reckitt Benckiser)

**Cream**, urea 5%, macrogol lauryl ether 3%, net price 50 g = £2.81, 100 g = £3.74, 500-g pump pack = £14.99

**Excipients** include benzyl alcohol, polysorbates

**Dose** for dry, scaling, and itching skin, apply twice daily

**Eucerin<sup>®</sup> Intensive** (Beiersdorf)

**Cream**, urea 10%, net price 100 mL = £7.59

**Excipients** include benzyl alcohol, isopropyl palmitate, wool fat

**Dose** for dry skin conditions including eczema, ichthyosis, xeroderma, hyperkeratosis, apply thinly and rub into area twice daily

**Lotion**, urea 10%, net price 250 mL = £7.93

**Excipients** include benzyl alcohol, isopropyl palmitate

**Dose** for dry skin conditions including eczema, ichthyosis, xeroderma, hyperkeratosis, apply sparingly and rub into area twice daily

**Flexitol<sup>®</sup>** (LaCorium)

**Heel balm**, urea 25%, net price 40 g = £2.75, 75 g = £3.80, 200 g = £9.40, 500 g = £14.75

**Excipients** include benzyl alcohol, cetostearyl alcohol, fragrance, lanolin

**Dose** for dry skin on soles of feet and heels, **ADULT** and **CHILD** over 12 years, apply 1–2 times daily

**Hydromol<sup>®</sup> Intensive** (Alliance)

**Cream**, urea 10%, net price 30 g = £1.64, 100 g = £4.37

**Excipients** none as listed in section 13.1.3

**Dose** for dry, scaling and itching skin, apply thinly twice daily

**Nutraplus<sup>®</sup>** (Galderma)

**Cream**, urea 10%, net price 100 g = £4.37

**Excipients** include hydroxybenzoates (parabens), propylene glycol

**Dose** for dry, scaling and itching skin, apply 2–3 times daily

**With antimicrobials****Dermol<sup>®</sup>** (Dermal)

**Cream**, benzalkonium chloride 0.1%, chlorhexidine hydrochloride 0.1%, isopropyl myristate 10%, liquid paraffin 10%, net price 100-g tube = £2.86, 500-g pump pack = £6.63

**Excipients** include cetostearyl alcohol

**Dose** for dry and pruritic skin conditions including eczema and dermatitis, apply to skin or use as soap substitute

**Dermol<sup>®</sup> 500 Lotion**, benzalkonium chloride 0.1%, chlorhexidine hydrochloride 0.1%, liquid paraffin 2.5%, isopropyl myristate 2.5%, net price 500-mL pump pack = £6.04

**Excipients** include cetostearyl alcohol

**Dose** for dry and pruritic skin conditions including eczema and dermatitis, apply to skin or use as soap substitute

**Eczmol<sup>®</sup>** (Genus)

**Cream**, chlorhexidine gluconate 1% in emollient basis, net price 250 mL = £3.70

**Excipients** include cetostearyl alcohol

**Dose** for dry and pruritic skin conditions including eczema and dermatitis, apply to skin or use as soap substitute

**13.2.1.1 Emollient bath and shower preparations**

Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. In dry skin conditions soap should be avoided (see section 13.2.1 for soap substitutes). The quantities of bath additives recommended for adults are suitable for an adult-size bath. Proportionately less should be used for a child-size bath or a washbasin; recommended bath additive quantities for children reflect this.

These preparations make skin and surfaces slippery—particular care is needed when bathing

**Aqueous Cream, BP**

**Cream**, emulsifying ointment 30%, <sup>1</sup>phenoxyethanol 1% in freshly boiled and cooled purified water, net price 100 g = 90p, 500 g = £4.50

**Excipients** include cetostearyl alcohol

**Aquamax<sup>®</sup>** (Dermato Logical)

**Cream wash**, light liquid paraffin 8%, white soft paraffin 20%, phenoxyethanol 1%, net price 250 g = £2.99

**Excipients** include cetostearyl alcohol, polysorbate 60

**Dose** for dry skin conditions, apply to wet or dry skin and rinse

**Aveeno<sup>®</sup>** (J&J)

**Aveeno<sup>®</sup> Bath oil**, colloidal oatmeal, white oat fraction in emollient basis, net price 250 mL = £4.49

**Excipients** include beeswax, fragrance

**Dose** ACBS: for endogenous and exogenous eczema, xeroderma, ichthyosis, and senile pruritus (pruritus of the elderly) associated with dry skin, add 20–30 mL/bath or apply to wet skin and rinse

**Balneum<sup>®</sup>** (Almiral)

**Balneum<sup>®</sup> bath oil**, soya oil 84.75%, net price 200 mL = £2.48, 500 mL = £5.38, 1 litre = £10.39

**Excipients** include butylated hydroxytoluene, propylene glycol, fragrance

**Dose** for dry skin conditions including those associated with dermatitis and eczema; add 20–60 mL/bath (**INFANT** 5–15 mL); do not use undiluted

**Balneum Plus<sup>®</sup> bath oil**, soya oil 82.95%, mixed lauromacrogols 15%, net price 500 mL = £6.66

**Excipients** include butylated hydroxytoluene, propylene glycol, fragrance

**Dose** for dry skin conditions including those associated with dermatitis and eczema where pruritus also experienced; add 20 mL/bath (**INFANT** 5 mL) or apply to wet skin and rinse

**Cetaben<sup>®</sup>** (Genus)

**Emollient bath additive**, light liquid paraffin 82.8%, net price 500 mL = £5.75

**Excipients** none as listed in section 13.1.3

**Dose** for dry skin conditions, including eczema, add 1–2 capfuls/bath (**CHILD** ½–1 capful) or apply to wet skin and rinse

**Dermalo<sup>®</sup>** (Dermal)

**Bath emollient**, acetylated wool alcohols 5%, liquid paraffin 65%, net price 500 mL = £3.44

**Excipients** none as listed in section 13.1.3

**Dose** for dermatitis, dry skin conditions including ichthyosis and pruritus of the elderly; add 15–20 mL/bath (**INFANT** and **CHILD** 5–10 mL) or apply to wet skin and rinse

1. The BP permits use of alternative antimicrobials provided their identity and concentration are stated on the label

**Doublebase<sup>®</sup>** (Dermal)

**Emollient bath additive**, liquid paraffin 65%, net price 500 mL = £5.45

**Excipients** include cetostearyl alcohol

**Dose** for dry skin conditions including dermatitis, ichthyosis, and pruritus of the elderly; add 15–20 mL/bath (INFANT and CHILD 5–10 mL)

**Emollient shower gel**, isopropyl myristate 15%, liquid paraffin 15%, net price 200 g = £5.21

**Excipients** none as listed in section 13.1.3

**Dose** for dry, chapped, or itchy skin conditions, apply to wet or dry skin and rinse, or apply to dry skin after showering

**Note** Also available as *Doublebase<sup>®</sup> Emollient Wash Gel*

**E45<sup>®</sup>** (Reckitt Benckiser)

**Emollient bath oil**, cetyl dimeticono 5%, liquid paraffin 91%, net price 250 mL = £3.19, 500 mL = £5.11

**Excipients** none as listed in section 13.1.3

**Dose** ACBS: for endogenous and exogenous eczema, xeroderma, ichthyosis, and senile pruritus (pruritus of the elderly) associated with dry skin; add 15 mL/bath (CHILD 5–10 mL) or apply to wet skin and rinse

**Emollient wash cream**, soap substitute, zinc oxide 5% in an emollient basis, net price 250-mL pump pack = £3.19

**Excipients** none as listed in section 13.1.3

**Dose** ACBS: for endogenous and exogenous eczema, xeroderma, ichthyosis and senile pruritus (pruritus of the elderly) associated with dry skin, use as soap substitute

**Hydromol<sup>®</sup>** (Alliance)

**Bath and shower emollient**, isopropyl myristate 13%, light liquid paraffin 37.8%, net price 350 mL = £3.88, 500 mL = £4.42, 1 litre = £8.80

**Excipients** none as listed in section 13.1.3

**Dose** for dry skin conditions including eczema, ichthyosis and pruritus of the elderly, add 1–3 capfuls/bath (INFANT ½–2 capfuls) or apply to wet skin and rinse

**LPL 63.4<sup>®</sup>** (Huxley)

**Emollient bath additive**, light liquid paraffin 63.4%, net price 500 mL = £3.10

**Excipients** include acetylated wool alcohols, isopropyl palmitate

**Dose** for dry skin conditions, add 1–3 capfuls/bath (CHILD 1 month–12 years, ½–2 capfuls) or apply to wet skin and rinse

**Oilatum<sup>®</sup>** (Stiefel)

**Emollient bath additive** (emulsion), light liquid paraffin 63.4%, net price 250 mL = £2.75, 500 mL = £4.57

**Excipients** include acetylated lanolin alcohols, isopropyl palmitate, fragrance

**Dose** for dry skin conditions including dermatitis, pruritus of the elderly, and ichthyosis, add 1–3 capfuls/bath (INFANT 0.5–2 capfuls) or apply to wet skin and rinse

**Junior bath additive**, light liquid paraffin 63.4%, net price 150 mL = £2.82, 250 mL = £3.25, 300 mL = £5.10, 600 mL = £5.89

**Excipients** include acetylated lanolin alcohols, isopropyl palmitate

**Dose** for dry skin conditions including dermatitis, pruritus of the elderly, and ichthyosis, add 1–3 capfuls/bath (INFANT 0.5–2 capfuls) or apply to wet skin and rinse

**Shower emollient** (gel), light liquid paraffin 70%, net price (with fragrance or fragrance-free) 150 g = £5.15

**Excipients** none as listed in section 13.1.3

**Dose** for dry skin conditions including dermatitis, pruritus of the elderly, and ichthyosis, apply to wet skin and rinse

**QV<sup>®</sup>** (Sound Opinion)

**Bath oil**, light liquid paraffin 85.13%, net price 200 mL = £2.20, 500 mL = £4.66

**Excipients** none as listed in section 13.1.3

**Dose** for dry skin conditions including eczema, psoriasis, ichthyosis, and pruritus, add 10 mL/bath (INFANT 5 mL) or apply to wet skin and rinse

**Gentle wash**, glycerol 15%, net price 250 mL = £3.14, 500-mL pump pack = £5.24

**Excipients** include hydroxybenzoates (parabens)

**Dose** for dry skin conditions including eczema, psoriasis, ichthyosis, and pruritus, use as soap substitute

**Zerolatum<sup>®</sup>** (Thornton & Ross)

**Emollient medicinal bath oil**, liquid paraffin 65%, acetylated wool alcohols 5%, net price 500 mL = £4.79

**Excipients** none as listed in section 13.1.3

**Dose** for dry skin conditions including dermatitis, pruritus of the elderly, and ichthyosis, add 15–20 mL/bath (CHILD 5–10 mL)

**Zeroneum<sup>®</sup>** (Thornton & Ross)

**Bath oil**, refined soya bean oil 83.35%, net price 500 mL = £4.48

**Excipients** include butylated hydroxytoluene, fragrance, propylene glycol

**Dose** for dry skin conditions including eczema, add 20 mL/bath (CHILD 5 mL)

▲ **With antimicrobials****Dermol<sup>®</sup>** (Dermal)

**Dermol 600<sup>®</sup> Bath Emollient**, benzalkonium chloride 0.5%, liquid paraffin 25%, isopropyl myristate 25%, net price 600 mL = £7.55

**Excipients** include polysorbate 60

**Dose** for dry and pruritic skin conditions including eczema and dermatitis, add up to 30 mL/bath (INFANT up to 15 mL); do not use undiluted

**Dermol<sup>®</sup> 200 Shower Emollient**, benzalkonium chloride 0.1%, chlorhexidine hydrochloride 0.1%, liquid paraffin 2.5%, isopropyl myristate 2.5%, net price 200 mL = £3.55

**Excipients** include cetostearyl alcohol

**Dose** for dry and pruritic skin conditions including eczema and dermatitis, apply to skin or use as soap substitute

**Dermol<sup>®</sup> Wash Emulsion**, benzalkonium chloride 0.1%, chlorhexidine hydrochloride 0.1%, liquid paraffin 2.5%, isopropyl myristate 2.5%, net price 200-mL = £3.55

**Excipients** include cetostearyl alcohol

**Dose** for dry and pruritic skin conditions including eczema and dermatitis, apply to skin or use as soap substitute

**Emulsiderm<sup>®</sup>** (Dermal)

**Liquid emulsion**, benzalkonium chloride 0.5%, liquid paraffin 25%, isopropyl myristate 25%, net price 300 mL (with 15-mL measure) = £3.85, 1 litre (with 30-mL measure) = £12.00

**Excipients** include polysorbate 60

**Dose** for dry skin conditions including eczema and ichthyosis, add 7–30 mL/bath or rub into dry skin until absorbed

**Oilatum<sup>®</sup> Plus** (Stiefel)

**Bath additive**, benzalkonium chloride 6%, triclosan 2%, light liquid paraffin 52.5%, net price 500 mL = £6.98

**Excipients** include acetylated lanolin alcohols, isopropyl palmitate

**Dose** for topical treatment of eczema including eczema at risk from infection, add 1–2 capfuls/bath (INFANT over 6 months 1 mL); do not use undiluted

**Zerolatum<sup>®</sup> Plus** (Thornton & Ross)

**Bath additive**, benzalkonium chloride 6%, triclosan 2%, light liquid paraffin 51.66%, net price 500 mL = £5.82

**Excipients** include acetylated lanolin alcohols, isopropyl palmitate, polysorbate 80

**Dose** for prophylactic management of eczema at risk from infection, add 1–2 capfuls/bath (INFANT over 6 months, 1 mL); do not use undiluted

▲ **With tar**

Section 13.5.2

## 13.2.2 Barrier preparations

Barrier preparations often contain water-repellent substances such as **dimeticone** or other silicones. They are used on the skin around stomas, bedsores, and pressure areas in the elderly where the skin is intact. Where the skin has broken down, barrier preparations have a limited role in protecting adjacent skin. Barrier preparations are not a substitute for adequate nursing care.

**Nappy rash** The first line of treatment is to ensure that nappies are changed frequently and that tightly fitting water-proof pants are avoided. The rash may clear when left exposed to the air and a barrier preparation, applied with each nappy change, can be helpful. A mild corticosteroid such as hydrocortisone 0.5% or 1% (section 13.4) can be used if inflammation is causing discomfort, but it should be avoided in neonates. The barrier preparation should be applied after the corticosteroid preparation to prevent further skin damage. Preparations containing hydrocortisone should be applied for no more than a week; the hydrocortisone should be discontinued as soon as the inflammation subsides. The occlusive effect of nappies and water-proof pants may increase absorption of corticosteroids (for cautions, see section 13.4). If the rash is associated with candidal infection, a topical antifungal such as clotrimazole cream (section 13.10.2) can be used. Topical antibacterial preparations (section 13.10.1) can be used if bacterial infection is present; treatment with an oral antibacterial may occasionally be required in severe or recurrent infection. Hydrocortisone may be used in combination with antimicrobial preparations if there is considerable inflammation, erosion, and infection.

▲ **Non-proprietary barrier preparations****Zinc and Castor Oil Ointment, BP**

**Ointment**, zinc oxide 7.5%, castor oil 50%, arachis (peanut) oil 30.5%, white beeswax 10%, cetostearyl alcohol 2%, net price 500 g = £6.04  
For nappy and urinary rash

▲ **Proprietary barrier preparations****Conotrane<sup>®</sup>** (Astellas)

**Cream**, benzalkonium chloride 0.1%, dimeticone '350' 22%, net price 100 g = 88p, 500 g = £3.51  
**Excipients** include cetostearyl alcohol, fragrance  
For nappy and urinary rash and pressure sores

**Drapolene<sup>®</sup>** (Omega Pharma)

**Cream**, benzalkonium chloride 0.01%, cetrimide 0.2% in a basis containing white soft paraffin, cetyl alcohol and wool fat, net price 100 g = £1.76, 200 g = £2.86, 350 g = £4.28  
**Excipients** include cetyl alcohol, chlorocresol, wool fat  
For nappy and urinary rash; minor wounds

**Medicaid<sup>®</sup>** (LPC)

**Cream**, cetrimide 0.5% in a basis containing light liquid paraffin, white soft paraffin, cetostearyl alcohol, glyceryl monostearate, net price 50 g = £1.69  
**Excipients** include cetostearyl alcohol, fragrance, hydroxybenzoates (parabens), wool fat  
For nappy rash, minor burns, and abrasions

**Metanium<sup>®</sup>** (Thornton & Ross)

**Ointment**, titanium dioxide 20%, titanium peroxide 5%, titanium salicylate 3% in a basis containing dimeticone, light liquid paraffin, white soft paraffin, and benzoin tincture, net price 30 g = £2.24  
**Excipients** none as listed in section 13.1.3  
For nappy rash

**Morhulin<sup>®</sup>** (Actavis)

**Ointment**, cod-liver oil 11.4%, zinc oxide 38%, in a basis containing liquid paraffin and yellow soft paraffin, net price 50 g = £1.91  
**Excipients** include wool fat derivative  
For minor wounds, varicose ulcers, pressure sores, eczema, and nappy rash

**Siopel<sup>®</sup>** (Derma UK)

**Barrier cream**, dimeticone '1000' 10%, cetrimide 0.3%, arachis (peanut) oil, net price 50 g = £2.15  
**Excipients** include butylated hydroxytoluene, cetostearyl alcohol, hydroxybenzoates (parabens)  
For protection against water-soluble irritants

**Sprilon<sup>®</sup>** (Ayrton Saunders)

**Spray application**, dimeticone 1.04%, zinc oxide 12.5%, in a basis containing wool alcohols, cetostearyl alcohol, dextran, white soft paraffin, liquid paraffin, propellants, net price 115-g pressurised aerosol unit = £8.90  
**Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens), wool fat  
For urinary rash, pressure sores, leg ulcers, moist eczema, fissures, fistulae and ileostomy care  
**Note** Flammable

**Sudocrem<sup>®</sup>** (Forest)

**Cream**, benzyl alcohol 0.39%, benzyl benzoate 1.01%, benzyl cinnamate 0.15%, hydrous wool fat (hypoallergenic lanolin) 4%, zinc oxide 15.25%, net price 60 g = £1.45, 125 g = £2.15, 250 g = £3.67, 400 g = £5.25  
**Excipients** include beeswax (synthetic), propylene glycol, butylated hydroxyanisole, fragrance  
For nappy rash and pressure sores

## 13.3 Topical local anaesthetics and antipruritics

*Pruritus* may be caused by systemic disease (such as obstructive jaundice, endocrine disease, chronic renal disease, iron deficiency, and certain malignant diseases), skin disease (e.g. psoriasis, eczema, urticaria, and scabies), drug hypersensitivity, or as a side-effect of opioid analgesics. Where possible, the underlying causes should be treated. An **emollient** (section 13.2.1) may be of value where the pruritus is associated with dry skin. Pruritus that occurs in otherwise healthy elderly people can also be treated with an emollient. **Levomenthol cream** can be used to relieve pruritus; it exerts a cooling effect on the skin. For advice on the treatment of pruritus in palliative care, see p. 23.

Preparations containing **crotonitron** are sometimes used but are of uncertain value. Preparations containing **calamine** are often ineffective.

A topical preparation containing **doxepin** 5% is licensed for the relief of pruritus in eczema; it can cause drowsiness and there may be a risk of sensitisation.

Pruritus is common in biliary obstruction, especially in primary biliary cirrhosis and drug-induced cholestasis. Oral administration of **colestyramine** is the treatment of choice (section 1.9.2).

Topical antihistamines and local anaesthetics are only marginally effective and occasionally cause sensitisation. For *insect stings* and *insect bites*, a short course of a topical corticosteroid is appropriate. Short-term treatment with a **sedating antihistamine** (section 3.4.1) may help in insect stings and in intractable pruritus where sedation is desirable. Calamine preparations are of little value for the treatment of insect stings or bites.

For preparations used in *pruritus ani*, see section 1.7.1.

## CALAMINE

**Indications** pruritus

**Contra-indications** avoid application prior to x-ray (zinc oxide may affect outcome of x-ray)

**Calamine** (Non-proprietary)

**Aqueous cream**, calamine 4%, zinc oxide 3%, liquid paraffin 20%, self-emulsifying glyceryl monostearate 5%, cetomacrogol emulsifying wax 5%, phenoxethanol 0.5%, freshly boiled and cooled purified water 62.5%, net price 100 mL = £1.23

**Lotion** (= cutaneous suspension), calamine 15%, zinc oxide 5%, glycerol 5%, bentonite 3%, sodium citrate 0.5%, liquefied phenol 0.5%, in freshly boiled and cooled purified water, net price 200 mL = 88p

**Oily lotion** (BP 1980), calamine 5%, arachis (peanut) oil 50%, oleic acid 0.5%, wool fat 1%, in calcium hydroxide solution, net price 200 mL = £1.57

## CROTAMITON

**Indications** pruritus (including pruritus after scabies—section 13.10.4); see notes above

**Cautions** avoid use near eyes, in buccal mucosa, or on broken or very inflamed skin; use on doctor's advice for children under 3 years

**Contra-indications** acute exudative dermatoses

**Pregnancy** manufacturer advises avoid, especially during the first trimester—no information available

**Breast-feeding** no information available; avoid application to nipple area

**Dose**

• Pruritus, apply 2–3 times daily; **CHILD** under 3 years, apply once daily

**Eurax**<sup>®</sup> (Novartis Consumer Health)

**Cream**, crotamiton 10%, net price 30 g = £2.38, 100 g = £4.15

**Excipients** include beeswax, fragrance, hydroxybenzoates (parabens), stearyl alcohol

**Lotion**, crotamiton 10%, net price 100 mL = £3.14

**Excipients** include cetyl alcohol, fragrance, propylene glycol, sorbic acid, stearyl alcohol

## DOXEPIN HYDROCHLORIDE

**Indications** pruritus in eczema; depressive illness (section 4.3.1)

**Cautions** susceptibility to angle-closure glaucoma; urinary retention; mania; cardiac arrhythmias; severe

heart disease; avoid application to large areas; **interactions**: Appendix 1 (antidepressants, tricyclic)

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Hepatic impairment** manufacturer advises caution in severe liver disease

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk

**Side-effects** drowsiness; local burning, stinging, irritation, tingling and rash; systemic side-effects such as antimuscarinic effects, headache, fever, dizziness, gastro-intestinal disturbances also reported

**Dose**

• **ADULT** and **CHILD** over 12 years, apply thinly 3–4 times daily; usual max. 3 g per application; usual total max. 12 g daily; coverage should be less than 10% of body surface area

**Xepin**<sup>®</sup> (CHS) (PoM)

**Cream**, doxepin hydrochloride 5%, net price 30 g = £11.70. Label: 2, 10, patient information leaflet

**Excipients** include benzyl alcohol

## LEVOMENTHOL

**Indications** pruritus

**Levomenthol Cream, BP**  
(Menthol in Aqueous Cream)

**Cream**, levomenthol 0.5%, net price 500 g = £16.07; 1% 100 g = £3.97, 500 g = £16.59; 2% 50 g = £1.53, 100 g = £3.67, 450 g = £17.99, 500 g = £16.97

**Dose** apply 1–2 times daily

## TOPICAL LOCAL ANAESTHETICS

**Indications** relief of local pain, see notes above. See section 15.2 for use in surface anaesthesia

**Cautions** occasionally cause hypersensitivity

**Note** Topical local anaesthetic preparations may be absorbed, especially through mucosal surfaces, therefore excessive application should be avoided and they should preferably not be used for more than about 3 days; not generally suitable for young children

## TOPICAL ANTIHISTAMINES

**Indications** see notes above

**Cautions** may cause hypersensitivity; avoid in eczema; photosensitivity (diphenhydramine); not recommended for longer than 3 days

## 13.4 Topical corticosteroids

Topical corticosteroids are used for the treatment of inflammatory conditions of the skin (other than those arising from an infection), in particular eczema (section 13.5.1), contact dermatitis, insect stings (p. 43), and eczema of scabies (section 13.10.4). Corticosteroids suppress the inflammatory reaction during use; they are not curative and on discontinuation a rebound exacerbation of the condition may occur. They are generally used to relieve symptoms and suppress signs of the disorder when other measures such as emollients are ineffective.

Topical corticosteroids are not recommended in the routine treatment of urticaria; treatment should only

be initiated and supervised by a specialist. Topical corticosteroids are **contra-indicated** in rosacea. They may worsen ulcerated or secondarily infected lesions. They should not be used indiscriminately in pruritus (where they will only benefit if inflammation is causing the itch) and are **not** recommended for acne vulgaris.

Systemic or very potent topical corticosteroids should be avoided or given only under specialist supervision in *psoriasis* because, although they may suppress the psoriasis in the short term, relapse or vigorous rebound occurs on withdrawal (sometimes precipitating severe pustular psoriasis). For the role of topical corticosteroids in the treatment of psoriasis, see section 13.5.2.

In general, the most potent topical corticosteroids should be reserved for recalcitrant dermatoses such as *chronic discoid lupus erythematosus*, *lichen simplex chronicus*, *hypertrophic lichen planus*, and *palmoplantar pustulosis*. Potent corticosteroids should generally be avoided on the face and skin flexures, but specialists occasionally prescribe them for use on these areas in certain circumstances.

When topical treatment has failed, intralesional corticosteroid injections (section 10.1.2.2) may be used. These are more effective than the very potent topical corticosteroid preparations and should be reserved for severe cases where there are localised lesions such as *keloid scars*, *hypertrophic lichen planus*, or *localised alopecia areata*.

**Perioral lesions** Hydrocortisone cream 1% can be used for up to 7 days to treat uninfected inflammatory lesions on the lips. Hydrocortisone and miconazole cream or ointment is useful where infection by susceptible organisms and inflammation co-exist, particularly for initial treatment (up to 7 days) e.g. in angular cheilitis (see also p. 775). Organisms susceptible to miconazole include *Candida* spp. and many Gram-positive bacteria including streptococci and staphylococci.

**Children** Children, especially infants, are particularly susceptible to side-effects. However, concern about the safety of topical corticosteroids in children should not result in the child being undertreated. The aim is to control the condition as well as possible; inadequate treatment will perpetuate the condition. A mild corticosteroid such as hydrocortisone 0.5% or 1% is useful for treating nappy rash (section 13.2.2) and hydrocortisone 1% for atopic eczema in childhood (section 13.5.1). A moderately potent or potent corticosteroid may be appropriate for severe atopic eczema on the limbs, for 1–2 weeks only, switching to a less potent preparation as the condition improves. In an acute flare-up of atopic eczema, it may be appropriate to use more potent formulations of topical corticosteroids for a short period to regain control of the condition. A very potent corticosteroid should be initiated under the supervision of a specialist. Continuous daily application of a mild corticosteroid such as hydrocortisone 1% is equivalent to a potent corticosteroid such as betamethasone 0.1% applied intermittently. Carers of young children should be advised that treatment should **not** necessarily be reserved to 'treat only the worst areas' and they may need to be advised that patient information leaflets may contain inappropriate advice for the patient's condition.

**Choice of formulation** Water-miscible corticosteroid *creams* are suitable for moist or weeping lesions whereas *ointments* are generally chosen for dry, lichenified or scaly lesions or where a more occlusive effect is

required. *Lotions* may be useful when minimal application to a large or hair-bearing area is required or for the treatment of exudative lesions. *Occlusive polythene or hydrocolloid dressings* increase absorption, but also increase the risk of side-effects; they are therefore used only under supervision on a short-term basis for areas of very thick skin (such as the palms and soles). The inclusion of urea or salicylic acid also increases the penetration of the corticosteroid.

In the BNF topical corticosteroids for the skin are categorised as 'mild', 'moderately potent', 'potent' or 'very potent' (see p. 789); the **least potent** preparation which is effective should be chosen but dilution should be avoided whenever possible.

**Cautions** Avoid prolonged use of a topical corticosteroid on the face (and keep away from eyes). In children avoid prolonged use and use potent or very potent corticosteroids under specialist supervision; extreme caution is required in dermatoses of infancy including nappy rash—treatment should be limited to 5–7 days.

**Psoriasis** The use of potent or very potent corticosteroids in psoriasis can result in rebound relapse, development of generalised pustular psoriasis, and local and systemic toxicity.

**Contra-indications** Topical corticosteroids are contra-indicated in untreated bacterial, fungal, or viral skin lesions, in acne, in rosacea, and in perioral dermatitis; potent corticosteroids are contra-indicated in widespread plaque psoriasis (see notes above).

**Side-effects** *Mild* and *moderately potent* topical corticosteroids are associated with few side-effects but care is required in the use of *potent* and *very potent* corticosteroids. Absorption through the skin can rarely cause adrenal suppression and even Cushing's syndrome (section 6.3.2), depending on the area of the body being treated and the duration of treatment. Absorption is greatest where the skin is thin or raw, and from intertriginous areas; it is increased by occlusion. Local side-effects include:

- spread and worsening of untreated infection;
- thinning of the skin which may be restored over a period after stopping treatment but the original structure may never return;
- irreversible striae atrophicae and telangiectasia;
- contact dermatitis;
- perioral dermatitis;
- acne, or worsening of acne or rosacea;
- mild depigmentation which may be reversible;
- hypertrichosis also reported.

In order to minimise the side-effects of a topical corticosteroid, it is important to apply it **thinly** to affected areas **only**, no more frequently than **twice daily**, and to use the least potent formulation which is fully effective.

**Application** Topical corticosteroid preparations should be applied no more frequently than twice daily; once daily is often sufficient.

Topical corticosteroids should be spread thinly on the skin but in sufficient quantity to cover the affected areas. The length of cream or ointment expelled from a tube may be used to specify the quantity to be applied to a

given area of skin. This length can be measured in terms of a *finger tip unit* (the distance from the tip of the adult index finger to the first crease). One fingertip unit (approximately 500 mg from a tube with a standard 5-mm diameter nozzle) is sufficient to cover an area that is twice that of the flat adult handprint (palm and fingers).

### Suitable quantities of corticosteroid preparations to be prescribed for specific areas of the body

Area of body	Creams and Ointments
Face and neck	15 to 30 g
Both hands	15 to 30 g
Scalp	15 to 30 g
Both arms	30 to 60 g
Both legs	100 g
Trunk	100 g
Groins and genitalia	15 to 30 g

These amounts are usually suitable for an adult for a single daily application for 2 weeks

If a patient is using topical corticosteroids of different potencies, the patient should be told when to use each corticosteroid. The potency of each topical corticosteroid (see Topical Corticosteroid Preparation Potencies, below) should be included on the label with the directions for use. The label should be attached to the container (for example, the tube) rather than the outer packaging.

Mixing topical preparations on the skin should be avoided where possible; several minutes should elapse between application of different preparations.

**Compound preparations** The advantages of including other substances (such as antibacterials or antifungals) with corticosteroids in topical preparations are uncertain, but such combinations may have a place where inflammatory skin conditions are associated with bacterial or fungal infection, such as infected eczema. In these cases the antimicrobial drug should be chosen according to the sensitivity of the infecting organism and used regularly for a short period (typically twice daily for 1 week). Longer use increases the likelihood of resistance and of sensitisation.

The keratolytic effect of salicylic acid facilitates the absorption of topical corticosteroids; however, excessive and prolonged use of topical preparations containing salicylic acid may cause salicylism.

### Topical corticosteroid preparation potencies

Potency of a topical corticosteroid preparation is a result of the formulation as well as the corticosteroid. Therefore, proprietary names are shown below.

#### Mild

Hydrocortisone 0.1–2.5%, *Dioderm*, *Mildison*, *Synalar 1* in 10 dilution

- Mild with antimicrobials: *Canesten HC*, *Daktacort*, *Econacort*, *Fucidin H*, *Nystaform-HC*, *Terra-Cortril*, *Timodine*

#### Moderate

*Betnovate-RD*, *Eumovate*, *Haelan*, *Modrasone*, *Synalar 1* in 4 Dilution, *Ultralanum Plain*

- Moderate with antimicrobials: *Trimovate*
- Moderate with urea: *Alphaderm*, *Calmurid HC*

#### Potent

Beclomethasone dipropionate 0.025%, Betamethasone valerate 0.1%, *Betacap*, *Betesil*, *Bettamousse*, *Betnovate*, *Cutivate*, *Diprosone*, *Elocon*, Hydrocortisone butyrate, *Locoid*, *Locoid Crelo*, *Metosyn*, Mometasone furoate 0.1%, *Nerisone*, *Synalar*

- Potent with antimicrobials: *Aureocort*, Betamethasone and clioquinol, Betamethasone and neomycin, *Fucibet*, *Lotriderm*, *Synalar C*, *Synalar N*

- Potent with salicylic acid: *Diprosalic*

#### Very potent

*Clarelux*, *Dermovate*, *Etrivex*, *Nerisone Forte*

- Very potent with antimicrobials: Clobetasol with neomycin and nystatin

## HYDROCORTISONE

**Indications** mild inflammatory skin disorders such as eczemas (but for over-the-counter preparations, see below); nappy rash (see also section 13.2.2)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

#### Dose

- Apply thinly 1–2 times daily

**Hydrocortisone** (Non-proprietary) (PoM)

**Cream**, hydrocortisone 0.5%, net price, 15 g = £1.31, 30 g = £2.96; 1%, 15 g = £1.04, 30 g = £2.08, 50 g = £3.47; 2.5%, 15 g = £24.07. Label: 28, counselling, application, see above. Potency: mild

**Dental prescribing on NHS** Hydrocortisone Cream 1% 15 g may be prescribed

**Ointment**, hydrocortisone 0.5%, net price 15 g = £3.92, 30 g = £4.90; 1%, 15 g = £1.10, 30 g = £2.20, 50 g = £3.67; 2.5%, 15 g = £23.82. Label: 28, counselling, application, see above. Potency: mild

When hydrocortisone cream or ointment is prescribed and no strength is stated, the 1% strength should be supplied

#### Over-the-counter hydrocortisone preparations

Skin creams and ointments containing hydrocortisone (alone or with other ingredients) can be sold to the public for the treatment of allergic contact dermatitis, irritant dermatitis, insect bite reactions and mild to moderate eczema, to be applied sparingly over the affected area 1–2 times daily for max. 1 week. Over-the-counter hydrocortisone preparations should not be sold without medical advice for children under 10 years or for pregnant women; they should not be sold for application to the face, anogenital region, broken or infected skin (including cold sores, acne, and athlete's foot); over-the-counter hydrocortisone preparations containing clotrimazole or miconazole nitrate can be sold to the public for athlete's foot and candidal intertrigo

#### Proprietary hydrocortisone preparations

**Dioderm**<sup>®</sup> (Derma) (PoM)

**Cream**, hydrocortisone 0.1%, net price 30 g = £2.39. Label: 28, counselling, application, see p. 788.

Potency: mild

**Excipients** include ceteostearyl alcohol, propylene glycol

**Note** Although this contains only 0.1% hydrocortisone, the formulation is designed to provide a clinical activity comparable to that of Hydrocortisone Cream 1% BP

**Mildison**<sup>®</sup> (Astellas) **[POM]**

**Lipocream**, hydrocortisone 1%, net price 30 g = £1.71. Label: 28, counselling, application, see p. 788.

Potency: mild

**Excipients** include benzyl alcohol, cetostearyl alcohol, hydroxybenzoates (parabens)

**Compound preparations**

Compound preparations with coal tar, see section 13.5.2

**Alphaderm**<sup>®</sup> (Alliance) **[POM]**

**Cream**, hydrocortisone 1%, urea 10%, net price 30 g = £2.38; 100 g = £7.03. Label: 28, counselling, application, see p. 788. Potency: moderate

**Excipients** none as listed in section 13.1.3

**Calmurid HC**<sup>®</sup> (Galderma) **[POM]**

**Cream**, hydrocortisone 1%, urea 10%, lactic acid 5%, net price 100 g = £10.51. Label: 28, counselling, application, see p. 788. Potency: moderate

**Excipients** none as listed in section 13.1.3

**Note** If stinging occurs, manufacturer advises dilute to half-strength with aqueous cream for 1 week then transfer to undiluted preparation (but see section 13.1.1 for advice to avoid dilution where possible)

**With antimicrobials**

See notes above for comment on compound preparations

**Canesten HC**<sup>®</sup> (Bayer Consumer Care) **[POM]**

**Cream**, hydrocortisone 1%, clotrimazole 1%, net price 30 g = £2.42. Label: 28, counselling, application, see p. 788. Potency: mild

**Excipients** include benzyl alcohol, cetostearyl alcohol

**Note** A 15-g tube is on sale to the public for the treatment of athlete's foot and fungal infection of skin folds with associated inflammation

**Daktacort**<sup>®</sup> (Janssen) **[POM]**

**Cream**, hydrocortisone 1%, miconazole nitrate 2%, net price 30 g = £2.49. Label: 28, counselling, application, see p. 788. Potency: mild

**Excipients** include butylated hydroxyanisole, disodium edetate

**Cautions interactions:** Appendix 1 (antifungals, imidazole)

**Dental prescribing on NHS** May be prescribed as Miconazole and Hydrocortisone Cream for max. 7 days

**Note** A 15-g tube is on sale to the public for the treatment of athlete's foot and candidal intertrigo

**Ointment**, hydrocortisone 1%, miconazole nitrate 2%, net price 30 g = £2.50. Label: 28, counselling, application, see p. 788. Potency: mild

**Excipients** none as listed in section 13.1.3

**Cautions interactions:** Appendix 1 (antifungals, imidazole)

**Dental prescribing on NHS** May be prescribed as Miconazole and Hydrocortisone Ointment for max. 7 days

**Fucidin H**<sup>®</sup> (LEO) **[POM]**

**Cream**, hydrocortisone acetate 1%, fusidic acid 2%, net price 30 g = £5.02, 60 g = £10.04. Label: 28, counselling, application, see p. 788. Potency: mild

**Excipients** include butylated hydroxyanisole, cetyl alcohol, polysorbate 60, potassium sorbate

**Nystaform-HC**<sup>®</sup> (Typharm) **[POM]**

**Cream**, hydrocortisone 0.5%, nystatin 100 000 units/g, chlorhexidine hydrochloride 1%, net price 30 g = £2.66. Label: 28, counselling, application, see p. 788. Potency: mild

**Excipients** include benzyl alcohol, cetostearyl alcohol, polysorbate 60

**Ointment**, hydrocortisone 1%, nystatin 100 000 units/g, chlorhexidine acetate 1%, net price 30 g = £2.66. Label: 28, counselling, application, see p. 788. Potency: mild

**Excipients** none as listed in section 13.1.3

**Terra-Cortril**<sup>®</sup> (Alliance) **[POM]**

**Ointment**, hydrocortisone 1%, oxytetracycline (as hydrochloride) 3%, net price 30 g = £5.01. Label: 28, counselling, application, see p. 788. Potency: mild

**Excipients** none as listed in section 13.1.3

**Contra-indications** children under 12 years

**Pregnancy** section 5.1.3

**Breast-feeding** section 5.1.3

**Timodine**<sup>®</sup> (Alliance) **[POM]**

**Cream**, hydrocortisone 0.5%, nystatin 100 000 units/g, benzalkonium chloride solution 0.2%, dimeticone '350' 10%, net price 30 g = £2.86. Label: 28, counselling, application, see p. 788. Potency: mild

**Excipients** include butylated hydroxyanisole, cetostearyl alcohol, hydroxybenzoates (parabens), sodium metabisulfite, sorbic acid

**HYDROCORTISONE BUTYRATE**

**Indications** severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; psoriasis, see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**

- Apply thinly 1–2 times daily

**Locoid**<sup>®</sup> (Astellas) **[POM]**

**Cream**, hydrocortisone butyrate 0.1%, net price 30 g = £1.60, 100 g = £4.93. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens)

**Lipocream**, hydrocortisone butyrate 0.1%, net price 30 g = £1.69, 100 g = £5.17. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include benzyl alcohol, cetostearyl alcohol, hydroxybenzoates (parabens)

**Note** For bland cream basis see *Lipobase*<sup>®</sup>, section 13.2.1

**Ointment**, hydrocortisone butyrate 0.1%, net price 30 g = £1.60, 100 g = £4.93. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** none as listed in section 13.1.3

**Scalp lotion**, hydrocortisone butyrate 0.1%, in an aqueous isopropyl alcohol basis, net price 100 mL = £6.83. Label: 15, 28, counselling, application, see p. 788. Potency: potent

**Excipients** none as listed in section 13.1.3

**Locoid Crelo**<sup>®</sup> (Astellas) **[POM]**

**Lotion** (topical emulsion), hydrocortisone butyrate 0.1% in a water-miscible basis, net price 100 g (with applicator nozzle) = £5.91. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include butylated hydroxytoluene, cetostearyl alcohol, hydroxybenzoates (parabens), propylene glycol

**ALCLOMETASONE DIPROPIONATE**

**Indications** inflammatory skin disorders such as eczemas

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**

- Apply thinly 1–2 times daily

**Modrasone**<sup>®</sup> (TEVA UK) (PoM)

**Cream**, alclometasone dipropionate 0.05%, net price 50 g = £2.68. Label: 28, counselling, application, see p. 788. Potency: moderate  
**Excipients** include cetostearyl alcohol, chlorocresol, propylene glycol

**BECLOMETASONE DIPROPIONATE**

(Beclomethasone dipropionate)

**Indications** severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; psoriasis, see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**

- Apply thinly 1–2 times daily

**Beclomethasone** (Non-proprietary) (PoM)

**Cream**, beclomethasone dipropionate 0.025%, net price 30 g = £68.00. Label: 28, counselling, application, see p. 788. Potency: potent  
**Ointment**, beclomethasone dipropionate 0.025%, net price 30 g = £68.00. Label: 28, counselling, application, see p. 788. Potency: potent

**BETAMETHASONE ESTERS**

**Indications** severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; psoriasis, see notes above

**Cautions** see notes above; use of more than 100 g per week of 0.1% preparation likely to cause adrenal suppression

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**

- Apply thinly 1–2 times daily

**Betamethasone Valerate** (Non-proprietary) (PoM)

**Cream**, betamethasone (as valerate) 0.1%, net price 30 g = £2.84, 100 g = £9.47. Label: 28, counselling, application, see p. 788. Potency: potent  
**Ointment**, betamethasone (as valerate) 0.1%, net price 30 g = £2.24, 100 g = £7.47. Label: 28, counselling, application, see p. 788. Potency: potent

**Betacap**<sup>®</sup> (Dermal) (PoM)

**Scalp application**, betamethasone (as valerate) 0.1% in a water-miscible basis containing coconut oil derivative, net price 100 mL = £3.75. Label: 15, 28, counselling, application, see p. 788. Potency: potent  
**Excipients** none as listed in section 13.1.3

**Betesis**<sup>®</sup> (Genus) (PoM)

**Medicated plasters**, betamethasone (as valerate) 2.25 mg, net price 4 = £9.92. Counselling, application. Potency: potent  
**Excipients** include disodium edetate, hydroxybenzoates (parabens)  
**Dose ADULT** over 18 years, apply plaster to clean, dry skin once daily; max. 6 plasters daily; max. duration of treatment 30 days  
**Counselling** Leave at least 30 minutes between applications; plasters may be cut; avoid water contact with plaster—take bath or shower between applications; see also p. 789

**Betnovate**<sup>®</sup> (GSK) (PoM)

**Cream**, betamethasone (as valerate) 0.1% in a water-miscible basis, net price 30 g = £1.43, 100 g = £4.05. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include cetostearyl alcohol, chlorocresol  
**Ointment**, betamethasone (as valerate) 0.1% in an anhydrous paraffin basis, net price 30 g = £1.43, 100 g = £4.05. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** none as listed in section 13.1.3

**Lotion**, betamethasone (as valerate) 0.1%, net price 100 mL = £4.58. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens)

**Scalp application**, betamethasone (as valerate) 0.1% in a water-miscible basis, net price 100 mL = £4.99. Label: 15, 28, counselling, application, see p. 788. Potency: potent

**Excipients** none as listed in section 13.1.3

**Betnovate-RD**<sup>®</sup> (GSK) (PoM)

**Cream**, betamethasone (as valerate) 0.025% in a water-miscible basis (1 in 4 dilution of *Betnovate*<sup>®</sup> cream), net price 100 g = £3.15. Label: 28, counselling, application, see p. 788. Potency: moderate  
**Excipients** include cetostearyl alcohol, chlorocresol  
**Ointment**, betamethasone (as valerate) 0.025% in an anhydrous paraffin basis (1 in 4 dilution of *Betnovate*<sup>®</sup> ointment), net price 100 g = £3.15. Label: 28, counselling, application, see p. 788. Potency: moderate

**Excipients** none as listed in section 13.1.3

**Betamousse**<sup>®</sup> (RPH) (PoM)

**Foam** (= scalp application), betamethasone valerate 0.12% (= betamethasone 0.1%), net price 100 g = £9.75. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include cetyl alcohol, polysorbate 60, propylene glycol, stearyl alcohol

**Note** Flammable

**Diprosone**<sup>®</sup> (MSD) (PoM)

**Cream**, betamethasone (as dipropionate) 0.05%, net price 30 g = £2.16, 100 g = £6.12. Label: 28, counselling, application, see p. 788. Potency: potent  
**Excipients** include cetostearyl alcohol, chlorocresol

**Ointment**, betamethasone (as dipropionate) 0.05%, net price 30 g = £2.16, 100 g = £6.12. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** none as listed in section 13.1.3

**Lotion**, betamethasone (as dipropionate) 0.05%, net price 30 mL = £2.73, 100 mL = £7.80. Label: 28, counselling, application, see p. 788. Potency: potent  
**Excipients** none as listed in section 13.1.3

**With salicylic acid**

See notes above for comment on compound preparations  
 For prescribing information on salicylic acid, see p. 800

**Diprosalic**<sup>®</sup> (MSD) (PoM)

**Ointment**, betamethasone (as dipropionate) 0.05%, salicylic acid 3%, net price 30 g = £3.18, 100 g = £9.14. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** none as listed in section 13.1.3

**Dose** apply thinly 1–2 times daily; max. 60 g per week

**Scalp application**, betamethasone (as dipropionate) 0.05%, salicylic acid 2%, in an alcoholic basis, net price 100 mL = £10.10. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include disodium edetate  
**Dose** apply a few drops 1–2 times daily

**With antimicrobials**

See notes above for comment on compound preparations

**Betamethasone and clioquinol** (Non-proprietary) (PoM)**Cream**, betamethasone (as valerate) 0.1%, clioquinol 3%, net price 30 g = £9.48. Label: 28, counselling, application, see p. 788. Potency: potent**Excipients** may include cetostearyl alcohol, chlorocresol**Note** Stains clothing**Ointment**, betamethasone (as valerate) 0.1%, clioquinol 3%, net price 30 g = £9.48. Label: 28, counselling, application, see p. 788. Potency: potent**Note** Stains clothing**Betamethasone and neomycin** (Non-proprietary) (PoM)**Cream**, betamethasone (as valerate) 0.1%, neomycin sulfate 0.5%, net price 30 g = £9.48, 100 g = £28.01. Label: 28, counselling, application, see p. 788. Potency: potent**Excipients** may include cetostearyl alcohol, chlorocresol**Ointment**, betamethasone (as valerate) 0.1%, neomycin sulfate 0.5%, net price 30 g = £9.48, 100 g = £28.01. Label: 28, counselling, application, see p. 788. Potency: potent**Fucibet**<sup>®</sup> (LEO) (PoM)**Cream**, betamethasone (as valerate) 0.1%, fusidic acid 2%, net price 30 g = £5.32, 60 g = £10.63. Label: 28, counselling, application, see p. 788. Potency: potent**Excipients** include cetostearyl alcohol, chlorocresol**Lipid cream**, betamethasone (as valerate) 0.1%, fusidic acid 2%, net price 30 g = £5.62. Label: 28, counselling, application, see p. 788. Potency: potent**Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens)**Lotriderm**<sup>®</sup> (TEVA UK) (PoM)**Cream**, betamethasone dipropionate 0.064% (= betamethasone 0.05%), clotrimazole 1%, net price 30 g = £6.34. Label: 28, counselling, application, see p. 788. Potency: potent**Excipients** include benzyl alcohol, cetostearyl alcohol, propylene glycol**CLOBETASOL PROPIONATE****Indications** short-term treatment only of severe resistant inflammatory skin disorders such as recalcitrant eczemas unresponsive to less potent corticosteroids; psoriasis, see notes above**Cautions** see notes above**Contra-indications** see notes above**Side-effects** see notes above**Dose**

- Apply thinly 1–2 times daily for up to 4 weeks; max. 50 g of 0.05% preparation per week

**Clarelux**<sup>®</sup> (Fabre) (PoM)**Foam** (= scalp application), clobetasol propionate 0.05%, net price 100 g = £11.06. Label: 15, 28, counselling, application, see p. 788. Potency: very potent**Excipients** include cetyl alcohol, polysorbate 60, propylene glycol, stearyl alcohol**Caution** flammable**Note** Apply directly to scalp lesions (foam begins to subside immediately on contact with skin)**Dermovate**<sup>®</sup> (GSK) (PoM)**Cream**, clobetasol propionate 0.05%, net price 30 g = £2.69, 100 g = £7.90. Label: 28, counselling, application, see p. 788. Potency: very potent**Excipients** include beeswax (or beeswax substitute), cetostearyl alcohol, chlorocresol, propylene glycol**Ointment**, clobetasol propionate 0.05%, net price 30 g = £2.69, 100 g = £7.90. Label: 28, counselling, application, see p. 788. Potency: very potent**Excipients** include propylene glycol**Scalp application**, clobetasol propionate 0.05%, in a thickened alcoholic basis, net price 30 mL = £3.07, 100 mL = £10.42. Label: 15, 28, counselling, application, see p. 788. Potency: very potent**Excipients** none as listed in section 13.1.3**Etrivex**<sup>®</sup> (Galderna) (PoM)**Shampoo**, clobetasol propionate 0.05%, net price 125 mL = £15.99. Label: 28, counselling, application, see p. 788. Potency: very potent**Excipients** none as listed in section 13.1.3**Dose** moderate scalp psoriasis, **ADULT** over 18 years, apply thinly once daily, rinse off after 15 minutes; reduce frequency of application after clinical improvement; max. duration of treatment 4 weeks**With antimicrobials**

See notes above for comment on compound preparations

**Clobetasol with neomycin and nystatin** (Non-proprietary) (PoM)**Cream**, clobetasol propionate 0.05%, neomycin sulfate 0.5%, nystatin 100 000 units/g, net price 30 g = £64.00. Label: 28, counselling, application, see p. 788. Potency: very potent**Ointment**, clobetasol propionate 0.05%, neomycin sulfate 0.5%, nystatin 100 000 units/g, in a paraffin basis, net price 30 g = £64.00. Label: 28, counselling, application, see p. 788. Potency: very potent**CLOBETASONE BUTYRATE****Indications** eczemas and dermatitis of all types; maintenance between courses of more potent corticosteroids**Cautions** see notes above**Contra-indications** see notes above**Side-effects** see notes above**Dose**

- Apply thinly 1–2 times daily

**<sup>1</sup>Emovate**<sup>®</sup> (GSK) (PoM)**Cream**, clobetasone butyrate 0.05%, net price 30 g = £1.86, 100 g = £5.44. Label: 28, counselling, application, see p. 788. Potency: moderate**Excipients** include beeswax substitute, cetostearyl alcohol, chlorocresol**Ointment**, clobetasone butyrate 0.05%, net price 30 g = £1.86, 100 g = £5.44. Label: 28, counselling, application, see p. 788. Potency: moderate**Excipients** none as listed in section 13.1.3**With antimicrobials**

See notes above for comment on compound preparations

**Trimovate**<sup>®</sup> (GSK) (PoM)**Cream**, clobetasone butyrate 0.05%, oxytetracycline 3% (as calcium salt), nystatin 100 000 units/g, net price 30 g = £3.29. Label: 28, counselling, application, see p. 788. Potency: moderate**Excipients** include cetostearyl alcohol, chlorocresol, sodium metabisulfite**Note** Stains clothing

1. Cream can be sold to the public for short-term symptomatic treatment and control of patches of eczema and dermatitis (but not seborrhoeic dermatitis) in adults and children over 12 years provided pack does not contain more than 15 g

## DIFLUCORTOLONE VALERATE

**Indications** severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; high strength (0.3%), short-term treatment of severe exacerbations; psoriasis, see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

### Dose

- Apply thinly 1–2 times daily for up to 4 weeks (0.1% preparations) or 2 weeks (0.3% preparations), reducing strength as condition responds; max. 60 g of 0.3% per week

**Nerisone**<sup>®</sup> (Meadow) PoM

**Cream**, diflucortolone valerate 0.1%, net price 30 g = £1.59. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include disodium edetate, hydroxybenzoates (parabens), stearyl alcohol

**Oily cream**, diflucortolone valerate 0.1%, net price 30 g = £2.56. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include beeswax

**Ointment**, diflucortolone valerate 0.1%, net price 30 g = £1.59. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** none as listed in section 13.1.3

**Nerisone Forte**<sup>®</sup> (Meadow) PoM

**Oily cream**, diflucortolone valerate 0.3%, net price 15 g = £2.09. Label: 28, counselling, application, see p. 788. Potency: very potent

**Excipients** include beeswax

**Ointment**, diflucortolone valerate 0.3%, net price 15 g = £2.09. Label: 28, counselling, application, see p. 788. Potency: very potent

**Excipients** none as listed in section 13.1.3

## FLUDROXYCORTIDE

(Flurandrenolone)

**Indications** inflammatory skin disorders such as eczemas

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

### Dose

- Apply thinly 1–2 times daily

**Haelan**<sup>®</sup> (Typharm) PoM

**Cream**, fludroxycortide 0.0125%, net price 60 g = £3.26. Label: 28, counselling, application, see p. 788. Potency: moderate

**Excipients** include cetyl alcohol, propylene glycol

**Ointment**, fludroxycortide 0.0125%, net price 60 g = £3.26. Label: 28, counselling, application, see p. 788. Potency: moderate

**Excipients** include beeswax, cetyl alcohol, polysorbate

**Tape**, polythene adhesive film impregnated with fludroxycortide 4 micrograms/cm<sup>2</sup>, net price 7.5 cm × 50 cm = £9.27, 7.5 cm × 200 cm = £24.95

**Dose** for chronic localised recalcitrant dermatoses (but not acute or weeping), cut tape to fit lesion, apply to clean, dry skin shorn of hair, usually for 12 hours daily

## FLUCINOLONE ACETONIDE

**Indications** inflammatory skin disorders such as eczemas; psoriasis, see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

### Dose

- Apply thinly 1–2 times daily, reducing strength as condition responds

**Synalar**<sup>®</sup> (GP Pharma) PoM

**Cream**, flucinolone acetonide 0.025%, net price 30 g = £4.14, 100 g = £11.75. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include benzyl alcohol, cetostearyl alcohol, polysorbates, propylene glycol

**Gel**, flucinolone acetonide 0.025%, net price 30 g = £5.56, 60 g = £10.02. For use on scalp and other hairy areas. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include hydroxybenzoates (parabens), propylene glycol

**Ointment**, flucinolone acetonide 0.025%, net price 30 g = £4.14, 100 g = £11.75. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include propylene glycol, wool fat

**Synalar 1 in 4 Dilution**<sup>®</sup> (GP Pharma) PoM

**Cream**, flucinolone acetonide 0.00625%, net price 50 g = £4.84. Label: 28, counselling, application, see p. 788. Potency: moderate

**Excipients** include benzyl alcohol, cetostearyl alcohol, polysorbates, propylene glycol

**Ointment**, flucinolone acetonide 0.00625%, net price 50 g = £4.84. Label: 28, counselling, application, see p. 788. Potency: moderate

**Excipients** include propylene glycol, wool fat

**Synalar 1 in 10 Dilution**<sup>®</sup> (GP Pharma) PoM

**Cream**, flucinolone acetonide 0.0025%, net price 50 g = £4.58. Label: 28, counselling, application, see p. 788. Potency: mild

**Excipients** include benzyl alcohol, cetostearyl alcohol, polysorbates, propylene glycol

### With antimicrobials

See notes above for comment on compound preparations

**Synalar C**<sup>®</sup> (GP Pharma) PoM

**Cream**, flucinolone acetonide 0.025%, clioquinol 3%, net price 15 g = £2.66. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include cetostearyl alcohol, disodium edetate, hydroxybenzoates (parabens), polysorbates, propylene glycol

**Ointment**, flucinolone acetonide 0.025%, clioquinol 3%, net price 15 g = £2.66. Label: 28, counselling, application, see p. 788. Potency: potent

**Note** stains clothing

**Excipients** include propylene glycol, wool fat

**Synalar N**<sup>®</sup> (GP Pharma) PoM

**Cream**, flucinolone acetonide 0.025%, neomycin sulfate 0.5%, net price 30 g = £4.36. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens), polysorbates, propylene glycol

**Ointment**, flucinolone acetonide 0.025%, neomycin sulfate 0.5%, in a greasy basis, net price 30 g = £4.36. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include propylene glycol, wool fat

**FLUOCINONIDE**

**Indications** severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; psoriasis, see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**

- Apply thinly 1–2 times daily

**Metosyn**<sup>®</sup> (GP Pharma) (PoM)

**FAPG cream**, fluocinonide 0.05%, net price 25 g = £3.96, 100 g = £13.34. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include propylene glycol

**Ointment**, fluocinonide 0.05%, net price 25 g = £3.50, 100 g = £13.15. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include propylene glycol, wool fat

**FLUOCORTOLONE**

**Indications** severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; psoriasis, see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**

- Apply thinly 1–2 times daily, reducing strength as condition responds

**Ultralanum Plain**<sup>®</sup> (Meadow) (PoM)

**Cream**, fluocortolone caproate 0.25%, fluocortolone pivalate 0.25%, net price 50 g = £2.95. Label: 28, counselling, application, see p. 788. Potency: moderate

**Excipients** include disodium edetate, fragrance, hydroxybenzoates (parabens), stearyl alcohol

**Ointment**, fluocortolone 0.25%, fluocortolone caproate 0.25%, net price 50 g = £2.95. Label: 28, counselling, application, see p. 788. Potency: moderate

**Excipients** include wool fat, fragrance

**FLUTICASONE PROPIONATE**

**Indications** inflammatory skin disorders such as dermatitis and eczemas unresponsive to less potent corticosteroids

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**

- Apply thinly 1–2 times daily

**Cutivate**<sup>®</sup> (GSK) (PoM)

**Cream**, fluticasone propionate 0.05%, net price 15 g = £2.27, 30 g = £4.24. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include cetostearyl alcohol, imidurea, propylene glycol

**Ointment**, fluticasone propionate 0.005%, net price 15 g = £2.27, 30 g = £4.24. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include propylene glycol

**MOMETASONE FUROATE**

**Indications** severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; psoriasis, see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**

- Apply thinly once daily (to scalp in case of lotion)

**Mometasone** (Non-proprietary) (PoM)

**Ointment**, mometasone furoate 0.1%, net price 30 g = £3.24, 100 g = £10.80. Label: 28, counselling, application, see p. 788. Potency: potent

**Elocon**<sup>®</sup> (MSD) (PoM)

**Cream**, mometasone furoate 0.1%, net price 30 g = £4.36, 100 g = £12.58. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include beeswax

**Ointment**, mometasone furoate 0.1%, net price 30 g = £4.32, 100 g = £12.44. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include beeswax, propylene glycol

**Scalp lotion**, mometasone furoate 0.1% in an aqueous isopropyl alcohol basis, net price 30 mL = £4.36. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include propylene glycol

**TRIAMCINOLONE ACETONIDE**

**Indications** severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; psoriasis, see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**

- Apply thinly 1–2 times daily

▲ **With antimicrobials**

See notes above for comment on compound preparations

**Aureocort**<sup>®</sup> (AMCo) (PoM)

**Ointment**, triamcinolone acetonide 0.1%, chlortetracycline hydrochloride 3%, in an anhydrous greasy basis containing wool fat and white soft paraffin, net price 15 g = £3.51. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include wool fat

**Note** Stains clothing

**13.5 Preparations for eczema and psoriasis****13.5.1 Preparations for eczema****13.5.2 Preparations for psoriasis****13.5.3 Drugs affecting the immune response****13.5.1 Preparations for eczema**

Eczema (dermatitis) has several causes, which may influence treatment. The main types of eczema are irritant, allergic contact, atopic, venous and discoid; different types may co-exist. Lichenification, due to scratching and rubbing, may complicate any chronic

eczema. *Atopic eczema* is the most common type and it usually involves dry skin as well as infection and lichenification.

Management of eczema involves the removal or treatment of contributory factors including occupational and domestic irritants. Known or suspected contact allergens should be avoided. Rarely, ingredients in topical medicinal products may sensitise the skin; the BNF lists active ingredients together with excipients that have been associated with skin sensitisation.

Skin dryness and the consequent irritant eczema requires **emollients** (section 13.2.1) applied regularly (at least twice daily) and liberally to the affected area; this can be supplemented with bath or shower emollients. The use of emollients should continue even if the eczema improves or if other treatment is being used.

**Topical corticosteroids** (section 13.4) are also required in the management of eczema; the potency of the corticosteroid should be appropriate to the severity and site of the condition. Mild corticosteroids are generally used on the face and on flexures; potent corticosteroids are generally required for use on adults with discoid or lichenified eczema or with eczema on the scalp, limbs, and trunk. Treatment should be reviewed regularly, especially if a potent corticosteroid is required. In patients with frequent flares (2–3 per month), a topical corticosteroid can be applied on 2 consecutive days each week to prevent further flares.

Bandages (including those containing **zinc and ichthammol**) are sometimes applied over topical corticosteroids or emollients to treat eczema of the limbs. Dry-wrap dressings can be used to provide a physical barrier to help prevent scratching and improve retention of emollients.

For the role of topical **pimecrolimus** and **tacrolimus** in atopic eczema see section 13.5.3.

**Infection** Bacterial infection (commonly with *Staphylococcus aureus* and occasionally with *Streptococcus pyogenes*) can exacerbate eczema and requires treatment with topical or systemic **antibacterial drugs** (section 13.10.1 and section 5.1). Antibacterial drugs should be used in short courses (typically 1 week) to reduce the risk of drug resistance or skin sensitisation. Associated eczema is treated simultaneously with a topical corticosteroid which can be combined with a topical antimicrobial.

Eczema involving widespread or recurrent infection requires the use of a systemic antibacterial that is active against the infecting organism. Products that combine an antiseptic with an emollient application (section 13.2.1) and with a bath emollient (section 13.2.1.1) can also be used; antiseptic shampoos (section 13.9) can be used on the scalp.

Intertriginous eczema commonly involves candida and bacteria; it is best treated with a mild or moderately potent topical corticosteroid and a suitable antimicrobial drug.

Widespread herpes simplex infection may complicate atopic eczema and treatment with a systemic antiviral drug (section 5.3.2.1) is indicated.

The management of *seborrhoeic dermatitis* is described below.

#### Management of other features of eczema

**Lichenification**, which results from repeated scratching is treated initially with a potent corticosteroid. Bandages

containing **ichthammol paste** (to reduce pruritus) and other substances such as **zinc oxide** can be applied over the corticosteroid or emollient. **Coal tar** (section 13.5.2) and **ichthammol** can be useful in some cases of *chronic eczema*.

A *non-sedating antihistamine* (section 3.4.1) may be of some value in relieving severe itching or urticaria associated with eczema. A *sedating antihistamine* (section 3.4.1) can be used if itching causes sleep disturbance.

*Exudative ('weeping') eczema* requires a potent corticosteroid initially; infection may also be present and require specific treatment (see above). **Potassium permanganate** solution (1 in 10 000) can be used in exuding eczema for its antiseptic and astringent effects; treatment should be stopped when exudation stops.

**Severe refractory eczema** *Severe refractory eczema* is best managed under specialist supervision; it may require phototherapy or drugs that act on the immune system (section 13.5.3). **Alitretinoin** (p. 796) is licensed for the treatment of severe chronic hand eczema refractory to potent topical corticosteroids; patients with hyperkeratotic features are more likely to respond to alitretinoin than those with pompholyx.

**Seborrhoeic dermatitis** *Seborrhoeic dermatitis (seborrhoeic eczema)* is associated with species of the yeast *Malassezia* and affects the scalp, paranasal areas, and eyebrows. Shampoos active against the yeast (including those containing ketoconazole and coal tar, section 13.9) and combinations of mild corticosteroids with suitable antimicrobials (section 13.4) are used.

## Topical preparations for eczema

### ICHTHAMMOL

**Indications** chronic lichenified eczema

**Side-effects** skin irritation

#### Dose

- Apply 1–3 times daily

#### Ichthammol Ointment, BP 1980

Ointment, ichthammol 10%, yellow soft paraffin 45%, wool fat 45%

#### Zinc and Ichthammol Cream, BP

Cream, ichthammol 5%, cetostearyl alcohol 3%, wool fat 10%, in zinc cream  
Available from 'special-order' manufacturers or specialist importing companies, see p. 1104

#### Zinc Paste and Ichthammol Bandage, BP 1993

See Appendix 5 (section A5.8.9)

## Oral retinoid for eczema

The retinoid, **alitretinoin**, is licensed for the treatment of severe chronic hand eczema refractory to potent topical corticosteroids; patients with hyperkeratotic features are more likely to respond to alitretinoin than those with pompholyx.

Alitretinoin should be prescribed **only** by, or under the supervision of, a consultant dermatologist.

Alitretinoin is **teratogenic** and must **not** be given to women of child-bearing potential unless they practise effective contraception and then only after detailed assessment and explanation by the physician. See also Pregnancy Prevention under Cautions, below.

**NICE guidance****Alitretinoin for the treatment of severe chronic hand eczema in adults (August 2009)**

Alitretinoin is recommended for the treatment of severe chronic hand eczema that has not responded to potent topical corticosteroids. Treatment should be stopped as soon as an adequate response has been achieved (hands clear or almost clear), or if the eczema remains severe after 12 weeks, or if an adequate response has not been achieved by 24 weeks.

[www.nice.org.uk/TA177](http://www.nice.org.uk/TA177)

**ALITRETINOIN**

**Indications** severe chronic hand eczema refractory to potent topical corticosteroids

**Cautions** avoid blood donation during treatment and for at least 1 month after stopping treatment; monitor serum lipids (more frequently in those with diabetes, history of hyperlipidaemia, or risk factors for cardiovascular disease)—discontinue if uncontrolled hyperlipidaemia; history of depression; dry eye syndrome; **interactions:** Appendix 1 (retinoids)  
**Pregnancy prevention** In women of child-bearing potential, exclude pregnancy 1 month before treatment, up to 3 days before treatment, every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 5 weeks after stopping treatment—perform pregnancy test in the first 3 days of the menstrual cycle. Women must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. Women should be advised to use at least 1 method of contraception but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone but can be used in conjunction with other contraceptive methods. Each prescription for alitretinoin should be limited to a supply of up to 30 days' treatment and dispensed within 7 days of the date stated on the prescription. Women should be advised to discontinue treatment and to seek prompt medical attention if they become pregnant during treatment or within 1 month of stopping treatment

**Contra-indications** uncontrolled hyperlipidaemia; uncontrolled hypothyroidism; hypervitaminosis A

**Hepatic impairment** manufacturer advises avoid—no information available

**Renal impairment** manufacturer advises avoid in severe impairment—no information available

**Pregnancy** avoid—teratogenic; effective contraception must be used—see Pregnancy Prevention above

**Breast-feeding** manufacturer advises avoid

**Side-effects** raised serum concentration of triglycerides and of cholesterol (risk of pancreatitis if triglycerides above 9 mmol/litre); flushing; headache; changes in thyroid function tests; anaemia; myalgia; raised creatine kinase, arthralgia; conjunctivitis, dry eyes (may respond to lubricating eye ointment or tear replacement therapy)—sometimes decreased tolerance to contact lenses, eye irritation; dryness of skin and lips, cheilitis, erythema, alopecia; *less commonly* epistaxis, hyperostosis, ankylosing spondylitis, blurred vision, cataracts, pruritus, and asteototic eczema; *rarely* benign intracranial hypertension (discontinue if severe headache, nausea, vomiting, papilloedema, or visual disturbances occur) and vas-

culitis; also reported mood changes, depression, suicidal ideation, keratitis and impaired night vision

**Dose**

- **ADULT** over 18 years, 30 mg once daily, reduced to 10 mg once daily if not tolerated; patients with diabetes, history of hyperlipidaemia, or risk factors for cardiovascular disease, initially 10 mg once daily, increased if necessary up to max. 30 mg daily

**Note** Duration of treatment 12–24 weeks; discontinue if no response after 12 weeks. Course may be repeated in those who relapse. See also Pregnancy Prevention, above

**Toctino<sup>®</sup> (Basilea) (PoM)**

**Capsules**, alitretinoin 10 mg (brown), net price 30-cap pack = £411.43; 30 mg (red-brown), 30-cap pack = £411.43. Label: 10, patient information leaflet, 11, 21

**13.5.2 Preparations for psoriasis**

Psoriasis is characterised by epidermal thickening and scaling. It commonly affects extensor surfaces and the scalp.

Occasionally, psoriasis is provoked or exacerbated by drugs such as lithium, chloroquine and hydroxychloroquine, beta-blockers, non-steroidal anti-inflammatory drugs, and ACE inhibitors. Psoriasis may not be seen until the drug has been taken for weeks or months.

**Emollients** (section 13.2.1), in addition to their effects on dryness, scaling and cracking, may have an anti-proliferative effect in psoriasis, and may be the only treatment necessary for mild psoriasis. They are particularly useful in *inflammatory psoriasis* and in *plaque psoriasis of palms and soles*, in which irritant factors can perpetuate the condition. Emollients are useful adjuncts to other more specific treatment.

More specific topical treatment for *chronic stable plaque psoriasis* on extensor surfaces of trunk and limbs involves the use of **vitamin D analogues**, **coal tar**, **dithranol**, and the retinoid **tazarotene**. However, they can irritate the skin and they are not suitable for the more inflammatory forms of psoriasis; their use should be suspended during an inflammatory phase of psoriasis. The efficacy and the irritancy of each substance varies between patients. If a substance irritates significantly, it should be stopped or the concentration reduced; if it is tolerated, its effects should be assessed after 4 to 6 weeks and treatment continued if it is effective.

*Scalp psoriasis* is usually scaly, and the scale may be thick and adherent; this will require softening with an emollient cream, ointment, or oil. A tar-based shampoo is first-line treatment for scalp psoriasis; a keratolytic, such as salicylic acid, should also be used if there is significant scaling, to allow other treatments to work.

Some preparations prescribed for psoriasis affecting the scalp, combine salicylic acid with coal tar or sulfur. The product should be applied generously, and an adequate quantity should be prescribed. It should be left on for at least an hour, often more conveniently overnight, before washing off. The use of scalp preparations containing a potent corticosteroid or a vitamin D analogue, either alone or in combination, can also be helpful.

*Facial, flexural and genital psoriasis* can be managed with short-term use of a mild or moderate potency topical corticosteroid (a mild potency topical corticosteroid is preferred for the initial treatment of facial psoriasis).

Calcitriol or tacalcitol can be used for longer-term treatment, or if the response to mild or moderate potency topical corticosteroids is inadequate; calcipotriol is more likely to cause irritation. Low strength tar preparations can also be used. Pimecrolimus or tacrolimus by topical application [unlicensed indication] can be used short-term, under specialist supervision, in patients whose condition has not responded adequately to other treatments, or who are intolerant of them.

Widespread *unstable psoriasis* of erythrodermic or generalised pustular type requires urgent specialist assessment. Initial topical treatment should be limited to using emollients frequently and generously; emollients should be prescribed in quantities of 1 kg or more. More localised acute or subacute *inflammatory psoriasis* with hot, spreading or itchy lesions, should be treated topically with emollients or with a corticosteroid of moderate potency.

**Calcipotriol** and **tacalcitol** are analogues of vitamin D that affect cell division and differentiation. **Calcitriol** is an active form of vitamin D. Vitamin D and its analogues are used first-line for the long-term treatment of plaque psoriasis; they do not smell or stain and they may be more acceptable than tar or dithranol products. Of the vitamin D analogues, tacalcitol and calcitriol are less likely to irritate.

**Coal tar** has anti-inflammatory properties that are useful in chronic plaque psoriasis; it also has antiscaling properties. Crude coal tar (coal tar, BP) is the most effective form, typically in a concentration of 1 to 10% in a soft paraffin base, but few outpatients tolerate the smell and mess. Cleaner extracts of coal tar included in proprietary preparations, are more practicable for home use but they are less effective and improvement takes longer. Contact of coal tar products with normal skin is not normally harmful and they can be used for widespread small lesions; however, irritation, contact allergy, and sterile folliculitis can occur. The milder tar extracts can be used on the face and flexures. Tar baths and tar shampoos are also helpful.

**Dithranol** is effective for chronic plaque psoriasis. Its major disadvantages are irritation (for which individual susceptibility varies) and staining of skin and of clothing. It should be applied to chronic extensor plaques only, carefully avoiding normal skin. Dithranol is not generally suitable for widespread small lesions nor should it be used in the flexures or on the face. Treatment should be started with a low concentration such as dithranol 0.1%, and the strength increased gradually every few days up to 3%, according to tolerance. Proprietary preparations are more suitable for home use; they are usually washed off after 5 to 60 minutes ('short contact'). Specialist nurses may apply intensive treatment with dithranol paste which is covered by stockinette dressings and usually retained overnight. Dithranol should be discontinued if even a low concentration causes acute inflammation; continued use can result in the psoriasis becoming unstable. When applying dithranol, hands should be protected by gloves or they should be washed thoroughly afterwards.

**Tazarotene**, a retinoid, has a similar efficacy to vitamin D and its analogues, but is associated with a greater incidence of irritation. Although irritation is common, it is minimised by applying tazarotene sparingly to the plaques and avoiding normal skin; application to the face and in flexures should also be avoided. Tazarotene does not stain and is odourless.

A topical **corticosteroid** (section 13.4) is not generally suitable for long-term use or as the sole treatment of extensive chronic plaque psoriasis; any early improvement is not usually maintained and there is a risk of the condition deteriorating or of precipitating an unstable form of psoriasis (e.g. erythrodermic psoriasis or generalised pustular psoriasis) on withdrawal. Topical use of potent corticosteroids on widespread psoriasis can also lead to systemic as well as local side-effects. However, topical corticosteroids used short-term may be appropriate to treat psoriasis in specific sites such as the face or flexures (with a mild or moderate corticosteroid), and psoriasis of the scalp, palms, and soles (with a potent corticosteroid). Very potent corticosteroids should only be used under specialist supervision.

Combining the use of a corticosteroid with another specific topical treatment may be beneficial in chronic plaque psoriasis; the drugs may be used separately at different times of the day or used together in a single formulation. *Eczema* co-existing with psoriasis may be treated with a corticosteroid, or coal tar, or both.

**Phototherapy** **Phototherapy** is available in specialist centres under the supervision of a dermatologist. **Ultraviolet B (UVB)** radiation is usually effective for *chronic stable psoriasis* and for *guttate psoriasis*. It may be considered for patients with moderately severe psoriasis in whom topical treatment has failed, but it may irritate inflammatory psoriasis.

**Photochemotherapy** combining long-wave ultraviolet A radiation with a psoralen (PUVA) is available in specialist centres under the supervision of a dermatologist. The psoralen, which enhances the effect of irradiation, is administered either by mouth or topically. PUVA is effective in most forms of psoriasis, including *localised palmoplantar pustular psoriasis*. Early adverse effects include phototoxicity and pruritus. Higher cumulative doses exaggerate skin ageing, increase the risk of dysplastic and neoplastic skin lesions, especially squamous cancer, and pose a theoretical risk of cataracts.

Phototherapy combined with coal tar, dithranol, tazarotene, topical vitamin D or vitamin D analogues, or oral acitretin, allows reduction of the cumulative dose of phototherapy required to treat psoriasis.

**Systemic treatment** **Systemic treatment** is required for severe, resistant, unstable or complicated forms of psoriasis, and it should be initiated only under specialist supervision. Systemic drugs for psoriasis include acitretin (see below) and drugs that affect the immune response (such as ciclosporin and methotrexate, section 13.5.3).

Systemic corticosteroids should be used only rarely in psoriasis because rebound deterioration may occur on reducing the dose.

**Acitretin**, a metabolite of etretinate, is a retinoid (vitamin A derivative); it is prescribed by specialists. The main indication for acitretin is *psoriasis*, but it is also used in disorders of keratinisation such as severe *Darier's disease* (keratosis follicularis), and some forms of *ichthyosis*. Although a minority of cases of psoriasis respond well to acitretin alone, it is only moderately effective in many cases and it is combined with other treatments. A therapeutic effect occurs after 2 to 4 weeks and the maximum benefit after 4 months. Consideration should be given to stopping acitretin if the response is inadequate after 4 months at the optimum dose. The manufacturers of acitretin do not recommend

continuous treatment for longer than 6 months. However, some patients may benefit from longer treatment, provided that the lowest effective dose is used, patients are monitored carefully for adverse effects, and the need for treatment is reviewed regularly.

Apart from teratogenicity, which remains a risk for 3 years after stopping, acitretin is the least toxic systemic treatment for psoriasis; in women with a potential for child-bearing, the possibility of pregnancy must be excluded before treatment and effective contraception must be used during treatment and for at least 3 years afterwards (oral progestogen-only contraceptives not considered effective).

## Topical preparations for psoriasis

### Vitamin D and analogues

Calcipotriol, calcitriol, and tacalcitol are used for the management of *plaque psoriasis*. They should be avoided by those with calcium metabolism disorders, and used with caution in *generalised pustular or erythrodermic exfoliative psoriasis* (enhanced risk of hypercalcaemia). Local skin reactions (itching, erythema, burning, paraesthesia, dermatitis) are common. Hands should be washed thoroughly after application to avoid inadvertent transfer to other body areas. Aggravation of psoriasis has also been reported.

### CALCIPOTRIOL

**Indications** see under Dose

**Cautions** see notes above; avoid use on face; avoid excessive exposure to sunlight and sunlamps

**Contra-indications** see notes above

**Pregnancy** manufacturers advise avoid unless essential

**Breast-feeding** no information available

**Side-effects** see notes above; also photosensitivity, dry skin; rarely facial or perioral dermatitis

#### Dose

● Plaque psoriasis, apply ointment once or twice daily; max. 100 g weekly (less with *scalp solution*, see below); CHILD over 6 years, apply twice daily; 6–12 years max. 50 g weekly; over 12 years max. 75 g weekly

**Note** Patient information leaflet for *Dovonex*® ointment advises liberal application (but note max. recommended weekly dose, above)

● Scalp psoriasis, apply scalp solution twice daily; max. 60 mL weekly (less with *ointment*, see below); CHILD under 18 years see *BNF for Children*

**Note** When preparations used together max. total calcipotriol 5 mg in any one week (e.g. scalp solution 60 mL with ointment 30 g or scalp solution 30 mL with ointment 60 g)

**Calcipotriol** (Non-proprietary) (PoM)

**Ointment**, calcipotriol 50 micrograms/g, net price 120 g = £24.04

**Note** Not licensed for use in children under 18 years

**Scalp solution**, calcipotriol 50 micrograms/mL, net price 60 mL = £41.85, 120 mL = £83.71

**Dovonex**® (LEO) (PoM)

**Ointment**, calcipotriol 50 micrograms/g, net price 30 g = £5.78

**Excipients** include disodium edetate, propylene glycol

### With betamethasone

For prescribing information and for comment on the limited role of corticosteroids in psoriasis, see section 13.4.

**Dovobet**® (LEO) (PoM)

**Ointment**, betamethasone (as dipropionate) 0.05%, calcipotriol (as monohydrate) 50 micrograms/g, net price 30 g = £16.54. Label: 28

**Excipients** include butylated hydroxytoluene

**Dose** stable plaque psoriasis, apply once daily to max. 30% of body surface (max. 15 g daily) for 4 weeks; if necessary, treatment may be continued beyond 4 weeks or repeated, on the advice of a specialist; CHILD under 18 years see *BNF for Children*

**Gel**, betamethasone (as dipropionate) 0.05%, calcipotriol (as monohydrate) 50 micrograms/g, net price 30 g = £16.54, 60 g = £33.08, 2 × 60 g = £61.43. Label: 28

**Excipients** include butylated hydroxytoluene

**Dose** scalp psoriasis, apply 1–4 g to scalp once daily, shampoo off after leaving on scalp overnight or during day; usual duration of therapy 4 weeks; if necessary, treatment may be continued beyond 4 weeks or repeated, on the advice of a specialist; CHILD under 18 years see *BNF for Children*

Mild to moderate plaque psoriasis, apply once daily to max. 30% of body surface (max. 15 g daily) for 8 weeks; if necessary, treatment may be continued beyond 8 weeks or repeated, on the advice of a specialist; CHILD under 18 years see *BNF for Children*

**Note** When different preparations containing calcipotriol used together, max. total calcipotriol 5 mg in any one week

### CALCITRIOL

(1,25-Dihydroxycholecalciferol)

**Indications** mild to moderate plaque psoriasis

**Cautions** see notes above

**Contra-indications** see notes above; do not apply under occlusion

**Pregnancy** manufacturer advises use in restricted amounts only if clearly necessary and to monitor urine- and serum-calcium concentration

**Breast-feeding** manufacturer advises avoid

**Side-effects** see notes above

#### Dose

● ADULT and CHILD over 12 years, apply twice daily; not more than 35% of body surface to be treated daily, max. 30 g daily

**Silks**® (Galderma) (PoM)

**Ointment**, calcitriol 3 micrograms/g, net price 100 g = £16.34

**Excipients** none as listed in section 13.1.3

### TACALCITOL

**Indications** plaque psoriasis

**Cautions** see notes above; avoid eyes; monitor serum calcium if risk of hypercalcaemia; if used in conjunction with UV treatment, UV radiation should be given in the morning and tacalcitol applied at bedtime

**Contra-indications** see notes above

**Pregnancy** manufacturer advises avoid unless no safer alternative—no information available

**Breast-feeding** manufacturer advises avoid application to breast area; no information available on presence in milk

**Side-effects** see notes above

**Dose**

- **ADULT** and **CHILD** over 12 years, apply once daily preferably at bedtime; max. 10 g ointment or 10 mL lotion daily

**Note** When lotion and ointment used together, max. total tacalcitol 280 micrograms in any one week (e.g. lotion 30 mL with ointment 40 g)

**Curatoderm**<sup>®</sup> (Almirall) (POM)

**Lotion**, tacalcitol (as monohydrate) 4 micrograms/g, net price 30 mL = £12.73

**Excipients** include disodium edetate, propylene glycol

**Ointment**, tacalcitol (as monohydrate) 4 micrograms/g, net price 30 g = £13.40, 60 g = £23.14, 100 g = £30.86

**Excipients** none as listed in section 13.1.3

**Tazarotene****TAZAROTENE**

**Indications** mild to moderate plaque psoriasis affecting up to 10% of skin area

**Cautions** wash hands immediately after use, avoid contact with eyes, face, intertriginous areas, hair-covered scalp, eczematous or inflamed skin; avoid excessive exposure to UV light (including sunlight, solariums, PUVA or UVB treatment); do not apply emollients or cosmetics within 1 hour of application

**Pregnancy** avoid; effective contraception required (oral progestogen-only contraceptives not considered effective)

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** local irritation (more common with higher concentration and may require discontinuation), pruritus, burning, erythema, desquamation, non-specific rash, contact dermatitis, and worsening of psoriasis; rarely stinging and inflamed, dry or painful skin

**Dose**

- Apply once daily in the evening usually for up to 12 weeks; **CHILD** under 18 years not recommended

**Zorac**<sup>®</sup> (Allergan) (POM)

**Gel**, tazarotene 0.05%, net price 30 g = £14.09; 0.1%, 30 g = £14.80

**Excipients** include benzyl alcohol, butylated hydroxyanisole, butylated hydroxytoluene, disodium edetate, polysorbate 40

**Tars****TARS**

**Indications** psoriasis and occasionally chronic atopic eczema

**Cautions** application to face and skin flexures; use suitable chemical protection gloves for extemporaneous preparation

**Contra-indications** not for use in sore, acute, or pustular psoriasis or in presence of infection; avoid eyes, mucosa, genital or rectal areas; broken or inflamed skin

**Side-effects** skin irritation and acne-like eruptions, photosensitivity; stains skin, hair, and fabric

**Dose**

- Apply 1–3 times daily starting with low-strength preparations

**Note** For shampoo preparations see section 13.9; for use with dressings see Appendix 5 (section A5.8.9)

**Non-proprietary preparations**

May be difficult to obtain. Patients may find newer proprietary preparations more acceptable

**Calamine and Coal Tar Ointment, BP**

**Ointment**, calamine 12.5 g, strong coal tar solution 2.5 g, zinc oxide 12.5 g, hydrous wool fat 25 g, white soft paraffin 47.5 g

**Excipients** include wool fat

**Dose** apply 1–2 times daily

**Coal Tar and Salicylic Acid Ointment, BP**

**Ointment**, coal tar 2 g, salicylic acid 2 g, emulsifying wax 11.4 g, white soft paraffin 19 g, coconut oil 54 g, polysorbate '80' 4 g, liquid paraffin 7.6 g

**Excipients** include cetostearyl alcohol

**Dose** apply 1–2 times daily

**Coal Tar Paste, BP**

**Paste**, strong coal tar solution 7.5%, in compound zinc paste

**Dose** apply 1–2 times daily

**Zinc and Coal Tar Paste, BP**

**Paste**, zinc oxide 6%, coal tar 6%, emulsifying wax 5%, starch 38%, yellow soft paraffin 45%

**Excipients** include cetostearyl alcohol

**Dose** apply 1–2 times daily

**Proprietary preparations****Carbo-Dome**<sup>®</sup> (Sandoz)

**Cream**, coal tar solution 10%, in a water-miscible basis, net price 30 g = £4.77, 100 g = £16.38

**Excipients** include beeswax, hydroxybenzoates (parabens)

**Dose** psoriasis, apply to skin 2–3 times daily; **CHILD** under 12 years and **ELDERLY**, cream can be diluted with a few drops of water before applying

**Cocois**<sup>®</sup> (RPH)

**Scalp ointment**, coal tar solution 12%, salicylic acid 2%, precipitated sulfur 4%, in a coconut oil emollient basis, net price 40 g (with applicator nozzle) = £6.22, 100 g = £11.69

**Excipients** include cetostearyl alcohol

**Dose** scaly scalp disorders including psoriasis, eczema, seborrhoeic dermatitis and dandruff, apply to scalp once weekly as necessary (if severe use daily for first 3–7 days), shampoo off after 1 hour; **CHILD** 6–12 years, medical supervision required (not recommended under 6 years)

**Exorex**<sup>®</sup> (Forest)

**Lotion**, coal tar solution 5% in an emollient basis, net price 100 mL = £8.11, 250 mL = £16.24

**Excipients** include hydroxybenzoates (parabens)

**Dose** psoriasis, apply to skin or scalp 2–3 times daily; **CHILD** under 12 years and **ELDERLY**, lotion can be diluted with a few drops of water before applying

**Psoriderm**<sup>®</sup> (Derma)

**Cream**, coal tar 6%, lecithin 0.4%, net price 225 mL = £9.42

**Excipients** include isopropyl palmitate, propylene glycol

**Dose** psoriasis, apply to skin or scalp 1–2 times daily

**Scalp lotion**—section 13.9

**Sebco**<sup>®</sup> (Derma UK)

**Scalp ointment**, coal tar solution 12%, salicylic acid 2%, precipitated sulfur 4%, in a coconut oil emollient basis, net price 40 g = £4.54, 100 g = £8.52

**Excipients** include cetostearyl alcohol

**Dose** scaly scalp disorders including psoriasis, eczema, seborrhoeic dermatitis and dandruff, apply to scalp as necessary (if severe use daily for first 3–7 days), shampoo off after 1 hour; **CHILD** 6–12 years, medical supervision required (not recommended under 6 years)

**Bath preparations****Coal Tar Solution, BP**

**Solution**, coal tar 20%, polysorbate '80' 5%, in alcohol (96%), net price 500 mL = £11.20. Label: 15

**Excipients** include polysorbates

**Dose** use 100 mL in a bath

**Note** Strong Coal Tar Solution BP contains coal tar 40%

**Polytar Emollient<sup>®</sup>** (Stiefel)

**Bath additive**, coal tar solution 2.5%, arachis (peanut) oil extract of coal tar 7.5%, tar 7.5%, cade oil 7.5%, light liquid paraffin 35%, net price 500 mL = £5.78

**Excipients** include isopropyl palmitate

**Dose** psoriasis, eczema, atopic and pruritic dermatoses, use 2–4 capfuls (15–30 mL) in bath and soak for 20 minutes

**Psoriderm<sup>®</sup>** (Dermal)

**Bath emulsion**, coal tar 40%, net price 200 mL = £2.74

**Excipients** include polysorbate 20

**Dose** psoriasis, use 30 mL in a bath and soak for 5 minutes

**Dithranol****DITHRANOL**

(Anthralin)

**Indications** subacute and chronic psoriasis, see notes above

**Cautions** avoid use near eyes and sensitive areas of skin; see also notes above

**Contra-indications** hypersensitivity; acute and pustular psoriasis

**Side-effects** local burning sensation and irritation; stains skin, hair, and fabrics

**Dose**

- See notes above and under preparations

**Note** Some of these dithranol preparations also contain coal tar or salicylic acid—for cautions, contra-indications, and side-effects see under Tars (above) or under Salicylic Acid

**Non-proprietary preparations****<sup>1</sup>Dithranol Ointment, BP** (POM)

**Ointment**, dithranol, in yellow soft paraffin; usual strengths 0.1–2%. Part of basis may be replaced by hard paraffin if a stiffer preparation is required. Label: 28

**Dithranol Paste, BP**

**Paste**, dithranol in zinc and salicylic acid (Lassar's) paste. Usual strengths 0.1–1% of dithranol. Label: 28

**Proprietary preparations****Dithrocream<sup>®</sup>** (Dermal)

**Cream**, dithranol 0.1%, net price 50 g = £3.77; 0.25%, 50 g = £4.04; 0.5%, 50 g = £4.66; 1%, 50 g = £5.42; (POM) 2%, 50 g = £6.79. Label: 28

**Excipients** include cetostearyl alcohol, chlorocresol  
**Dose** for application to skin or scalp; 0.1–0.5% cream suitable for overnight treatment, 1–2% cream for max. 1 hour

**Micanol<sup>®</sup>** (GP Pharma)

**Cream**, dithranol 1% in a lipid-stabilised basis, net price 50 g = £16.18; (POM) 3%, 50 g = £20.15. Label: 28

**Excipients** none as listed in section 13.1.3

**Dose** for application to skin or scalp, apply 1% cream for up to 30 minutes once daily, if necessary 3% cream can be used under medical supervision

**Note** At the end of contact time, use plenty of lukewarm (not hot) water to rinse off cream; soap may be used *after* the cream has been rinsed off; use shampoo before applying cream to scalp and if necessary after cream has been rinsed off

**Psorin<sup>®</sup>** (LPC)

**Ointment**, dithranol 0.11%, coal tar 1%, salicylic acid 1.6%, net price 50 g = £9.22, 100 g = £18.44. Label: 28

**Excipients** include beeswax, wool fat

**Dose** for application to skin up to twice daily

**Scalp gel**, dithranol 0.25%, salicylic acid 1.6% in gel basis containing methyl salicylate, net price 50 g = £7.03. Label: 28

**Excipients** none as listed in section 13.1.3

**Dose** for application to scalp, initially apply on alternate days for 10–20 minutes; may be increased to daily application for max. 1 hour and then wash off

**Salicylic acid****SALICYLIC ACID**

For coal tar preparations containing salicylic acid, see under Tars, p. 799; for dithranol preparations containing salicylic acid see under Dithranol, above

**Indications** hyperkeratotic skin disorders; warts and calluses (section 13.7); scalp conditions (section 13.9); fungal nail infections (section 13.10.2)

**Cautions** see notes above; avoid broken or inflamed skin

**Salicylate toxicity** Salicylate toxicity may occur particularly if applied on large areas of skin or neonatal skin

**Side-effects** sensitivity, excessive drying, irritation, systemic effects after widespread use (see under Cautions)

**Dose**

- See preparations

**Zinc and Salicylic Acid Paste, BP**

**Paste**, (Lassar's Paste), zinc oxide 24%, salicylic acid 2%, starch 24%, white soft paraffin 50%

Available from 'special-order' manufacturers or specialist importing companies, see p. 1104

**Dose** apply twice daily

**Oral retinoids for psoriasis****ACITRETIN**

**Note** Acitretin is a metabolite of etretinate

**Indications** severe extensive psoriasis resistant to other forms of therapy; palmoplantar pustular psoriasis; severe congenital ichthyosis; severe Darier's disease (keratosis follicularis)

**Cautions** avoid concomitant use of keratolytics; do not donate blood during and for 2 years after stopping therapy (teratogenic risk); check liver function at start, then every 2–4 weeks for first 2 months and then every 3 months; monitor serum-triglyceride and serum-cholesterol concentrations before treatment, 1 month after starting, then every 3 months; diabetes (can alter glucose tolerance—initial frequent blood

1. (POM) if dithranol content more than 1%, otherwise may be sold to the public

glucose checks); investigate atypical musculoskeletal symptoms; in children use only in exceptional circumstances and monitor growth parameters and bone development (premature epiphyseal closure reported); avoid excessive exposure to sunlight and unsupervised use of sunlamps; **interactions:** Appendix 1 (retinoids)

**Pregnancy prevention** In women of child-bearing potential (including those with a history of infertility), exclude pregnancy up to 3 days before treatment, every month during treatment, and every 1–3 months for 3 years after stopping treatment. Treatment should be started on day 2 or 3 of menstrual cycle. Women must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 3 years after stopping treatment. Women should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone but can be used in conjunction with other contraceptive methods. Each prescription for acitretin should be limited to a supply of up to 30 days' treatment and dispensed within 7 days of the date stated on the prescription. Women should be advised to seek medical attention immediately if they become pregnant during treatment or within 3 years of stopping treatment. They should also be advised to avoid alcohol during treatment and for 2 months after stopping treatment

**Contra-indications** hyperlipidaemia

**Hepatic impairment** avoid in severe impairment—risk of further impairment

**Renal impairment** avoid in severe impairment; increased risk of toxicity

**Pregnancy** avoid—teratogenic; effective contraception must be used—see Cautions above

**Breast-feeding** avoid

**Side-effects** abdominal pain, diarrhoea, nausea, vomiting, dryness and inflammation of mucous membranes, peripheral oedema, reversible increase in serum-cholesterol and serum-triglyceride concentrations (with high doses), headache, arthralgia, myalgia, dryness of conjunctiva (causing conjunctivitis and decreased tolerance to contact lenses), alopecia (reversible on withdrawal), abnormal hair texture, skin exfoliation, pruritus, epidermal fragility, sticky skin, dermatitis, erythema, brittle nails, paronychia; *less commonly* hepatitis, dizziness, visual disturbances, photosensitivity; *rarely* peripheral neuropathy; *very rarely* benign intracranial hypertension (discontinue if severe headache, nausea, vomiting, or visual disturbances occur), bone pain, exostosis (skeletal hyperostosis and extra-osseous calcification reported following long-term treatment with etretinate, and premature epiphyseal closure in children, see Cautions above), night blindness, ulcerative keratitis; *also reported* taste disturbance, rectal haemorrhage, flushing, malaise, drowsiness, granulomatous lesions, impaired hearing, tinnitus, initial worsening of psoriasis, dry skin, sweating

#### Dose

- **Adult** over 18 years (under expert supervision), initially 25–30 mg daily (Darier's disease 10 mg daily) for 2–4 weeks, then adjusted according to response, usual range 25–50 mg daily; up to 75 mg daily for short periods in psoriasis (see p. 797); **CHILD** under 18 years see *BNF for Children*

**Neotigason**® (Actavis) [PmM]

**Capsules**, acitretin 10 mg (brown/white), net price 60-cap pack = £17.30; 25 mg (brown/yellow), 60-cap pack = £43.00. Label: 10, patient information leaflet, 11, 21

## 13.5.3 Drugs affecting the immune response

Drugs affecting the immune response are used for eczema or psoriasis. Systemic drugs acting on the immune system are used under specialist supervision.

**Pimecrolimus** by topical application is licensed for *mild to moderate atopic eczema*. **Tacrolimus** is licensed for topical use in *moderate to severe atopic eczema*. Both are drugs whose long-term safety is still being evaluated and they should not usually be considered first-line treatments unless there is a specific reason to avoid or reduce the use of topical corticosteroids. Treatment of atopic eczema with topical pimecrolimus or topical tacrolimus should be initiated only by prescribers experienced in managing the condition. For the role of topical tacrolimus and pimecrolimus in the treatment of psoriasis, see section 13.5.2.

### NICE guidance

#### Tacrolimus and pimecrolimus for atopic eczema (August 2004)

Topical pimecrolimus and tacrolimus are options for atopic eczema not controlled by maximal topical corticosteroid treatment or if there is a risk of important corticosteroid side-effects (particularly skin atrophy).

Topical pimecrolimus is recommended for moderate atopic eczema on the face and neck of children aged 2–16 years and topical tacrolimus is recommended for moderate to severe atopic eczema in adults and children over 2 years. Pimecrolimus and tacrolimus should be used within their licensed indications.

[www.nice.org.uk/TA82](http://www.nice.org.uk/TA82)

The *Scottish Medicines Consortium* (p. 4) has advised (March 2010) that tacrolimus ointment (*Protopic*®) is accepted for restricted use within NHS Scotland for the prevention of flares in those with moderate to severe atopic eczema in accordance with the licensed indications; initiation of treatment is restricted to doctors (including general practitioners) with specialist interest and experience in treating atopic eczema with immunomodulatory therapy.

For the role of topical corticosteroids in eczema, see section 13.5.1, and for their role in psoriasis, see section 13.5.2. A short course of a systemic corticosteroid (section 6.3.2) can be given for eczema flares that have not improved despite appropriate topical treatment.

**Ciclosporin** by mouth can be used for *severe psoriasis* and for *severe eczema*. **Azathioprine** or **mycophenolate mofetil** (section 8.2.1) are used for severe refractory eczema [unlicensed indication].

**Methotrexate** can be used for *severe psoriasis*, the dose being adjusted according to severity of the condition and haematological and biochemical measurements. Folic acid (section 9.1.2) should be given to reduce the possibility of side-effects associated with methotrexate. Folic acid can be given at a dose of 5 mg once weekly [unlicensed indication], on a different day from the methotrexate; alternative regimens of folic acid may be used in some settings.

**Etanercept**, **adalimumab**, and **infliximab** inhibit the activity of tumour necrosis factor (TNF $\alpha$ ). They are used for *severe plaque psoriasis* either refractory to at least 2

standard systemic treatments and photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications; while either etanercept or adalimumab is considered to be the first choice in stable disease, infliximab or adalimumab may be useful when rapid disease control is required. **Ustekinumab** (a monoclonal antibody that inhibits interleukins 12 and 23) can be used for *severe plaque psoriasis* that has not responded to at least 2 standard systemic treatments and photochemotherapy, or when these treatments cannot be used because of intolerance or contra-indications (see also NICE guidance below). Adalimumab, etanercept, infliximab and ustekinumab are also licensed for psoriatic arthritis (section 10.1.3).

**NICE guidance<sup>1</sup>****Adalimumab for plaque psoriasis in adults (June 2008)**

Adalimumab is recommended for the treatment of severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) and photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Adalimumab should be withdrawn if the response is not adequate after 16 weeks.

[www.nice.org.uk/TA146](http://www.nice.org.uk/TA146)

**NICE guidance<sup>2</sup>****Etanercept and efalizumab for plaque psoriasis in adults (July 2006)**

Etanercept is recommended for severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) and to photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Etanercept should be withdrawn if the response is not adequate after 12 weeks.

Following suspension of the marketing authorisation for efalizumab, NICE has temporarily withdrawn its guidance on the use of efalizumab for plaque psoriasis.

[www.nice.org.uk/TA103](http://www.nice.org.uk/TA103)

**NICE guidance****Infliximab for plaque psoriasis in adults (January 2008)**

Infliximab is recommended for the treatment of very severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) or to photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Infliximab should be withdrawn if the response is not adequate after 10 weeks.

[www.nice.org.uk/TA134](http://www.nice.org.uk/TA134)

**NICE guidance****Ustekinumab for plaque psoriasis in adults (September 2009)**

Ustekinumab is recommended for the treatment of severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) and to photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Ustekinumab should be withdrawn if the response is not adequate after 16 weeks.

For patients weighing over 100 kg, the manufacturer should provide the 90-mg dose of ustekinumab at the same price as the 45-mg dose

[www.nice.org.uk/TA180](http://www.nice.org.uk/TA180)

**AZATHIOPRINE**

**Indications** severe refractory eczema [unlicensed indication]; inflammatory bowel disease (section 1.5.3); autoimmune conditions and prophylaxis of transplant rejection (section 8.2.1); rheumatoid arthritis (section 10.1.3)

**Cautions** section 8.2.1

**Contra-indications** section 8.2.1; also very low or absent thiopurine methyltransferase (TPMT) activity

**Hepatic impairment** section 8.2.1

**Renal impairment** section 8.2.1

**Pregnancy** section 8.2.1

**Breast-feeding** section 8.2.1

**Side-effects** section 8.2.1

**Dose**

- Severe refractory eczema [unlicensed indication], by mouth, normal or high TPMT activity, 1–3 mg/kg daily; intermediate TPMT activity, 0.5–1.5 mg/kg daily

**Preparations**

Section 8.2.1

**CICLOSPORIN**

(Cyclosporin)

**Indications** see under Dose; severe acute ulcerative colitis (section 1.5.3); transplantation and graft-versus-host disease (section 8.2.2)

**Cautions** section 8.2.2

**Additional cautions in atopic dermatitis and psoriasis**

**Contra-indicated** in abnormal renal function, uncontrolled hypertension (see also below), infections not under control, and malignancy (see also below).

Dermatological and physical examination, including blood pressure and renal function measurements required at least twice before starting. During treatment, monitor serum creatinine every 2 weeks for first 3 months then every month; reduce dose by 25–50% if serum creatinine increases more than 30% above baseline (even if within normal range) and discontinue if reduction not successful within 1 month. Discontinue if hypertension develops that cannot be controlled by dose reduction or antihypertensive therapy. Avoid excessive exposure to sunlight and avoid use of UVB or PUVA. *In atopic dermatitis*, also allow herpes simplex infections to clear before starting (if they occur during treatment withdraw if severe); *Staphylococcus aureus* skin

1. The *Scottish Medicines Consortium* issued similar advice in May 2008.

2. The *Scottish Medicines Consortium* issued similar advice on the use of etanercept in adults (August 2009) and children over 6 years old (April 2012)

infections not absolute contra-indication providing controlled (but avoid erythromycin unless no other alternative—see also **interactions**: Appendix 1 (ciclosporin)); investigate lymphadenopathy that persists despite improvement in atopic dermatitis. In *psoriasis*, also exclude malignancies (including those of skin and cervix) before starting (biopsy any lesions not typical of psoriasis) and treat patients with malignant or pre-malignant conditions of skin only after appropriate treatment (and if no other option); discontinue if lymphoproliferative disorder develops

**Hepatic impairment** see section 8.2.2

**Renal impairment** see Cautions above

**Pregnancy** see Immunosuppressant Therapy, p. 615

**Breast-feeding** see section 8.2.2

**Side-effects** see section 8.2.2

### Dose

- Short-term treatment (usually for max. 8 weeks but can be longer under specialist supervision) of severe atopic dermatitis where conventional therapy ineffective or inappropriate, administered in accordance with expert advice, **by mouth**, **ADULT** and **CHILD** over 16 years, initially 2.5 mg/kg daily in 2 divided doses, if good initial response not achieved within 2 weeks, increase rapidly to max. 5 mg/kg daily; initial dose of 5 mg/kg daily in 2 divided doses if very severe; **CHILD** under 16 years see *BNF for Children*
- Severe psoriasis where conventional therapy ineffective or inappropriate, administered in accordance with expert advice, **by mouth**, **ADULT** and **CHILD** over 16 years, initially 2.5 mg/kg daily in 2 divided doses, increased gradually to max. 5 mg/kg daily if no improvement within 1 month; initial dose of 5 mg/kg daily justified if rapid control required; discontinue if inadequate response after 3 months at the optimum dose; max. duration of treatment usually 1 year unless other treatments cannot be used; **CHILD** under 16 years see *BNF for Children*

**Important** For preparations and counselling and for advice on conversion between the preparations, see section 8.2.2

### Preparations

Section 8.2.2

## METHOTREXATE

**Indications** severe psoriasis unresponsive to conventional therapy (specialist use only); Crohn's disease (section 1.5.3); malignant disease (section 8.1.3); rheumatoid arthritis (section 10.1.3)

**Cautions** section 10.1.3; also photosensitivity—psoriasis lesions aggravated by UV radiation (skin ulceration reported)

**Contra-indications** see section 10.1.3

**Hepatic impairment** avoid—dose-related toxicity

**Renal impairment** see section 10.1.3

**Pregnancy** see section 10.1.3

**Breast-feeding** see section 10.1.3

**Side-effects** see section 10.1.3

### Dose

- **By mouth** or **by intramuscular** or **intravenous** or **subcutaneous injection**, 2.5–10 mg once weekly, increased according to response in steps of 2.5–5 mg at intervals of at least 1 week; usual dose 7.5–15 mg once weekly; max. weekly dose 30 mg; stop treatment if inadequate response after 3 months at the optimum dose; **CHILD** 2–18 years see *BNF for Children*

### Important

Note that the above dose is a **weekly** dose. To avoid error with low dose methotrexate, it is recommended that:

- the patient is carefully advised of the **dose and frequency** and the reason for taking methotrexate and any other prescribed medicine (e.g. folic acid);
- only one **strength** of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;
- the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;
- the patient is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort and dark urine), and respiratory effects (e.g. shortness of breath).

### Preparations

Section 10.1.3

## PIMECROLIMUS

**Indications** see Dose

**Cautions** UV light (avoid excessive exposure to sunlight and sunlamps), avoid other topical treatments except emollients at treatment site; alcohol consumption (risk of facial flushing and skin irritation)

**Contra-indications** contact with eyes and mucous membranes, application under occlusion, infection at treatment site; congenital epidermal barrier defects; generalised erythroderma; immunodeficiency; concomitant use with drugs that cause immunosuppression (may be prescribed in exceptional circumstances by specialists); application to malignant or potentially malignant skin lesions

**Side-effects** burning sensation, pruritus, erythema, skin infections (including folliculitis and *less commonly* impetigo, herpes simplex and zoster, molluscum contagiosum); *rarely* papilloma, skin discoloration, local reactions including pain, paraesthesia, peeling, dryness, oedema, and worsening of eczema; skin malignancy reported

### Dose

- Short-term treatment of mild to moderate atopic eczema (including flares) when topical corticosteroids cannot be used (see also notes above), apply twice daily until symptoms resolve (stop treatment if eczema worsens or no response after 6 weeks); **CHILD** under 2 years not recommended
- Short-term treatment of facial, flexural, or genital psoriasis in patients unresponsive to, or intolerant of other topical therapy [unlicensed indication] (see also section 13.5.2), **ADULT** over 18 years, apply twice daily until symptoms resolve (max. duration of treatment 4 weeks)

**Elidel**<sup>®</sup> (Meda) (PoM)

**Cream**, pimecrolimus 1%, net price 30 g = £19.69, 60 g = £37.41, 100 g = £59.07. Label: 4, 11, 28  
**Excipients** include benzyl alcohol, cetyl alcohol, propylene glycol, stearyl alcohol

## TACROLIMUS

**Indications** see Dose; other indications section 8.2.2

**Cautions** UV light (avoid excessive exposure to sunlight and sunlamps); alcohol consumption (risk of facial flushing and skin irritation)

**Contra-indications** infection at treatment site; congenital epidermal barrier defects; generalised erythroderma; immunodeficiency; concomitant use with drugs that cause immunosuppression (may be prescribed in exceptional circumstances by specialists); application to malignant or potentially malignant skin lesions; avoid contact with eyes and mucous membranes; application under occlusion

**Pregnancy** manufacturer advises avoid unless essential; toxicity in *animal* studies following systemic administration

**Breast-feeding** manufacturer advises avoid—present in milk following systemic administration

**Side-effects** application-site reactions including rash, irritation, pain and paraesthesia; herpes simplex infection, Kaposi's varicelliform eruption; application-site infections; *less commonly* acne; *also reported* rosacea, malignancies (including skin malignancy, cutaneous lymphoma and other types of lymphomas)

#### Dose

- Short-term treatment of moderate to severe atopic eczema (including flares) in patients unresponsive to, or intolerant of conventional therapy (see also notes above), **ADULT** and **CHILD** over 16 years, initially apply 0.1% ointment thinly twice daily until lesion clears (consider other treatment if eczema worsens or no improvement after 2 weeks); reduce to once daily or switch to 0.03% ointment if condition allows; **CHILD** 2–16 years, initially apply 0.03% ointment thinly twice daily for up to 3 weeks (consider other treatment if eczema worsens or if no improvement after 2 weeks) then reduce to once daily until lesion clears
- Prevention of flares in patients with moderate to severe atopic eczema and 4 or more flares a year who have responded to initial treatment with topical tacrolimus (see also notes above), **ADULT** and **CHILD** over 16 years, apply 0.1% ointment thinly twice weekly; use short-term treatment regimen during an acute flare; review need for preventative therapy after 1 year; **CHILD** 2–16 years, apply 0.03% ointment thinly twice weekly; use short-term treatment regimen during an acute flare; interrupt preventative therapy after 1 year to reassess condition
- Short-term treatment of facial, flexural, or genital psoriasis in patients unresponsive to, or intolerant of other topical therapy [unlicensed indication] (see also section 13.5.2), **ADULT** over 18 years, initially apply 0.1% ointment thinly twice daily until symptoms resolve; reduce to once daily or switch to 0.03% ointment if condition allows; max. duration of treatment 4 weeks

**Protopic**<sup>®</sup> (Astellas) (POM)

Ointment, tacrolimus (as monohydrate) 0.03%, net price 30 g = £19.44, 60 g = £35.46; 0.1%, 30 g = £21.60, 60 g = £39.40. Label: 4, 11, 28  
**Excipients** include beeswax

## Cytokine modulators

### ADALIMUMAB

**Indications** see notes above; Crohn's disease (section 1.5.3); ankylosing spondylitis, polyarticular juvenile idiopathic arthritis, psoriatic arthritis, rheumatoid arthritis (section 10.1.3)

**Cautions** section 10.1.3, p. 723

**Important** See section 10.1.3, p. 723 for information on tuberculosis and blood disorders

**Contra-indications** section 10.1.3, p. 723

**Pregnancy** section 10.1.3, p. 723

**Breast-feeding** section 10.1.3, p. 723

**Side-effects** section 10.1.3, p. 723

#### Dose

- **By subcutaneous injection**, plaque psoriasis, **ADULT** over 18 years, initially 80 mg, then 40 mg on alternate weeks starting 1 week after initial dose; discontinue treatment if no response within 16 weeks

#### Preparations

Section 10.1.3

## ETANERCEPT

**Indications** see notes above; ankylosing spondylitis, psoriatic arthritis, polyarticular course juvenile idiopathic arthritis, rheumatoid arthritis (section 10.1.3)

**Cautions** section 10.1.3, p. 725

**Important** See section 10.1.3, p. 725 for information on tuberculosis and blood disorders

**Contra-indications** section 10.1.3, p. 725

**Hepatic impairment** section 10.1.3, p. 725

**Pregnancy** section 10.1.3, p. 725

**Breast-feeding** section 10.1.3, p. 725

**Side-effects** section 10.1.3, p. 725

#### Dose

- **By subcutaneous injection**, plaque psoriasis, 25 mg twice weekly or 50 mg once weekly for up to 24 weeks; discontinue if no response after 12 weeks; **CHILD** 6–18 years, 800 micrograms/kg (max. 50 mg) once weekly for up to 24 weeks; discontinue if no response after 12 weeks

#### Preparations

Section 10.1.3

## INFLIXIMAB

**Indications** see notes above; inflammatory bowel disease (section 1.5.3); ankylosing spondylitis, psoriatic arthritis, rheumatoid arthritis (section 10.1.3)

**Cautions** section 10.1.3, p. 726; monitor for non-melanoma skin cancer before and during treatment

**Important** See section 10.1.3, p. 726 for information on tuberculosis, blood disorders, and hypersensitivity reactions

**Contra-indications** section 10.1.3, p. 726

**Pregnancy** section 10.1.3, p. 726

**Breast-feeding** section 10.1.3, p. 726

**Side-effects** section 10.1.3, p. 726

#### Dose

- **By intravenous infusion**, plaque psoriasis, **ADULT** over 18 years, 5 mg/kg, repeated 2 weeks and 6 weeks after initial infusion, then every 8 weeks; discontinue if no response within 14 weeks of initial infusion

#### Preparations

Section 10.1.3

## USTEKINUMAB

**Indications** see notes above; psoriatic arthritis (section 10.1.3)

**Cautions** predisposition to infection; history or development of malignancy; monitor for non-melanoma skin cancer, especially in patients with a history of PUVA treatment or prolonged immuno-

suppressant therapy, or those over 60 years of age; elderly; **interactions:** Appendix 1 (ustekinumab)

**Tuberculosis** Patients should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting ustekinumab. Patients who have previously received adequate treatment for tuberculosis can start ustekinumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting ustekinumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with ustekinumab. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop

**Contra-indications** active infection

**Pregnancy** avoid; manufacturer advises effective contraception during treatment and for 15 weeks after stopping treatment

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** diarrhoea, nausea, headache, malaise, dizziness, infections (sometimes severe), arthralgia, myalgia, oropharyngeal pain, pruritus, injection-site reactions; *less commonly* depression, facial palsy, nasal congestion, hypersensitivity reactions (possibly delayed onset), pustular psoriasis

#### Dose

- By **subcutaneous injection**, plaque psoriasis, **ADULT** over 18 years, body-weight under 100 kg, initially 45 mg, then 45 mg 4 weeks after initial dose, then 45 mg every 12 weeks; body-weight over 100 kg, initially 45–90 mg, then 45–90 mg 4 weeks after initial dose, then 45–90 mg every 12 weeks

**Note** Discontinue if no response within 16 weeks

**Stelara**<sup>®</sup> (Janssen) (PoM)

**Injection**, ustekinumab 90 mg/mL, net price 0.5-mL (45-mg) prefilled syringe = £2147.00. Label: 10, counselling, tuberculosis

## 13.6 Acne and rosacea

### 13.6.1 Topical preparations for acne

### 13.6.2 Oral preparations for acne

**Acne** Treatment of acne should be commenced early to prevent scarring. Patients should be counselled that an improvement may not be seen for at least a couple of months. The choice of treatment depends on whether the acne is predominantly inflammatory or comedonal and its severity.

*Mild to moderate acne* is generally treated with topical preparations (section 13.6.1). Systemic treatment (section 13.6.2) with oral antibacterials is generally used for *moderate to severe acne* or where topical preparations are not tolerated or are ineffective or where application to the site is difficult. Another oral preparation used for acne is the hormone treatment co-cyprindiol (cyproterone acetate with ethinylestradiol); it is for women only.

*Severe acne*, acne unresponsive to prolonged courses of oral antibacterials, scarring, or acne associated with psychological problems calls for early referral to a consultant dermatologist who may prescribe isotretinoin for administration by mouth.

**Rosacea** Brimonidine (section 13.6.3) is licensed for the treatment of facial erythema in rosacea. Rosacea is not comedonal (but may exist with acne which may be comedonal). The pustules and papules of rosacea respond to topical metronidazole (section 13.10.1.2) or to topical azelaic acid (section 13.6.1). Alternatively, oral administration of oxytetracycline or tetracycline 500 mg twice daily (section 5.1.3), or of erythromycin 500 mg twice daily (section 5.1.5), can be used; courses usually last 6–12 weeks and are repeated intermittently. Doxycycline (section 5.1.3) 100 mg once daily can be used [unlicensed indication] if oxytetracycline or tetracycline is inappropriate (e.g. in renal impairment). A modified-release preparation of doxycycline is licensed in low doses of 40 mg once daily for the treatment of facial rosacea (section 5.1.3). Isotretinoin is occasionally given in refractory cases [unlicensed indication]. Camouflagers (section 13.8.2) may be required for the redness.

### 13.6.1 Topical preparations for acne

In mild to moderate acne, comedones and inflamed lesions respond well to benzoyl peroxide (see below) or to a topical retinoid (see p. 807). Alternatively, topical application of an antibacterial such as erythromycin or clindamycin may be effective for inflammatory acne. If topical preparations prove inadequate, oral preparations may be needed (section 13.6.2).

### Benzoyl peroxide and azelaic acid

**Benzoyl peroxide** is effective in mild to moderate acne. Both comedones and inflamed lesions respond well to benzoyl peroxide. The lower concentrations seem to be as effective as higher concentrations in reducing inflammation. It is usual to start with a lower strength and to increase the concentration of benzoyl peroxide gradually. Adverse effects include local skin irritation, particularly when therapy is initiated, but the scaling and redness often subside with treatment continued at a reduced frequency of application. If the acne does not respond after 2 months then use of a topical antibacterial should be considered.

**Azelaic acid** has antimicrobial and anticomedonal properties. It may be an alternative to benzoyl peroxide or to a topical retinoid for treating mild to moderate comedonal acne, particularly of the face. Some patients prefer azelaic acid because it is less likely to cause local irritation than benzoyl peroxide.

## BENZOYL PEROXIDE

**Indications** acne vulgaris

**Cautions** avoid contact with eyes, mouth, mucous membranes, and broken skin; may bleach fabrics and hair; avoid excessive exposure to sunlight

**Side-effects** skin irritation (reduce frequency or suspend use until irritation subsides and re-introduce at reduced frequency)

#### Dose

- Apply 1–2 times daily preferably after washing with soap and water, start treatment with lower-strength preparations

**Note** May bleach clothing

**Acnecide**<sup>®</sup> (Galderma)

Gel, benzoyl peroxide 5% in an aqueous gel basis, net price 30 g = £5.44, 60 g = £10.88

**Excipients** include propylene glycol

**Brevexyl**<sup>®</sup> (GSK)

Cream, benzoyl peroxide 4% in an aqueous basis, net price 50 g = £4.13

**Excipients** include cetyl alcohol, fragrance, stearyl alcohol

**PanOxyl**<sup>®</sup> (GSK)

Aquagel (= aqueous gel), benzoyl peroxide 2.5%, net price 40 g = £1.76; 5%, 40 g = £1.92; 10%, 40 g = £2.13

**Excipients** include propylene glycol

Cream, benzoyl peroxide 5% in a non-greasy basis, net price 40 g = £1.89

**Excipients** include isopropyl palmitate, propylene glycol

Gel, benzoyl peroxide 10% in an aqueous alcoholic basis, net price 40 g = £1.99

**Excipients** include fragrance

Wash, benzoyl peroxide 10% in a detergent basis, net price 150 mL = £4.00

**Excipients** include imidurea

**Note** May be difficult to obtain

**With antimicrobials**

See also Topical Antibacterials for Acne, below and Antibacterials, below

**Duac**<sup>®</sup> **Once Daily** (GSK) (PoM)

Gel, benzoyl peroxide 3%, clindamycin 1% (as phosphate) in an aqueous basis, net price 30 g = £11.94

**Excipients** include disodium edetate

**Dose** ADULT and CHILD over 12 years, apply once daily in the evening

Gel, benzoyl peroxide 5%, clindamycin 1% (as phosphate) in an aqueous basis, net price 25 g = £9.95, 50 g = £19.90

**Excipients** include disodium edetate

**Dose** ADULT and CHILD over 12 years, apply once daily in the evening

**Quinoderm**<sup>®</sup> (Alliance)

Cream, benzoyl peroxide 5%, potassium hydroxyquinoline sulfate 0.5%, in an astringent vanishing-cream basis, net price 50 g = £2.43

**Excipients** include cetostearyl alcohol, edetic acid (EDTA)

**Dose** acne vulgaris, acneform eruptions, folliculitis, apply 2–3 times daily

Cream, benzoyl peroxide 10%, potassium hydroxyquinoline sulfate 0.5%, in an astringent vanishing-cream basis, net price 25 g = £1.58, 50 g = £2.55

**Excipients** include cetostearyl alcohol, edetic acid (EDTA)

**Dose** acne vulgaris, acneform eruptions, folliculitis, apply 2–3 times daily

**AZELAIC ACID**

**Indications** see preparations

**Cautions** avoid contact with eyes, mouth, and mucous membranes

**Side-effects** local irritation (reduce frequency or discontinue temporarily); *less commonly* skin discoloration; *also reported* worsening of asthma

**Finacea**<sup>®</sup> (Bayer) (PoM)

Gel, azelaic acid 15%, net price 30 g = £7.48

**Excipients** include disodium edetate, polysorbate 80, propylene glycol

**Dose** facial acne vulgaris, ADULT and CHILD over 12 years, apply twice daily; discontinue if no improvement after 1 month

Papulopustular rosacea, ADULT over 18 years, apply twice daily; discontinue if no improvement after 2 months

**Skinoren**<sup>®</sup> (Bayer) (PoM)

Cream, azelaic acid 20%, net price 30 g = £3.74

**Excipients** include propylene glycol

**Dose** acne vulgaris, ADULT and CHILD over 12 years, apply twice daily (sensitive skin, once daily for first week)

**Topical antibacterials for acne**

For many patients with mild to moderate inflammatory acne, topical antibacterials may be no more effective than topical benzoyl peroxide or tretinoin. Topical antibacterials are probably best reserved for patients who wish to avoid oral antibacterials or who cannot tolerate them. Topical preparations of **erythromycin** and **clindamycin** are effective for inflammatory acne. Topical antibacterials can produce mild irritation of the skin, and on rare occasions cause sensitisation; gastro-intestinal disturbances have been reported with topical clindamycin.

Antibacterial resistance of *Propionibacterium acnes* is increasing; there is cross-resistance between erythromycin and clindamycin. To avoid development of resistance:

- when possible use non-antibiotic antimicrobials (such as benzoyl peroxide or azelaic acid);
- avoid concomitant treatment with different oral and topical antibacterials;
- if a particular antibacterial is effective, use it for repeat courses if needed (short intervening courses of benzoyl peroxide or azelaic acid may eliminate any resistant propionibacteria);
- do not continue treatment for longer than necessary (however, treatment with a topical preparation should be continued for at least 6 months).

**ANTIBACTERIALS**

**Indications** acne vulgaris

**Cautions** some manufacturers advise preparations containing alcohol are not suitable for use with benzoyl peroxide; discontinue clindamycin preparations immediately if diarrhoea or colitis occur

**Dalacin T**<sup>®</sup> (Pharmacia) (PoM)

**Topical solution**, clindamycin 1% (as phosphate), in an aqueous alcoholic basis, net price (both with applicator) 30 mL = £4.34, 50 mL = £7.23

**Excipients** include propylene glycol

**Dose** apply thinly twice daily

**Lotion**, clindamycin 1% (as phosphate) in an aqueous basis, net price 30 mL = £5.08, 60 mL = £10.16

**Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens)

**Dose** apply thinly twice daily

**Stiemycin**<sup>®</sup> (Stiefel) (PoM)

**Solution**, erythromycin 2% in an alcoholic basis, net price 50 mL = £7.69

**Excipients** include propylene glycol

**Dose** ADULT and CHILD over 12 years, apply thinly twice daily

**Zindaclin**<sup>®</sup> (Crawford) (PoM)

Gel, clindamycin 1% (as phosphate), net price 30 g = £8.66

**Excipients** include propylene glycol

**Dose** ADULT and CHILD over 12 years, apply thinly once daily

**Zineryt<sup>®</sup>** (Astellas) (PoM)

**Topical solution**, powder for reconstitution, erythromycin 40 mg, zinc acetate 12 mg/mL when reconstituted with solvent containing ethanol, net price per pack of powder and solvent to provide 30 mL = £7.71, 90 mL = £16.68

**Excipients** none as listed in section 13.1.3

**Dose** apply twice daily

## Topical retinoids and related preparations for acne

Topical **tretinoin**, its isomer **isotretinoin**, and **adapalene** (a retinoid-like drug), are useful for treating comedones and inflammatory lesions in mild to moderate acne. Patients should be warned that some redness and skin peeling can occur initially but settles with time. If undue irritation occurs, the frequency of application should be reduced or treatment suspended until the reaction subsides; if irritation persists, discontinue treatment. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop.

Isotretinoin is given by mouth in severe acne; see section 13.6.2 for **warnings** relating to use by mouth.

**Cautions** Topical retinoids should be avoided in severe acne involving large areas. Contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin should be avoided. These drugs should be used with caution in sensitive areas such as the neck, and accumulation in angles of the nose should be avoided. Exposure to UV light (including sunlight, solariums) should be avoided; if sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used. Use of retinoids with abrasive cleaners, comedogenic or astringent cosmetics should be avoided. Allow peeling (resulting from other irritant treatments) to subside before using a topical retinoid; alternating a preparation that causes peeling with a topical retinoid may give rise to contact dermatitis (reduce frequency of retinoid application).

**Pregnancy** Topical retinoids are contra-indicated in pregnancy; women of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).

**Side-effects** Local reactions include burning, erythema, stinging, pruritus, dry or peeling skin (discontinue if severe). Increased sensitivity to UVB light or sunlight occurs. Temporary changes of skin pigmentation with tretinoin have been reported. Eye irritation and oedema, and blistering or crusting of skin have been reported rarely.

### ADAPALENE

**Indications** mild to moderate acne

**Cautions** see notes above

**Pregnancy** see notes above

**Breast-feeding** amount of drug in milk probably too small to be harmful; ensure infant does not come in contact with treated areas

**Side-effects** see notes above

**Dose**

- **ADULT** and **CHILD** over 12 years, apply thinly once daily in the evening

**Differin<sup>®</sup>** (Galderma) (PoM)

**Cream**, adapalene 0.1%, net price 45 g = £16.15.

**Label:** 11

**Excipients** include disodium edetate, hydroxybenzoates (parabens)

**Gel**, adapalene 0.1%, net price 45 g = £16.15. **Label:** 11

**Excipients** include disodium edetate, hydroxybenzoates (parabens), propylene glycol

#### With benzoyl peroxide

**Epiduo<sup>®</sup>** (Galderma) (PoM)

**Gel**, adapalene 0.1%, benzoyl peroxide 2.5%, net price 45 g = £17.91. **Label:** 11

**Excipients** include disodium edetate, polysorbate 80, propylene glycol

**Dose** **ADULT** and **CHILD** over 9 years, acne vulgaris, apply thinly once daily in the evening

**Note** May bleach clothing and hair

**Note** The *Scottish Medicines Consortium* (p. 4) has advised (March 2014) that *Epiduo<sup>®</sup>* should be restricted for use in mild to moderate facial acne when monotherapy with benzoyl peroxide or adapalene is inappropriate.

## ISOTRETINOIN

**Note** Isotretinoin is an isomer of tretinoin

**Important** For prescribing information on isotretinoin when given by mouth, see p. 809

**Indications** see notes above; oral treatment (see section 13.6.2)

**Cautions** (*topical application only*) see notes above; also personal or familial history of non-melanoma skin cancer

**Contra-indications** (*topical application only*) rosacea, perioral dermatitis

**Pregnancy** (*topical application only*) see notes above

**Breast-feeding** avoid

**Side-effects** (*topical application only*) see notes above

**Dose**

- Apply thinly 1–2 times daily

**Isotret<sup>®</sup>** (Stiefel) (PoM)

**Gel**, isotretinoin 0.05%, net price 30 g = £5.94.

**Label:** 11

**Excipients** include butylated hydroxytoluene

#### With antibacterial

**Isotrexin<sup>®</sup>** (Stiefel) (PoM)

**Gel**, isotretinoin 0.05%, erythromycin 2% in ethanolic basis, net price 30 g = £7.47. **Label:** 11

**Excipients** include butylated hydroxytoluene

## TRETINOIN

**Note** Tretinoin is the acid form of vitamin A

**Indications** see preparations; malignant disease (section 8.1.5)

**Cautions** see notes above

**Contra-indications** personal or familial history of non-melanoma skin cancer; rosacea; perioral dermatitis

**Pregnancy** see notes above

**Breast-feeding** amount of drug in milk after topical application probably too small to be harmful; ensure infant does not come in contact with treated areas

**Side-effects** see notes above

**Dose**

- See preparations

**With antibacterial****Aknemycin® Plus** (Almiral) (PoM)

**Solution**, tretinoin 0.025%, erythromycin 4% in an alcoholic basis, net price 25 mL = £7.05. Label: 11

**Excipients** none as listed in section 13.1.3

**Dose** acne, apply thinly 1–2 times daily

**Other topical preparations for acne**

Preparations containing **abrasive agents** are not considered beneficial in acne.

A topical preparation of **nicotinamide** is available for inflammatory acne.

**ABRASIVE AGENTS**

**Indications** acne vulgaris (but see notes above)

**Cautions** avoid contact with eyes; discontinue use temporarily if skin becomes irritated

**Contra-indications** superficial venules, telangiectasia

**Brasivol®** (Stiefel)

**Paste No. 1**, aluminium oxide 38.09% in fine particles, in a soap-detergent basis, net price 75 g = £2.76

**Excipients** include fragrance, *N*-(3-Chloroallyl) hexamium chloride (quaternium 15)

**Dose** use instead of soap 1–3 times daily

**NICOTINAMIDE**

**Indications** see under preparation

**Cautions** avoid contact with eyes and mucous membranes (including nose and mouth); reduce frequency of application if excessive dryness, irritation or peeling

**Side-effects** dry skin, pruritus, erythema, burning, irritation

**Nicam®** (Dermal)

**Gel**, nicotinamide 4%, net price 60 g = £7.10

**Excipients** none as listed in section 13.1.3

**Dose** inflammatory acne vulgaris, apply twice daily; reduce to once daily or on alternate days if irritation occurs

lupus erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation; it is given in a dose of 100 mg once daily or 50 mg twice daily.

**Erythromycin** (section 5.1.5) in a dose of 500 mg twice daily is an alternative for the management of acne but propionibacteria strains resistant to erythromycin are becoming widespread and this may explain poor response.

**Trimethoprim** (section 5.1.8) in a dose of 300 mg twice daily may be used for acne resistant to other antibacterials [unlicensed indication]. Prolonged treatment with trimethoprim may depress haematopoiesis; it should generally be initiated by specialists.

Concomitant use of different topical and systemic antibacterials is undesirable owing to the increased likelihood of the development of bacterial resistance.

**Hormone treatment for acne**

**Co-cyprindiol** (cyproterone acetate with ethinylestradiol) contains an anti-androgen. It is licensed for use in women with moderate to severe acne that has not responded to topical therapy or oral antibacterials, and for moderately severe hirsutism. Although it is an effective hormonal contraceptive, it should not be used solely for contraception.

Improvement of acne with co-cyprindiol probably occurs because of decreased sebum secretion which is under androgen control. Some women with moderately severe hirsutism may also benefit because hair growth is also androgen-dependent.

There is an increased risk of venous thromboembolism in women taking co-cyprindiol, particularly during the first year of use. The incidence of venous thromboembolism is 1.5–2 times higher in women using co-cyprindiol than in women using combined oral contraceptives containing levonorgestrel, but the risk may be similar to that associated with use of combined oral contraceptives containing third-generation progestogens (desogestrel and gestodene) or drospirenone (see section 7.3.1). It is contra-indicated in those with a history of venous or arterial thromboembolism, or in those with severe or multiple risk factors for arterial disease or venous thromboembolism (see section 7.3.1). Women requiring co-cyprindiol may have an inherently increased risk of cardiovascular disease.

**CO-CYPRINDIOL**

A mixture of cyproterone acetate and ethinylestradiol in the mass proportions 2000 parts to 35 parts, respectively

**Indications** moderate to severe acne in women refractory to topical therapy or oral antibacterials (but see notes above); moderately severe hirsutism

**Cautions** see under Combined Hormonal Contraceptives, section 7.3.1

**Contra-indications** see under Combined Hormonal Contraceptives, section 7.3.1 and notes above

**Hepatic impairment** see under Combined Hormonal Contraceptives, section 7.3.1

**Pregnancy** avoid—risk of feminisation of male fetus with cyproterone

**Breast-feeding** manufacturer advises avoid; possibility of anti-androgen effects in neonate with cyproterone

**Oral antibacterials for acne**

Systemic antibacterial treatment is useful for inflammatory acne if topical treatment is not adequately effective or if it is inappropriate. Anticomedonal treatment (e.g. with topical benzoyl peroxide) may also be required.

Either **oxytetracycline** or **tetracycline** (section 5.1.3) is usually given for acne in a dose of 500 mg twice daily. If there is no improvement after the first 3 months another oral antibacterial should be used. Maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer.

**Doxycycline** and **lymecycline** (section 5.1.3) are alternatives to tetracycline. Doxycycline can be used in a dose of 100 mg daily. Lymecycline is given in a dose of 408 mg daily.

Although **minocycline** is as effective as other tetracyclines for acne, it is associated with a greater risk of

**13.6.2 Oral preparations for acne**

**Side-effects** see under Combined Hormonal Contraceptives, section 7.3.1

#### Dose

- 1 tablet daily for 21 days starting on day 1 of menstrual cycle; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs); time to symptom remission, at least 3 months; review need for treatment regularly

#### Co-cyprindiol (Non-proprietary) ▼ [PoM]

**Tablets**, co-cyprindiol 2000/35 (cyproterone acetate 2 mg, ethinylestradiol 35 micrograms), net price 63-tab pack = £5.42

**Brands include** *Acnecin*<sup>®</sup>, *Cicafem*<sup>®</sup>, *Clairette*<sup>®</sup>

#### Dianette<sup>®</sup> (Bayer) ▼ [PoM]

**Tablets**, beige, s/c, co-cyprindiol 2000/35 (cyproterone acetate 2 mg, ethinylestradiol 35 micrograms), net price 63-tab pack = £7.71

## Oral retinoid for acne

The retinoid **isotretinoin** reduces sebum secretion. It is used for the systemic treatment of nodulo-cystic and conglobate acne, severe acne, scarring, acne which has not responded to an adequate course of a systemic antibacterial, or acne which is associated with psychological problems. It is also useful in women who develop acne in the third or fourth decades of life, since late onset acne is frequently unresponsive to antibacterials.

Isotretinoin is a toxic drug that should be prescribed **only** by, or under the supervision of, a consultant dermatologist. It is given for at least 16 weeks; repeat courses are not normally required.

Side-effects of isotretinoin include severe dryness of the skin and mucous membranes, nose bleeds, and joint pains. The drug is **teratogenic** and **must not** be given to women of child-bearing age unless they practise effective contraception (oral progestogen-only contraceptives not considered effective) and then only after detailed assessment and explanation by the physician. Women must also be registered with a pregnancy prevention programme (see under Cautions below).

Although a causal link between isotretinoin use and psychiatric changes (including suicidal ideation) has not been established, the possibility should be considered before initiating treatment; if psychiatric changes occur during treatment, isotretinoin should be stopped, the prescriber informed, and specialist psychiatric advice should be sought.

## ISOTRETINOIN

**Note** Isotretinoin is an isomer of tretinoin

**Indications** see notes above

**Cautions** see notes above; also avoid blood donation during treatment and for at least 1 month after treatment; history of depression; monitor all patients for depression; measure hepatic function and serum lipids before treatment, 1 month after starting and then every 3 months (reduce dose or discontinue if transaminase or serum lipids persistently raised); discontinue if uncontrolled hypertriglyceridaemia or pancreatitis; diabetes; dry eye syndrome (associated with risk of keratitis); avoid keratolytics; **interactions:** Appendix 1 (retinoids)

**Pregnancy prevention** In women of child-bearing potential, exclude pregnancy up to 3 days before treatment (start treatment on day 2 or 3 of menstrual cycle), every month during treatment (unless there are compelling

reasons to indicate that there is no risk of pregnancy), and 5 weeks after stopping treatment—perform pregnancy test in the first 3 days of the menstrual cycle. Women must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. Women should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone, but can be used in conjunction with other contraceptive methods. Each prescription for isotretinoin should be limited to a supply of up to 30 days' treatment and dispensed within 7 days of the date stated on the prescription; repeat prescriptions or faxed prescriptions are not acceptable. Women should be advised to discontinue treatment and to seek prompt medical attention if they become pregnant during treatment or within 1 month of stopping treatment.

**Counselling** Warn patient to avoid wax epilation (risk of epidermal stripping), dermabrasion, and laser skin treatments (risk of scarring) during treatment and for at least 6 months after stopping; patient should avoid exposure to UV light (including sunlight) and use sunscreen and emollient (including lip balm) preparations from the start of treatment.

**Contra-indications** hypervitaminosis A, hyperlipidaemia

**Hepatic impairment** avoid—further impairment of liver function may occur

**Renal impairment** in severe impairment, reduce initial dose (e.g. 10 mg daily) and increase gradually up to 1 mg/kg daily as tolerated

**Pregnancy** avoid—teratogenic; effective contraception must be used—see Pregnancy Prevention above

**Breast-feeding** avoid

**Side-effects** dryness of skin (with dermatitis, scaling, thinning, erythema, pruritus), epidermal fragility (trauma may cause blistering), dryness of lips (sometimes cheilitis), dryness of eyes (with blepharitis and conjunctivitis), dryness of pharyngeal mucosa (with hoarseness), dryness of nasal mucosa (with epistaxis), headache, myalgia and arthralgia, raised plasma-triglyceride concentration (risk of pancreatitis if triglycerides above 9 mmol/litre), raised serum-cholesterol concentration (with reduced high-density lipoprotein concentration), raised blood-glucose concentration, raised serum-transaminase concentration, haematuria and proteinuria, thrombocytopenia, thrombocytosis, neutropenia and anaemia; *rarely* mood changes (depression, aggressive behaviour, anxiety, and very rarely psychosis and suicidal ideation)—expert referral required, skin reactions (including reports of Stevens-Johnson syndrome and toxic epidermal necrolysis), alopecia; *very rarely* nausea, hepatitis, inflammatory bowel disease, gastrointestinal haemorrhage, haemorrhagic diarrhoea (discontinue treatment), benign intracranial hypertension (avoid concomitant tetracyclines), convulsions, malaise, drowsiness, dizziness, diabetes mellitus, lymphadenopathy, hyperuricaemia, glomerulonephritis, tendinitis, arthritis, raised serum-creatinine concentration, bone changes (including reduced bone density, early epiphyseal closure, and skeletal hyperostosis) and calcification of tendons and ligaments following long-term administration, visual disturbances (papilloedema, corneal opacities, cataracts, decreased night vision, photophobia, blurred vision, colour blindness)—expert referral required and consider withdrawal, decreased tolerance to contact lenses, keratitis, impaired hearing, Gram-positive infections of skin and mucous membranes, exacerbation of acne, acne fulminans, allergic vascu-

litis and granulomatous lesions, paronychia, hirsutism, nail dystrophy, skin hyperpigmentation, photosensitivity, increased sweating

#### Dose

- **ADULT** and **CHILD** over 12 years, 500 micrograms/kg daily (in 1–2 divided doses), increased if necessary to 1 mg/kg daily, for 16–24 weeks (repeat treatment course after a period of at least 8 weeks if relapse after first course); max. cumulative dose 150 mg/kg per course

#### Isotretinoin (Non-proprietary) (PoM)

**Capsules**, isotretinoin 5 mg, net price 56-cap pack = £14.78; 20 mg, 56-cap pack = £37.85. Label: 10, patient information leaflet, 11, 21

#### Roaccutane® (Roche) (PoM)

**Capsules**, isotretinoin 10 mg (brown-red), net price 30-cap pack = £14.54; 20 mg (brown-red/white), 30-cap pack = £20.02. Label: 10, patient information card, 11, 21

### 13.6.3 Topical preparations for rosacea

**Brimonidine**, a selective  $\alpha_2$ -adrenoceptor agonist, reduces erythema in rosacea by cutaneous vasoconstriction. For advice on the management of rosacea, see Rosacea, p. 805

#### BRIMONIDINE TARTRATE

**Indications** facial erythema in rosacea

**Cautions** avoid contact with eyes, mouth, and mucous membranes; avoid use on irritated skin or open wounds; apply other topical preparations (including cosmetics) only after brimonidine gel has dried on skin; **interactions:** Appendix 1 (brimonidine)

**Pregnancy** manufacturer advises avoid—limited information available

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** pruritus, burning sensation; *less commonly* dry mouth, headache, paraesthesia, skin irritation, dry skin

#### Dose

- **ADULT** over 18 years, apply thinly once daily until erythema subsides (max. 5 mg brimonidine tartrate daily divided over forehead, chin, nose, and cheeks)

#### Mirvaso® (Galderma) (PoM)

**Gel**, brimonidine tartrate 5 mg/g, net price 30 g = £33.69. Label: 28

**Excipients** include hydroxybenzoates (parabens), propylene glycol

Preparations of **salicylic acid**, **formaldehyde**, **gluteraldehyde** or **silver nitrate** are available for purchase by the public; they are suitable for the removal of warts on hands and feet. **Salicylic acid** is a useful keratolytic which may be considered first; it is also suitable for the removal of *corns and calluses*. Preparations of salicylic acid in a colloidion basis are available but some patients may develop an allergy to colophony in the formulation. Cryotherapy causes pain, swelling, and blistering, and may be no more effective than topical salicylic acid in the treatment of warts.

### SALICYLIC ACID

**Indications** see under preparations; psoriasis (section 13.5.2); fungal nail infections (section 13.10.2)

**Cautions** significant peripheral neuropathy, patients with diabetes at risk of neuropathic ulcers; impaired peripheral circulation; protect surrounding skin and avoid broken skin; not suitable for application to face, anogenital region, or large areas

**Side-effects** skin irritation, skin ulceration (with high concentrations)

#### Dose

- See under preparations; advise patient to apply carefully to wart and to protect surrounding skin (e.g. with soft paraffin or specially designed plaster); rub wart surface gently with file or pumice stone once weekly; treatment may need to be continued for up to 3 months

#### Cuplex® (Crawford)

**Gel**, salicylic acid 11%, lactic acid 4%, in a colloidion basis, net price 5 g = £2.88. Label: 15

**Dose** for plantar and mosaic warts, corns, and calluses, apply twice daily

**Note** Contains colophony (see notes above)

#### Duofilm® (GSK)

**Paint**, salicylic acid 16.7%, lactic acid 16.7%, in flexible colloidion, net price 15 mL (with applicator) = £2.25. Label: 15

**Dose** for plantar and mosaic warts, apply daily

#### Occlusal® (Alliance)

**Cutaneous solution**, salicylic acid 26% in polyacrylic solution, net price 10 mL (with applicator) = £3.56. Label: 15

**Dose** for common and plantar warts, apply daily

#### Salactol® (Dermal)

**Paint**, salicylic acid 16.7%, lactic acid 16.7%, in flexible colloidion, net price 10 mL (with applicator) = £1.71. Label: 15

**Dose** for warts, particularly plantar warts, verrucas, corns, and calluses, apply daily

**Note** Contains colophony (see notes above)

#### Salatac® (Dermal)

**Gel**, salicylic acid 12%, lactic acid 4% in a colloidion basis, net price 8 g (with applicator) = £2.98. Label: 15

**Dose** for warts, verrucas, corns, and calluses, apply daily

#### Verrugon® (Ransom)

**Ointment**, salicylic acid 50% in a paraffin basis, net price 6 g = £3.12

**Dose** for plantar warts, apply daily

## 13.7 Preparations for warts and calluses

Warts (verrucae) are caused by a human papillomavirus, which most frequently affects the hands, feet (plantar warts), and the anogenital region (see below); treatment usually relies on local tissue destruction. Warts may regress on their own and treatment is required only if the warts are painful, unsightly, persistent, or cause distress.

## FORMALDEHYDE

**Indications** see under preparations

**Cautions** see under Salicylic Acid

**Side-effects** see under Salicylic Acid

**Veracur**<sup>®</sup> (Typham)

**Gel**, formaldehyde 0.75% in a water-miscible gel basis, net price 15 g = £2.41

**Dose** for warts, particularly plantar warts, apply twice daily

## GLUTARALDEHYDE

**Indications** warts, particularly plantar warts

**Cautions** protect surrounding skin; not for application to face, mucosa, or anogenital areas

**Side-effects** rashes, skin irritation (discontinue if severe); stains skin brown

**Dose**

- Apply twice daily (see also under Salicylic acid)

**Glutaro**<sup>®</sup> (Derma)

**Solution** (= application), glutaraldehyde 10%, net price 10 mL (with applicator) = £2.07

## SILVER NITRATE

**Indications** warts, verrucas, umbilical granulomas, over-granulating tissue, cauterisation

**Cautions** protect surrounding skin and avoid broken skin; not suitable for application to face, ano-genital region, or large areas

**Side-effects** chemical burns on surrounding skin; stains skin and fabric

**Dose**

- Common warts and verrucas, apply moistened caustic pencil tip for 1–2 minutes; repeat after 24 hours up to max. 3 applications for warts or max. 6 applications for verrucas

**Note** Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application

- Umbilical granulomas, apply moistened caustic pencil tip (usually containing silver nitrate 40%) for 1–2 minutes while protecting surrounding skin with soft paraffin

**AVOCA**<sup>®</sup> (Bray)

**Caustic pencil**, tip containing silver nitrate 40%, potassium nitrate 60%, net price = 94p; silver nitrate 95%, potassium nitrate 5%, treatment pack (including emery file, 6 adhesive dressings and protector pads) = £2.27

## Anogenital warts

The treatment of anogenital warts (condylomata acuminata) should be accompanied by screening for other sexually transmitted infections. **Podophyllotoxin** (the major active ingredient of podophyllum) may be used for *soft, non-keratinised* external anogenital warts. Patients with a limited number of external warts or *keratinised* lesions may be better treated with cryotherapy or other forms of physical ablation.

**Imiquimod** cream is licensed for the treatment of external anogenital warts; it may be used for both keratinised and non-keratinised lesions. It is also licensed for the treatment of superficial basal cell carcinoma and actinic keratosis (section 13.8.1).

Inosine pranobex (section 5.3.2.1) is licensed for adjunctive treatment of genital warts but it has been superseded by more effective drugs.

## IMIQUIMOD

**Indications** see preparations

**Cautions** avoid contact with eyes, lips, nostrils, or broken skin, and open wounds; not suitable for internal genital warts; uncircumcised males (risk of phimosis or stricture of foreskin); autoimmune disease; immunosuppressed patients

**Pregnancy** no evidence of teratogenicity or toxicity in *animal* studies; manufacturer advises caution

**Breast-feeding** no information available

**Side-effects** local reactions (including itching, burning sensation, erythema, erosion, oedema, excoriation, and scabbing); headache; influenza-like symptoms; myalgia; *less commonly* local ulceration and alopecia; *rarely* Stevens-Johnson syndrome and cutaneous lupus erythematosus-like effect; *very rarely* dysuria in women; permanent hypopigmentation or hyperpigmentation reported

**Dose**

- See preparations

**Aldara**<sup>®</sup> (Meda) (POM)

**Cream**, imiquimod 5%, net price 12-sachet pack = £48.60. Label: 10, patient information leaflet

**Excipients** include benzyl alcohol, cetyl alcohol, hydroxybenzoates (parabens), polysorbate 60, stearyl alcohol

**Condoms** may damage latex condoms and diaphragms

**Dose** warts (external genital and perianal), apply thinly 3 times a week at night until lesions resolve (max. 16 weeks); **CHILD** under 18 years see *BNF for Children*

Superficial basal cell carcinoma, apply to lesion (and 1 cm beyond it) on 5 nights each week for 6 weeks; assess response 12 weeks after completing treatment

Actinic keratosis, apply to lesion 3 times a week at night for 4 weeks; assess response after a 4 week treatment-free interval; repeat 4-week course if lesions persist; max. 2 courses

**Important** Should be rubbed in and allowed to stay on the treated area for 6–10 hours for warts or for 8 hours for basal cell carcinoma and actinic keratosis, then washed off with mild soap and water (uncircumcised males treating warts under foreskin should wash the area daily). The cream should be washed off before sexual contact

**Zyclara**<sup>®</sup> (Meda) (POM)

**Cream**, imiquimod 3.75%, net price 28-sachet pack = £113.00. Label: 10, patient information leaflet

**Excipients** include benzyl alcohol, cetyl alcohol, hydroxybenzoates (parabens), polysorbate 60, stearyl alcohol

**Dose** Actinic keratosis, apply to lesion on face or balding scalp at bedtime for 2 weeks (max. 2 sachets daily); repeat course after a 2-week treatment-free interval; assess response 8 weeks after second course

**Important** Should be rubbed in and allowed to stay on the treated area for 8 hours, then washed off with mild soap and water

## PODOPHYLLOTOXIN

**Indications** see under preparations

**Cautions** avoid normal skin and open wounds; keep away from face; very irritant to eyes

**Pregnancy** avoid

**Breast-feeding** avoid

**Side-effects** local irritation

**Condyline**<sup>®</sup> (Takeda) [P<sub>oM</sub>]

**Solution**, podophyllotoxin 0.5% in alcoholic basis, net price 3.5 mL (with applicators) = £14.49. Label: 15

**Dose** condylomata acuminata affecting the penis or the female external genitalia, apply twice daily for 3 consecutive days; treatment may be repeated at weekly intervals if necessary for a total of five 3-day treatment courses; direct medical supervision for lesions in the female and for lesions greater than 4 cm<sup>2</sup> in the male; max. 50 single applications ('loops') per session (consult product literature); **CHILD** 2–18 years see *BNF for Children*

**Warticon**<sup>®</sup> (GSK) [P<sub>oM</sub>]

**Cream**, podophyllotoxin 0.15%, net price 5 g (with mirror) = £14.86

**Excipients** include butylated hydroxyanisole, cetyl alcohol, hydroxybenzoates (parabens), sorbic acid, stearyl alcohol

**Dose** condylomata acuminata affecting the penis or the female external genitalia, apply twice daily for 3 consecutive days; treatment may be repeated at weekly intervals if necessary for a total of four 3-day treatment courses; direct medical supervision for lesions greater than 4 cm<sup>2</sup>; **CHILD** 2–18 years see *BNF for Children*

**Solution**, blue, podophyllotoxin 0.5% in alcoholic basis, net price 3 mL (with applicators) = £12.38. Label: 15

**Dose** condylomata acuminata affecting the penis or the female external genitalia, apply twice daily for 3 consecutive days; treatment may be repeated at weekly intervals if necessary for a total of four 3-day treatment courses; direct medical supervision for lesions greater than 4 cm<sup>2</sup>; max. 50 single applications ('loops') per session (consult product literature); **CHILD** 2–18 years see *BNF for Children*

Sunscreen preparations contain substances that protect the skin against UVA and UVB radiation, but they are not substitute for covering the skin and avoiding sunlight. The sun protection factor (SPF, usually indicated in the preparation title) provides guidance on the degree of protection offered against UVB; it indicates the multiples of protection provided against burning, compared with unprotected skin; for example, an SPF of 8 should enable a person to remain 8 times longer in the sun without burning. However, in practice, users do not apply sufficient sunscreen product and the protection is lower than that found in experimental studies.

Some manufacturers use a star rating system to indicate the protection against UVA relative to protection against UVB for sunscreen products. However, the usefulness of the star rating system remains controversial. The EU Commission (September 2006) has recommended that the UVA protection factor for a sunscreen should be at least one-third of the sun protection factor (SPF); products that achieve this requirement will be labelled with a UVA logo alongside the SPF classification. Preparations that also contain reflective substances, such as titanium dioxide, provide the most effective protection against UVA.

Sunscreen preparations may rarely cause allergic reactions.

For optimum photoprotection, sunscreen preparations should be applied **thickly and frequently** (approximately 2 hourly). In photodermatoses, they should be used from spring to autumn. As maximum protection from sunlight is desirable, preparations with the highest SPF should be prescribed.

## 13.8 Sunscreens and camouflagers

### 13.8.1 Sunscreen preparations

### 13.8.2 Camouflagers

### 13.8.1 Sunscreen preparations

Solar ultraviolet irradiation can be harmful to the skin. It is responsible for disorders such as *polymorphic light eruption*, *solar urticaria*, and it provokes the various *cutaneous porphyrias*. It also provokes (or at least aggravates) skin lesions of *lupus erythematosus* and may aggravate *rosacea* and some other *dermatoses*. Certain drugs, such as demeclocycline, phenothiazines, or amiodarone, can cause photosensitivity. All these conditions (as well as *sunburn*) may occur after relatively short periods of exposure to the sun. Solar ultraviolet irradiation may provoke attacks of recurrent herpes labialis (but it is not known whether the effect of sunlight exposure is local or systemic).

The effects of exposure over longer periods include *ageing changes* and more importantly the initiation of *skin cancer*.

Solar ultraviolet radiation is approximately 200–400 nm in wavelength. The medium wavelengths (290–320 nm, known as UVB) cause *sunburn*. The long wavelengths (320–400 nm, known as UVA) are responsible for many *photosensitivity reactions* and *photodermatoses*. Both UVA and UVB contribute to long-term *photodamage* and to the changes responsible for *skin cancer* and ageing.

### Ingredient nomenclature in sunscreen preparations

rINN	INCI
amiloxate	isoamyl <i>p</i> -methoxycinnamate
avobenzene	butyl methoxydibenzoylmethane
bemotrizinol	bis-ethylhexyloxyphenol methoxyphenyl triazine
bisocotriazole	methylene bis-benzotriazolyl tetramethylbutylphenol
ecamsule	terephthalylidene dicamphor sulfonic acid
ensulizole	phenylbenzimidazole sulfonic acid
enzacamene	4-methylbenzylidene camphor
octinoxate	octyl (or ethylhexyl) methoxycinnamate
octocriene	octocrylene
oxybenzone	benzophenone-3

The European Commission Cosmetic Products Regulation (EC) 1223/2009 requires the use of INCI (International Nomenclature of Cosmetic Ingredients) for cosmetics and sunscreens. This table includes the rINN and the INCI synonym for the active ingredients of sunscreen preparations in the BNF

**Borderline substances** The preparations marked 'ACBS' are regarded as drugs when prescribed for skin protection against ultraviolet radiation in abnormal cutaneous photosensitivity resulting from genetic disorders or photodermatoses, including vitiligo and those

resulting from radiotherapy; chronic or recurrent herpes simplex labialis. Preparations with SPF less than 30 should not normally be prescribed. See also Appendix 2.

#### Anthelios<sup>®</sup> (L'Oréal Active)

**XL SPF 50+ Melt-in cream** (UVA and UVB protection; UVB-SPF 50+), avobenzene 3.5%, bemotrizinol 3%, drometrizole trisiloxane 0.5%, ecamsule 1%, octocriylene 2.5%, titanium dioxide 4.2%, net price 50 mL = £3.63. ACBS

**Excipients** include disodium edetate, stearyl alcohol

**Note** For INCI synonyms, see table above

#### Sunsense<sup>®</sup> Ultra (Crawford)

**Lotion** (UVA and UVB protection; UVB-SPF 50+), octinoxate 6%, enzacamene 4%, avobenzene 2%, oxybenzone 2%, ensulizole 2%, titanium dioxide 3%, net price 50-mL bottle with roll-on applicator = £5.01, 125 mL = £8.14, 500-mL pump pack = £18.17. ACBS

**Excipients** include butylated hydroxytoluene, cetyl alcohol, fragrance, hydroxybenzoates (parabens), propylene glycol

**Note** For INCI synonyms, see table above

#### Uvistat<sup>®</sup> (LPC)

**Cream** (UVA and UVB protection; UVB-SPF 30), avobenzene 5%, bisotrizole 1.5%, octinoxate 7.5%, octocriylene 4%, titanium dioxide 5.2%, net price 125 mL = £7.45. ACBS

**Excipients** include disodium edetate, hydroxybenzoates (parabens), propylene glycol

**Note** For INCI synonyms, see table above

**Cream** (UVA and UVB protection; UVB-SPF 50), amiloxate 2%, avobenzene 5%, bisotrizole 6%, octinoxate 10%, octocriylene 4%, titanium dioxide 4.8%, net price 125 mL = £8.45. ACBS

**Excipients** include disodium edetate, polysorbate 60, propylene glycol

**Note** For INCI synonyms, see table above

**Lipscreen** (UVA and UVB protection; UVB-SPF 50), avobenzene 5%, bemotrizinol 3%, octinoxate 10%, octocriylene 4%, titanium dioxide 3%, net price 5 g = £2.99. ACBS

**Excipients** include butylated hydroxytoluene, hydroxybenzoates (parabens)

**Note** For INCI synonyms, see table above

## Photodamage

Patients should be advised to use a high-SPF sunscreen and to minimise exposure of the skin to direct sunlight or sun lamps.

Topical treatments can be used for *actinic keratosis*. An **emollient** may be sufficient for mild lesions. **Diclofenac** gel is suitable for the treatment of superficial lesions in mild disease. **Fluorouracil** cream is effective against most types of non-hypertrophic actinic keratosis; a solution containing fluorouracil and salicylic acid is available for the treatment of low or moderately thick hyperkeratotic actinic keratosis. **Imiquimod** (section 13.7) is used for lesions on the face and scalp when cryotherapy or other topical treatments cannot be used. Fluorouracil and imiquimod produce a more marked inflammatory reaction than diclofenac but lesions resolve faster. A short course of **ingenol mebutate** is licensed for the treatment of non-hypertrophic actinic keratosis; response to treatment can usually be assessed 8 weeks after the course. **Photodynamic therapy** in combination with methyl-5-aminolevulinic acid cream (*Metvix*<sup>®</sup>, available from Galderma) or 5-aminolaevulinic acid gel (*Ameluz*<sup>®</sup>▼, available from Spirit Health-

care) is used in specialist centres for treating superficial and confluent, non-hypertrophic actinic keratosis when other treatments are inadequate or unsuitable; it is particularly suitable for multiple lesions, for periorbital lesions, or for lesions located at sites of poor healing.

Imiquimod or topical fluorouracil is used for treating superficial *basal cell carcinomas*. Photodynamic therapy in combination with methyl-5-aminolevulinic acid cream is used in specialist centres for treating superficial, nodular basal cell carcinomas when other treatments are unsuitable.

## DICLOFENAC SODIUM

**Indications** actinic keratosis

**Cautions** as for topical NSAIDs, see section 10.3.2

**Contra-indications** as for topical NSAIDs, see section 10.3.2

**Side-effects** as for topical NSAIDs, see section 10.3.2; also paraesthesia; application of large amounts may result in systemic effects, see section 10.1

### Dose

- Apply thinly twice daily for 60–90 days; max. 8 g daily

#### Solaraze<sup>®</sup> (Almiral) (PoM)

**Gel**, diclofenac sodium 3% in a sodium hyaluronate basis, net price 50 g = £38.30, 100 g = £76.60

**Excipients** include benzyl alcohol

## FLUOROURACIL

**Indications** superficial malignant and pre-malignant skin lesions; other malignant disease (section 8.1.3)

**Cautions** avoid contact with eyes and mucous membranes; do not apply to bleeding lesions; caution in handling—irritant to tissues

**Pregnancy** manufacturers advise avoid (teratogenic)

**Breast-feeding** manufacturers advise avoid

**Side-effects** local irritation (use a topical corticosteroid for severe discomfort associated with inflammatory reactions), photosensitivity, erythema multiforme

### Dose

- See under preparations

#### Efudix<sup>®</sup> (Meda) (PoM)

**Cream**, fluorouracil 5%, net price 40 g = £32.90

**Excipients** include hydroxybenzoates (parabens), polysorbate 60, propylene glycol, stearyl alcohol

**Dose** superficial malignant and pre-malignant skin lesions, apply thinly to the affected area once or twice daily; max. area of skin treated at one time, 500 cm<sup>2</sup> (e.g. 23 cm × 23 cm); usual duration of initial therapy, 3–4 weeks

**Note** Alternative regimens may be in use in some settings

#### With salicylic acid

For prescribing information on salicylic acid, see section 13.5.2

#### Actikerall<sup>®</sup> (Almiral) (PoM)

**Solution**, fluorouracil 0.5%, salicylic acid 10%, net price 25 mL = £38.30. Label: 15

**Excipients** none as listed in section 13.1.3

**Dose** low or moderately thick hyperkeratotic actinic keratosis, apply to affected area once daily for up to 12 weeks; if severe side-effects occur, reduce frequency to 3 times a week until side-effects improve; if treating area with thin epidermis, reduce frequency of application and monitor response more often; max. area of skin treated at one time, 25 cm<sup>2</sup> (e.g. 5 cm × 5 cm)

## INGENOL MEBUTATE

**Indications** see under Dose

**Cautions** avoid contact with eyes, lips, broken skin, or inside of nostrils and ears; avoid occlusive dressings on treated area

**Pregnancy** not absorbed from skin, but manufacturer advises avoid

**Breast-feeding** not absorbed from skin; ensure infant does not come in contact with treated area for 6 hours after application

**Side-effects** local reactions (including erythema, blistering, crusting, erosion, exfoliation, pain, pruritus, oedema, infection), headache; *less commonly* local ulceration, paraesthesia

### Dose

- Actinic keratosis on face and scalp, apply 150 micrograms/g gel once daily for 3 days
- Actinic keratosis on trunk and extremities, apply 500 micrograms/g gel once daily for 2 days

**Note** One tube covers skin area of 25cm<sup>2</sup>. Allow gel to dry on treatment area for 15 minutes. Avoid washing or touching the treated area for 6 hours after application; after this time, area may be washed with mild soap and water. Avoid use immediately after shower or less than 2 hours before bedtime.

**Picato**<sup>®</sup> (LEO) ▼ (PoM)

Gel, ingenol mebutate 150 micrograms/g, net price 3 × 0.47-g single-use tubes = £65.00; 500 micrograms/g, 2 × 0.47-g single-use tubes = £65.00

**Excipients** include benzyl alcohol

**Note** Flammable

## 13.8.2 Camouflagers

Disfigurement of the skin can be very distressing to patients and may have a marked psychological effect. In skilled hands, or with experience, camouflage cosmetics can be very effective in concealing scars and birthmarks. The depigmented patches in vitiligo are also very disfiguring and camouflage creams are of great cosmetic value.

**Borderline substances** The preparations marked 'ACBS' are regarded as drugs when prescribed for post-operative scars and other deformities and as an adjunctive therapy in the relief of emotional disturbances due to disfiguring skin disease, such as vitiligo. See also Appendix 2.

**Covermark**<sup>®</sup> (Derma UK)

**Classic foundation** (masking cream), net price 15 mL (10 shades) = £11.86. ACBS

**Excipients** include beeswax, hydroxybenzoates (parabens), fragrance

**Finishing powder**, net price 25 g = £11.86. ACBS

**Excipients** include beeswax, hydroxybenzoates (parabens), fragrance

**Dermablend**<sup>®</sup> (L'Oréal Active)

**Ultra corrective foundation**, (7 shades), net price 12 g = £5.60. ACBS

**Excipients** include beeswax, isopropyl palmitate

**Dermacolor**<sup>®</sup> (Fox)

**Camouflage creme**, (100 shades), net price 25 mL = £10.52. ACBS

**Excipients** include beeswax, butylated hydroxytoluene, fragrance, propylene glycol, stearyl alcohol, wool fat

**Fixing powder**, (7 shades), net price 60 g = £9.05.

ACBS

**Excipients** include fragrance

**Keromask**<sup>®</sup> (Lornamead)

**Masking cream**, (24 shades), net price 15 mL = £5.68. ACBS

**Excipients** include butylated hydroxyanisole, hydroxybenzoates (parabens), wool fat, propylene glycol  
**Finishing powder**, (4 shades), net price 20 g = £5.68. ACBS

**Excipients** include butylated hydroxytoluene, hydroxybenzoates (parabens)

**Veil**<sup>®</sup> (Thomas Blake)

**Cover cream**, (40 shades), net price 19 g = £22.42, 44 g = £33.35, 70 g = £42.10. ACBS

**Excipients** include hydroxybenzoates (parabens), wool fat derivative

**Finishing powder**, translucent, net price 35 g = £24.58. ACBS

**Excipients** include butylated hydroxyanisole, hydroxybenzoates (parabens)

## 13.9 Shampoos and other preparations for scalp and hair conditions

*Dandruff* is considered to be a mild form of seborrhoeic dermatitis (see also section 13.5.1). Shampoos containing antimicrobial agents such as **pyrithione zinc** (which are widely available) and **selenium sulfide** may have beneficial effects. Shampoos containing **tar** extracts may be useful and they are also used in *psoriasis*. **Ketoconazole** shampoo should be considered for more persistent or severe dandruff or for seborrhoeic dermatitis of the scalp.

**Corticosteroid** gels and lotions (section 13.4) can also be used.

Shampoos containing **coal tar** and **salicylic acid** may also be useful. A cream or an ointment containing coal tar and salicylic acid is very helpful in *psoriasis* that affects the scalp (section 13.5.2). Patients who do not respond to these treatments may need to be referred to exclude the possibility of other skin conditions.

*Cradle cap* in infants may be treated with **coconut oil** or **olive oil** applications followed by shampooing.

See below for male-pattern baldness and also section 13.5 (*psoriasis* and *eczema*), section 13.10.4 (lice), and section 13.10.2 (ringworm).

### Shampoos

**<sup>1</sup>Ketoconazole** (Non-proprietary) (PoM)

**Cream**—section 13.10.2

**Shampoo**, ketoconazole 2%, net price 120 mL = £3.27

**Excipients** include imidurea

**Brands include** *Dandrazol*<sup>®</sup> 2% Shampoo, *Nizoral*<sup>®</sup>

**Dose** **ADULT** and **CHILD** over 12 years, treatment of seborrhoeic dermatitis and dandruff apply twice weekly for 2–4 weeks (prophylaxis apply once every 1–2 weeks); treatment of pityriasis versicolor apply once daily for max. 5 days (prophylaxis apply once daily for up to 3 days before sun exposure); leave preparation on for 3–5 minutes before rinsing

1. Can be sold to the public for the prevention and treatment of dandruff and seborrhoeic dermatitis of the scalp as a shampoo formulation containing ketoconazole max. 2%, in a pack containing max. 120 mL and labelled to show a max. frequency of application of once every 3 days

**Alphosyl 2 in 1**<sup>®</sup> (GSK Consumer Healthcare)

**Shampoo**, alcoholic coal tar extract 5%, net price 125 mL = £1.89, 250 mL = £4.52

**Excipients** include hydroxybenzoates (parabens), fragrance

**Dose** dandruff, use once or twice weekly as necessary; psoriasis, seborrhoeic dermatitis, scaling and itching, use every 2–3 days

**Capasal**<sup>®</sup> (Dermal)

**Shampoo**, coal tar 1%, coconut oil 1%, salicylic acid 0.5%, net price 250 mL = £4.69

**Excipients** none as listed in section 13.1.3

**Dose** scaly scalp disorders including psoriasis, seborrhoeic dermatitis, dandruff, and cradle cap, apply daily as necessary

**Ceanel Concentrate**<sup>®</sup> (Alliance)

**Shampoo**, cetrimide 10%, undecenoic acid 1%, net price 150 mL = £3.40, 500 mL = £9.80

**Excipients** none as listed in section 13.1.3

**Dose** scalp psoriasis, seborrhoeic dermatitis, dandruff, apply 3 times in first week then twice weekly

**Dermax**<sup>®</sup> (Dermal)

**Shampoo**, benzalkonium chloride 0.5%, net price 250 mL = £5.69

**Excipients** none as listed in section 13.1.3

**Dose** seborrhoeic scalp conditions associated with dandruff and scaling, apply as necessary

**Psoriderm**<sup>®</sup> (Dermal)

**Scalp lotion** (= shampoo), coal tar 2.5%, lecithin 0.3%, net price 250 mL = £4.74

**Excipients** include disodium edetate

**Dose** scalp psoriasis, use as necessary

**Selsun**<sup>®</sup> (Chatterm UK)

**Shampoo**, selenium sulfide 2.5%, net price 50 mL = £1.44, 100 mL = £1.96, 150 mL = £2.75

**Excipients** include fragrance

**Cautions** avoid using 48 hours before or after applying hair colouring, straightening or waving preparations

**Dose** seborrhoeic dermatitis and dandruff, apply twice weekly for 2 weeks then once weekly for 2 weeks and then as necessary; **CHILD** under 5 years not recommended; pityriasis versicolor, section 13.10.2 [unlicensed indication]

**T/Gel**<sup>®</sup> (J&J)

**Shampoo**, coal tar extract 2%, net price 125 mL = £3.61, 250 mL = £5.12

**Excipients** include fragrance, hydroxybenzoates (parabens), imidurea

**Dose** scalp psoriasis, seborrhoeic dermatitis, dandruff, apply 2–3 times weekly

**Other scalp preparations****Cocoi**<sup>®</sup>

Section 13.5.2

**Etrivex**<sup>®</sup>

Section 13.4

**Polytar**<sup>®</sup> (GSK)

**Liquid**, tar blend 1%, net price 250 mL = £2.23

**Excipients** include arachis (peanut) oil, fragrance, imidurea, polysorbate 80

**Dose** scalp disorders including psoriasis, seborrhoea, eczema, pruritus, and dandruff, apply 1–2 times weekly

**Polytar Plus**<sup>®</sup> (GSK)

**Liquid**, tar blend 1%, net price 500 mL = £3.91

**Excipients** include arachis (peanut) oil, fragrance, imidurea, polysorbate 80

**Dose** scalp disorders including psoriasis, seborrhoea, pruritus, and dandruff, apply 1–2 times weekly

**Sebco**<sup>®</sup>

Section 13.5.2

**Hirsutism**

Hirsutism may result from hormonal disorders or as a side-effect of drugs such as minoxidil, corticosteroids, anabolic steroids, androgens, danazol, and progestogens.

Weight loss can reduce hirsutism in obese women.

Women should be advised about local methods of hair removal, and in the mildest cases this may be all that is required.

**Eflornithine**, an antiprotozoal drug, inhibits the enzyme ornithine decarboxylase in hair follicles. Topical eflornithine can be used as an adjunct to laser therapy for facial hirsutism in women. Eflornithine should be discontinued in the absence of improvement after treatment for 4 months.

**Co-cyprindiol** (section 13.6.2) may be effective for moderately severe hirsutism. **Metformin** (section 6.1.2.2) is an alternative in women with polycystic ovary syndrome [unlicensed indication]. Systemic treatment is required for 6–12 months before benefit is seen.

**EFLORNITHINE**

**Indications** see notes above

**Pregnancy** toxicity in *animal studies*—manufacturer advises avoid

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** acne, application site reactions including burning and stinging sensation, rash; *less commonly* abnormal hair texture and growth

**Dose**

- **ADULT** over 18 years, apply thinly twice daily

**Note** Preparation must be rubbed in thoroughly; cosmetics may be applied over treated area 5 minutes after eflornithine; do not wash treated area for 4 hours after application

**Vaniqa**<sup>®</sup> (Almirall) [PoM]

**Cream**, eflornithine (as hydrochloride monohydrate) 11.5%, net price 60 g = £56.87

**Excipients** include cetostearyl alcohol, hydroxybenzoates, stearyl alcohol

**Note** The *Scottish Medicines Consortium* has advised (September 2005) that eflornithine for facial hirsutism be restricted for use in women in whom alternative drug treatment cannot be used

**Androgenetic alopecia**

**Finasteride** is licensed for the treatment of androgenetic alopecia in men. Continuous use for 3–6 months is required before benefit is seen, and effects are reversed 6–12 months after treatment is discontinued.

Topical application of **minoxidil** may stimulate limited hair growth in a small proportion of adults but only for as long as it is used.

**FINASTERIDE**

**Indications** androgenetic alopecia in men; benign prostatic hyperplasia (section 6.4.2)

**Cautions** section 6.4.2

**Side-effects** section 6.4.2

**Dose**

- **By mouth** 1 mg daily

**Propecia**<sup>®</sup> (MSD) [PoM] [MHS]

**Tablets**, f/c, beige, finasteride 1 mg, net price 28-tablet pack = £26.99, 84-tablet pack = £81.55

## MINOXIDIL

**Indications** androgenetic alopecia (men and women)

**Cautions** section 2.5.1 (but only about 1–2% absorbed); avoid contact with eyes, mouth and mucous membranes, broken, infected, shaved, or inflamed skin; avoid inhalation of spray mist; avoid occlusive dressings and topical drugs which enhance absorption

**Contra-indications** section 2.5.1

**Pregnancy** section 2.5.1

**Breast-feeding** section 2.5.1

**Side-effects** section 2.5.1; also headache, local irritation; *less commonly* hypotension, changes in hair colour or texture (discontinue if increased hair loss persists for more than 2 weeks)

### Dose

- See under preparations below

**Regaine®** (McNeil) 

**Regaine® for Women Regular Strength cutaneous solution**, minoxidil 2% in an aqueous alcoholic basis, net price 60-mL bottle with applicators = £14.16

**Excipients** include propylene glycol

**Cautions** flammable; wash hands after application

**Dose** apply 1 mL twice daily to affected areas of scalp; discontinue if no improvement after 1 year

**Regaine® for Men Extra Strength cutaneous solution**, minoxidil 5% in an aqueous alcoholic basis, net price 60-mL bottle with applicators = £19.84, 3 × 60-mL bottles = £39.71

**Excipients** include propylene glycol

**Cautions** flammable; wash hands after application

**Dose** apply 1 mL twice daily to affected areas of scalp; discontinue if no improvement after 1 year

**Regaine® for Men Extra Strength cutaneous foam**, minoxidil 5%, net price 60 g = £21.84, 3 × 60 g = £43.69

**Excipients** include butylated hydroxytoluene, cetyl alcohol, stearyl alcohol, polysorbate 60

**Cautions** flammable; wash hands after application

**Dose** apply half a capful twice daily to affected areas of scalp; discontinue if no improvement after 16 weeks

**Note** Ensure hair and scalp dry before application

ficial infection with clearly defined edges (and often affecting the face), is also treated with a systemic antibacterial (see Table 1, section 5.1).

In the community, acute *impetigo* on small areas of the skin may be treated by short-term topical application of **fusidic acid**; **mupirocin** should be used only to treat meticillin-resistant *Staphylococcus aureus*. If the impetigo is extensive or longstanding, an oral antibacterial such as **flucloxacillin** (or **clarithromycin** in penicillin-allergy) (Table 1, section 5.1) should be used. Mild antiseptics (section 13.11) can be used to soften crusts.

Although many antibacterial drugs are available in topical preparations, some are potentially hazardous and frequently their use is not necessary if adequate hygienic measures can be taken. Moreover, not all skin conditions that are oozing, crusted, or characterised by pustules are actually infected. Topical antibacterials should be **avoided** on *leg ulcers* unless used in short courses for defined infections; treatment of bacterial colonisation is generally inappropriate.

To minimise the development of resistant organisms it is advisable to limit the choice of antibacterials applied topically to those not used systemically. Unfortunately some of these, for example neomycin, may cause sensitisation, and there is cross-sensitivity with other aminoglycoside antibiotics, such as gentamicin. If *large areas of skin* are being treated, ototoxicity may also be a hazard with aminoglycoside antibiotics (and also with polymyxins), particularly in children, in the elderly, and in those with renal impairment. *Resistant organisms* are more common in hospitals, and whenever possible swabs should be taken for bacteriological examination before beginning treatment.

**Mupirocin** is not related to any other antibacterial in use; it is effective for skin infections, particularly those due to Gram-positive organisms but it is not indicated for pseudomonal infection. Although *Staphylococcus aureus* strains with low-level resistance to mupirocin are emerging, it is generally useful in infections resistant to other antibacterials. To avoid the development of resistance, mupirocin or fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital. In the presence of mupirocin-resistant MRSA infection, a topical antiseptic such as povidone-iodine, chlorhexidine, or alcohol can be used; their use should be discussed with the local microbiologist.

**Retapamulin** can be used for impetigo and other superficial bacterial skin infections caused by *Staphylococcus aureus* and *Streptococcus pyogenes* that are resistant to first-line topical antibacterials. However, it is not effective against MRSA. The *Scottish Medicines Consortium* (p. 4) has advised (March 2008) that retapamulin (*Altargo®*) is **not recommended** for use within NHS Scotland for the treatment of superficial skin infections.

**Silver sulfadiazine** is used in the treatment of infected burns.

## 13.10 Anti-infective skin preparations

- 13.10.1 Antibacterial preparations
- 13.10.2 Antifungal preparations
- 13.10.3 Antiviral preparations
- 13.10.4 Parasitocidal preparations
- 13.10.5 Preparations for minor cuts and abrasions

### 13.10.1 Antibacterial preparations

- 13.10.1.1 Antibacterial preparations only used topically
- 13.10.1.2 Antibacterial preparations also used systemically

*Cellulitis*, a rapidly spreading deeply seated inflammation of the skin and subcutaneous tissue, requires systemic antibacterial treatment (see Table 1, section 5.1). Lower leg infections or infections spreading around wounds are almost always cellulitis. *Erysipelas*, a super-

#### 13.10.1.1 Antibacterial preparations only used topically

### MUPIROCIN

**Indications** bacterial skin infections (see also notes above)

**Renal impairment** manufacturer advises caution when mupirocin ointment used in moderate or severe

impairment because it contains macrogols (polyethylene glycol)

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—no information available

**Breast-feeding** no information available

**Side-effects** local reactions including urticaria, pruritus, burning sensation, rash

#### Dose

- **ADULT** and **CHILD** over 1 year, apply up to 3 times daily for up to 10 days; **CHILD** under 1 year see *BNF for Children*

**Mupirocin** (Non-proprietary) (PoM)

**Ointment**, mupirocin 2%, net price 15 g = £5.36

**Bactroban**® (GSK) (PoM)

**Cream**, mupirocin (as mupirocin calcium) 2%, net price 15 g = £4.38

**Excipients** include benzyl alcohol, cetyl alcohol, stearyl alcohol

**Ointment**, mupirocin 2%, net price 15 g = £4.38

**Excipients** none as listed in section 13.1.3

**Nasal ointment**—section 12.2.3

## NEOMYCIN SULFATE

**Indications** bacterial skin infections

**Cautions** large areas, see below

**Large areas** If large areas of skin are being treated ototoxicity may be a hazard, particularly in children, in the elderly, and in those with renal impairment

**Contra-indications** neonates

**Renal impairment** see Cautions above

**Side-effects** sensitisation (see also notes above)

**Neomycin Cream BPC** (PoM) 

**Cream**, neomycin sulfate 0.5%, cetomacrogol emulsifying ointment 30%, chlorocresol 0.1%, disodium edetate 0.01%, in freshly boiled and cooled purified water, net price 15 g = £2.17

**Excipients** include ceteostearyl alcohol, edetic acid (EDTA)

**Dose** apply up to 3 times daily (short-term use)

## POLYMYXINS

**Indications** bacterial skin infections

**Cautions** large areas, see below

**Large areas** If large areas of skin are being treated nephrotoxicity and neurotoxicity may be a hazard, particularly in children, in the elderly, and in those with renal impairment

**Renal impairment** see Cautions above

**Side-effects** sensitisation (see also notes above)

**Polyfax**® (TEVA UK) (PoM)

**Ointment**, polymyxin B sulfate 10 000 units, bacitracin zinc 500 units/g, net price 4 g = £3.26, 20 g = £4.62

**Excipients** none as listed in section 13.1.3

**Dose** apply twice daily or more frequently if required

## RETAPAMULIN

**Indications** superficial bacterial skin infections (see also notes above)

**Contra-indications** contact with eyes and mucous membranes

**Side-effects** local reactions including irritation, erythema, pain, contact dermatitis, and pruritus

#### Dose

- **ADULT** over 18 years, apply thinly twice daily for 5 days; max. area of skin treated 100 cm<sup>2</sup> or lesion length 10 cm; **CHILD** 9 months–18 years, apply thinly twice daily for 5 days; max. area of skin treated 2% of body surface area

**Note** Review treatment if no response within 2–3 days

**Altargo**® (GSK) (PoM)

**Ointment**, retapamulin 1%, net price 5 g = £7.89.

**Label:** 28

**Excipients** include butylated hydroxytoluene

## SILVER SULFADIAZINE

**Indications** prophylaxis and treatment of infection in burn wounds; as an adjunct to short-term treatment of infection in leg ulcers and pressure sores; as an adjunct to prophylaxis of infection in skin graft donor sites and extensive abrasions; for conservative management of finger-tip injuries

**Cautions** G6PD deficiency; may inactivate enzymatic debriding agents—concomitant use may be inappropriate; for large amounts see also **interactions**: Appendix 1 (sulfonamides)

**Large areas** Plasma-sulfadiazine concentrations may approach therapeutic levels with *side-effects* and *interactions* as for sulfonamides (see section 5.1.8) if large areas of skin are treated. Owing to the association of sulfonamides with severe blood and skin disorders, treatment should be stopped immediately if blood disorders or rashes develop—but leucopenia developing 2–3 days after starting treatment of burns patients is reported usually to be self-limiting and silver sulfadiazine need not usually be discontinued provided blood counts are monitored carefully to ensure return to normality within a few days. Argylia may also occur if large areas of skin are treated (or if application is prolonged).

**Contra-indications** sensitivity to sulfonamides; not recommended for neonates

**Hepatic impairment** manufacturer advises caution if significant impairment; see also Large Areas, above

**Renal impairment** manufacturer advises caution if significant impairment; see also Large Areas, above

**Pregnancy** risk of neonatal haemolysis and methaemoglobinaemia in third trimester

**Breast-feeding** small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants

**Side-effects** allergic reactions including burning, itching and rashes; argylia reported following prolonged use; leucopenia reported (monitor blood levels)

**Flamazine**® (S&N Hlth.) (PoM)

**Cream**, silver sulfadiazine 1%, net price 20 g = £2.91, 50 g = £3.85, 250 g = £10.32, 500 g = £18.27

**Excipients** include cetyl alcohol, polysorbates, propylene glycol

**Dose** burns, apply daily or more frequently if very exudative; leg ulcers or pressure sores, apply daily or on alternate days (not recommended if ulcer very exudative); finger-tip injuries, apply every 2–3 days; consult product literature for details

**Note** Apply with sterile applicator

### 13.10.1.2 Antibacterial preparations also used systemically

**Sodium fusidate** is a narrow-spectrum antibacterial used for staphylococcal infections. For the role of sodium fusidate in the treatment of impetigo see p. 816.

**Metronidazole** is used topically for rosacea and to reduce the odour associated with anaerobic infections;

oral metronidazole (section 5.1.11) is used to treat wounds infected with anaerobic bacteria.

**Angular cheilitis** An ointment containing sodium fusidate is used in the fissures of angular cheilitis when associated with staphylococcal infection. For further information on angular cheilitis, see section 12.3.2.

## FUSIDIC ACID

**Indications** staphylococcal skin infections; penicillin-resistant staphylococcal infections (section 5.1.7); staphylococcal eye infections (section 11.3.1)

**Cautions** see notes above; avoid contact with eyes

**Side-effects** rarely hypersensitivity reactions

### Dose

- Apply 3–4 times daily

**Fucidin**<sup>®</sup> (LEO) (PoM)

**Cream**, fusidic acid 2%, net price 15 g = £1.92, 30 g = £3.59

**Excipients** include butylated hydroxyanisole, cetyl alcohol

**Ointment**, sodium fusidate 2%, net price 15 g = £2.23, 30 g = £3.79

**Excipients** include cetyl alcohol, wool fat

**Dental prescribing on NHS** May be prescribed as Sodium Fusidate ointment

## METRONIDAZOLE

**Indications** see preparations; rosacea (see also section 13.6); *Helicobacter pylori* eradication (section 1.3); anaerobic infections (section 5.1.11 and section 7.2.2); protozoal infections (section 5.4.2)

**Cautions** avoid exposure to strong sunlight or UV light

**Side-effects** skin irritation

### Dose

- See preparations

**Acea**<sup>®</sup> (Ferndale) (PoM)

**Gel**, metronidazole 0.75%, net price 40 g = £9.95

**Excipients** include disodium edetate, hydroxybenzoates (parabens)

**Dose** acute inflammatory exacerbation of rosacea, apply thinly twice daily for 8 weeks

**Anabact**<sup>®</sup> (CHS) (PoM)

**Gel**, metronidazole 0.75%, net price 15 g = £4.47, 30 g = £7.89

**Excipients** include hydroxybenzoates (parabens), propylene glycol

**Dose** malodorous fungating tumours and malodorous gravitational and decubitus ulcers, apply to clean wound 1–2 times daily and cover with non-adherent dressing

**Metrogel**<sup>®</sup> (Galderma) (PoM)

**Gel**, metronidazole 0.75%, net price 40 g = £22.63

**Excipients** include hydroxybenzoates (parabens), propylene glycol

**Dose** acute inflammatory exacerbation of rosacea, apply thinly twice daily for 8–9 weeks

Malodorous fungating tumours, apply to clean wound 1–2 times daily and cover with non-adherent dressing

**Metrosa**<sup>®</sup> (Linderna) (PoM)

**Gel**, metronidazole 0.75%, net price 40 g = £19.90

**Excipients** include propylene glycol

**Dose** acute exacerbation of rosacea, apply thinly twice daily for up to 8 weeks

**Rosiced**<sup>®</sup> (Fabre) (PoM)

**Cream**, metronidazole 0.75%, net price 30 g = £7.50

**Excipients** include propylene glycol

**Dose** inflammatory papules and pustules of rosacea, apply twice daily for 6 weeks (longer if necessary)

**Rozex**<sup>®</sup> (Galderma) (PoM)

**Cream**, metronidazole 0.75%, net price 30 g = £6.60, 40 g = £9.88

**Excipients** include benzyl alcohol, isopropyl palmitate

**Gel**, metronidazole 0.75%, net price 30 g = £6.60, 40 g = £9.88

**Excipients** include disodium edetate, hydroxybenzoates (parabens), propylene glycol

**Dose** inflammatory papules, pustules and erythema of rosacea, apply twice daily for 3–4 months

**Zyomet**<sup>®</sup> (AMCo) (PoM)

**Gel**, metronidazole 0.75%, net price 30 g = £12.00

**Excipients** include benzyl alcohol, disodium edetate, propylene glycol

**Dose** acute inflammatory exacerbation of rosacea, apply thinly twice daily for 8–9 weeks

## 13.10.2 Antifungal preparations

Most localised fungal infections are treated with topical preparations. To prevent relapse, local antifungal treatment should be continued for 1–2 weeks after the disappearance of all signs of infection. Systemic therapy (section 5.2) is necessary for scalp infection or if the skin infection is widespread, disseminated, or intractable; although topical therapy may be used to treat some nail infections, systemic therapy (section 5.2) is more effective. Skin scrapings should be examined if systemic therapy is being considered or where there is doubt about the diagnosis.

**Dermatophytoses** Ringworm infection can affect the scalp (*tinea capitis*), body (*tinea corporis*), groin (*tinea cruris*), hand (*tinea manuum*), foot (*tinea pedis*, athlete's foot), or nail (*tinea unguium*). Scalp infection requires systemic treatment (section 5.2); additional application of a topical antifungal, during the early stages of treatment, may reduce the risk of transmission. A topical antifungal can also be used to treat asymptomatic carriers of scalp ringworm. Most other local ringworm infections can be treated adequately with topical antifungal preparations (including shampoos, section 13.9). The imidazole antifungals **clotrimazole**, **econazole**, **ketoconazole**, and **miconazole** are all effective. **Terbinafine** cream is also effective but it is more expensive. Other topical antifungals include **griseofulvin** and the **undecenoates**. **Compound benzoic acid ointment** (Whitfield's ointment) has been used for ringworm infections but it is cosmetically less acceptable than proprietary preparations. Topical preparations for athlete's foot containing **tolnaftate** are on sale to the public.

Antifungal dusting powders are of little therapeutic value in the treatment of fungal skin infections and may cause skin irritation; they may have some role in preventing re-infection.

Antifungal treatment may not be necessary in asymptomatic patients with *tinea* infection of the nails. If treatment is necessary, a systemic antifungal (section 5.2) is more effective than topical therapy. However, topical application of **amorolfine** or **tioconazole** may be useful for treating early onychomycosis when involvement is limited to mild distal disease, or for superficial white onychomycosis, or where there are contra-indications to systemic therapy.

**Pityriasis versicolor** Pityriasis (*tinea*) *versicolor* can be treated with **ketoconazole** shampoo (section 13.9). Alternatively, **selenium sulfide** shampoo [unli-

censed indication] (section 13.9) can be used as a lotion (diluting with a small amount of water can reduce irritation) and left on the affected area for 10 minutes before rinsing off; it should be applied once daily for 7 days, and the course repeated if necessary.

Topical imidazole antifungals such as **clotrimazole**, **econazole**, **ketoconazole**, and **miconazole**, or topical **terbinafine** are alternatives, but large quantities may be required.

If topical therapy fails, or if the infection is widespread, pityriasis versicolor is treated systemically with a triazole antifungal (section 5.2). Relapse is common, especially in the immunocompromised.

**Candidiasis** Candidal skin infections can be treated with a topical imidazole antifungal, such as **clotrimazole**, **econazole**, **ketoconazole**, or **miconazole**; topical **terbinafine** is an alternative. Topical application of **nystatin** is also effective for candidiasis but it is ineffective against dermatophytosis. Refractory candidiasis requires systemic treatment (section 5.2) generally with a triazole such as **fluconazole**; systemic treatment with **terbinafine** is **not appropriate** for refractory candidiasis.

**Angular cheilitis** Miconazole cream is used in the fissures of angular cheilitis when associated with *Candida*. For further information on angular cheilitis, see p. 775.

**Compound topical preparations** Combination of an imidazole and a mild corticosteroid (such as hydrocortisone 1%) (section 13.4) may be of value in the treatment of eczematous intertrigo and, in the first few days only, of a severely inflamed patch of ringworm. Combination of a mild corticosteroid with either an imidazole or **nystatin** may be of use in the treatment of intertrigo associated with candida.

**Cautions** Contact with eyes and mucous membranes should be avoided.

**Side-effects** Occasional local irritation and hypersensitivity reactions include mild burning sensation, erythema, and itching. Treatment should be discontinued if these are severe.

## AMOROLFINE

**Indications** fungal nail infections

**Cautions** see notes above; also avoid contact with ears; use with caution in child likely to suck affected digits

**Side-effects** see notes above

### Dose

- Apply to infected nails 1–2 times weekly after filing and cleansing; allow to dry (approx. 3 minutes); treat finger nails for 6 months, toe nails for 9–12 months (review at intervals of 3 months); avoid nail varnish or artificial nails during treatment

**Amorolfine** (Non-proprietary) [POM]

**Nail lacquer**, amorolfine (as hydrochloride) 5%, net price 5-mL pack = £14.18, 2 × 2.5-mL pack = £19.53. Label: 10, patient information leaflet

**Brands include** *Omicur*<sup>®</sup>

**Note** Amorolfine nail lacquer can be sold to the public if supplied for the treatment of mild cases of distal and lateral subungual onychomycoses caused by dermatophytes, yeasts and moulds; subject to treatment of max. 2 nails, max. strength of nail lacquer amorolfine 5% and a pack size of 3 mL

**Loceryl**<sup>®</sup> (Galderma) [POM]

**Nail lacquer**, amorolfine (as hydrochloride) 5%, net price 5-mL pack (with nail files, spatulas, and cleansing swabs) = £9.08. Label: 10, patient information leaflet

**Excipients** none as listed in section 13.1.3

## BENZOIC ACID

**Indications** ringworm (tinea), but see notes above

**Benzoic Acid Ointment, Compound, BP** (Whitfield's ointment)

**Ointment**, benzoic acid 6%, salicylic acid 3%, in emulsifying ointment

**Excipients** include cetostearyl alcohol

**Dose** apply twice daily

## CLOTRIMAZOLE

**Indications** fungal skin infections; vaginal candidiasis (section 7.2.2); otitis externa (section 12.1.1)

**Cautions** see notes above

**Pregnancy** minimal absorption from skin; not known to be harmful

**Side-effects** see notes above

### Dose

- Apply 2–3 times daily

**Clotrimazole** (Non-proprietary)

**Cream**, clotrimazole 1%, net price 20 g = £1.26

**Canesten**<sup>®</sup> (Bayer Consumer Care)

**Cream**, clotrimazole 1%, net price 20 g = £2.14, 50 g = £3.50

**Excipients** include benzyl alcohol, cetostearyl alcohol, polysorbate 60

**Solution**, clotrimazole 1% in macrogol 400 (polyethylene glycol 400), net price 20 mL = £2.30. For hairy areas

**Excipients** none as listed in section 13.1.3

**Spray**, clotrimazole 1%, in 30% isopropyl alcohol, net price 40-mL atomiser = £4.72. Label: 15. For large or hairy areas

**Excipients** include propylene glycol

## ECONAZOLE NITRATE

**Indications** fungal skin infections; vaginal candidiasis (section 7.2.2)

**Cautions** see notes above

**Pregnancy** minimal absorption from skin; not known to be harmful

**Side-effects** see notes above

### Dose

- Skin infections apply twice daily; nail infections, apply once daily under occlusive dressing

**Pevaryl**<sup>®</sup> (Janssen)

**Cream**, econazole nitrate 1%, net price 30 g = £3.71

**Excipients** include butylated hydroxyanisole, fragrance

## GRISEOFULVIN

**Indications** tinea pedis; resistant fungal infections (section 5.2.5)

**Cautions** see notes above

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid unless potential benefit outweighs risk

**Side-effects** see notes above

**Dose**

- Apply 400 micrograms (1 spray) to an area approx. 13 cm<sup>2</sup> once daily, increased to 1.2 mg (3 sprays, allowing each spray to dry between applications) once daily if necessary; max. treatment duration 4 weeks

**Grisol AF**<sup>®</sup> (Transdermal)

Spray, griseofulvin 400 micrograms/metered spray, net price 20-mL (400-dose) spray = £3.35. Label: 15  
**Excipients** include benzyl alcohol

## KETOCONAZOLE

**Indications** fungal skin infections; vulval candidiasis (section 7.2.2)

**Cautions** see notes above

**Side-effects** see notes above

**Dose**

- **ADULT** over 18 years, tinea pedis, apply twice daily; other fungal infections, apply 1–2 times daily

**Nizoral**<sup>®</sup> (Janssen) (PoM)

<sup>1</sup>Cream, ketoconazole 2%, net price 30 g = £4.24  
**Excipients** include cetyl alcohol, polysorbates, propylene glycol, stearyl alcohol  
**Note** A 15-g tube is available for sale to the public for the treatment of tinea pedis, tinea cruris, and candidal intertrigo  
**Shampoo**—section 13.9

## MICONAZOLE NITRATE

**Indications** fungal skin infections; oral and intestinal fungal infections (section 12.3.2); vaginal candidiasis (section 7.2.2)

**Cautions** see notes above; **interactions:** Appendix 1 (antifungals, imidazole)

**Pregnancy** absorbed from skin in small amounts; manufacturer advises caution

**Side-effects** see notes above

**Dose**

- Apply twice daily continuing for 10 days after lesions have healed; nail infections, apply 1–2 times daily

**Miconazole** (Non-proprietary)

**Cream**, miconazole nitrate 2%, net price 20 g = £2.05, 45 g = £1.97

**Dental prescribing on NHS** Miconazole cream may be prescribed

**Daktarin**<sup>®</sup> (Janssen)

**Cream**, miconazole nitrate 2%, net price 30 g = £1.82

**Excipients** include butylated hydroxyanisole

**Note** A 15-g tube (SLS) is on sale to the public

**Powder**(SLS), miconazole nitrate 2%, net price 20 g = £2.37

**Excipients** none as listed in section 13.1.3

**Aktiv Spray powder**, miconazole nitrate 0.16%, in an aerosol basis, net price 100 g = £3.11. Label: 15

**Excipients** none as listed in section 13.1.3

## NYSTATIN

**Indications** skin infections due to *Candida* spp.; oral fungal infections (section 12.3.2)

**Cautions** see notes above

**Side-effects** see notes above

1. (SLS) except for seborrhoeic dermatitis and pityriasis versicolor and endorsed 'SLS'

**Nystaform**<sup>®</sup> (Typharm) (PoM)

**Cream**, nystatin 100 000 units/g, chlorhexidine hydrochloride 1%, net price 30 g = £2.62

**Excipients** include benzyl alcohol, cetostearyl alcohol, polysorbate 60

**Dose** apply 2–3 times daily continuing for 7 days after lesions have healed.

## SALICYLIC ACID

**Indications** fungal nail infections, particularly tinea; hyperkeratotic skin disorders (section 13.5.2); warts and calluses (section 13.7)

**Cautions** avoid broken or inflamed skin

**Salicylate toxicity** Salicylate toxicity can occur particularly if applied on large areas of skin

**Pregnancy** avoid

**Side-effects** see notes above

**Dose**

- **ADULT** and **CHILD** over 5 years, apply twice daily and after washing

**Phytex**<sup>®</sup> (Wynlit) (S)

**Paint**, salicylic acid 1.46% (total combined), tannic acid 4.89% and boric acid 3.12% (as borotannic complex), in a vehicle containing alcohol and ethyl acetate, net price 25 mL (with brush) = £2.97

**Excipients** none as listed in section 13.1.3

**Note** Flammable

## TERBINAFINE

**Indications** fungal skin infections

**Cautions** avoid contact with eyes

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—*animal* studies suggest no adverse effects

**Breast-feeding** manufacturer advises avoid—present in milk, but less than 5% of the dose is absorbed after topical application of terbinafine; avoid application to mother's chest

**Side-effects** see notes above

**Dose**

- Apply thinly 1–2 times daily for up to 1 week in tinea pedis, 1–2 weeks in tinea corporis and tinea cruris, 2 weeks in cutaneous candidiasis and pityriasis versicolor; review after 2 weeks; **CHILD** see *BNF for Children*

<sup>2</sup>**Terbinafine** (Non-proprietary) (PoM)

**Cream**, terbinafine hydrochloride 1%, net price 15 g = £1.73, 30 g = £3.46

**Lamisil**<sup>®</sup> (Novartis Consumer Health) (PoM)

**Cream**, terbinafine hydrochloride 1%, net price 15 g = £4.86, 30 g = £8.76

**Excipients** include benzyl alcohol, cetyl alcohol, polysorbate 60, stearyl alcohol

**Tablets**—section 5.2.5

## TIOCONAZOLE

**Indications** fungal nail infections

**Cautions** see notes above

**Pregnancy** manufacturer advises avoid

2. Preparations of terbinafine hydrochloride (max. 1%) can be sold to the public for external use for the treatment of tinea pedis as a cutaneous solution in a pack containing max. 15 g, or for the treatment of tinea pedis and cruris as a cream in a pack containing max. 15 g, or for the treatment of tinea pedis, cruris, and corporis as a spray in a pack containing max. 30 mL spray or as a gel in a pack containing max. 30 g gel

**Side-effects** see notes above; also local oedema, dry skin, nail discoloration, periungual inflammation, nail pain, rash, exfoliation

#### Dose

- Apply to nails and surrounding skin twice daily usually for up to 6 months (may be extended to 12 months)

**Trosyl**<sup>®</sup> (Pfizer) (PoM)

Cutaneous solution, tioconazole 28%, net price 12 mL (with applicator brush) = £27.38

**Excipients** none as listed in section 13.1.3

## UNDECENOATES

**Indications** see under preparations below

**Cautions** see notes above; avoid broken skin

**Side-effects** see notes above

#### Dose

- See under preparations below

**Mycota**<sup>®</sup> (Thornton & Ross)

Cream, zinc undecenoate 20%, undecenoic acid 5%, net price 25 g = £2.01

**Excipients** include cetostearyl alcohol, fragrance

**Dose** treatment of athlete's foot, apply twice daily continuing for 7 days after lesions have healed

Prevention of athlete's foot, apply once daily

**Powder**, zinc undecenoate 20%, undecenoic acid 2%, net price 70 g = £2.71

**Excipients** include fragrance

**Dose** treatment of athlete's foot, apply twice daily continuing for 7 days after lesions have healed

Prevention of athlete's foot, apply once daily

**Spray application**, undecenoic acid 3.9%, dichlorophen 0.4% (pressurised aerosol pack), net price 100 mL = £2.50

**Excipients** include fragrance

**Dose** treatment of athlete's foot, apply twice daily continuing for 7 days after lesions have healed

Prevention of athlete's foot, apply once daily

**Note** flammable

## 13.10.3 Antiviral preparations

**Aciclovir** cream is licensed for the treatment of initial and recurrent labial and genital *herpes simplex infections*; treatment should begin as early as possible. Systemic treatment is necessary for buccal or vaginal infections and for *herpes zoster (shingles)* (for details of systemic use see section 5.3.2.1).

**Herpes labialis** **Aciclovir** cream can be used for the treatment of initial and recurrent labial herpes simplex infections (cold sores). It is best applied at the earliest possible stage, usually when prodromal changes of sensation are felt in the lip and before vesicles appear.

**Penciclovir** cream is also licensed for the treatment of herpes labialis; it needs to be applied more frequently than aciclovir cream.

Systemic treatment is necessary if cold sores recur frequently or for infections in the mouth (see p. 423).

## ACICLOVIR

(Acyclovir)

**Indications** see notes above; herpes simplex and varicella-zoster infections (section 5.3.2.1); eye infections (section 11.3.3)

**Cautions** avoid contact with eyes and mucous membranes

**Pregnancy** not known to be harmful—manufacturers advise use only when potential benefit outweighs risk; limited absorption from topical aciclovir preparations

**Side-effects** transient stinging or burning; occasionally erythema, itching or drying of the skin

#### Dose

- Apply to lesions every 4 hours (5 times daily) for 5–10 days, starting at first sign of attack

**Aciclovir** (Non-proprietary) (PoM)

Cream, aciclovir 5%, net price 2 g = 83p, 10 g = £4.15

**Dental prescribing on NHS** Aciclovir Cream may be prescribed

**Note** A 2-g tube and a pump pack are on sale to the public for the treatment of cold sores

**Zovirax**<sup>®</sup> (GSK) (PoM)

Cream, aciclovir 5%, net price 2 g = £4.63, 10 g = £13.96

**Excipients** include cetostearyl alcohol, propylene glycol

**Eye ointment**—section 11.3.3

**Tablets**—section 5.3.2.1

## PENCICLOVIR

**Indications** see notes above

**Cautions** avoid contact with eyes and mucous membranes

**Side-effects** transient stinging, burning, numbness; hypersensitivity reactions also reported

**Vectavir**<sup>®</sup> (Novartis Consumer Health) (PoM)

Cream, penciclovir 1%, net price 2 g = £4.20

**Excipients** include cetostearyl alcohol, propylene glycol

**Dose** herpes labialis, apply to lesions every 2 hours during waking hours for 4 days, starting at first sign of attack; CHILD under 12 years, not recommended

**Dental prescribing on NHS** May be prescribed as Penciclovir Cream

## 13.10.4 Parasiticial preparations

### Suitable quantities of parasiticial preparations

Area of body	Skin creams	Lotions	Cream rinses
Scalp (head lice)	—	50–100 mL	50–100 mL
Body (scabies)	30–60 g	100 mL	—
Body (crab lice)	30–60 g	100 mL	—

These amounts are usually suitable for an adult for single application.

### Scabies

**Permethrin** is used for the treatment of *scabies (Sarcoptes scabiei)*; **malathion** can be used if permethrin is inappropriate.

**Benzyl benzoate** is an irritant and should be avoided in children; it is less effective than malathion and permethrin.

**Ivermectin** (available on a named patient basis from 'special-order' manufacturers or specialist importing

companies, see p. 1104) in a dose of 200 micrograms/kg by mouth has been used, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or 'Norwegian') scabies that does not respond to topical treatment alone; further doses of 200 micrograms/kg may be required.

**Application** Although acaricides have traditionally been applied after a hot bath, this is **not** necessary and there is even evidence that a hot bath may increase absorption into the blood, removing them from their site of action on the skin.

All members of the affected household should be treated simultaneously. Treatment should be applied to the whole body including the scalp, neck, face, and ears. Particular attention should be paid to the webs of the fingers and toes and lotion brushed under the ends of nails. It is now recommended that malathion and permethrin should be applied twice, one week apart; in the case of benzyl benzoate up to 3 applications on consecutive days may be needed. It is important to warn users to reapply treatment to the hands if they are washed. Patients with hyperkeratotic scabies may require 2 or 3 applications of acaricide on consecutive days to ensure that enough penetrates the skin crusts to kill all the mites.

**Itching** The *itch* and *eczema* of scabies persists for some weeks after the infestation has been eliminated and treatment for pruritus and eczema (section 13.5.1) may be required. Application of **crotonitron** can be used to control itching after treatment with more effective acaricides. A topical corticosteroid may help to reduce itch and inflammation after scabies has been treated successfully; however, persistent symptoms suggest that scabies eradication was not successful. Oral administration of a **sedating antihistamine** (section 3.4.1) at night may also be useful.

## Head lice

**Dimeticone** is effective against head lice (*Pediculus humanus capitis*) and acts on the surface of the organism. **Malathion**, an organophosphorus insecticide, is an alternative, but resistance has been reported. Benzyl benzoate is licensed for the treatment of head lice but it is less effective than other drugs.

Head lice infestation (pediculosis) should be treated using lotion or liquid formulations only if live lice are present. Shampoos are diluted too much in use to be effective. A contact time of 8–12 hours or overnight treatment is recommended for lotions and liquids; a 2-hour treatment is not sufficient to kill eggs.

In general, a course of treatment for head lice should be 2 applications of product 7 days apart to kill lice emerging from any eggs that survive the first application. All affected household members should be treated simultaneously.

**Wet combing methods** Head lice can be mechanically removed by combing wet hair meticulously with a plastic detection comb (probably for at least 30 minutes each time) over the whole scalp at 4-day intervals for a minimum of 2 weeks, and continued until no lice are found on 3 consecutive sessions; hair conditioner or vegetable oil can be used to facilitate the process.

Several devices for the removal of head lice such as combs and topical solutions, are available and some are prescribable on the NHS (consult Drug Tariff—see

Appliances and Reagents, p. 1092 for links to online Drug Tariffs).

## Crab lice

**Permethrin** and **malathion** are used to eliminate *crab lice* (*Phthirus pubis*). An aqueous preparation should be applied, allowed to dry naturally and washed off after 12 hours; a second treatment is needed after 7 days to kill lice emerging from surviving eggs. All surfaces of the body should be treated, including the scalp, neck, and face (paying particular attention to the eyebrows and other facial hair). A different insecticide should be used if a course of treatment fails.

## Benzyl benzoate

**Benzyl benzoate** is effective for *scabies* but is not a first-choice for *scabies* (see notes above).

### BENZYL BENZOATE

**Indications** scabies (but see notes above)

**Cautions** children (not recommended, see also under Dose, below), avoid contact with eyes and mucous membranes; do not use on broken or secondarily infected skin

**Breast-feeding** suspend feeding until product has been washed off

**Side-effects** skin irritation, burning sensation especially on genitalia and excoriations, occasionally rashes

#### Dose

- Apply over the whole body; repeat without bathing on the following day and wash off 24 hours later; a third application may be required in some cases

**Note** Not recommended for children—dilution to reduce irritant effect also reduces efficacy. Some manufacturers recommend application to the body but to exclude the head and neck. However, application should be extended to the scalp, neck, face, and ears

**Benzyl Benzoate Application, BP** (Non-proprietary)

**Application**, benzyl benzoate 25% in an emulsion basis, net price 500 mL = £2.50

## Dimeticone

**Dimeticone** coats head lice and interferes with water balance in lice by preventing the excretion of water; it is less active against eggs and treatment should be repeated after 7 days.

### DIMETICONE

**Indications** head lice

**Cautions** avoid contact with eyes; children under 6 months, medical supervision required

**Side-effects** skin irritation

#### Dose

- Rub into dry hair and scalp, allow to dry naturally, shampoo after minimum 8 hours (or overnight); repeat application after 7 days

**Hedrin**<sup>®</sup> (Thornton & Ross)

**Lotion**, dimeticone 4%, net price 50 mL = £2.98, 120 mL spray pack = £7.13, 150 mL = £6.92

**Note** Patients should be told to keep hair away from fire and flames during treatment

## Malathion

**Malathion** is recommended for *scabies*, *head lice* and *crab lice* (for details see notes above).

The risk of systemic effects associated with 1–2 applications of malathion is considered to be very low; however, applications of malathion liquid repeated at intervals of less than 1 week or application for more than 3 consecutive weeks should be **avoided** since the likelihood of eradication of lice is not increased.

### MALATHION

**Indications** see notes above and under preparations

**Cautions** avoid contact with eyes; do not use on broken or secondarily infected skin; children under 6 months, medical supervision required

**Side-effects** skin irritation and hypersensitivity reactions; chemical burns also reported

#### Dose

- Head lice, rub 0.5% preparation into dry hair and scalp, allow to dry naturally, remove by washing after 12 hours (see also notes above); repeat application after 7 days
- Crab lice, apply 0.5% aqueous preparation over whole body, allow to dry naturally, wash off after 12 hours or overnight; repeat application after 7 days
- Scabies, apply 0.5% preparation over whole body, and wash off after 24 hours; if hands are washed with soap within 24 hours, they should be retreated; see also notes above; repeat application after 7 days

**Note** For scabies, manufacturer recommends application to the body but not necessarily to the head and neck. However, application should be extended to the scalp, neck, face, and ears

#### Derbac-M<sup>®</sup> (SSL)

**Liquid**, malathion 0.5% in an aqueous basis, net price 50 mL = £3.05, 200 mL = £7.33

**Excipients** include cetostearyl alcohol, fragrance, hydroxybenzoates (parabens)

For crab lice, head lice, and scabies

## Permethrin

**Permethrin** is effective for *scabies* and *crab lice* (for details see notes above). Permethrin is active against *head lice* but the formulation and licensed methods of application of the current products make them unsuitable for the treatment of head lice.

### PERMETHRIN

**Indications** see notes above and under Dose

**Cautions** avoid contact with eyes; do not use on broken or secondarily infected skin; children under 6 months, medical supervision required for cream rinse (head lice); children aged 2 months–2 years, medical supervision required for dermal cream (scabies)

**Side-effects** pruritus, erythema, and stinging; rarely rashes and oedema

#### Dose

- Scabies, apply 5% preparation over whole body and wash off after 8–12 hours; **CHILD** (see also Cautions, above) apply over whole body including face, neck, scalp and ears; if hands washed with soap within 8 hours of application, they should be treated again with

cream (see notes above); repeat application after 7 days

**Note** Manufacturer recommends application to the body but to exclude head and neck. However, application should be extended to the scalp, neck, face, and ears  
Larger patients may require up to two 30-g packs for adequate treatment

- Crab lice, **ADULT** over 18 years, apply 5% cream over whole body, allow to dry naturally and wash off after 12 hours or after leaving on overnight; repeat application after 7 days

#### Permethrin (Non-proprietary)

**Cream**, permethrin 5%, net price 30 g = £6.96

#### Lyclear<sup>®</sup> Creme Rinse (Omega Pharma)

**Cream rinse**, permethrin 1% in basis containing isopropyl alcohol 20%, net price 59 mL = £3.55, 2 × 59-mL pack = £6.46

**Excipients** include cetyl alcohol

**Dose** head lice, not recommended, therefore no dose stated (insufficient contact time)

#### Lyclear<sup>®</sup> Dermal Cream (Omega Pharma)

**Dermal cream**, permethrin 5%, net price 30 g = £5.71. Label: 10, patient information leaflet

**Excipients** include butylated hydroxytoluene, wool fat derivative

## 13.10.5 Preparations for minor cuts and abrasions

Some of the preparations listed are used in minor burns, and abrasions. They are applied as necessary but should not be used on large wounds or for prolonged periods because of the possibility of hypersensitivity. The effervescent effect of hydrogen peroxide (section 13.11.6) is used to clean minor cuts and abrasions. Preparations containing camphor and sulfonamides should be **avoided**. Preparations such as magnesium sulfate paste are also listed but are now rarely used to treat carbuncles and boils as these are best treated with antibiotics (section 5.1.1.2).

#### Cetrimide Cream, BP

**Cream**, cetrimide 0.5% in a suitable water-miscible basis such as cetostearyl alcohol 5%, liquid paraffin 50% in freshly boiled and cooled purified water, net price 50 g = £1.11

#### Proflavine Cream, BPC

**Cream**, proflavine hemisulfate 0.1%, yellow beeswax 2.5%, chlorocresol 0.1%, liquid paraffin 67.3%, freshly boiled and cooled purified water 25%, wool fat 5%, net price 100 mL = £2.40

**Excipients** include beeswax, wool fat

**Note** Stains clothing

#### Preparations for boils

#### Magnesium Sulfate Paste, BP

**Paste**, dried magnesium sulfate 45 g, glycerol 55 g, phenol 500 mg, net price 25 g = 97p, 50 g = £1.93

**Note** Should be stirred before use

**Dose** apply under dressing

## Collodion

**Flexible collodion** may be used to seal minor cuts and wounds that have partially healed.

### Collodion, Flexible, BP

**Collodion**, castor oil 2.5%, colophony 2.5% in a collodion basis, prepared by dissolving pyroxylin (10%) in a mixture of 3 volumes of ether and 1 volume of alcohol (90%), net price 10 mL = 30p. Label: 15

**Contra-indications** allergy to colophony in elastic adhesive plasters and tape

## Skin tissue adhesive

Tissue adhesives are used for closure of minor skin wounds and for additional suture support. They should be applied by an appropriately trained healthcare professional. Skin tissue adhesives may cause skin sensitisation.

### Dermabond ProPen® (Ethicon)

**Topical Skin Adhesive**, sterile, octyl 2-cyanoacrylate, net price 0.5 mL = £18.92

### Epiglu® (Schuco)

**Tissue adhesive**, sterile, ethyl-2-cyanoacrylate 954.5 mg/g, polymethylmethacrylate, net price 4 × 3-g vials = £149.50 (with dispensing pipettes and palette)

### Histoacryl® (B. Braun)

**Tissue adhesive**, sterile, enbucrilate, net price 5 × 200-mg unit (blue) = £32.00, 10 × 200-mg unit (blue) = £67.20, 5 × 500-mg unit (clear or blue) = £34.65, 10 × 500-mg unit (blue) = £69.30

### LiquiBand® (MedLogic)

**Tissue adhesive**, sterile, enbucrilate, net price 0.5-g amp = £5.50

**Hydrogen peroxide**, an oxidising agent, can be used in solutions of up to 6% for skin disinfection, such as cleansing and deodorising wounds and ulcers; hydrogen peroxide is also available as a cream for superficial bacterial skin infections.

For irrigating ulcers or wounds, lukewarm sterile sodium chloride 0.9% solution is used, but tap water is often appropriate.

**Potassium permanganate** solution 1 in 10 000, a mild antiseptic with astringent properties, can be used for exudative eczematous areas; treatment should be stopped when the skin becomes dry. It can stain skin and nails especially with prolonged use.

## 13.11.1 Alcohols and saline

### ALCOHOL

**Indications** skin preparation before injection

**Cautions** flammable; avoid broken skin; patients have suffered severe burns when diathermy has been preceded by application of alcoholic skin disinfectants

### Industrial Methylated Spirit, BP

**Solution**, 19 volumes of ethanol and 1 volume approved wood naphtha, net price '66 OP' (containing 95% by volume alcohol) 100 mL = 50p; '74 OP' (containing 99% by volume alcohol) 100 mL = 39p. Label: 15

### Surgical Spirit, BP

**Spirit**, methyl salicylate 0.5 mL, diethyl phthalate 2%, castor oil 2.5%, in industrial methylated spirit, net price 100 mL = 20p. Label: 15

### SODIUM CHLORIDE

**Indications** see notes above; nebuliser diluent (section 3.1.5); sodium depletion (section 9.2.1.2); electrolyte imbalance (section 9.2.2.1); eye (section 11.8.1); oral hygiene (section 12.3.4)

### Sodium Chloride (Non-proprietary)

**Solution** (sterile), sodium chloride 0.9%, net price 25 × 20-mL unit = £4.95, 200-mL can = £2.65, 1 litre = 80p

### Flowfusor® (Fresenius Kabi)

**Solution** (sterile), sodium chloride 0.9%, net price 120-mL Bellows Pack = £1.53

### Irricless® (ConvaTec)

**Solution** in aerosol can (sterile), sodium chloride 0.9%, net price 240-mL can = £3.46

### Irripod® (C D Medical)

**Solution** (sterile), sodium chloride 0.9%, net price 25 × 20-mL sachet = £5.84

### Miniversol® (Aguettant)

**Solution** (sterile), sodium chloride 0.9%, net price 30 × 45-mL unit = £13.20; 30 × 100-mL unit = £19.50

### Normaso® (Mölnlycke)

**Solution** (sterile), sodium chloride 0.9%, net price 25 × 25-mL sachet = £6.36; 10 × 100-mL sachet = £7.73

## 13.11 Skin cleansers, antiseptics, and desloughing agents

- 13.11.1 Alcohols and saline
- 13.11.2 Chlorhexidine salts
- 13.11.3 Cationic surfactants and soaps
- 13.11.4 Iodine
- 13.11.5 Phenolics
- 13.11.6 Oxidisers and dyes
- 13.11.7 Desloughing agents

Soap or detergent is used with water to cleanse intact skin; emollient preparations such as aqueous cream (section 13.2.1.1) or emulsifying ointment (section 13.2.1) can be used in place of soap or detergent for cleansing dry skin.

An antiseptic is used for skin that is infected or that is susceptible to recurrent infection. Detergent preparations containing **chlorhexidine** or **povidone-iodine**, which should be thoroughly rinsed off, are used. Emollients may also contain antiseptics (section 13.2.1).

Antiseptics such as **chlorhexidine** or **povidone-iodine** are used on intact skin before surgical procedures; their antiseptic effect is enhanced by an alcoholic solvent. Antiseptic solutions containing **cetrimide** can be used if a detergent effect is also required.

**Stericlens<sup>®</sup>** (C D Medical)

**Solution** in aerosol can (sterile), sodium chloride 0.9%, net price 100-mL can = £2.06, 240-mL can = £3.13

**Steripod<sup>®</sup> Sodium Chloride** (Medlock)

**Solution** (sterile), sodium chloride 0.9%, net price 25 × 20-mL sachet = £7.84

## 13.11.2 Chlorhexidine salts

### CHLORHEXIDINE

**Indications** see under preparations; bladder irrigation and catheter patency solutions (see section 7.4.4)

**Cautions** avoid contact with eyes, brain, meninges and middle ear; not for use in body cavities; alcoholic solutions not suitable before diathermy

**Side-effects** occasional sensitivity

**Chlorhexidine 0.05%** (Baxter)

**2000 Solution** (sterile), pink, chlorhexidine acetate 0.05%, net price 1000 mL = 77p

For cleansing and disinfecting wounds and burns

**Cepton<sup>®</sup>** (LPC)

**Skin wash** (= solution), red, chlorhexidine gluconate 1%, net price 150 mL = £3.64

For use as skin wash in acne

**Lotion**, blue, chlorhexidine gluconate 0.1%, net price 150 mL = £2.48

For skin disinfection in acne

**Chloraprep<sup>®</sup>** (CareFusion)

**Cutaneous solution**, sterile, chlorhexidine gluconate 2% in isopropyl alcohol 70%, net price (all with single applicator) 0.67 mL (with *SEPP*<sup>®</sup> applicator) = 30p, 1.5 mL (with *FREPP*<sup>®</sup> applicator) = 55p, 1.5 mL = 55p, 3 mL = 85p, 10.5 mL = £2.92, 26 mL = £6.50; (all with single applicator, with tint) 3 mL = 89p, 10.5 mL = £3.07, 26 mL = £6.83

For skin disinfection before invasive procedures; **CHILD** under 2 months, not recommended

**Note** Flammable

**CX Antiseptic Dusting Powder<sup>®</sup>** (Ecolab)

**Dusting powder**, sterile, chlorhexidine acetate 1%, net price 15 g = £3.93

For skin disinfection

**Hibiscrub<sup>®</sup>** (Mölnlycke)

**Cleansing solution**, red, chlorhexidine gluconate 4%, perfumed, in a surfactant solution, net price 250 mL = £4.25, 500 mL = £5.25, 5 litres = £24.00

**Excipients** include fragrance

Use instead of soap for pre-operative hand and skin preparation and for general hand and skin disinfection

**Hibi<sup>®</sup> Liquid Hand Rub+** (Mölnlycke)

**Solution**, chlorhexidine gluconate 0.5%, in isopropyl alcohol 70%, net price 500 mL = £5.25

To be used undiluted for hand and skin disinfection

**Hibitane Obstetric<sup>®</sup>** (Derma UK)

**Cream**, chlorhexidine gluconate solution 5% (= 1% chlorhexidine gluconate), in a pourable water-miscible basis, net price 250 mL = £9.00

For use in obstetrics and gynaecology as an antiseptic and lubricant (for application to skin around vulva and perineum and to hands of midwife or doctor)

**Hydrex<sup>®</sup>** (Ecolab)

**Solution**, chlorhexidine gluconate solution 2.5% (= chlorhexidine gluconate 0.5%), in denatured ethanol 70%, net price 600 mL (clear) = £3.49; 600 mL (pink) = £3.49, 200-mL spray = £1.77, 500-mL spray = £3.01

For pre-operative skin disinfection

**Note** Flammable

**Surgical scrub**, chlorhexidine gluconate 4% in a surfactant solution, net price 250 mL = £3.39, 500 mL = £3.59

**Excipients** include fragrance

For pre-operative hand and skin preparation and for general hand disinfection

**Unisept<sup>®</sup>** (Medlock)

**Solution** (sterile), pink, chlorhexidine gluconate 0.05%, net price 25 × 25-mL sachet = £5.54; 10 × 100-mL sachet = £6.83

For cleansing and disinfecting wounds and burns and swabbing in obstetrics

**With cetrimide****Tisept<sup>®</sup>** (Medlock)

**Solution** (sterile), yellow, chlorhexidine gluconate 0.015%, cetrimide 0.15%, net price 25 × 25-mL sachet = £5.33; 10 × 100-mL sachet = £6.85

To be used undiluted for general skin disinfection and wound cleansing

**Travasept 100<sup>®</sup>** (Baxter)

**Solution** (sterile), yellow, chlorhexidine acetate 0.015%, cetrimide 0.15%, net price 500 mL = 72p, 1 litre = 77p

To be used undiluted in skin disinfection such as wound cleansing and obstetrics

## 13.11.3 Cationic surfactants and soaps

### CETRIMIDE

**Indications** skin disinfection

**Cautions** avoid contact with eyes; avoid use in body cavities

**Side-effects** skin irritation and occasionally sensitisation

**Preparations**

Ingredient of *Tisept<sup>®</sup>* and *Travasept<sup>®</sup> 100*, see above

## 13.11.4 Iodine

### POVIDONE-IODINE

**Indications** skin disinfection

**Cautions** broken skin (see below)

**Large open wounds** The application of povidone-iodine to large wounds or severe burns may produce systemic adverse effects such as metabolic acidosis, hypernatraemia and impairment of renal function.

**Contra-indications** corrected gestational age under 32 weeks; avoid regular use in patients with thyroid disorders or those receiving lithium therapy

**Renal impairment** avoid regular application to inflamed or broken mucosa

**Pregnancy** sufficient iodine may be absorbed to affect the fetal thyroid in the second and third trimester

**Breast-feeding** avoid

**Side-effects** rarely sensitivity; may interfere with thyroid function tests

**Betadine**<sup>®</sup> (Ayrton Saunders)

**Dry powder spray**, povidone-iodine 2.5% in a pressurised aerosol unit, net price 150-g unit = £2.63

For skin disinfection, particularly minor wounds and infections; **CHILD** under 2 years not recommended

**Note** Not for use in serous cavities

**Savlon**<sup>®</sup> **Dry** (Novartis Consumer Health)

**Powder spray**, povidone-iodine 1.14% in a pressurised aerosol unit, net price 50-mL unit = £2.51  
For minor wounds

**Videne**<sup>®</sup> (Ecolab)

**Alcoholic tincture**, povidone-iodine 10%, net price 500 mL = £5.43

To be applied undiluted in pre-operative skin disinfection

**Antiseptic solution**, povidone-iodine 10% in aqueous solution, net price 500 mL = £5.43

To be applied undiluted in pre-operative skin disinfection and general antiseptics

**Surgical scrub**, povidone-iodine 7.5% in aqueous solution, net price 500 mL = £5.43

To be used as a pre-operative scrub for hand and skin disinfection

## 13.11.5 Phenolics

Triclosan has been used for disinfection of the hands and wounds, and for disinfection of the skin before surgery.

## 13.11.6 Oxidisers and dyes

### HYDROGEN PEROXIDE

**Indications** see under preparations below

**Cautions** large or deep wounds; avoid on healthy skin and eyes; bleaches fabric; incompatible with products containing iodine or potassium permanganate

**Hydrogen Peroxide Solution, BP**

**Solution 6%** (20 vols), net price 200 mL = 54p

**Solution 3%** (10 vols), net price 200 mL = 53p

For skin disinfection, particularly cleansing and deodorising wounds and ulcers

**Note** The BP directs that when hydrogen peroxide is prescribed, hydrogen peroxide solution 6% (20 vols) should be dispensed.

**Important** Strong solutions of hydrogen peroxide which contain 27% (90 vols) and 30% (100 vols) are only for the preparation of weaker solutions

**Crystacide**<sup>®</sup> (Derma UK)

**Cream**, hydrogen peroxide 1%, net price 25 g = £8.07, 40 g = £11.62

**Excipients** include edetic acid (EDTA), propylene glycol

**Dose** superficial bacterial skin infection, apply 2–3 times daily for up to 3 weeks

### POTASSIUM PERMANGANATE

**Indications** cleansing and deodorising suppurating eczematous reactions and wounds

**Cautions** irritant to mucous membranes

**Dose**

• Wet dressings or baths, approx. 0.01% solution

**Note** Stains skin and clothing

**Potassium Permanganate Solution**

**Solution**, potassium permanganate 0.1% (1 in 1000) in water

**Dose** to be diluted 1 in 10 to provide a 0.01% (1 in 10000) solution

**Permitabs**<sup>®</sup> (Alliance)

**Solution tablets**, for preparation of topical solution, potassium permanganate 400 mg, net price 30-tab pack = £14.59

**Note** 1 tablet dissolved in 4 litres of water provides a 0.01% (1 in 10000) solution

## 13.11.7 Desloughing agents

Alginate, hydrogel and hydrocolloid dressings (Appendix 5) are effective at wound debridement. Sterile larvae (maggots) (available from BioMonde) are also used for managing sloughing wounds and are prescribable on the NHS.

Desloughing solutions and creams are of little clinical value. Substances applied to an open area are easily absorbed and perilesional skin is easily sensitised; gravitational dermatitis may be complicated by superimposed contact sensitivity to substances such as neomycin or lanolin.

For further information on wound management products see Appendix 5, p. 1061.

## 13.12 Antiperspirants

**Aluminium chloride** is a potent antiperspirant used in the treatment of hyperhidrosis. Aluminium salts are also incorporated in preparations used for minor fungal skin infections associated with hyperhidrosis.

In more severe cases specialists use **glycopyrronium bromide** as a 0.05% solution in the iontophoretic treatment of hyperhidrosis of plantar and palmar areas. **Botox**<sup>®</sup> contains **botulinum toxin type A complex** and is licensed for use intradermally for severe hyperhidrosis of the axillae unresponsive to topical antiperspirant or other antihidrotic treatment (section 4.9.3).

### ALUMINIUM SALTS

**Indications** see under Dose below

**Cautions** avoid contact with eyes or mucous membranes; avoid use on broken or irritated skin; do not shave axillae or use depilatories within 12 hours of application; avoid contact with clothing

**Side-effects** skin irritation

**Dose**

- Hyperhidrosis affecting axillae, hands or feet, apply liquid formulation at night to dry skin, wash off the following morning, initially daily then reduce frequency as condition improves—do not bathe immediately before use
- Hyperhidrosis, bromidrosis, intertrigo, and prevention of tinea pedis and related conditions, apply powder to dry skin

**Anhydrol**<sup>®</sup> **Forte** (Dermal)

**Solution** (= application), aluminium chloride hexahydrate 20% in an alcoholic basis, net price 60-mL bottle with roll-on applicator = £2.51. Label: 15

**Excipients** none as listed in section 13.1.3

**Driclor**<sup>®</sup> (Stiefel)

**Application**, aluminium chloride hexahydrate 20% in an alcoholic basis, net price 75-mL bottle with roll-on applicator = £3.01. Label: 15

**Excipients** none as listed in section 13.1.3

**Note** A 30-mL pack is on sale to the public

**ZeaSORB**<sup>®</sup> (Stiefel)

**Dusting powder**, aldioxa 0.22%, chloroxylenol 0.5%, net price 50 g = £2.61

**Excipients** include fragrance

**GLYCOPYRRONIUM BROMIDE**

**Indications** iontophoretic treatment of hyperhidrosis; drying secretions (see Prescribing in Palliative Care, p. 21); maintenance treatment of chronic obstructive pulmonary disease (section 3.1.2); other indications, see section 15.1.3

**Cautions** see notes (Antimuscarinics) in section 1.2 (but poorly absorbed and systemic effects unlikely)

**Contra-indications** see notes (Antimuscarinics) in section 1.2 (but poorly absorbed and systemic effects unlikely); also infections affecting the treatment site

**Side-effects** see notes (Antimuscarinics) in section 1.2 (but poorly absorbed and systemic effects unlikely); also tingling at administration site

**Dose**

- Consult product literature; only 1 site to be treated at a time, max. 2 sites treated in any 24 hours, treatment not to be repeated within 7 days

**Robinul**<sup>®</sup> (AMCo) (PoM)

**Powder**, glycopyrronium bromide, net price 3 g = £266.00

**13.13 Topical circulatory preparations**

These preparations are used to improve circulation in conditions such as bruising, superficial thrombophlebitis, chilblains and varicose veins but are of little value. Chilblains are best managed by avoidance of exposure to cold; neither systemic nor topical vasodilator therapy is established as being effective. Sclerotherapy of varicose veins is described in section 2.13.

Rubefaciants are described in section 10.3.2.

**Hirudoid**<sup>®</sup> (Genus) 

**Cream**, heparinoid 0.3% in a vanishing-cream basis, net price 50 g = £3.99

**Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens)

**Gel**, heparinoid 0.3%, net price 50 g = £3.99

**Excipients** include propylene glycol, fragrance

**Dose** apply up to 4 times daily in superficial soft-tissue injuries and superficial thrombophlebitis

# 14 Immunological products and vaccines

<b>14.1</b>	<b>Active immunity</b>	<b>828</b>
<b>14.2</b>	<b>Passive immunity</b>	<b>831</b>
<b>14.3</b>	<b>Storage and use</b>	<b>831</b>

<b>14.5.2</b>	<b>Disease-specific immunoglobulins</b>	<b>854</b>
<b>14.5.3</b>	<b>Anti-D (Rh<sub>0</sub>) immunoglobulin</b>	<b>856</b>
<b>14.6</b>	<b>International travel</b>	<b>857</b>

## 14.1 Active immunity

Active immunity can be acquired by natural disease or by vaccination. **Vaccines** stimulate production of antibodies and other components of the immune mechanism; they consist of either:

1. a *live attenuated* form of a virus (e.g. measles, mumps and rubella vaccine) or bacteria (e.g. BCG vaccine), or
2. *inactivated* preparations of the virus (e.g. influenza vaccine) or bacteria, or
3. *detoxified exotoxins* produced by a micro-organism (e.g. tetanus vaccine), or
4. *extracts* of a micro-organism, which may be derived from the organism (e.g. pneumococcal vaccine) or produced by recombinant DNA technology (e.g. hepatitis B vaccine).

**Live attenuated vaccines** usually produce a durable immunity, but not always as long-lasting as that resulting from natural infection.

**Inactivated vaccines** may require a primary series of injections of vaccine to produce an adequate antibody response, and in most cases booster (reinforcing) injections are required; the duration of immunity varies from months to many years. Some inactivated vaccines are adsorbed onto an adjuvant (such as aluminium hydroxide) to enhance the antibody response.

Advice in this chapter reflects that in the handbook *Immunisation against Infectious Disease* (2006), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). Chapters from the handbook are available at [www.immunisation.dh.gov.uk](http://www.immunisation.dh.gov.uk)

The advice in this chapter also incorporates changes announced by the Chief Medical Officer and Health Department Updates.

**Cautions** Most individuals can safely receive the majority of vaccines. Vaccination may be postponed if the individual is suffering from an acute illness; however, it is not necessary to postpone immunisation in patients with minor illnesses without fever or systemic

upset. See also Predisposition to Neurological Problems, below. For individuals with bleeding disorders, see Route of Administration, below. If alcohol or disinfectant is used for cleansing the skin it should be allowed to evaporate before vaccination to prevent possible inactivation of live vaccines.

When 2 or more vaccines are required (and are not available as a combined preparation), they should be given simultaneously at different sites, preferably in a different limb; if more than one injection is to be given in the same limb, they should be administered at least 2.5 cm apart (but see also BCG Vaccines, p. 832). When 2 live vaccines cannot be given at the same time, they should be separated by an interval of at least 4 weeks. For **interactions** see Appendix 1 (vaccines).

See also Cautions under individual vaccines.

**Contra-indications** Vaccines are contra-indicated in those who have a confirmed anaphylactic reaction to a preceding dose of a vaccine containing the same antigens or vaccine component (such as antibacterials in viral vaccines). The presence of the following excipients in vaccines and immunological products has been noted under the relevant entries:

Gelatin	Penicillins
Gentamicin	Polymyxin B
Kanamycin	Streptomycin
Neomycin	Thiomersal

**Hypersensitivity to egg** Individuals with evidence of previous anaphylactic reaction to egg should not be given tick-borne encephalitis vaccine, and yellow fever vaccine should only be considered under the guidance of a specialist. Individuals with a history of egg allergy can be immunised with either an egg free influenza vaccine, if available, or an influenza vaccine with an ovalbumin content less than 120 nanograms/mL (facilities should be available to treat anaphylaxis). If an influenza vaccine containing ovalbumin is being considered in those with a history of anaphylaxis to egg or egg allergy with uncontrolled asthma, these individuals should be referred to a specialist in hospital. See also Cautions under MMR vaccine.

See also Vaccines and HIV infection, below.

Live vaccines may be contra-indicated temporarily in individuals who are:

- immunosuppressed (see Impaired Immune Response, below);
- pregnant (see Pregnancy and Breast-feeding, below).

See also Contra-indications under individual vaccines.

**Impaired immune response** Immune response to vaccines may be reduced in immunosuppressed patients and there is also a risk of generalised infection with live vaccines. Severely immunosuppressed patients should not be given live vaccines (including those with severe primary immunodeficiency). Specialist advice should be sought for those being treated with high doses of corticosteroids (dose equivalents of prednisolone:

adults, at least 40 mg daily for more than 1 week; children, 2 mg/kg daily for at least 1 week or 1 mg/kg daily for 1 month), or other immunosuppressive drugs<sup>1</sup>, and those being treated for malignant conditions with chemotherapy or generalised radiotherapy<sup>1,2</sup>. However, with the exception of severe combined immunodeficiency, the benefit from rotavirus vaccination is likely to outweigh the risk in other types of immunosuppression; if there is any doubt, advice should be sought from a specialist. For special reference to *HIV infection*, see below.

The Royal College of Paediatrics and Child Health has produced a statement, *Immunisation of the Immunocompromised Child (2002)* (available at [www.rcpch.ac.uk](http://www.rcpch.ac.uk)).

**Pregnancy** Live vaccines should not be administered routinely to *pregnant women* because of the theoretical risk of fetal infection but where there is a significant risk of exposure to disease (e.g. to yellow fever), the need for vaccination usually outweighs any possible risk to the fetus. Termination of pregnancy following inadvertent immunisation is not recommended. There is no evidence of risk from vaccinating pregnant women with inactivated viral or bacterial vaccines or toxoids. For use of specific vaccines during pregnancy, see under individual vaccines.

**Breast-feeding** Although there is a theoretical risk of live vaccine being present in breast milk, vaccination is not contra-indicated for women who are breast-feeding when there is significant risk of exposure to disease. There is no evidence of risk from vaccinating women who are breast-feeding, with inactivated viral or bacterial vaccines or toxoids. For use of specific vaccines during breast-feeding, see under individual vaccines.

**Side-effects** Injection of a vaccine may be followed by local reactions such as pain, inflammation, redness, and lymphangitis. An induration or sterile abscess may develop at the injection site. Gastro-intestinal disturbances, fever, headache, irritability, loss of appetite, fatigue, myalgia, and malaise are among the most commonly reported side-effects. Other side-effects include influenza-like symptoms, dizziness, paraesthesia, asthenia, drowsiness, arthralgia, rash, and lymphadenopathy. Hypersensitivity reactions, such as bronchospasm, angioedema, urticaria, and anaphylaxis, are very rare but can be fatal (see section 3.4.3 for management of allergic emergencies).

**Oral vaccines** such as cholera, live poliomyelitis, rotavirus, and live typhoid can also cause gastro-intestinal disturbances such as nausea, vomiting, abdominal pain and cramps, and diarrhoea.

See also Predisposition to Neurological Problems, below.

Some vaccines (e.g. poliomyelitis) produce very few reactions, while others (e.g. measles, mumps and rubella) may cause a very mild form of the disease. Occasionally more serious adverse reactions can occur—these should always be reported to the CHM (see Adverse Reactions to Drugs, p. 12).

See also Preterm Birth, p. 830.

1. Live vaccines should be postponed until at least 3 months after stopping high-dose systemic corticosteroids and at least 6 months after stopping other immunosuppressive drugs or generalised radiotherapy (at least 12 months after discontinuing immunosuppressants following bone-marrow transplantation).
2. Use of normal immunoglobulin should be considered after exposure to measles (see p. 853) and varicella-zoster immunoglobulin considered after exposure to chickenpox or herpes zoster (see p. 855).

### Post-immunisation pyrexia in infants

The parent should be advised that if pyrexia develops after childhood immunisation, and the infant seems distressed, a dose of paracetamol can be given and, if necessary, a second dose can be given 4–6 hours later. Ibuprofen can be used if paracetamol is unsuitable, but if a second dose of ibuprofen is required, it is given 6 hours after the first dose. The parent should be warned to seek medical advice if the pyrexia persists.

For post-immunisation pyrexia in an infant aged 2–3 months, the dose of paracetamol is 60 mg; the dose of ibuprofen is 50 mg (on a doctor's advice). An oral syringe can be obtained from any pharmacy to give the small volume required.

### Predisposition to neurological problems

When there is a personal or family history of *febrile convulsions*, there is an increased risk of these occurring during fever from any cause including immunisation, but this is not a contra-indication to immunisation. In children who have had a seizure associated with fever without neurological deterioration, immunisation is *recommended*; advice on the *management of fever* (see Post-immunisation pyrexia in infants, above) should be given before immunisation. When a child has had a convulsion not associated with fever, and the neurological condition is not deteriorating, immunisation is *recommended*. Children with stable neurological disorders (e.g. spina bifida, congenital brain abnormality, and perinatal hypoxic-ischaemic encephalopathy) should be immunised according to the recommended schedule. When there is a *still evolving neurological problem*, including poorly controlled epilepsy, immunisation should be *deferred* and the child referred to a specialist. Immunisation is recommended if a cause for the neurological disorder is identified. If a cause is not identified, immunisation should be deferred until the condition is stable.

Further information on adverse effects associated with specific vaccines can be found under individual vaccines.

**Vaccines and HIV infection** HIV-positive individuals with or without symptoms can receive the following live vaccines:

MMR (but avoid if immunity significantly impaired), varicella-zoster vaccine against chickenpox (but avoid if immunity significantly impaired—consult product literature)<sup>2</sup>, rotavirus;

and the following inactivated vaccines:

anthrax, cholera (oral), diphtheria, haemophilus influenzae type b, hepatitis A, hepatitis B, human papillomavirus, influenza (injection), meningococcal, pertussis, pneumococcal, poliomyelitis, rabies, tetanus, tick-borne encephalitis, typhoid (injection).

HIV-positive individuals should **not** receive:

BCG, influenza nasal spray (unless stable HIV infection and receiving antiretroviral therapy), typhoid (oral), yellow fever<sup>3</sup>

**Note** The above advice differs from that for other immunocompromised patients; *Immunisation Guidelines for HIV-infected Adults* issued by British HIV Association (BHIVA) are available at [www.bhiva.org](http://www.bhiva.org) and, *Immunisation of HIV-infected Children* issued by Children's HIV Association (CHIVA) are available at [www.chiva.org.uk](http://www.chiva.org.uk)

3. If yellow fever risk is unavoidable, specialist advice should be sought.

## Immunisation schedule

Vaccines for the childhood immunisation schedule should be obtained from **local health organisations** or from **ImmForm** ([www.immform.dh.gov.uk](http://www.immform.dh.gov.uk))—not to be prescribed on FP10 (HS21 in Northern Ireland; GP10 in Scotland; WP10 in Wales).

### Preterm birth

Babies born preterm should receive all routine immunisations based on their actual date of birth. The risk of apnoea following vaccination is increased in preterm babies, particularly in those born at or before 28 weeks gestational age. If babies at risk of apnoea are in hospital at the time of their first immunisation, they should be monitored for 48 hours after immunisation. If a baby develops apnoea, bradycardia, or desaturation after the first immunisation, the second immunisation should also be given in hospital with similar monitoring. Seroconversion may be unreliable in babies born earlier than 28 weeks' gestation or in babies treated with corticosteroids for chronic lung disease; consideration should be given to testing for antibodies against *Haemophilus influenzae* type b, meningococcal C, and hepatitis B after primary immunisation.

When to immunise (for preterm infants—see note above)	Vaccine given and dose schedule (for details of dose, see under individual vaccines)
Neonates at risk only	<ul style="list-style-type: none"> <li>● <b>BCG Vaccine</b> See section 14.4, BCG Vaccines</li> <li>● <b>Hepatitis B Vaccine</b> See section 14.4, Hepatitis B Vaccine</li> </ul>
2 months	<ul style="list-style-type: none"> <li>● <b>Diphtheria, Tetanus, Pertussis (Acellular, Component), Poliomyelitis (Inactivated), and Haemophilus Type b Conjugate Vaccine (Adsorbed)</b> First dose</li> <li>● <b>Pneumococcal Polysaccharide Conjugate Vaccine (Adsorbed)</b> First dose</li> <li>● <b>Rotavirus vaccine</b> First dose</li> </ul>
3 months	<ul style="list-style-type: none"> <li>● <b>Diphtheria, Tetanus, Pertussis (Acellular, Component), Poliomyelitis (Inactivated), and Haemophilus Type b Conjugate Vaccine (Adsorbed)</b> Second dose</li> <li>● <b>Meningococcal Group C Conjugate Vaccine</b> First dose</li> <li>● <b>Rotavirus vaccine</b> Second dose</li> </ul>
4 months	<ul style="list-style-type: none"> <li>● <b>Diphtheria, Tetanus, Pertussis (Acellular, Component), Poliomyelitis (Inactivated), and Haemophilus Type b Conjugate Vaccine (Adsorbed)</b> Third dose</li> <li>● <b>Pneumococcal Polysaccharide Conjugate Vaccine (Adsorbed)</b> Second dose</li> </ul>
12–13 months	<ul style="list-style-type: none"> <li>● <b>Measles, Mumps and Rubella Vaccine, Live (MMR)</b> First dose</li> <li>● <b>Pneumococcal Polysaccharide Conjugate Vaccine (Adsorbed)</b> Single booster dose</li> <li>● <b>Haemophilus Type b Conjugate Vaccine and Meningococcal Group C Conjugate Vaccine</b> Single booster dose</li> </ul>
Between 3 years and 4 months, and 5 years	<ul style="list-style-type: none"> <li>● <b>Adsorbed Diphtheria [low dose], Tetanus, Pertussis (Acellular, Component) and Poliomyelitis (Inactivated) Vaccine</b> or <b>Adsorbed Diphtheria, Tetanus, Pertussis (Acellular, Component) and Poliomyelitis (Inactivated) Vaccine</b> Single booster dose</li> <li><b>Note:</b> Preferably allow interval of at least 3 years after completing primary course</li> <li>● <b>Measles, Mumps and Rubella Vaccine, Live (MMR)</b> Second dose</li> </ul>
11–14 years (females only) <sup>1</sup>	<ul style="list-style-type: none"> <li>● <b>Human Papillomavirus Vaccine</b> 2 doses; second dose 12 months after first dose<sup>2,3</sup></li> </ul>
13–15 years	<ul style="list-style-type: none"> <li>● <b>Meningococcal Group C Conjugate Vaccine</b> Single booster dose</li> </ul>
13–18 years	<ul style="list-style-type: none"> <li>● <b>Adsorbed Diphtheria [low dose], Tetanus, and Poliomyelitis (Inactivated) Vaccine</b> Single booster dose</li> <li><b>Note:</b> Can be given at the same time as the booster dose of meningococcal group C conjugate vaccine at 13–15 years of age</li> </ul>
During adult life, women of child-bearing age susceptible to rubella	<ul style="list-style-type: none"> <li>● <b>Measles, Mumps and Rubella Vaccine, Live (MMR)</b> Women of child-bearing age who have not received 2 doses of a rubella-containing vaccine or who do not have a positive antibody test for rubella should be offered rubella immunisation (using the MMR vaccine)—exclude pregnancy before immunisation, but see also section 14.4, Measles, Mumps and Rubella Vaccine</li> </ul>

1. First dose of HPV vaccine will be offered to females aged 12–13 years of age in England, Wales, and Northern Ireland, and 11–14 years of age in Scotland.

2. If a 3-dose course of HPV vaccine has been started under the 2013/2014 programme, where possible, the course should be completed.

3. The two human papillomavirus vaccines are not interchangeable and, ideally, one vaccine product should be used for the entire course. However, for those females who started the schedule with *Cervarix*® under the national immunisation programme, but did not complete the vaccination course, the course can be completed with *Gardasil*®.

## Immunisation schedule (continued)

When to immunise (for preterm infants—see note above)	Vaccine given and dose schedule (for details of dose, see under individual vaccines)
During adult life, those entering or being at university who are at risk of meningococcal group C disease	<ul style="list-style-type: none"> <li>● <b>Meningococcal Group C Conjugate Vaccine</b> Single dose <b>Note:</b> Should be offered to those of any age entering or being at university who have never been vaccinated against meningococcal group C disease, or those born after September 1995 who are entering university and only received meningococcal group C vaccine under the age of 10 years</li> </ul>
During adult life, if not previously immunised	<ul style="list-style-type: none"> <li>● <b>Adsorbed Diphtheria [low dose], Tetanus, and Poliomyelitis (Inactivated) Vaccine</b> 3 doses at intervals of 1 month Booster dose at least 1 year after primary course and again 5–10 years later</li> </ul>
70 years	<ul style="list-style-type: none"> <li>● <b>Shingles (Herpes Zoster) Vaccine, Live</b> Single dose</li> </ul>

**Vaccines and asplenia** The following vaccines are recommended for asplenic patients or those with splenic dysfunction:

haemophilus influenzae type b; influenza; meningococcal A, C, W135, and Y conjugate; pneumococcal.

For antibiotic prophylaxis in asplenia see p. 357.

**Route of administration** Vaccines should not be given intravenously. Most vaccines are given by the intramuscular route, although some are given by either the intradermal, deep subcutaneous, or oral route. The intramuscular route should not be used in patients with **bleeding disorders** such as haemophilia or thrombocytopenia, vaccines usually given by the intramuscular route should be given by deep subcutaneous injection instead.

**Note** The Department of Health has advised *against the use of jet guns* for vaccination owing to the risk of transmitting blood-borne infections, such as HIV.

### High-risk groups

For information on high-risk groups, see section 14.4 under individual vaccines

#### BCG Vaccines

#### Hepatitis A Vaccine

#### Hepatitis B Vaccine

#### Influenza Vaccine

#### Pneumococcal Vaccines

#### Tetanus Vaccines

## 14.2 Passive immunity

Immunity with immediate protection against certain infective organisms can be obtained by injecting preparations made from the plasma of immune individuals with adequate levels of antibody to the disease for which protection is sought (see under Immunoglobulins, section 14.5). The duration of this passive immunity varies according to the dose and the type of immunoglobulin. Passive immunity may last only a few weeks; when necessary, passive immunisation can be repeated.

Antibodies of human origin are usually termed *immunoglobulins*. The term *antisera* is applied to material prepared in animals. Because of serum sickness and other allergic-type reactions that may follow injections of antisera, this therapy has been replaced wherever possible by the use of immunoglobulins. Reactions are theoretically possible after injection of human immunoglobulins but reports of such reactions are very rare.

## 14.3 Storage and use

Care must be taken to store all vaccines and other immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many vaccines and immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Vaccines and immunoglobulins should be protected from light. Reconstituted vaccines and opened multi-dose vials must be used within the period recommended in the product literature. Unused vaccines should be disposed of by incineration at a registered disposal contractor.

Particular attention must be paid to instructions on the use of diluents. Vaccines which are liquid suspensions or are reconstituted before use should be adequately mixed to ensure uniformity of the material to be injected.

## 14.4 Vaccines and antisera

**Availability** Anthrax and yellow fever vaccines, botulism antitoxin, diphtheria antitoxin, and snake and spider venom antitoxins are available from local designated holding centres.

For antivenom, see Emergency Treatment of Poisoning, p. 43.

Enquiries for vaccines not available commercially can also be made to:

Vaccines and Countermeasures Response Department  
Public Health England  
Wellington House  
133–155 Waterloo Road  
London, SE1 8UG  
vaccinesupply@phe.gov.uk

In Scotland information about availability of vaccines can be obtained from a Specialist in Pharmaceutical Public Health.

In Wales enquiries for vaccines not available commercially should be directed to:

Welsh Medicines Information Centre  
University Hospital of Wales  
Cardiff, CF14 4XW  
Tel: (029) 2074 2979

In Northern Ireland:

Pharmacy and Medicines Management Centre  
Beech House  
Antrim Hospital Site  
Northern Health and Social Care Trust  
Bush Road  
Antrim, BT41 2RL  
rphps.admin@northerntrust.hscni.net

For further details of availability, see under individual vaccines.

## Anthrax vaccine

Anthrax vaccine is made from antigens from *B. anthracis*. Anthrax immunisation is indicated for individuals who handle infected animals, for those exposed to imported infected animal products, and for laboratory staff who work with *Bacillus anthracis*. A 4-dose regimen is used for primary immunisation; booster doses should be given annually to workers at continued risk of exposure to anthrax.

In the event of possible contact with *B. anthracis*, post-exposure immunisation may be indicated, in addition to antimicrobial prophylaxis (section 5.1.12). Advice on the use of anthrax vaccine for post-exposure prophylaxis must be obtained from Public Health England Colindale (tel. 020 8200 4400).

### ANTHRAX VACCINE

**Indications** pre-exposure immunisation against anthrax; post-exposure immunisation (see notes above)

**Cautions** see section 14.1

**Contra-indications** see section 14.1

**Pregnancy** see p. 829

**Breast-feeding** see p. 829

**Side-effects** see section 14.1

#### Dose

- By intramuscular injection in deltoid region, initial course 3 doses of 0.5 mL at intervals of 3 weeks followed by a fourth dose after an interval of 6 months; booster, 0.5 mL every 12 months

#### Anthrax Vaccine (PoM)

**Injection**, suspension of anthrax antigens (not less than 0.125 mL/0.5 mL dose), sterile filtrate, adsorbed on to aluminium potassium sulfate

**Excipients** include thiomersal

Available from Public Health England's Centre for Emergency Preparedness and Response (Porton Down)

## BCG vaccines

BCG (*Bacillus Calmette-Guérin*) is a live attenuated strain derived from *Mycobacterium bovis* which stimulates the development of hypersensitivity to *M. tuberculosis*. BCG vaccine should be given intradermally by operators skilled in the technique (see below).

The expected reaction to successful BCG vaccination is induration at the site of injection followed by a local lesion which starts as a papule 2 or more weeks after vaccination; the lesion may ulcerate then subside over several weeks or months, leaving a small, flat scar. A dry dressing may be used if the ulcer discharges, but air should not be excluded.

Apart from children under 6 years, any person being considered for BCG immunisation must first be given a

skin test for hypersensitivity to tuberculo-protein (see under Diagnostic Agents, below). A skin test is not necessary for a child under 6 years provided that the child has not stayed for longer than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000, the child has not had contact with a person with tuberculosis, and there is no family history of tuberculosis within the last 5 years.

BCG is recommended for the following groups if BCG immunisation has not previously been carried out:

- neonates with a family history of tuberculosis in the last 5 years;
- all neonates and infants (0–12 months) born in areas where the incidence<sup>1</sup> of tuberculosis is greater than 40 per 100 000;
- neonates, infants, and children under 16 years with a parent or grandparent born in a country with an incidence<sup>1</sup> of tuberculosis greater than 40 per 100 000;
- new immigrants aged under 16 years who were born in, or lived for more than 3 months in a country with an incidence<sup>1</sup> of tuberculosis greater than 40 per 100 000;
- new immigrants aged 16–35 years from Sub-Saharan Africa or a country with an incidence<sup>1</sup> of tuberculosis greater than 500 per 100 000
- contacts aged under 36 years of those with active respiratory tuberculosis (for healthcare or laboratory workers who have had contact with clinical materials or patients with tuberculosis, age limit does not apply);
- healthcare workers and laboratory staff (irrespective of age) who are likely to have contact with patients, clinical materials, or derived isolates; other individuals under 35 years<sup>2</sup> at occupational risk including veterinary and other staff who handle animal species susceptible to tuberculosis, and staff working directly with prisoners, in care homes for the elderly, or in hostels or facilities for the homeless or refugees;
- individuals under 16 years intending to live with local people for more than 3 months in a country with an incidence<sup>1</sup> of tuberculosis greater than 40 per 100 000 (section 14.6).

BCG vaccine can be given simultaneously with another live vaccine (see also section 14.1), but if they are not given at the same time an interval of 4 weeks should normally be allowed. When BCG is given to infants, there is no need to delay routine primary immunisations. No further vaccination should be given in the arm used for BCG vaccination for at least 3 months because of the risk of regional lymphadenitis.

Bladder instillations of BCG are licensed for the management of bladder carcinoma (section 8.2.4).

For advice on chemoprophylaxis against tuberculosis, see section 5.1.9; for the treatment of infection following vaccination, seek expert advice.

1. List of countries or primary care trusts where the incidence of tuberculosis is greater than 40 cases per 100 000 is available at [www.hpa.org.uk](http://www.hpa.org.uk)
2. There is inadequate evidence of protection by BCG vaccine in adults aged over 35 years; however, vaccination is recommended for healthcare workers irrespective of age because of the increased risk to them or their patients

## BACILLUS CALMETTE-GUÉRIN VACCINE

BCG Vaccine

**Indications** immunisation against tuberculosis

**Cautions** see section 14.1

**Contra-indications** see section 14.1; *also* neonate in household contact with known or suspected case of active tuberculosis; generalised septic skin conditions (for patients with eczema, lesion-free site should be used)

**Pregnancy** see p. 829

**Breast-feeding** see p. 829

**Side-effects** see section 14.1 and notes above; *also* at the injection site, subcutaneous abscess, prolonged ulceration; *rarely* disseminated complications such as osteitis or osteomyelitis

### Dose

- **By intradermal injection ADULT and CHILD** over 1 year, 0.1 mL; **NEONATE and CHILD** under 1 year, 0.05 mL  
**Intradermal injection technique** Skin is stretched between thumb and forefinger and needle (size 25G or 26G) inserted (bevel upwards) for about 3 mm into superficial layers of dermis (almost parallel with surface). Needle should be short with short bevel (can usually be seen through epidermis during insertion). Tense raised blanched bleb showing tips of hair follicles is sign of correct injection; 7 mm bleb  $\equiv$  0.1 mL injection, 3 mm bleb  $\equiv$  0.05 mL injection; if considerable resistance not felt, needle too deep and should be removed and reinserted before giving more vaccine.

To be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be **avoided**.

### Intradermal

#### Bacillus Calmette-Guérin Vaccine <sup>(PoM)</sup>

BCG Vaccine, Dried/Tub/BCG

**Injection (powder for suspension)**, freeze-dried preparation of live bacteria of a strain derived from the bacillus of Calmette and Guérin.

Available from health organisations or direct from ImmForm (SSI brand, multidose vial with diluent)

## Diagnostic agents

The *Mantoux test* is recommended for tuberculin skin testing, but no licensed preparation is currently available. Guidance for healthcare professionals is available at [www.dh.gov.uk/immunisation](http://www.dh.gov.uk/immunisation).

In the Mantoux test, the diagnostic dose is administered by intradermal injection of Tuberculin Purified Protein Derivative (PPD).

The *Heaf test* (involving the use of multiple-puncture apparatus) is no longer available.

**Note** Response to tuberculin may be suppressed by live viral vaccines, viral infection, sarcoidosis, corticosteroid therapy, or immunosuppression due to disease or treatment. Tuberculin testing should not be carried out within 4 weeks of receiving a live viral vaccine.

Two interferon gamma release assay (IGRA) tests are also available as an aid in the diagnosis of tuberculosis infection: *QuantIFERON<sup>®</sup> TB Gold* and *T-SPOT<sup>®</sup> TB*. Both tests measure T-cell mediated immune response to synthetic antigens. For further information on the use of interferon gamma release assay tests for tuberculosis, see [www.hpa.org.uk](http://www.hpa.org.uk).

#### Tuberculin Purified Protein Derivative <sup>(PoM)</sup> (Tuberculin PPD)

**Injection**, heat-treated products of growth and lysis of appropriate *Mycobacterium* spp. 20 units/mL (2 units/0.1-mL dose) (for routine use), 1.5-mL vial; 100 units/mL (10 units/0.1-mL dose), 1.5-mL vial

**Dose by intradermal injection**, for Mantoux test, 2 units (0.1 mL of 20 units/mL strength) for routine Mantoux test; if first test is negative and a further test is considered appropriate 10 units (0.1 mL of 100 units/mL strength) Available from ImmForm (SSI brand)

**Note** The strength of tuberculin PPD in this product may be different to the strengths of products used previously for the Mantoux test; care is required to select the correct strength

## Botulism antitoxin

A polyvalent botulism antitoxin is available for the post-exposure prophylaxis of botulism and for the treatment of persons thought to be suffering from botulism. It specifically neutralises the toxins produced by *Clostridium botulinum* types A, B, and E. It is not effective against infantile botulism as the toxin (type A) is seldom, if ever, found in the blood in this type of infection.

Hypersensitivity reactions are a problem. It is essential to read the contra-indications, warnings, and details of sensitivity tests on the package insert. Prior to treatment checks should be made regarding previous administration of any antitoxin and history of any allergic condition, e.g. asthma, hay fever, etc. All patients should be tested for sensitivity (diluting the antitoxin if history of allergy).

#### Botulism Antitoxin <sup>(PoM)</sup>

A preparation containing the specific antitoxic globulins that have the power of neutralising the toxins formed by types A, B, and E of *Clostridium botulinum*.

**Note** The BP title Botulinum Antitoxin is not used because the preparation currently in use may have a different specification.

**Dose** prophylaxis, consult product literature Available from local designated centres, for details see TOXBASE (requires registration) [www.toxbase.org](http://www.toxbase.org). For supplies outside working hours apply to other designated centres or to the Public Health England Colindale duty doctor (Tel (020) 8200 6868). For major incidents, obtain supplies from the local blood bank

## Cholera vaccine

**Cholera vaccine** (oral) contains inactivated Inaba (including El-Tor biotype) and Ogawa strains of *Vibrio cholerae*, serotype O1 together with recombinant B-subunit of the cholera toxin produced in Inaba strains of *V.cholerae*, serotype O1.

Oral cholera vaccine is licensed for travellers to endemic or epidemic areas on the basis of current recommendations (see also section 14.6). Immunisation should be completed at least 1 week before potential exposure. However, there is no requirement for cholera vaccination for international travel.

Immunisation with cholera vaccine does not provide complete protection and all travellers to a country where cholera exists should be warned that scrupulous attention to food, water, and personal hygiene is **essential**.

*Injectable cholera vaccine* provides unreliable protection and is no longer available in the UK.

## CHOLERA VACCINE

**Indications** see notes above

**Cautions** see section 14.1 and notes above

**Contra-indications** see section 14.1; also acute gastro-intestinal illness

**Pregnancy** see p. 829

**Breast-feeding** see p. 829

**Side-effects** see section 14.1; also *rarely* respiratory symptoms such as rhinitis and cough; *very rarely* sore throat, insomnia

### Dose

- **ADULT** and **CHILD** over 6 years 2 doses separated by an interval of 1–6 weeks; **CHILD** 2–6 years 3 doses each separated by an interval of 1–6 weeks

**Note** If more than 6 weeks have elapsed between doses, the primary course should be restarted

- A single booster dose can be given 2 years after primary course for adults and children over 6 years, and 6 months after primary course for children 2–6 years. If more than 2 years have elapsed since the last vaccination, the primary course should be repeated

**Counselling** Dissolve effervescent sodium bicarbonate granules in a glassful of water (approximately 150 mL). For adults and children over 6 years, add vaccine suspension to make one dose. For child 2–6 years, discard half (approximately 75 mL) of the solution, then add vaccine suspension to make one dose. Drink within 2 hours. Food, drink, and other oral medicines should be avoided for 1 hour before and after vaccination

**Dukoral**<sup>®</sup> (Crucell) (POM)

**Oral suspension**, for dilution with solution of effervescent sodium bicarbonate granules, heat- and formaldehyde-inactivated Inaba (including El-Tor biotype) and Ogawa strains of *Vibrio cholerae* bacteria and recombinant cholera toxin B-subunit produced in *V. cholerae*, net price 2-dose pack = £23.42. Counselling, administration

## Diphtheria vaccines

Diphtheria vaccines are prepared from the toxin of *Corynebacterium diphtheriae* and adsorption on aluminium hydroxide or aluminium phosphate improves antigenicity. The vaccine stimulates the production of the protective antitoxin. The quantity of diphtheria toxoid in a preparation determines whether the vaccine is defined as 'high dose' or 'low dose'. Vaccines containing the higher dose of diphtheria toxoid are used for primary immunisation of children under 10 years of age. Vaccines containing the lower dose of diphtheria toxoid are used for primary immunisation in adults and children over 10 years. Single-antigen diphtheria vaccine is not available and adsorbed diphtheria vaccine is given as a combination product containing other vaccines.

For primary immunisation of children aged between 2 months and 10 years vaccination is recommended usually in the form of 3 doses (separated by 1-month intervals) of diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed) (see Immunisation schedule, section 14.1). In unimmunised individuals aged over 10 years the primary course comprises of 3 doses of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine.

A booster dose should be given 3 years after the primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed). Children under 10 years should receive *either* adsorbed diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine or adsorbed diphtheria [low dose], tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine. Individuals aged over 10 years should receive adsorbed diphtheria [low dose], tetanus, and poliomyelitis (inactivated) vaccine.

A second booster dose, of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine, should be given 10 years after the previous booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed).

**Travel** Those intending to travel to areas with a risk of diphtheria infection should be fully immunised according to the UK schedule (see also section 14.6). If more than 10 years have lapsed since completion of the UK schedule, a dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine should be administered.

**Contacts** Staff in contact with diphtheria patients or with potentially pathogenic clinical specimens or working directly with *C. diphtheriae* or *C. ulcerans* should receive a booster dose if fully immunised (with 5 doses of diphtheria-containing vaccine given at appropriate intervals); further doses should be given at 10-year intervals if risk persists. Individuals at risk who are not fully immunised should complete the primary course; a booster dose should be given after 5 years and then at 10-year intervals. Adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine is used for this purpose; immunity should be checked by antibody testing at least 3 months after completion of immunisation.

Advice on the management of cases, carriers, contacts and outbreaks must be sought from health protection units. The immunisation history of infected individuals and their contacts should be determined; those who have been incompletely immunised should complete their immunisation and fully immunised individuals should receive a reinforcing dose. For advice on antibacterial treatment to prevent a secondary case of diphtheria in a non-immune individual, see Table 2, section 5.1.

## DIPHTHERIA-CONTAINING VACCINES

**Indications** see notes above

**Cautions** see section 14.1 and see also individual components of vaccines

**Contra-indications** see section 14.1 and see also individual components of vaccines

**Pregnancy** see p. 829

**Breast-feeding** see p. 829

**Side-effects** see section 14.1; also restlessness, sleep disturbances, and unusual crying in infants

### Dose

- See under preparations

### ▲ Diphtheria-containing vaccines for children under 10 years

**Important** For persons aged 10 years or over see Diphtheria-containing Vaccines for Children over 10 years and Adults, below, and see Diphtheria-containing Vaccines for Immunisation of Pregnant Women Against Pertussis, below

#### Diphtheria, Tetanus, Pertussis (Acellular, Component), Poliomyelitis (Inactivated) and Haemophilus Type b Conjugate Vaccine (Adsorbed) <sup>(PoM)</sup>

**Injection**, suspension of diphtheria toxoid, tetanus toxoid, acellular pertussis, inactivated poliomyelitis and *Haemophilus influenzae* type b (conjugated to tetanus protein), net price 0.5-mL pre-filled syringe = £32.00

**Excipients** may include neomycin, polymyxin B and streptomycin

**Brands include** *Pediacel*®, available as part of childhood immunisation schedule from health organisations or *ImmForm*

**Dose** by intramuscular injection, **CHILD** 2 months–10 years, primary immunisation, 3 doses each of 0.5 mL separated by intervals of 1 month; see also notes on booster doses, above

#### Adsorbed Diphtheria, Tetanus, Pertussis (Acellular, Component) and Poliomyelitis (Inactivated) Vaccine <sup>(PoM)</sup>

**Injection**, suspension of diphtheria toxoid, tetanus toxoid, acellular pertussis and inactivated poliomyelitis vaccine components adsorbed on a mineral carrier, net price 0.5-mL pre-filled syringe = £17.56

**Excipients** may include neomycin and polymyxin B

**Brands include** *Infanrix-IPV*®, available as part of childhood immunisation schedule from health organisations or *ImmForm*

**Dose** by intramuscular injection, **CHILD** 3–10 years, first booster dose 3 years after primary immunisation, 0.5 mL; see also notes on booster doses, above

#### Adsorbed Diphtheria [low dose], Tetanus, Pertussis (Acellular, Component) and Poliomyelitis (Inactivated) Vaccine <sup>(PoM)</sup>

**Injection**, suspension of diphtheria toxoid [low dose], tetanus toxoid, acellular pertussis and inactivated poliomyelitis vaccine components adsorbed on a mineral carrier, net price 0.5-mL pre-filled syringe = £20.00

**Excipients** may include neomycin, polymyxin B and streptomycin

**Brands include** *Repevax*®, available as part of childhood immunisation schedule from health organisations or *ImmForm*

**Dose** by intramuscular injection, **CHILD** 3–10 years, first booster dose 3 years after primary immunisation, 0.5 mL; see also notes on booster doses, above

### ▲ Diphtheria-containing vaccines for children over 10 years and adults

A **low dose** of diphtheria toxoid is sufficient to recall immunity in individuals previously immunised against diphtheria but whose immunity may have diminished with time; it is insufficient to cause serious reactions in an individual who is already immune. Preparations containing low dose diphtheria should be used for adults and children over 10 years, for both primary immunisation and booster doses. For immunisation of pregnant women against pertussis see Diphtheria-containing Vaccines for Immunisation of Pregnant Women Against Pertussis, below.

#### Adsorbed Diphtheria [low dose], Tetanus and Poliomyelitis (Inactivated) Vaccine <sup>(PoM)</sup>

**Injection**, suspension of diphtheria toxoid [low dose], tetanus toxoid and inactivated poliomyelitis vaccine components adsorbed on a mineral carrier, net price 0.5-mL pre-filled syringe = £6.50

**Excipients** may include neomycin, polymyxin B and streptomycin

**Brands include** *Revaxis*®, available as part of immunisation schedule from health organisations or *ImmForm*

**Dose** by intramuscular injection, **ADULT** and **CHILD** over 10 years, primary immunisation, 3 doses each of 0.5 mL separated by intervals of 1 month; second booster dose, 0.5 mL given 10 years after first booster dose (may also be used as first booster dose in those over 10 years who have received only 3 previous doses of a diphtheria-containing vaccine); see also notes on booster doses and contacts, above

### ▲ Diphtheria-containing vaccines for immunisation of pregnant women against pertussis

For immunisation of children over 10 years and adults against diphtheria see Diphtheria-containing Vaccines for Children over 10 years and Adults, above

#### Adsorbed Diphtheria [low dose], Tetanus, Pertussis (Acellular, Component) and Poliomyelitis (Inactivated) Vaccine <sup>(PoM)</sup>

**Injection**, suspension of diphtheria toxoid [low dose], tetanus toxoid, acellular pertussis and inactivated poliomyelitis vaccine components adsorbed on a mineral carrier, net price 0.5-mL pre-filled syringe = £20.00

**Excipients** may include neomycin, polymyxin B and streptomycin

**Brands include** *Repevax*®, available from *Immform*

**Contra-indications** section 14.1; see also individual components of vaccine; also contra-indicated in pregnant women with a history of encephalopathy of unknown origin within 7 days of previous immunisation with a pertussis-containing vaccine

**Dose** Vaccination of pregnant women against pertussis (see p. 845), by intramuscular injection, 0.5 mL as a single dose

### ▲ Diphtheria antitoxin

**Diphtheria antitoxin** is used for passive immunisation in suspected cases of diphtheria only (without waiting for bacteriological confirmation); tests for hypersensitivity should be first carried out. It is derived from horse serum, and reactions are common after administration; resuscitation facilities should be available immediately.

It is no longer used for prophylaxis because of the risk of hypersensitivity; unimmunised contacts should be promptly investigated and given antibacterial prophylaxis (section 5.1, table 2) and vaccine (see Contacts above).

#### Diphtheria Antitoxin <sup>(PoM)</sup>

Dip/Ser

**Dose** prophylaxis, not recommended therefore no dose stated (see notes above)

Treatment, consult product literature

### Haemophilus type b conjugate vaccine

**Haemophilus influenzae type b (Hib) vaccine** is made from capsular polysaccharide; it is conjugated with a protein such as tetanus toxoid to increase immunogenicity, especially in young children. *Haemophilus influenzae* type b vaccine immunisation is given in combination with diphtheria, tetanus, pertussis (acellular,

component) and poliomyelitis (inactivated) vaccine, as a component of the primary course of childhood immunisation (see Immunisation schedule, section 14.1) (see under Diphtheria-containing Vaccines). For infants under 1 year, the course consists of 3 doses of a vaccine containing *Haemophilus influenzae* type b component with an interval of 1 month between doses. A booster dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) should be given at 12–13 months of age.

Children 1–10 years who have not been immunised against *Haemophilus influenzae* type b need to receive only 1 dose of *Haemophilus influenzae* type b vaccine (combined with meningococcal group C conjugate vaccine). However, if a primary course of immunisation has not been completed, these children should be given 3 doses of diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed). The risk of infection falls sharply in older children and the vaccine is not normally required for children over 10 years.

*Haemophilus influenzae* type b vaccine may be given to those over 10 years who are considered to be at increased risk of invasive *H. influenzae* type b disease (such as those with sickle-cell disease or complement deficiency, or those receiving treatment for malignancy).

#### Invasive *Haemophilus influenzae* type b disease

After recovery from infection, unimmunised and partially immunised index cases under 10 years of age should complete their age-specific course of immunisation. Previously vaccinated cases under 10 years of age should be given an additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) if Hib antibody concentrations are low or if it is not possible to measure antibody concentrations. Index cases of any age with asplenia or splenic dysfunction should complete their immunisation according to the recommendations below; fully vaccinated cases with asplenia or splenic dysfunction should be given an additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) if they received their previous dose over 1 year ago.

For use of rifampicin in the prevention of secondary cases of *Haemophilus influenzae* type b disease, see Table 2, section 5.1.

#### Asplenia, splenic dysfunction or complement deficiency

Individuals diagnosed with asplenia, splenic dysfunction, or complement deficiency at:

- under 2 years of age should be vaccinated according to the Immunisation Schedule (section 14.1). The booster dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine), given at 12–13 months of age, should be followed at least 1 month later by one dose of meningococcal A, C, W135, and Y conjugate vaccine. An additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) should be given after the second birthday;
- over 2 years of age should receive one dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine), followed 1 month later by one dose of meningococcal A, C, W135, and Y conjugate vaccine.

## HAEMOPHILUS TYPE B CONJUGATE VACCINE

**Indications** see notes above

**Cautions** see section 14.1

**Contra-indications** see section 14.1

**Pregnancy** see p. 829

**Breast-feeding** see p. 829

**Side-effects** see section 14.1; also atopic dermatitis, hypotonia

#### Dose

- Primary immunisation, see under Diphtheria
- Booster dose, see notes above and under preparation below

#### Menitorix® (GSK) (PoM)

**Injection**, powder for reconstitution, capsular polysaccharide of *Haemophilus influenzae* type b and capsular polysaccharide of *Neisseria meningitidis* group C (both conjugated to tetanus protein), net price single-dose vial (with syringe containing 0.5 mL diluent) = £37.76

**Dose by intramuscular injection, CHILD** 1–10 years, 0.5 mL  
**ADULT** and **CHILD** over 1 year, with asplenia or splenic dysfunction (see notes above), 0.5 mL

Available as part of the childhood immunisation schedule from **ImmForm**

#### Combined vaccines

See also under Diphtheria-containing Vaccines

## Hepatitis A vaccine

**Hepatitis A vaccine** is prepared from formaldehyde-inactivated hepatitis A virus grown in human diploid cells.

Immunisation is recommended for:

- laboratory staff who work directly with the virus;
- staff and residents of homes for those with severe learning difficulties;
- workers at risk of exposure to untreated sewage;
- individuals who work with primates;
- patients with haemophilia or other conditions treated with plasma-derived clotting factors;
- patients with severe liver disease;
- travellers to high-risk areas (see p. 857);
- individuals who are at risk due to their sexual behaviour;
- parenteral drug abusers.

Immunisation should be considered for:

- patients with chronic liver disease including chronic hepatitis B or chronic hepatitis C;
- prevention of secondary cases in close contacts of confirmed cases of hepatitis A, within 14 days of exposure to the primary case (within 8 weeks of exposure to the primary case where there is more than 1 contact in the household).

A booster dose is usually given 6–12 months after the initial dose. A second booster dose can be given 20 years after the previous booster dose to those who continue to be at risk. Specialist advice should be sought on re-immunisation of immunocompromised individuals.

For rapid protection against hepatitis A after exposure or during an outbreak, in adults a single dose of a monovalent vaccine is recommended; for children under 16 years, a single dose of the combined vaccine *Ambirix*<sup>®</sup> can also be used.

Intramuscular **normal immunoglobulin** (section 14.5.1) is recommended for use in addition to Hepatitis A vaccine for close contacts (of confirmed cases of hepatitis A) who have chronic liver disease or HIV infection, or who are immunosuppressed or over 50 years of age.

Post-exposure prophylaxis is not required for healthy children under 1 year of age, so long as all those involved in nappy changing are vaccinated against hepatitis A. However, children 2–12 months of age can be given a dose of hepatitis A vaccine if it is not possible to vaccinate their carers, or if the child becomes a source of infection to others [unlicensed use]; in these cases, if the child goes on to require long-term protection against hepatitis A after the first birthday, the full course of 2 doses should be given.

## HEPATITIS A VACCINE

**Indications** immunisation against hepatitis A infection

**Cautions** see section 14.1

**Contra-indications** see section 14.1

**Pregnancy** see p. 829

**Breast-feeding** see p. 829

**Side-effects** see section 14.1; for combination vaccines, see also Typhoid vaccine, p. 850

### Dose

- See under preparations

### Single component

**Avaxim**<sup>®</sup> (Sanofi Pasteur) (PoM)

**Injection**, suspension of formaldehyde-inactivated hepatitis A virus (GBM grown in human diploid cells) 320 antigen units/mL adsorbed onto aluminium hydroxide, net price 0.5-mL prefilled syringe = £18.10

**Excipients** include neomycin

**Dose** by intramuscular injection (see note below), **ADULT** and **CHILD** over 16 years, 0.5 mL as a single dose; booster dose 0.5 mL 6–12 months after initial dose

**Note** Booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose with *Avaxim*<sup>®</sup>. The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders; not to be injected into the buttock (vaccine efficacy reduced)

**Epaxal**<sup>®</sup> (Cruce) (PoM)

**Injection**, suspension of formaldehyde-inactivated hepatitis A virus (RG-SB grown in human diploid cells) at least 48 units/mL, net price 0.5-mL prefilled syringe = £23.81

**Dose** by intramuscular injection (see note below), **ADULT** and **CHILD** over 1 year, 0.5 mL as a single dose; booster dose 0.5 mL 6–12 months after initial dose (1–6 months if splenectomised)

**Note** Booster dose may be delayed by up to 4 years in adults if not given after recommended interval following primary dose. The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders

**Important** *Epaxal*<sup>®</sup> contains influenza virus haemagglutinin grown in the allantoic cavity of chick embryos, therefore contra-indicated in those hypersensitive to eggs or chicken protein.

**Havrix Monodose**<sup>®</sup> (GSK) (PoM)

**Injection**, suspension of formaldehyde-inactivated hepatitis A virus (HM 175 grown in human diploid cells) 1440 ELISA units/mL adsorbed onto aluminium hydroxide, net price 1-mL prefilled syringe = £22.14, 0.5-mL (720 ELISA units) prefilled syringe (*Havrix Junior Monodose*<sup>®</sup>) = £16.77

**Excipients** include neomycin

**Dose** by intramuscular injection (see note below), **ADULT** and **CHILD** over 16 years, 1 mL as a single dose; booster dose, 1 mL 6–12 months after initial dose; **CHILD** 1–15 years 0.5 mL; booster dose, 0.5 mL 6–12 months after initial dose

**Note** Booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose with *Havrix Monodose*<sup>®</sup>. The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders

**Vaqta**<sup>®</sup> Paediatric (Sanofi Pasteur) (PoM)

**Injection**, suspension of formaldehyde-inactivated hepatitis A virus (grown in human diploid cells) 50 antigen units/mL adsorbed onto aluminium hydroxyphosphate sulfate, net price 0.5-mL prefilled syringe = £14.74

**Excipients** include neomycin

**Dose** by intramuscular injection (see note below) **CHILD** 1–17 years, 0.5 mL as a single dose; booster dose 0.5 mL 6–18 months after initial dose; under 1 year, not recommended

**Note** The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders (but immune response may be reduced)

**Vaqta**<sup>®</sup> Adult (Sanofi Pasteur) (PoM)

**Injection**, suspension of formaldehyde-inactivated hepatitis A virus (grown in human diploid cells) 50 antigen units/mL adsorbed onto aluminium hydroxyphosphate sulfate, net price 1-mL prefilled syringe = £18.10

**Excipients** include neomycin

**Dose** by intramuscular injection (see note below), **ADULT** over 18 years, 1 mL as a single dose; booster dose 1 mL 6–18 months after initial dose

**Note** The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders (but immune response may be delayed)

### With hepatitis B vaccine

**Ambirix**<sup>®</sup> (GSK) (PoM)

**Injection**, suspension of inactivated hepatitis A virus (grown in human diploid cells) 720 ELISA units/mL adsorbed onto aluminium hydroxide, and recombinant (DNA) hepatitis B surface antigen (grown in yeast cells) 20 micrograms/mL adsorbed onto aluminium phosphate, net price 1-mL prefilled syringe = £31.18

**Excipients** include neomycin

**Dose** **CHILD** 1–15 years, by intramuscular injection (see note below); primary course, 2 doses of 1 mL, the second 6–12 months after initial dose

**Note** Primary course should be completed with *Ambirix*<sup>®</sup> (single component vaccines given at appropriate intervals may be used for booster dose); the deltoid region is the preferred site of injection in older children; anterolateral thigh is the preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced); subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

**Important** *Ambirix*<sup>®</sup> is not recommended for post-exposure prophylaxis following percutaneous (needle-stick), ocular, or mucous membrane exposure to hepatitis B virus

**Twinrix<sup>®</sup>** (GSK) (Pom)

**Injection**, inactivated hepatitis A virus (grown in human diploid cells) 720 ELISA units/mL adsorbed onto aluminium hydroxide and recombinant (DNA) hepatitis B surface antigen (grown in yeast cells) 20 micrograms/mL adsorbed onto aluminium phosphate, net price 1-mL prefilled syringe (*Twinrix<sup>®</sup> Adult*) = £27.76, 1-mL vial (*Twinrix<sup>®</sup> Adult*) = £26.44, 0.5-mL prefilled syringe (*Twinrix<sup>®</sup> Paediatric*) = £20.79

**Excipients** include neomycin

**Dose by intramuscular injection** (see note below); **ADULT** and **CHILD** over 16 years, primary course of 3 doses of 1 mL (*Twinrix<sup>®</sup> Adult*), the second 1 month and the third 6 months after the first dose; **CHILD** 1–15 years, 3 doses of 0.5 mL (*Twinrix<sup>®</sup> Paediatric*)

Accelerated schedule (e.g. for travellers departing within 1 month); **ADULT**, second dose 7 days after first dose, third dose after further 14 days and a fourth dose 12 months after the first dose

**Note** Primary course should be completed with *Twinrix<sup>®</sup>* (single component vaccines given at appropriate intervals may be used for booster dose); the deltoid region is the preferred site of injection in adults and older children; anterolateral thigh is preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced); subcutaneous route used for patients with bleeding disorders (but immune response may be reduced).

**Important** *Twinrix<sup>®</sup>* not recommended for post-exposure prophylaxis following percutaneous (needle-stick), ocular or mucous membrane exposure to hepatitis B virus.

**With typhoid vaccine****Hepatyrix<sup>®</sup>** (GSK) (Pom)

**Injection**, suspension of inactivated hepatitis A virus (grown in human diploid cells) 1440 ELISA units/mL adsorbed onto aluminium hydroxide, combined with typhoid vaccine containing 25 micrograms/mL virulence polysaccharide antigen of *Salmonella typhi*, net price 1-mL prefilled syringe = £32.08

**Excipients** include neomycin

**Note** May be difficult to obtain

**Dose by intramuscular injection** (see note below); **ADULT** and **CHILD** over 15 years, 1 mL as a single dose; booster doses, see under single component hepatitis A vaccine (above) and under polysaccharide typhoid vaccine, p. 850

**Note** The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders; not to be injected into the buttock (vaccine efficacy reduced)

**VIATIM<sup>®</sup>** (Sanofi Pasteur) (Pom)

**Injection**, suspension of inactivated hepatitis A virus (grown in human diploid cells) 160 antigen units/mL adsorbed onto aluminium hydroxide, combined with typhoid vaccine containing 25 micrograms/mL virulence polysaccharide antigen of *Salmonella typhi*, net price 1-mL prefilled syringe = £29.80

**Excipients** include neomycin

**Dose by intramuscular injection** (see note below); **ADULT** and **CHILD** over 16 years, 1 mL as a single dose; booster doses, see under single component hepatitis A vaccine (above) and under polysaccharide typhoid vaccine, p. 850

**Note** The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders; not to be injected into the buttock (vaccine efficacy reduced)

In the UK, groups at high-risk of hepatitis B include:

- parenteral drug misusers, their sexual partners, and household contacts; other drug misusers who are likely to 'progress' to injecting;
- individuals who change sexual partners frequently;
- close family contacts of a case or individual with chronic hepatitis B infection;
- babies whose mothers have had acute hepatitis B during pregnancy or are positive for hepatitis B surface antigen (regardless of e-antigen markers); hepatitis B vaccination is started immediately on delivery and *hepatitis B immunoglobulin* (see p. 854) given at the same time (but preferably at a different site). Babies whose mothers are positive for hepatitis B surface antigen and for e-antigen antibody should receive the vaccine only (but babies weighing 1.5 kg or less should also receive the immunoglobulin regardless of the mother's e-antigen antibody status);
- individuals with haemophilia, those receiving regular blood transfusions or blood products, and carers responsible for the administration of such products;
- patients with chronic renal failure including those on haemodialysis. Haemodialysis patients should be monitored for antibodies annually and re-immunised if necessary. Home carers (of dialysis patients) should be vaccinated;
- individuals with chronic liver disease;
- healthcare personnel (including trainees) who have direct contact with blood or blood-stained body fluids or with patients' tissues;
- laboratory staff who handle material that may contain the virus;
- other occupational risk groups such as morticians and embalmers;
- staff and patients of day-care or residential accommodation for those with severe learning difficulties;
- staff and inmates of custodial institutions;
- those travelling to areas of high or intermediate prevalence who are at increased risk or who plan to remain there for lengthy periods (see p. 857);
- families adopting children from countries with a high or intermediate prevalence of hepatitis B;
- foster carers and their families.

Different immunisation schedules for hepatitis B vaccine are recommended for specific circumstances (see under individual preparations). Generally, three or four doses are required for primary immunisation; an 'accelerated schedule' is recommended for pre-exposure prophylaxis in high-risk groups where rapid protection is required, and for post-exposure prophylaxis (see below).

Immunisation may take up to 6 months to confer adequate protection; the duration of immunity is not known precisely, but a single booster 5 years after the primary course may be sufficient to maintain immunity for those who continue to be at risk.

Immunisation does not eliminate the need for common-sense precautions for avoiding the risk of infection from known carriers by the routes of infection which have been clearly established, consult *Guidance for Clinical*

**Hepatitis B vaccine**

**Hepatitis B vaccine** contains inactivated hepatitis B virus surface antigen (HBsAg) adsorbed onto aluminium hydroxide adjuvant. It is made biosynthetically using recombinant DNA technology. The vaccine is used in individuals at high risk of contracting hepatitis B.

*Health Care Workers: Protection against Infection with Blood-borne Viruses* (available at [www.dh.gov.uk](http://www.dh.gov.uk)). Accidental inoculation of hepatitis B virus-infected blood into a wound, incision, needle-prick, or abrasion may lead to infection, whereas it is unlikely that indirect exposure to a carrier will do so.

Following significant exposure to hepatitis B, an accelerated schedule, with the second dose given 1 month, and the third dose 2 months after the first dose, is recommended. For those at continued risk, a fourth dose should be given 12 months after the first dose. More detailed guidance is given in the handbook *Immunisation against Infectious Disease* see p. 828.

Specific **hepatitis B immunoglobulin** ('HBIG') is available for use with the vaccine in those accidentally inoculated and in neonates at special risk of infection (section 14.5.2).

A combined hepatitis A and hepatitis B vaccine is also available.

## HEPATITIS B VACCINE

**Indications** immunisation against hepatitis B infection

**Cautions** see section 14.1

**Contra-indications** see section 14.1

**Pregnancy** see p. 829

**Breast-feeding** see p. 829

**Side-effects** see section 14.1

### Dose

- See under preparations

### Single component

**Engerix B**<sup>®</sup> (GSK) (PoM)

**Injection**, suspension of hepatitis B surface antigen (prepared from yeast cells by recombinant DNA technique) 20 micrograms/mL adsorbed onto aluminium hydroxide, net price 0.5-mL (paediatric) pre-filled syringe = £9.67, 1-mL vial = £12.34, 1-mL pre-filled syringe = £12.99

**Dose** by intramuscular injection (see note below), **ADULT** and **CHILD** over 16 years, 3 doses of 20 micrograms, the second 1 month and the third 6 months after the first dose; **NEONATE** (except if born to hepatitis B surface antigen positive mother, see below) and **CHILD** 1 month–16 years, 3 doses of 10 micrograms

Accelerated schedule (all ages), second dose 1 month after first dose, third dose 2 months after first dose and fourth dose 12 months after first dose; *exceptionally* (e.g. for travellers departing within 1 month), **ADULT** over 18 years, second dose 7 days after first dose, third dose 21 days after first dose, and fourth dose 12 months after first dose

Alternative schedule for **CHILD** 11–15 years, 2 doses of 20 micrograms, the second dose 6 months after the first dose (this schedule not suitable if high risk of infection between doses or if compliance with second dose uncertain)

**NEONATE** born to hepatitis B surface antigen-positive mother (see also notes above), 4 doses of 10 micrograms, first dose at birth with hepatitis B immunoglobulin injection (separate site) the second 1 month, the third 2 months and the fourth 12 months after the first dose

Renal insufficiency (including haemodialysis patients), by intramuscular injection (see note below), **ADULT** and **CHILD** over 16 years, 4 doses of 40 micrograms, the second 1 month, the third 2 months and the fourth 6 months after the first dose; immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration; **NEONATE** (except if born to hepatitis B surface antigen positive mother, see above) and **CHILD** 1 month–16 years 3 doses of 10 micrograms, second dose 1 month and third dose 6 months after first dose or accelerated schedule, 4 doses of 10 micrograms, second dose 1 month, third dose 2 months and fourth dose 12

months after first dose; immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration

**Note** Deltoid muscle is preferred site of injection in adults and older children; anterolateral thigh is preferred site in neonates, infants and young children; not to be injected into the buttock (vaccine efficacy reduced)

**Fendrix**<sup>®</sup> (GSK) (PoM)

**Injection**, suspension of hepatitis B surface antigen (prepared from yeast cells by recombinant DNA technique) 40 micrograms/mL adsorbed onto aluminium phosphate, net price 0.5-mL pre-filled syringe = £38.10

**Excipients** include traces of thiomersal  
**Dose** **ADULT** and **CHILD** over 15 years with renal insufficiency (including pre-haemodialysis and haemodialysis patients), by intramuscular injection (see note below) 4 doses of 20 micrograms, the second 1 month, the third 2 months and the fourth 6 months after the first dose; immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration

**Note** Deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

**HBVaxPRO**<sup>®</sup> (Sanofi Pasteur) (PoM)

**Injection**, suspension of hepatitis B surface antigen (prepared from yeast cells by recombinant DNA technique) 10 micrograms/mL adsorbed onto aluminium hydroxyphosphate sulfate, net price 0.5-mL (5-microgram) pre-filled syringe = £8.95, 1-mL (10-microgram) pre-filled syringe = £12.20; 40 micrograms/mL, 1-mL (40-microgram) vial = £27.60

**Dose** by intramuscular injection (see note below), **ADULT** and **CHILD** over 16 years, 3 doses of 10 micrograms, the second 1 month and the third 6 months after the first dose; **CHILD** under 16 years, 3 doses of 5 micrograms  
Accelerated schedule (all ages), second dose 1 month after first dose, third dose 2 months after first dose with fourth dose at 12 months

Booster doses may be required in immunocompromised patients with low antibody concentration

**NEONATE** born to hepatitis B surface antigen-positive mother (see also notes above), 4 doses of 5 micrograms, first dose at birth with hepatitis B immunoglobulin injection (separate site), the second 1 month, the third 2 months and the fourth 12 months after the first dose

Chronic haemodialysis patients, by intramuscular injection (see note below) 3 doses of 40 micrograms, the second 1 month and the third 6 months after the first dose; booster doses may be required in those with low antibody concentration

**Note** Deltoid muscle is preferred site of injection in adults and older children; anterolateral thigh is preferred site in neonates and infants; not to be injected into the buttock (vaccine efficacy reduced)

### With hepatitis A vaccine

See Hepatitis A Vaccine

## Human papillomavirus vaccines

**Human papillomavirus vaccine** is available as a bivalent vaccine (*Cervarix*<sup>®</sup>) or a quadrivalent vaccine (*Gardasil*<sup>®</sup>). *Cervarix*<sup>®</sup> is licensed for use in females for the prevention of cervical cancer and other pre-cancerous lesions caused by human papillomavirus types 16 and 18. *Gardasil*<sup>®</sup> is licensed for use in females for the prevention of cervical cancer, genital warts and pre-cancerous lesions caused by human papillomavirus types 6, 11, 16, and 18. The vaccines may also provide limited protection against disease caused by other types of human papillomavirus. The two vaccines are not interchangeable and one vaccine product should be used for an entire course.

Human papillomavirus vaccine will be most effective if given before sexual activity starts. From September 2014, a 2-dose schedule is recommended, as long as the first dose is received before the age of 15 years. The first dose is given to females aged 11 to 14 years, and the second dose is given 6–24 months after the first dose (for the purposes of planning the national immunisation programme, it is appropriate to give the second dose 12 months after the first—see Immunisation schedule, section 14.1). If the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more. Females receiving their first dose aged 15 years or older require a 3-dose schedule (see *Cervarix*<sup>®</sup> and *Gardasil*<sup>®</sup>), with the second and third doses given 1 and 4–6 months after the first dose; all 3 doses should be given within a 12-month period. If the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses. If a 3-dose course of vaccination has been started before September 2014, then where possible this should be completed; if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses. Under the national programme in England, females remain eligible to receive the vaccine up to the age of 18 years if they did not receive the vaccine when scheduled. Where appropriate, immunisation with human papillomavirus vaccine should be offered to females coming into the UK as they may not have been offered protection in their country of origin. The duration of protection has not been established, but current studies suggest that protection is maintained for at least 6 years after completion of the primary course.

As the vaccines do not protect against all strains of human papillomavirus, routine cervical screening should continue.

## HUMAN PAPILLOMAVIRUS VACCINES

**Indications** see notes above and under preparations

**Cautions** see section 14.1

**Contra-indications** see section 14.1

**Pregnancy** not known to be harmful, but vaccination should be postponed until completion of pregnancy

**Breast-feeding** see p. 829

**Side-effects** see section 14.1

### Dose

• See notes above and under preparations

**Note** To avoid confusion, prescribers should specify the brand to be dispensed

**Cervarix**<sup>®</sup> (GSK) (POM)

**Injection**, suspension of virus-like particles of human papillomavirus type 16 (40 micrograms/mL), type 18 (40 micrograms/mL) capsid protein (prepared by recombinant DNA technique using a Baculovirus expression system) in monophosphoryl lipid A adjuvant adsorbed onto aluminium hydroxide, net price 0.5-mL pre-filled syringe = £80.50

**Dose** prevention of premalignant genital lesions and cervical cancer, by **intramuscular injection** into deltoid region, **ADULT** and **CHILD** over 15 years, 3 doses of 0.5 mL, the second 1–2.5 months, and the third 5–12 months after the first dose; **CHILD** 9–14 years, 2 doses of 0.5 mL, the second 5–7 months after the first dose (if second dose administered earlier than 5 months after the first, a third dose should be administered)

**Gardasil**<sup>®</sup> (Sanofi Pasteur) (POM)

**Injection**, suspension of virus-like particles of human papillomavirus type 6 (40 micrograms/mL), type 11 (80 micrograms/mL), type 16 (80 micrograms/mL), type 18 (40 micrograms/mL) capsid protein (prepared from yeast cells by recombinant DNA technique) adsorbed onto aluminium hydroxyphosphate sulfate, net price 0.5-mL pre-filled syringe = £86.50

**Dose** prevention of premalignant genital lesions, cervical cancer and genital warts, by **intramuscular injection** preferably into deltoid region or higher anterolateral thigh, **ADULT** and **CHILD** over 9 years, 3 doses of 0.5 mL, the second at least 1 month after the first dose, and the third at least 3 months after the second dose, schedule should be completed within 12 months after the first dose; alternative schedule for **CHILD** 9–13 years, 2 doses of 0.5 mL, the second 6 months after the first dose (if administered earlier than 6 months, a third dose should be administered)

## Influenza vaccines

While most viruses are antigenically stable, the influenza viruses A and B (especially A) are constantly altering their antigenic structure as indicated by changes in the haemagglutinins (H) and neuraminidases (N) on the surface of the viruses. It is essential that influenza vaccines in use contain the H and N components of the prevalent strain or strains as recommended each year by the World Health Organization.

Seasonal influenza vaccines will not control epidemics—immunisation is recommended for *persons at high risk*, and to reduce transmission of infection. Annual immunisation is strongly recommended for individuals aged over 6 months with the following conditions:

- chronic respiratory disease (includes asthma treated with continuous or repeated use of inhaled or systemic corticosteroids or asthma with previous exacerbations requiring hospital admission);
- chronic heart disease;
- chronic liver disease;
- chronic renal disease;
- chronic neurological disease;
- diabetes mellitus;
- immunosuppression because of disease (including asplenia or splenic dysfunction) or treatment (including prolonged systemic corticosteroid treatment [for over 1 month at dose equivalents of prednisolone: *adult and child over 20 kg*, 20 mg or more daily; *child under 20 kg*, 1 mg/kg or more daily] and chemotherapy);
- HIV infection (regardless of immune status).

Seasonal influenza vaccine is also recommended for all pregnant women, for all persons aged over 65 years, for residents of nursing or residential homes for the elderly and other long-stay facilities, and for carers of persons whose welfare may be at risk if the carer falls ill. Influenza immunisation should also be considered for household contacts of immunocompromised individuals.

As part of winter planning, NHS employers should offer vaccination to healthcare workers who are directly involved in patient care. Employers of social care workers should consider similar action.

Unless contra-indicated, the live influenza vaccine, *Fluenz Tetra*<sup>®</sup>, is preferred in children aged 2–18 years because it provides a higher level of protection than inactivated influenza vaccine. From 1 September 2014, seasonal influenza vaccine will be offered to all children aged 2–4 years (i.e. those born between 2 September 2009 and 1 September 2012).

Information on pandemic influenza, avian influenza and swine influenza may be found at [www.dh.gov.uk/pandemicflu](http://www.dh.gov.uk/pandemicflu) and at [www.hpa.org.uk](http://www.hpa.org.uk).

## INFLUENZA VACCINES

**Indications** annual immunisation against seasonal influenza

**Cautions** see section 14.1; increased risk of fever in child under 5 years with *Viroflu*<sup>®</sup> and *Inflexa*<sup>®</sup> V, and in child 5–9 years with *Enzira*<sup>®</sup> or preparations marketed by Pfizer or CSL Biotherapies in child under 5 years—increased risk of febrile convulsions

**Contra-indications** see section 14.1 and also *Fluenz Tetra*<sup>®</sup> below; avoid *Enzira*<sup>®</sup> or preparations marketed by Pfizer, or CSL Biotherapies in child under 5 years—increased risk of febrile convulsions

**Pregnancy** see section 14.1; inactivated vaccines not known to be harmful; avoid *Fluenz Tetra*<sup>®</sup>

**Breast-feeding** see section 14.1; inactivated vaccines not known to be harmful; avoid *Fluenz Tetra*<sup>®</sup>

**Side-effects** see section 14.1; also reported febrile convulsions and transient thrombocytopenia; with *intranasal spray*, rhinorrhoea and less commonly epistaxis

### Dose

- By **intramuscular injection**, **ADULT** and **CHILD** over 9 years, 0.5 mL as a single dose; **CHILD** 6 months–9 years, 0.5 mL; for children 6 months to 9 years who have not received seasonal influenza vaccine previously, repeat after at least 4 weeks
- By **intradermal injection**, see under *Intanza*<sup>®</sup> below
- **Intranasally**, see under *Fluenz Tetra*<sup>®</sup> below

### Trivalent seasonal influenza vaccines for intramuscular use

#### Inactivated Influenza Vaccine (Split Virion) (PoM)

Flu

**Injection**, suspension of formaldehyde-inactivated influenza virus (split virion grown in fertilised hens' eggs), net price 0.25-mL pre-filled syringe = £6.29; 0.5-mL pre-filled syringe = £6.59

**Excipients** may include neomycin and polymyxin  
Available from Sanofi Pasteur

**Cautions** increased risk of fever in child 5–9 years with preparations marketed by Pfizer or CSL Biotherapies—use alternative influenza vaccine if available

**Contra-indications** avoid preparations marketed by Pfizer or CSL Biotherapies in child under 5 years—increased risk of febrile convulsions

#### Inactivated Influenza Vaccine (Surface Antigen) (PoM)

Flu or Flu(adj)

**Injection**, suspension of propiolactone-inactivated influenza virus (surface antigen, grown in fertilised hens' eggs), net price 0.5-mL pre-filled syringe = £4.15

**Excipients** may include neomycin and polymyxin B, and traces of thiomersal  
Available from Novartis Vaccines

**Note** Not licensed for children under 4 years

#### Agrippal<sup>®</sup> (Novartis Vaccines) (PoM)

**Injection**, suspension of formaldehyde-inactivated influenza virus (surface antigen, grown in fertilised hens' eggs), net price 0.5-mL pre-filled syringe = £5.85

**Excipients** include kanamycin and neomycin

#### Enzira<sup>®</sup> (Pfizer) (PoM)

**Injection**, suspension of inactivated influenza virus (split virion, grown in fertilised hens' eggs), net price 0.5-mL pre-filled syringe = £5.25

**Excipients** include neomycin and polymyxin B

**Cautions** child 5–9 years (increased risk of fever)—use alternative influenza vaccine if available

**Contra-indications** child under 5 years—increased risk of febrile convulsions

#### Fluarix<sup>®</sup> (GSK) (PoM)

**Injection**, suspension of formaldehyde-inactivated influenza virus (split virion, grown in fertilised hens' eggs), net price 0.5-mL pre-filled syringe = £5.39

**Excipients** include gentamicin

**Note** Ovalbumin content less than 100 nanograms/mL

#### Fluvirin<sup>®</sup> (Novartis Vaccines) (PoM)

**Injection**, suspension of formaldehyde-inactivated influenza virus (surface antigen, grown in fertilised hens' eggs), net price 0.5-mL pre-filled syringe = £5.55

**Excipients** include neomycin, polymyxin B, and traces of thiomersal

**Note** Not licensed for use in children under 4 years

#### Imuvac<sup>®</sup> (Abbott Healthcare) (PoM)

**Injection**, suspension of formaldehyde-inactivated influenza virus (surface antigen, grown in fertilised hens' eggs), net price 0.5-mL pre-filled syringe = £6.59

**Excipients** include gentamicin

#### Influvac Desu<sup>®</sup> (Abbott Healthcare) (PoM)

**Injection**, suspension of formaldehyde-inactivated influenza virus (surface antigen, grown in fertilised hens' eggs), net price 0.5-mL pre-filled syringe = £5.22

**Excipients** include gentamicin

#### Viroflu<sup>®</sup> (Janssen) (PoM)

**Injection**, suspension of inactivated influenza virus (surface antigen, virosome, grown in fertilised hens' eggs), net price 0.5-mL pre-filled syringe = £6.59

**Excipients** include neomycin and polymyxin B

**Cautions** child under 5 years (increased risk of fever)—use only if a safer alternative influenza vaccine is not available

**Note** Ovalbumin content less than 100 nanograms/mL

**Note** Also available as *Inflexa*<sup>®</sup> V

### Tetavalent seasonal influenza vaccine for intramuscular use

#### Fluarix Tetra<sup>®</sup> (GSK) ▼ (PoM)

**Injection**, suspension of formaldehyde-inactivated influenza virus (split virion, grown in fertilised hens' eggs) net price 0.5-mL pre-filled syringe = £9.94

**Excipients** include gentamicin

**Note** Ovalbumin content less than 100 nanograms/mL

**Note** Not licensed for use in children under 3 years of age

### Trivalent seasonal influenza vaccine for intradermal use

#### Intanza<sup>®</sup> (Sanofi Pasteur) (PoM)

**Injection**, suspension of formaldehyde-inactivated influenza virus (split virion, grown in fertilised hens' eggs), net price, pre-filled syringe, 9 micrograms (0.1 mL) = £9.05; pre-filled syringe, 15 micrograms (0.1 mL) = £9.05

**Excipients** include neomycin

**Dose by intradermal injection** into deltoid region, **ADULT** 18–60 years, 9 micrograms as a single dose; **ADULT** over 60 years, 15 micrograms as a single dose

**■Tetravalent seasonal influenza vaccine for intranasal use****Fluenz Tetra**<sup>®</sup> (AstraZeneca) ▼ (PoM)

**Nasal spray**, suspension of live, attenuated influenza virus (produced in vero cells and grown in fertilised hens' eggs), net price 0.2 mL nasal applicator = £14.00

**Excipients** include gelatin and gentamicin

**Contra-indications** see section 14.1; also severe asthma, active wheezing; avoid close contact with severely immunocompromised patients for 1–2 weeks after vaccination; concomitant use with antiviral therapy for influenza (avoid antiviral for at least 2 weeks after *Fluenz Tetra*<sup>®</sup>; avoid *Fluenz Tetra*<sup>®</sup> for at least 48 hours after stopping the antiviral); concomitant use with salicylates in children

**Dose** **CHILD** 2–18 years, 0.1 mL into each nostril as a single dose; for children 2–9 years in the clinical risk groups, who have not received seasonal influenza vaccine previously, repeat after at least 4 weeks

MMR vaccine may be used in the control of outbreaks of measles (see under MMR Vaccine).

**■Single antigen vaccine**

No longer available in the UK

**■Combined vaccines**

See MMR vaccine

**Measles, Mumps and Rubella (MMR) vaccine**

A combined live **measles, mumps, and rubella vaccine** (MMR vaccine) aims to eliminate measles, mumps, and rubella (and congenital rubella syndrome). Every child should receive two doses of MMR vaccine by entry to primary school, unless there is a valid contra-indication (see section 14.1). MMR vaccine should be given irrespective of previous measles, mumps, or rubella infection or vaccination.

The first dose of MMR vaccine is given to children aged 12–13 months. A second dose is given before starting school at 3 years and 4 months–5 years of age (see Immunisation Schedule, section 14.1).

Children presenting for pre-school booster who have not received the first dose of MMR vaccine should be given a dose of MMR vaccine followed 3 months later by a second dose.

At school-leaving age or at entry into further education, MMR immunisation should be offered to individuals of both sexes who have not received 2 doses during childhood. In those who have received only a single dose of MMR in childhood, a second dose is recommended to achieve full protection. If 2 doses of MMR vaccine are required, the second dose should be given one month after the initial dose. The decision on whether to vaccinate adults should take into consideration their vaccination history, the likelihood of the individual remaining susceptible, and the future risk of exposure and disease.

MMR vaccine should be used to protect against rubella in *seronegative women of child-bearing age* (see Immunisation Schedule, section 14.1); unimmunised healthcare workers who might put pregnant women and other vulnerable groups at risk of rubella or measles should be vaccinated. MMR vaccine may also be offered to previously *unimmunised and seronegative post-partum women* (see MMR Vaccine, section 14.5.3)—vaccination a few days after delivery is important because about 60% of congenital abnormalities from rubella infection occur in babies of women who have borne more than one child. Immigrants arriving after the age of school immunisation are particularly likely to require immunisation.

**Contacts** MMR vaccine may also be used in the control of outbreaks of measles and should be offered to susceptible children aged over 6 months who are contacts of a case, within 3 days of exposure to infection. Children immunised before 12 months of age should still receive two doses of MMR vaccine at the recommended ages. If one dose of MMR vaccine has already been given to a child, then the second dose may be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months–5 years should still be given. Children aged under 9 months for whom avoid-

**Japanese encephalitis vaccine**

Japanese encephalitis vaccine is indicated for travellers to areas in Asia and the Far East where infection is endemic and for laboratory staff at risk of exposure to the virus. The primary immunisation course of 2 doses should be completed at least one week before potential exposure to Japanese encephalitis virus.

Up-to-date information on the risk of Japanese encephalitis in specific countries can be obtained from the National Travel Health Network and Centre ([www.nathnac.org](http://www.nathnac.org))

**JAPANESE ENCEPHALITIS VACCINE**

**Indications** immunisation against Japanese encephalitis

**Cautions** see section 14.1

**Contra-indications** see section 14.1

**Pregnancy** although manufacturer advises avoid because of limited information, miscarriage has been associated with Japanese encephalitis virus infection acquired during the first 2 trimesters of pregnancy

**Breast-feeding** see

**Side-effects** see section 14.1; also *less commonly* migraine, vertigo; *rarely* dyspnoea, palpitation, tachycardia, thrombocytopenia, neuritis

**Dose**

• See under preparation

**Ixiaro**<sup>®</sup> (Novartis Vaccines) ▼ (PoM)

**Injection**, suspension, inactivated Japanese encephalitis virus (produced in Vero cells), adsorbed onto aluminium hydroxide, net price 0.5-mL (6 micrograms) prefilled syringe = £59.50

**Dose** by intramuscular injection in deltoid region, **ADULT** over 18 years, 2 doses of 0.5 mL separated by interval of 28 days; booster dose 1–2 years after completing primary course, but for those at continued risk the booster dose should be given 1 year after completing the primary course; **CHILD** 2 months–3 years, 2 doses of 0.25 mL separated by interval of 28 days; **CHILD** 3–18 years, 2 doses of 0.5 mL separated by interval of 28 days

**Note** Anterolateral thigh is preferred site in infants. The subcutaneous route may be used for patients with bleeding disorders see section 14.1

**Measles vaccine**

**Measles vaccine** has been replaced by a combined live measles, mumps and rubella vaccine (MMR vaccine).

ance of measles infection is particularly important (such as those with history of recent severe illness) can be given normal immunoglobulin (section 14.5.1) after exposure to measles; routine MMR immunisation should then be given after at least 3 months at the appropriate age.

MMR vaccine is **not suitable** for prophylaxis following exposure to mumps or rubella since the antibody response to the mumps and rubella components is too slow for effective prophylaxis.

Children and adults with impaired immune response should not receive live vaccines (for advice on HIV see section 14.1). If they have been exposed to measles infection they should be given normal immunoglobulin (section 14.5.1).

**Travel** Unimmunised travellers, including children over 6 months, to areas where measles is endemic or epidemic should receive MMR vaccine. Children immunised before 12 months of age should still receive two doses of MMR vaccine at the recommended ages. If one dose of MMR vaccine has already been given to a child, then the second dose should be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months–5 years should still be given.

**Side-effects** See section 14.1; also malaise, fever, or a rash can occur after the first dose of MMR vaccine, most commonly about a week after vaccination and lasting about 2 to 3 days. Leaflets are available for parents on advice for reducing fever (including the use of paracetamol). Febrile seizures occur rarely 6 to 11 days after MMR vaccination; the incidence of febrile seizures is lower than that following measles infection. Parotid swelling occurs occasionally, usually in the third week, and rarely, arthropathy 2 to 3 weeks after immunisation. Adverse reactions are considerably less frequent after the second dose of MMR vaccine than after the first dose.

Idiopathic thrombocytopenic purpura has occurred rarely following MMR vaccination, usually within 6 weeks of the first dose. The risk of idiopathic thrombocytopenic purpura after MMR vaccine is much less than the risk after infection with wild measles or rubella virus. Children who develop idiopathic thrombocytopenic purpura within 6 weeks of the first dose of MMR should undergo serological testing before the second dose is due; if the results suggest incomplete immunity against measles, mumps or rubella then a second dose of MMR is recommended. The Specialist and Reference Microbiology Division, Health Protection Agency offers free serological testing for children who develop idiopathic thrombocytopenic purpura *within 6 weeks* of the first dose of MMR.

Post-vaccination aseptic meningitis was reported (rarely and with complete recovery) following vaccination with MMR vaccine containing Urabe mumps vaccine, which has now been discontinued; no cases have been confirmed in association with the currently used Jeryl Lynn mumps vaccine. Children with post-vaccination symptoms are not infectious.

Reviews undertaken on behalf of the CSM, the Medical Research Council, and the Cochrane Collaboration, have not found any evidence of a link between MMR vaccination and bowel disease or autism. The Chief Medical Officers have advised that the MMR vaccine is the safest and best way to protect children against measles, mumps, and rubella. Information (including fact sheets and a list of references) may be obtained from:  
[www.dh.gov.uk/immunisation](http://www.dh.gov.uk/immunisation)

## MEASLES, MUMPS AND RUBELLA VACCINE, LIVE

**Indications** immunisation against measles, mumps, and rubella

**Cautions** see section 14.1; also, after immunoglobulin administration or blood transfusion, leave an interval of at least 3 months before MMR immunisation as antibody response to measles component may be reduced—see also p. 856

**Hypersensitivity to egg** MMR vaccine can be given safely even when the child has had an anaphylactic reaction to food containing egg. Dislike of eggs, refusal to eat egg, or confirmed anaphylactic reactions to egg-containing food is not a contra-indication to MMR vaccination. Children with a confirmed anaphylactic reaction to the MMR vaccine should be assessed by a specialist.

**Contra-indications** see section 14.1

**Pregnancy** avoid pregnancy for at least 1 month after vaccination; see also, p. 829

**Breast-feeding** see p. 829

**Side-effects** see section 14.1 and notes above; also *less commonly* sleep disturbances, unusual crying in infants; also reported peripheral and optic neuritis

### Dose

- By **intramuscular** or **deep subcutaneous injection**, **ADULT** and **CHILD** over 9 months (but see also notes above), primary immunisation, 2 doses each of 0.5 mL, see Immunisation Schedule, section 14.1, p. 830; see also notes above for use in outbreaks, for contacts of cases, and for travel

### Combined vaccines

**MMRvaxPro**<sup>®</sup> (Sanofi Pasteur) (PoM)

**Injection**, powder for reconstitution, live attenuated, measles virus (Enders' Edmonston strain) and mumps virus (Jeryl Lynn strain) prepared in chick embryo cells, and rubella virus (Wistar RA 27/3 strain); single-dose vial (with syringe containing solvent)

**Excipients** include gelatin and neomycin

Only available as part of childhood immunisation schedule from health organisations or **ImmForm**

**Priorix**<sup>®</sup> (GSK) (PoM)

**Injection**, powder for reconstitution, live attenuated, measles virus (Schwarz strain) and mumps virus (RIT 4385 strain) prepared in chick embryo cells, and rubella virus (Wistar RA 27/3 strain); net price single-dose vial (with syringe containing solvent) = £7.64

**Excipients** include neomycin

Also available as part of childhood immunisation schedule from health organisations or **ImmForm**

## Meningococcal vaccines

Almost all childhood meningococcal disease in the UK is caused by *Neisseria meningitidis* serogroups B and C. **Meningococcal group C conjugate vaccine** protects only against infection by serogroup C. The risk of meningococcal disease declines with age—immunisation is not generally recommended after the age of 25 years.

Tetravalent meningococcal vaccines that cover serogroups A, C, W135, and Y are available. Although the duration of protection has not been established, the **meningococcal groups A, C, W135, and Y conjugate vaccine** is likely to provide longer-lasting protection than the unconjugated meningococcal polysaccharide vaccine. The antibody response to serogroup C in unconjugated meningococcal polysaccharide vaccines in young children may be suboptimal.

A **meningococcal group B vaccine**, *Bexsero*<sup>®</sup>, is licensed in the UK against infection caused by *Neisseria meningitidis* serogroup B. *Bexsero*<sup>®</sup> contains 3 recombinant *Neisseria meningitidis* serogroup B proteins and the outer membrane vesicles from the NZ 98/254 strain, in order to achieve broad protection against *Neisseria meningitidis* serogroup B; the proteins are adsorbed onto an aluminium compound to stimulate an enhanced immune response.

**Childhood immunisation** **Meningococcal group C conjugate vaccine** provides long-term protection against infection by serogroup C of *Neisseria meningitidis*. Immunisation consists of 1 dose given at 3 months of age; 2 booster doses are recommended, the first is given at 12–13 months of age (combined with haemophilus influenzae type b vaccine), and the second at 13–15 years of age (see Immunisation Schedule, section 14.1, p. 830).

Unimmunised children aged 4–12 months should be given 1 dose of meningococcal group C conjugate vaccine and then they should be vaccinated according to the Immunisation Schedule (section 14.1, p. 830). Unimmunised children aged 1–10 years should be given 1 dose of meningococcal group C conjugate vaccine, followed by a booster dose at 13–15 years of age. Unimmunised individuals aged 10–25 years should be given 1 dose of meningococcal group C conjugate vaccine, but a booster dose is not required.

From August 2014 there will be a catch-up programme for individuals aged under 25 years who are attending university for the first time and who did not receive a dose of meningococcal group C conjugate vaccine at 13–15 years of age.

Patients under 25 years of age with confirmed serogroup C disease, who have previously been immunised with meningococcal group C vaccine, should be offered meningococcal group C conjugate vaccine before discharge from hospital.

**Asplenia, splenic dysfunction, or complement deficiency** See p. 836.

**Travel** Individuals travelling to countries of risk (see below) should be immunised with **meningococcal groups A, C, W135, and Y conjugate vaccine**, even if they have previously received meningococcal group C conjugate vaccine. If an individual has recently received meningococcal group C conjugate vaccine, an interval of at least 4 weeks should be allowed before adminis-

tration of the tetravalent (meningococcal groups A, C, W135, and Y) vaccine.

Vaccination is particularly important for those living or working with local people or visiting an area of risk during outbreaks.

Immunisation recommendations and requirements for visa entry for individual countries should be checked before travelling, particularly to countries in Sub-Saharan Africa, Asia, and the Indian sub-continent where epidemics of meningococcal outbreaks and infection are reported. Country-by-country information is available from the National Travel Health Network and Centre ([www.nathnac.org](http://www.nathnac.org)).

Proof of vaccination with the tetravalent (meningococcal groups A, C, W135, and Y) vaccine is required for those travelling to Saudi Arabia during the Hajj and Umrah pilgrimages (where outbreaks of the W135 strain have occurred).

**Contacts** For advice on the immunisation of *laboratory workers and close contacts* of cases of meningococcal disease in the UK and on the role of the vaccine in the control of *local outbreaks*, consult Guidance for Public Health Management of Meningococcal Disease in the UK at [www.hpa.org.uk](http://www.hpa.org.uk). See Table 2, section 5.1 for antibacterial prophylaxis for prevention of secondary cases of meningococcal meningitis.

The need for immunisation of laboratory staff who work directly with *Neisseria meningitidis* should be considered.

## MENINGOCOCCAL VACCINES

**Indications** immunisation against *Neisseria meningitidis*

**Cautions** see section 14.1

**Contra-indications** see section 14.1

**Pregnancy** see p. 829

**Breast-feeding** see p. 829

**Side-effects** see section 14.1; also *rarely* symptoms of meningitis reported (but no evidence that the vaccine causes meningococcal C meningitis); also reported in children with meningococcal group B vaccine (*Bexsero*<sup>®</sup>) unusual crying and *rarely* Kawasaki disease

### Dose

- See under preparations

### ■ Meningococcal group C conjugate vaccine

**Menjugate Kit**<sup>®</sup> (Novartis Vaccines) (PoM)

**Injection**, powder for reconstitution, capsular polysaccharide antigen of *Neisseria meningitidis* group C (conjugated to *Corynebacterium diphtheriae* protein), adsorbed onto aluminium hydroxide, single-dose vial with diluent

**Dose** by intramuscular injection, **ADULT** and **CHILD** 3 months–25 years 0.5 mL, see notes above and Immunisation Schedule, section 14.1

Available as part of childhood immunisation schedule from ImmForm

**NeisVac-C**<sup>®</sup> (Baxter) (PoM)

**Injection**, suspension of polysaccharide antigen of *Neisseria meningitidis* group C (conjugated to tetanus toxoid protein), adsorbed onto aluminium hydroxide, 0.5-mL prefilled syringe

**Dose** by intramuscular injection, **ADULT** and **CHILD** 3 months–25 years 0.5 mL, see notes above and Immunisation Schedule, section 14.1

Available as part of childhood immunisation schedule from ImmForm

### ▲ Meningococcal group C conjugate vaccine with Haemophilus Influenzae type B vaccine

See Haemophilus Influenzae type B vaccine

### ▲ Meningococcal groups A, C, W135, and Y conjugate vaccine

**Menveo**<sup>®</sup> (Novartis Vaccines) PoM

**Injection**, powder for reconstitution, capsular oligosaccharide antigens of *Neisseria meningitidis* groups A, C, W135, and Y (conjugated to *Corynebacterium diphtheriae* protein), net price single-dose vial (with vial or prefilled syringe containing diluent) = £30.00

**Dose** by **intramuscular injection** preferably into deltoid region, **ADULT** and **CHILD** over 1 year 0.5 mL as a single dose; **CHILD** 3 months–1 year 2 doses of 0.5 mL separated by an interval of 1 month

**Note** Advice in BNF may differ from that in product literature

**Nimenrix**<sup>®</sup> (GSK) PoM

**Injection**, powder for reconstitution, capsular polysaccharide antigens of *Neisseria meningitidis* groups A, C, W135, and Y (conjugated to tetanus toxoid protein), net price single-dose vial (with syringe containing diluent) = £30.00

**Dose** by **intramuscular injection** preferably into deltoid region (or anterolateral thigh in child 1–2 years), **ADULT** and **CHILD** over 1 year 0.5 mL as a single dose; a second dose may be considered after 1 year in those who continue to be at risk of *Neisseria meningitidis* serogroup A infection

### ▲ Meningococcal polysaccharide A, C, W135 and Y vaccine

**ACWY Vax**<sup>®</sup> (GSK) PoM

**Injection**, powder for reconstitution, capsular polysaccharide antigens of *Neisseria meningitidis* groups A, C, W135, and Y, net price single-dose vial (with syringe containing diluent) = £16.73

**Dose** by **deep subcutaneous injection**, **ADULT** and **CHILD** over 5 years 0.5 mL as a single dose; booster dose for those at continued risk, 0.5 mL every 5 years

### ▲ Meningococcal group B vaccine

**Bexsero**<sup>®</sup> (Novartis) PoM

**Injection**, suspension of antigen of *Neisseria meningitidis* group B (produced in *E. Coli* cells by recombinant DNA technology), adsorbed onto aluminium hydroxide, net price 0.5 mL prefilled syringe = £75.00

**Excipients** may include traces of kanamycin

**Dose** by **deep intramuscular injection** preferably into deltoid region (or anterolateral thigh in infants), **ADULT** and **CHILD** over 11 years (unimmunised), 2 doses of 0.5 mL separated by an interval of at least 1 month; **CHILD** 2–6 months, primary immunisation 3 doses of 0.5 mL separated by an interval of at least 1 month, booster dose of 0.5 mL given between 1–2 years of age; **CHILD** 6 months–1 year (unimmunised), primary immunisation 2 doses of 0.5 mL separated by an interval of at least 2 months, booster dose of 0.5 mL given between 1–2 years of age and at least 2 months after completion of primary immunisation; **CHILD** 1–2 years (unimmunised), primary immunisation 2 doses of 0.5 mL separated by an interval of at least 2 months, booster dose of 0.5 mL given 12–24 months after completion of primary immunisation; **CHILD** 2–11 years (unimmunised), 2 doses of 0.5 mL separated by an interval of at least 2 months

## Mumps vaccine

### ▲ Single antigen vaccine

No longer available in the UK

### ▲ Combined vaccines

See MMR Vaccine

## Pertussis vaccine

**Pertussis vaccine** is given as a combination preparation containing other vaccines (see Diphtheria containing Vaccines). Acellular vaccines are derived from highly purified components of *Bordetella pertussis*. Primary immunisation against pertussis (whooping cough) requires 3 doses of an acellular pertussis-containing vaccine (see Immunisation schedule, section 14.1), given at intervals of 1 month from the age of 2 months.

All children up to the age of 10 years should receive primary immunisation with diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed).

A booster dose of an acellular pertussis-containing vaccine should ideally be given 3 years after the primary course, although, the interval can be reduced to 1 year if the primary course was delayed.

Children aged 1–10 years who have not received a *pertussis-containing* vaccine as part of their primary immunisation should be offered 1 dose of a suitable pertussis-containing vaccine; after an interval of at least 1 year, a booster dose of a suitable pertussis-containing vaccine should be given. Immunisation against pertussis is not routinely recommended in individuals over 10 years of age.

### Vaccination of pregnant women against pertussis

In response to the pertussis outbreak, the UK health departments introduced a temporary programme (October 2012) to vaccinate pregnant women against pertussis, and this programme will continue until further notice. The aim of the programme is to boost the levels of pertussis-specific antibodies that are transferred through the placenta, from the mother to the fetus, so that the newborn is protected before routine immunisation begins at 2 months of age.

Pregnant women should be offered a single dose of acellular pertussis-containing vaccine (as adsorbed diphtheria [low dose], tetanus, pertussis [acellular, component] and poliomyelitis [inactivated] vaccine; *Repevax*<sup>®</sup>) between 28 to 38 weeks of pregnancy; the optimal time for vaccination is between 28–32 weeks of pregnancy. Pregnant women should be offered a single dose of acellular pertussis-containing vaccine up to the onset of labour if they missed the opportunity for vaccination at 28–38 weeks of pregnancy. A single dose of acellular pertussis-containing vaccine may also be offered to new mothers, who have never previously been vaccinated against pertussis, until the child receives the first vaccination.

While this programme is in place, women who become pregnant again should be offered vaccination during each pregnancy to maximise transplacental transfer of antibody.

**Contacts** Vaccination against pertussis should be considered for close contacts of cases with pertussis who have been offered antibacterial prophylaxis (Table 2, section 5.1). Unimmunised or partially immunised contacts under 10 years of age should complete their vaccination against pertussis. A booster dose of an acellular pertussis-containing vaccine is recommended for contacts aged over 10 years who have not received a pertussis-containing vaccine in the last 5 years and who have not received adsorbed diphtheria [low dose], tetanus, and poliomyelitis (inactivated) vaccine in the last month.

**Cautions** Section 14.1.

**Contra-indications** Section 14.1.

**Pregnancy** See p. 829 and also Vaccination of Pregnant Women Against Pertussis above.

**Breast-feeding** See p. 829.

**Side-effects** See also section 14.1. The incidence of local and systemic effects is generally lower with vaccines containing acellular pertussis components than with the whole-cell pertussis vaccine used previously. However, compared with primary vaccination, booster doses with vaccines containing acellular pertussis are reported to increase the risk of injection-site reactions (some of which affect the entire limb); local reactions do not contra-indicate further doses (see below).

The vaccine should not be withheld from children with a history to a preceding dose of:

- fever, irrespective of severity;
- persistent crying or screaming for more than 3 hours;
- severe local reaction, irrespective of extent.

#### Combined vaccines

Combined vaccines, see under Diphtheria-containing vaccines

### Pneumococcal vaccines

Pneumococcal vaccines protect against infection with *Streptococcus pneumoniae* (pneumococcus); the vaccines contain polysaccharide from capsular pneumococci.

**Pneumococcal polysaccharide vaccine** contains purified polysaccharide from 23 capsular types of pneumococci, whereas **pneumococcal polysaccharide conjugate vaccine (adsorbed)** contains polysaccharide from either 10 capsular types (*Synflorix*<sup>®</sup>) or 13 capsular types (*Prevenar 13*<sup>®</sup>) and the polysaccharide is conjugated to protein.

The 13-valent conjugate vaccine (*Prevenar 13*<sup>®</sup>) is used in the childhood immunisation schedule. The recommended schedule consists of 3 doses, the first at 2 months of age, the second at 4 months, and the third at 12–13 months (see Immunisation Schedule, section 14.1).

Pneumococcal vaccination is recommended for individuals at increased risk of pneumococcal infection as follows:

- age over 65 years;
- asplenia or splenic dysfunction (including homozygous sickle cell disease and coeliac disease which could lead to splenic dysfunction);
- chronic respiratory disease (includes asthma treated with continuous or frequent use of a systemic corticosteroid);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- diabetes mellitus requiring insulin or oral hypoglycaemic drugs;
- immune deficiency because of disease (e.g. HIV infection) or treatment (including prolonged systemic corticosteroid treatment for over 1 month at dose equivalents of prednisolone: *adult and child*

*over 20 kg, 20 mg or more daily; child under 20 kg, 1 mg/kg or more daily);*

- presence of cochlear implant;
- conditions where leakage of cerebrospinal fluid may occur;
- child under 5 years with a history of invasive pneumococcal disease;
- at risk of occupational exposure to metal fume (e.g. welders).

Where possible, the vaccine should be given at least 2 weeks before splenectomy, cochlear implant surgery, chemotherapy, or radiotherapy; patients should be given advice about increased risk of pneumococcal infection. If it is not practical to vaccinate at least 2 weeks before splenectomy, chemotherapy, or radiotherapy, the vaccine should be given at least 2 weeks after the splenectomy or, where possible, at least 3 months after completion of chemotherapy or radiotherapy. Prophylactic antibacterial therapy against pneumococcal infection (Table 2, section 5.1) should not be stopped after immunisation. A patient card and information leaflet for patients with asplenia are available from the Department of Health or in Scotland from the Scottish Executive, Public Health Division 1 (Tel (0131) 244 2501).

**Choice of vaccine** Children under 2 years at increased risk of pneumococcal infection (see list above) should receive the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) at the recommended ages, followed by a single dose of the 23-valent pneumococcal polysaccharide vaccine after their second birthday (see below). Children at increased risk of pneumococcal infection presenting late for vaccination should receive 2 doses (separated by at least 1 month) of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) before the age of 12 months, and a third dose at 12–13 months. Children over 12 months and under 5 years (who have not been vaccinated or not completed the primary course) should receive a single dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) (2 doses separated by an interval of 2 months in the immunocompromised or those with asplenia or splenic dysfunction). All children under 5 years at increased risk of pneumococcal infection should receive a single dose of the 23-valent pneumococcal polysaccharide vaccine after their second birthday and at least 2 months after the final dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

Children over 5 years and adults who are at increased risk of pneumococcal disease should receive a single dose of the 23-valent unconjugated pneumococcal polysaccharide vaccine.

**Revaccination** In individuals with higher concentrations of antibodies to pneumococcal polysaccharides, revaccination with the 23-valent pneumococcal polysaccharide vaccine more commonly produces adverse reactions. Revaccination is therefore not recommended, except every 5 years in individuals in whom the antibody concentration is likely to decline rapidly (e.g. asplenia, splenic dysfunction and nephrotic syndrome). If there is doubt, the need for revaccination should be discussed with a haematologist, immunologist, or microbiologist.

## PNEUMOCOCCAL VACCINE

**Indications** immunisation against pneumococcal infection

**Cautions** see section 14.1

**Contra-indications** see section 14.1

**Pregnancy** see p. 829

**Breast-feeding** see p. 829

**Side-effects** see section 14.1; *also* Revaccination, above

### Dose

- See under preparations

### ▲ Pneumococcal polysaccharide vaccine

**Pneumovax® II** (Sanofi Pasteur) PoM

**Injection**, polysaccharide from each of 23 capsular types of pneumococcus, net price 0.5-mL vial = £8.32

**Contra-indications** concomitant use with the high potency varicella-zoster vaccine (*Zostavax*®)

**Dose** by intramuscular or subcutaneous injection, ADULT and CHILD over 2 years, 0.5 mL; revaccination, see notes above

### ▲ Pneumococcal polysaccharide conjugate vaccine (adsorbed)

**Prevenar 13®** (Pfizer) PoM

**Injection**, polysaccharide from each of 13 capsular types of pneumococcus (conjugated to carrier protein) adsorbed onto aluminium phosphate, net price 0.5-mL prefilled syringe = £49.10

**Dose** by intramuscular injection, CHILD 2 months–5 years, 0.5 mL (see notes above and Immunisation Schedule, section 14.1)

**Note** Deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants.

The dose in the BNF may differ from that in product literature.

Available as part of childhood immunisation schedule from ImmForm

**Synflorix®** (GSK) PoM

**Injection**, polysaccharide from each of 10 capsular types of pneumococcus (conjugated to carrier proteins) adsorbed onto aluminium phosphate, net price 0.5-mL prefilled syringe = £27.60

**Dose** by intramuscular injection, CHILD 6 weeks–5 years, consult product literature

**Note** Deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants

## Poliomyelitis vaccines

Two types of poliomyelitis vaccine (containing strains of poliovirus types 1, 2, and 3) are available, inactivated poliomyelitis vaccine (for injection) and live (oral) poliomyelitis vaccine. **Inactivated poliomyelitis vaccine**, only available in combined preparation (see under Diphtheria Vaccines), is recommended for routine immunisation.

A course of primary immunisation consists of 3 doses of a combined preparation containing inactivated poliomyelitis vaccine, starting at 2 months of age with intervals of 1 month between doses (see Immunisation schedule, section 14.1). A course of 3 doses should also be given to all unimmunised adults; no adult should remain unimmunised against poliomyelitis.

Two booster doses of a preparation containing inactivated poliomyelitis vaccine are recommended, the first before school entry and the second before leaving school (see Immunisation schedule, section 14.1).

Further booster doses are only necessary for adults at special risk, such as travellers to endemic areas, or laboratory staff likely to be exposed to the viruses, or healthcare workers in possible contact with cases; booster doses should be given to such individuals every 10 years.

**Live (oral) poliomyelitis vaccine** is no longer available for routine use; its use may be considered during large outbreaks, but advice should be sought from Public Health England. The live (oral) vaccine poses a very rare risk of vaccine-associated paralytic polio because the attenuated strain of the virus can revert to a virulent form. For this reason the live (oral) vaccine must **not** be used for immunosuppressed individuals or their household contacts. The use of inactivated poliomyelitis vaccine removes the risk of vaccine-associated paralytic polio altogether.

**Travel** Unimmunised travellers to areas with a high incidence of poliomyelitis should receive a full 3-dose course of a preparation containing inactivated poliomyelitis vaccine. Those who have not been vaccinated in the last 10 years should receive a booster dose of **adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine**. Information about countries with a high incidence of poliomyelitis can be obtained from [www.travax.nhs.uk](http://www.travax.nhs.uk) or from the National Travel Health Network and Centre ([www.nathnac.org](http://www.nathnac.org)).

## POLIOMYELITIS VACCINES

**Indications** immunisation against poliomyelitis

**Cautions** see section 14.1

**Contra-indications** see notes above and section 14.1

**Pregnancy** see p. 829

**Breast-feeding** see p. 829

**Side-effects** see notes above and section 14.1

### Dose

- See under preparations

### ▲ Combined vaccines

See under Diphtheria-containing Vaccines

### ▲ Inactivated (Salk) vaccine

See under Diphtheria-containing vaccines

## Rabies vaccine

Rabies vaccine contains inactivated rabies virus cultivated in either human diploid cells or purified chick embryo cells; vaccines are used for pre- and post-exposure prophylaxis.

**Pre-exposure prophylaxis** Immunisation should be offered to those at high risk of exposure to rabies—laboratory staff who handle the rabies virus, those working in quarantine stations, animal handlers, veterinary surgeons and field workers who are likely to be bitten by infected wild animals, certain port officials, and bat handlers. Transmission of rabies by humans has not been recorded but it is advised that those caring for patients with the disease should be vaccinated.

Immunisation against rabies is also recommended where there is limited access to prompt medical care for those living in areas where rabies is enzootic, for those travelling to such areas for longer than 1 month, and for those on shorter visits who may be exposed to unusual risk.

Immunisation against rabies is indicated during pregnancy if there is substantial risk of exposure to rabies and rapid access to post-exposure prophylaxis is likely to be limited.

Up-to-date country-by-country information on the incidence of rabies can be obtained from the National Travel Health Network and Centre ([www.nathnac.org](http://www.nathnac.org)) and, in Scotland, from Health Protection Scotland ([www.hps.scot.nhs.uk](http://www.hps.scot.nhs.uk)).

Immunisation against rabies requires 3 doses of rabies vaccine, with further booster doses for those who remain at frequent risk. To ensure continued protection in persons at high risk (e.g. laboratory workers), the concentration of antirabies antibodies in plasma is used to determine the intervals between doses.

**Post-exposure management** Following potential exposure to rabies, the wound or site of exposure (e.g. mucous membrane) should be cleansed under running water and washed for several minutes with soapy water as soon as possible after exposure. Disinfectant and a simple dressing can be applied, but suturing should be delayed because it may increase the risk of introducing rabies virus into the nerves.

Post-exposure prophylaxis against rabies depends on the level of risk in the country, the nature of exposure, and the individual's immunity. In each case, expert risk assessment and advice on appropriate management should be obtained from the local Public Health England Centre or Public Health England's Virus Reference Department, Colindale (tel. (020) 8200 4400) or the PHE Colindale Duty Doctor (tel. (020) 8200 6868), in Wales from the Public Health Wales local Health Protection Team or Public Health Wales Virus Reference Laboratory (tel. (029) 2074 7747), in Scotland from the local on-call infectious diseases consultant, and in Northern Ireland from the Public Health Agency Duty Room (tel (028) 9055 3997/ (028) 9063 2662) or the Regional Virology Service (tel. (028) 9024 0503).

There are no specific contra-indications to the use of rabies vaccine for post-exposure prophylaxis and its use should be considered whenever a patient has been attacked by an animal in a country where rabies is enzootic, even if there is no direct evidence of rabies in the attacking animal. Because of the potential consequences of untreated rabies exposure and because rabies vaccination has not been associated with fetal abnormalities, pregnancy is not considered a contra-indication to post-exposure prophylaxis.

For post-exposure prophylaxis of *fully immunised* individuals (who have previously received pre-exposure or post-exposure prophylaxis with cell-derived rabies vaccine), 2 doses of cell-derived vaccine are likely to be sufficient; the first dose is given on day 0 and the second dose is given between day 3–7. Rabies immunoglobulin is not necessary in such cases.

Post-exposure treatment for *unimmunised individuals* (or those whose prophylaxis is possibly incomplete) comprises 5 doses of rabies vaccine given over 1 month (on days 0, 3, 7, 14, and the fifth dose is given between day 28–30); also, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin (section 14.5.2) is given to unimmunised individuals on day 0 or within 7 days of starting the course of rabies vaccine. The immunisation course can be discontinued if it is proved that the individual was not at risk.

## RABIES VACCINE

**Indications** immunisation against rabies

**Cautions** see section 14.1

**Contra-indications** see section 14.1; but see also Post-exposure Management in notes above

**Pregnancy** see p. 829

**Breast-feeding** see p. 829

**Side-effects** see section 14.1; also reported paresis

### Dose

- Pre-exposure prophylaxis, by **intramuscular injection** in deltoid region or anterolateral thigh in infants, 1 mL on days 0, 7, and 28 (3rd dose can be given from day 21 if insufficient time before travel); for those at continuous risk, measure plasma-concentration of antirabies antibodies every 6 months and give a booster dose if the titre is less than 0.5 units/mL; for those at frequent risk, give a single reinforcing dose 1 year after the primary course is completed, and then give booster doses every 3–5 years or determine the frequency of booster doses according to plasma concentration of antirabies antibodies; for those at infrequent risk, consider giving a booster dose 10 years after the primary course is completed
- Post-exposure prophylaxis, by **intramuscular injection** in deltoid region or anterolateral thigh in infants, 1 mL (see notes above)

**Rabies Vaccine** (Sanofi Pasteur) PoM

Rab

**Injection**, powder for reconstitution, freeze-dried inactivated Wistar rabies virus strain PM/WI 38 1503-3M cultivated in human diploid cells, net price single-dose vial with syringe containing diluent = £33.90

**Excipients** include neomycin

**Rabipur**<sup>®</sup> (Novartis Vaccines) PoM

**Injection**, powder for reconstitution, freeze-dried inactivated Flury LEP rabies virus strain cultivated in chick embryo cells, net price single-dose vial = £28.80

**Excipients** include neomycin

## Rotavirus vaccine

**Rotavirus vaccine** is a live, oral vaccine that protects young children against gastro-enteritis caused by rotavirus infection. The recommended schedule consists of 2 doses, the first at 2 months of age, and the second at 3 months of age (see Immunisation schedule, section 14.1). The first dose of rotavirus vaccine must be given between 6–15 weeks of age and the second dose should be given after an interval of at least 4 weeks; the vaccine should not be started in children 15 weeks of age or older. Ideally, the full course should be completed before 16 weeks of age to provide protection before the main burden of disease, and to avoid a temporal association between vaccination and intussusception; the course must be completed before 24 weeks of age.

The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; however, vaccination of those with *immunosuppressed* close contacts may protect the contacts from wild-type rotavirus disease and outweigh any risk from transmission of vaccine virus. Carers of a recently vaccinated baby should be advised of the need to wash their hands after changing the baby's nappies.

## ROTAVIRUS VACCINE

**Indications** immunisation against gastro-enteritis caused by rotavirus

**Cautions** see section 14.1; *also* diarrhoea or vomiting (postpone vaccination); immunosuppressed close contacts (see notes above)

**Contra-indications** see section 14.1, however, with the exception of severe combined immunodeficiency, benefit from vaccination is likely to outweigh the risk in other types of immunosuppression—if there is any doubt, seek specialist advice; *also* predisposition to, or history of, intussusception

**Side-effects** see section 14.1

### Dose

- By mouth, CHILD over 6 weeks, 2 doses of 1.5 mL, separated by an interval of at least 4 weeks; first dose must be given between 6–15 weeks of age; course should be completed before 24 weeks of age (preferably before 16 weeks)

**Rotarix**<sup>®</sup> (GSK) (PoM)

Oral suspension, live attenuated rotavirus (RIX4414 strain), net price 1.5 mL prefilled oral syringe = £34.76

## Rubella vaccine

A combined measles, mumps and rubella vaccine (MMR vaccine) aims to eliminate rubella (German measles) and congenital rubella syndrome. MMR vaccine is used for childhood vaccination as well as for vaccinating adults (including women of child-bearing age) who do not have immunity against rubella (see MMR vaccine, p. 842)

### ▲ Single antigen vaccine

No longer available in the UK; the combined live measles, mumps and rubella vaccine is a suitable alternative

### ▲ Combined vaccines

see MMR vaccine

## Smallpox vaccine

Limited supplies of **smallpox vaccine** are held at the Specialist and Reference Microbiology Division, Public Health England Colindale (Tel. (020) 8200 4400) for the exclusive use of workers in laboratories where pox viruses (such as vaccinia) are handled.

If a wider use of the vaccine is being considered, *Guidelines for smallpox response and management in the post-eradication era* should be consulted at [www.hpa.org.uk](http://www.hpa.org.uk).

## Tetanus vaccines

**Tetanus vaccine** contains a cell-free purified toxin of *Clostridium tetani* adsorbed on aluminium hydroxide or aluminium phosphate to improve antigenicity.

Primary immunisation for children under 10 years consists of 3 doses of a combined preparation containing adsorbed tetanus vaccine (see Diphtheria-containing Vaccines), with an interval of 1 month between doses. Following routine childhood vaccination, 2 booster doses of a preparation containing adsorbed tetanus vaccine are recommended, the first before school

entry and the second before leaving school (see Immunisation schedule, section 14.1).

The recommended schedule of tetanus vaccination not only gives protection against tetanus in childhood but also gives the basic immunity for subsequent booster doses. In most circumstances, a total of 5 doses of tetanus vaccine is considered sufficient for long term protection.

For primary immunisation of adults and children over 10 years previously unimmunised against tetanus, 3 doses of **adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine** are given with an interval of 1 month between doses (see Diphtheria-containing Vaccines).

**Cautions** See also section 14.1. When an individual presents for a booster dose but has been vaccinated following a tetanus-prone wound, the vaccine preparation administered at the time of injury should be determined. If this is not possible, the booster should still be given to ensure adequate protection against all antigens in the booster vaccine.

Very rarely, tetanus has developed after abdominal surgery; patients awaiting elective surgery should be asked about tetanus immunisation and immunised if necessary.

Parenteral drug abuse is also associated with tetanus; those abusing drugs by injection should be vaccinated if unimmunised—booster doses should be given if there is any doubt about their immunisation status.

All laboratory staff should be offered a primary course if unimmunised.

Travel recommendations see section 14.6.

**Contra-indications** See section 14.1.

**Pregnancy** See p. 829.

**Breast-feeding** See p. 829.

**Side effects** See section 14.1.

**Wounds** Wounds are considered to be tetanus-prone if they are sustained more than 6 hours before surgical treatment or at any interval after injury and are puncture-type (particularly if contaminated with soil or manure) or show much devitalised tissue or are septic or are compound fractures or contain foreign bodies. All wounds should receive thorough cleansing.

- For *clean wounds*: fully immunised individuals (those who have received a total of 5 doses of a tetanus-containing vaccine at appropriate intervals) and those whose primary immunisation is complete (with boosters up to date), do not require tetanus vaccine; individuals whose primary immunisation is incomplete or whose boosters are not up to date require a reinforcing dose of a tetanus-containing vaccine (followed by further doses as required to complete the schedule); non-immunised individuals (or those whose immunisation status is not known or who have been fully immunised but are now immunocompromised) should be given a dose of the appropriate tetanus-containing vaccine immediately (followed by completion of the full course of the vaccine if records confirm the need).

- For *tetanus-prone wounds*: management is as for clean wounds with the addition of a dose of tetanus immunoglobulin (section 14.5.2) given at a different site; in fully immunised individuals and those whose primary immunisation is complete (with boosters up to date) the immunoglobulin is needed only if

the risk of infection is especially high (e.g. contamination with manure). Antibacterial prophylaxis (with benzylpenicillin, co-amoxiclav, or metronidazole) may also be required for tetanus-prone wounds.

#### Combined vaccines

See Diphtheria-containing Vaccines

### Tick-borne encephalitis vaccine

Tick-borne encephalitis vaccine contains inactivated tick-borne encephalitis virus cultivated in chick embryo cells. It is recommended for immunisation of those working in, or visiting, high-risk areas (see International Travel, section 14.6). Those working, walking or camping in warm forested areas of Central and Eastern Europe, Scandinavia, Northern and Eastern China, and some parts of Japan, particularly from April to November when ticks are most prevalent, are at greatest risk of tick-borne encephalitis. For full protection, 3 doses of the vaccine are required; booster doses are required every 3–5 years for those still at risk. Ideally, immunisation should be completed at least one month before travel.

### TICK-BORNE ENCEPHALITIS VACCINE, INACTIVATED

**Indications** immunisation against tick-borne encephalitis

**Cautions** see section 14.1

**Contra-indications** see section 14.1

**Pregnancy** see p. 829

**Breast-feeding** see p. 829

**Side-effects** see section 14.1

#### Dose

- Initial immunisation, by **intramuscular injection** in deltoid region or anterolateral thigh in infants, **ADULT** and **CHILD** over 16 years, 3 doses each of 0.5 mL, second dose after 1–3 months and third dose after further 5–12 months; **CHILD** 1–16 years 3 doses of 0.25 mL, second dose after 1–3 months and third dose after further 5–12 months; **ELDERLY** over 60 years and immunocompromised (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved

**Note** To achieve more rapid protection, second dose may be given 14 days after first dose

- Booster course, give first dose within 3 years after initial course completed, then every 3–5 years

**TicoVac**<sup>®</sup> (MASTA) (PoM)

**Injection**, suspension, formaldehyde-inactivated Neudörfel tick-borne encephalitis virus strain (cultivated in chick embryo cells) adsorbed onto hydrated aluminium hydroxide, net price 0.25-mL prefilled syringe (*TicoVac Junior*<sup>®</sup>) = £28.00, 0.5-mL prefilled syringe = £32.00

**Excipients** include gentamicin and neomycin

### Typhoid vaccines

Typhoid vaccine is available as Vi capsular polysaccharide (from *Salmonella typhi*) vaccine for injection and as live attenuated *Salmonella typhi* for oral use.

Typhoid immunisation is advised for :

- travellers to areas where typhoid is endemic, espe-

cially if staying with or visiting local people;

- travellers to endemic areas where frequent or prolonged exposure to poor sanitation and poor food hygiene is likely;
- laboratory personnel who, in the course of their work, may be exposed to *Salmonella typhi*.

Typhoid vaccination is not a substitute for scrupulous personal hygiene (see p. 858).

Capsular **polysaccharide typhoid vaccine** is usually given by **intramuscular injection**. Children under 2 years may respond suboptimally to the vaccine, but children aged between 1–2 years should be immunised if the risk of typhoid fever is considered high (immunisation is not recommended for infants under 12 months). Revaccination is needed every 3 years on continued exposure.

**Oral typhoid vaccine** is a **live attenuated vaccine** contained in an enteric-coated capsule. One capsule taken on alternate days for a total of 3 doses, provides protection 7–10 days after the last dose. Protection may persist for up to 3 years in those constantly (or repeatedly) exposed to *Salmonella typhi*, but those who only occasionally travel to endemic areas require further courses at intervals of 1 year.

**Interactions** Oral typhoid vaccine is inactivated by concomitant administration of antibacterials or antimalarials:

- Antibacterials should be avoided for 3 days before and after oral typhoid vaccination;
- Mefloquine* should be avoided for at least 12 hours before or after oral typhoid;
- For other antimalarials vaccination with oral typhoid vaccine should be completed at least 3 days before the first dose of the antimalarial (except proguanil hydrochloride with atovaquone, which may be given concomitantly).

### TYPHOID VACCINE

**Indications** immunisation against typhoid fever

**Cautions** section 14.1; **interactions**: see above and Appendix 1 (vaccines)

**Contra-indications** section 14.1; also for *oral vaccine*, acute gastro-intestinal illness

**Pregnancy** see p. 829

**Breast-feeding** see p. 829

**Side-effects** section 14.1

#### Dose

- See under preparations

#### Typhoid polysaccharide vaccine for injection

**Typherix**<sup>®</sup> (GSK) (PoM)

**Injection**, Vi capsular polysaccharide typhoid vaccine, 50 micrograms/mL virulence polysaccharide antigen of *Salmonella typhi*, net price 0.5-mL prefilled syringe = £9.93

**Dose by intramuscular injection**, 0.5 mL at least 2 weeks before potential exposure to typhoid infection; **CHILD** under 2 years (see notes above)

**Note** May be difficult to obtain

**Typhim Vi**<sup>®</sup> (Sanofi Pasteur) (PoM)

**Injection**, Vi capsular polysaccharide typhoid vaccine, 50 micrograms/mL virulence polysaccharide antigen of formaldehyde-inactivated *Salmonella typhi*, net price 0.5-mL prefilled syringe = £9.30

**Dose by intramuscular injection**, 0.5 mL, at least 2 weeks before potential exposure to typhoid infection **CHILD** under 2 years (see notes above)

### ▲ Polysaccharide vaccine with hepatitis A vaccine

See Hepatitis A Vaccine

### ▲ Typhoid vaccine, live (oral)

**Vivotif<sup>®</sup>** (Crucell) (PoM)

Capsules, e/c, live attenuated *Salmonella typhi* (Ty21a), net price 3-cap pack = £14.77. Label: 25, counselling, administration

**Dose** ADULT and CHILD over 6 years, 1 capsule on days 1, 3, and 5

**Counselling** Take one hour before a meal. Swallow as soon as possible after placing in mouth with a cold or lukewarm drink; it is important to store capsules in a refrigerator

## Varicella-zoster vaccines

The live varicella-zoster vaccines, *Varilrix<sup>®</sup>* and *Varivax<sup>®</sup>*, are licensed for immunisation against *varicella* (chickenpox) in seronegative individuals. They are not recommended for routine use in children, but can be given to seronegative healthy children over 1 year who come into close contact with individuals at high risk of severe varicella infections. The Department of Health recommends these vaccines for seronegative healthcare workers who come into direct contact with patients. Those with a history of chickenpox or shingles can be considered immune, but healthcare workers with a negative or uncertain history should be tested.

Rarely, the varicella-zoster vaccine virus has been transmitted from the vaccinated individual to close contacts. Therefore, contact with the following should be avoided if a vaccine-related cutaneous rash develops within 4–6 weeks of the first or second dose:

- varicella-susceptible pregnant women;
- individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy.

Healthcare workers who develop a generalised papular or vesicular rash on vaccination should avoid contact with patients until the lesions have crusted. Those who develop a localised rash after vaccination should cover the lesions and be allowed to continue working unless in contact with patients at high risk of severe varicella.

The high potency, live varicella-zoster vaccine, *Zostavax<sup>®</sup>*, is recommended for the prevention of *herpes zoster* (shingles) in adults 70 years of age, however, it can be given up to 80 years of age. A catch-up programme with *Zostavax<sup>®</sup>* will be offered from 1 September 2013 to all those born between 2 September 1933 and 1 September 1934. A single dose of *Zostavax<sup>®</sup>* is likely to give protection for at least 7 years, but the need for, or timing of, a booster dose has not been established. Although *Zostavax<sup>®</sup>* is not recommended for the treatment of shingles or post-herpetic neuralgia, it can be given to those with a previous history of shingles; ideally the vaccine should be delayed until systemic antiviral therapy has been completed.

**Varicella-zoster immunoglobulin** is used to protect susceptible individuals at increased risk of varicella infection, see p. 855.

## VARICELLA-ZOSTER VACCINE

**Indications** see notes above and preparations below

**Cautions** see section 14.1; also post-vaccination close-contact with susceptible individuals (see notes above)

**Contra-indications** see section 14.1

**Pregnancy** avoid pregnancy for 3 months after vaccination; see also p. 829

**Breast-feeding** see p. 829

**Side-effects** see section 14.1; also conjunctivitis and varicella-like rash; rarely thrombocytopenia

### Dose

- See under preparations

**Varilrix<sup>®</sup>** (GSK) (PoM)

**Injection**, powder for reconstitution, live attenuated varicella-zoster virus (Oka strain) propagated in human diploid cells, net price 0.5-mL vial (with diluent) = £27.31

**Excipients** include neomycin

**Dose** prevention of varicella infection (chickenpox), by **subcutaneous injection** preferably into deltoid region, ADULT and CHILD over 1 year (see notes above), 2 doses of 0.5 mL separated by an interval of at least 6 weeks (minimum 4 weeks)

**Varivax<sup>®</sup>** (Sanofi Pasteur) (PoM)

**Injection** powder for reconstitution, live attenuated varicella-zoster virus (Oka/Merck strain) propagated in human diploid cells, net price 0.5-mL vial (with diluent) = £30.28

**Excipients** include gelatin and neomycin

**Dose** prevention of varicella infection (chickenpox), by **intramuscular or subcutaneous injection** into deltoid region (or higher anterolateral thigh in children), ADULT and CHILD over 13 years (see notes above), 2 doses of 0.5 mL separated by 4–8 weeks; CHILD 1–13 years (see notes above) 2 doses of 0.5 mL separated by an interval of at least 4 weeks (two doses separated by 12 weeks in children with asymptomatic HIV infection)

**Zostavax<sup>®</sup>** (Sanofi Pasteur) (PoM)

**Injection**, powder for reconstitution, live attenuated varicella-zoster virus (Oka/Merck strain) propagated in human diploid cells, net price single-dose vial (with syringe containing diluent) = £99.96

**Excipients** include gelatin and neomycin

**Dose** prevention of herpes zoster (shingles), by **subcutaneous injection** preferably into deltoid region, ADULT 70–80 years, 0.65 mL as a single dose

**Note** Advice in BNF may differ from that in product literature

## Yellow fever vaccine

Live yellow fever vaccine is indicated for those travelling or living in areas where infection is endemic (see p. 857) and for laboratory staff who handle the virus or who handle clinical material from suspected cases. Infants under 6 months of age should not be vaccinated because there is a small risk of encephalitis; infants aged 6–9 months should be vaccinated only if the risk of yellow fever is high and unavoidable (seek expert advice). The immunity which probably lasts for life is officially accepted for 10 years starting from 10 days after primary immunisation and for a further 10 years immediately after revaccination.

Very rare, vaccine-associated adverse effects have been reported, such as viscerotropic disease (yellow fever vaccine-associated viscerotropic disease, YEL-AVD), a syndrome which may include metabolic acidosis, muscle and liver cytolysis, and multi-organ failure. Neurological disorders (yellow fever vaccine-associated neurotropic disease, YEL-AND) such as encephalitis have also been reported. These very rare adverse effects usually have occurred after the first dose of yellow fever vaccine in those with no previous immunity.

**Pregnancy** Live yellow fever vaccine should not be given during pregnancy because there is a theoretical

risk of fetal infection. Pregnant women should be advised not to travel to areas at high risk of yellow fever. If exposure cannot be avoided during pregnancy, then the vaccine should be given if the risk from disease in the mother outweighs the risk to the fetus from vaccination.

**Breast-feeding** Avoid; seek specialist advice if exposure to virus cannot be avoided.

## YELLOW FEVER VACCINE, LIVE

**Indications** immunisation against yellow fever

**Cautions** see section 14.1; also individuals over 60 years—greater risk of vaccine-associated adverse effects, see notes above

**Contra-indications** see section 14.1 and notes above; also children under 6 months; history of thymus dysfunction

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see section 14.1; also reported neurotropic disease and viscerotropic disease (see notes above)

### Dose

- By deep subcutaneous injection, ADULT and CHILD over 9 months, 0.5 mL (see also notes above)

### Yellow Fever Vaccine, Live (POM)

Yel(live)

**Injection**, powder for reconstitution, live, attenuated 17D-204 strain of yellow fever virus, cultivated in chick embryos; single dose vial with syringe containing 0.5 mL diluent

Available (only to designated Yellow Fever Vaccination centres) as *Stamari*<sup>®</sup>

## 14.5 Immunoglobulins

### 14.5.1 Normal immunoglobulin

### 14.5.2 Disease-specific immunoglobulins

### 14.5.3 Anti-D (Rh<sub>0</sub>) immunoglobulin

Two types of human immunoglobulin preparation are available, **normal immunoglobulin** and **disease-specific immunoglobulins**.

Human immunoglobulin is a sterile preparation of concentrated antibodies (immune globulins) recovered from pooled human plasma or serum obtained from outside the UK, tested and found non-reactive for hepatitis B surface antigen and for antibodies against hepatitis C virus and human immunodeficiency virus (types 1 and 2). A global shortage of human immunoglobulin and the rapidly increasing range of clinical indications for treatment with immunoglobulins has resulted in the need for a Demand Management programme in the UK (for further information consult [www.ivig.nhs.uk](http://www.ivig.nhs.uk) and *Clinical Guidelines for Immunoglobulin Use*, [www.gov.uk/dh](http://www.gov.uk/dh)).

Immunoglobulins of animal origin (antisera) were frequently associated with hypersensitivity reactions and are no longer used.

Further information on the use of immunoglobulins is included in the Health Protection Agency's *Immunoglobulin Handbook* [www.hpa.org.uk](http://www.hpa.org.uk), and in the Department of Health's publication, *Immunisation against Infectious Disease*, [www.gov.uk/dh](http://www.gov.uk/dh).

**Availability** Normal immunoglobulin for intramuscular administration is available from some regional Public Health laboratories for protection of contacts and the control of outbreaks of hepatitis A, measles, and rubella only. For other indications, subcutaneous or intravenous normal immunoglobulin should be purchased from the manufacturer.

**Disease-specific immunoglobulins** (section 14.5.2) are available from some regional Public Health laboratories, with the exception of **tetanus immunoglobulin** which is available from BPL, hospital pharmacies, or blood transfusion departments. **Rabies immunoglobulin** is available from the Specialist and Reference Microbiology Division, Public Health England, Colindale. **Hepatitis B immunoglobulin** required by transplant centres should be obtained commercially.

In Scotland all immunoglobulins are available from the *Scottish National Blood Transfusion Service* (SNBTS).

In Wales all immunoglobulins are available from the *Welsh Blood Service* (WBS).

In Northern Ireland all immunoglobulins are available from the *Northern Ireland Blood Transfusion Service* (NIBTS).

## 14.5.1 Normal immunoglobulin

Human **normal immunoglobulin** ('HNIG') is prepared from pools of at least 1000 donations of human plasma; it contains immunoglobulin G (IgG) and antibodies to hepatitis A, measles, mumps, rubella, varicella, and other viruses that are currently prevalent in the general population.

Normal immunoglobulin may **interfere with the immune response to live virus vaccines** which should therefore only be given **at least 3 weeks before or 3 months after** an injection of normal immunoglobulin (this does not apply to yellow fever vaccine since normal immunoglobulin does not contain antibody to this virus).

**Uses** Normal immunoglobulin (containing 10%–18% protein) is administered by *intramuscular injection* for the protection of susceptible contacts against **hepatitis A virus** (infectious hepatitis), **measles** and, to a lesser extent, **rubella**. Injection of immunoglobulin produces immediate protection lasting several weeks.

Normal immunoglobulin (containing 3%–12% protein) for *intravenous administration* is used as *replacement therapy* for patients with congenital agammaglobulinemia and hypogammaglobulinaemia, and for the short-term treatment of idiopathic thrombocytopenic purpura and Kawasaki disease; it is also used for the prophylaxis of infection following bone-marrow transplantation and in children with symptomatic HIV infection who have recurrent bacterial infections. Normal immunoglobulin for replacement therapy may also be given intramuscularly or subcutaneously, but intravenous formulations are normally preferred. Intravenous immunoglobulin is also used in the treatment of Guillain-Barré syndrome as an alternative to plasma exchange.

For guidance on the use of intravenous normal immunoglobulins and alternative therapies for certain conditions, consult *Clinical Guidelines for Immunoglobulin Use* ([www.gov.uk/dh](http://www.gov.uk/dh)).

**Hepatitis A** Hepatitis A vaccine is preferred for individuals at risk of infection (see p. 836) including those visiting areas where the disease is highly endemic (all countries excluding Northern and Western Europe, North America, Japan, Australia, and New Zealand). In unimmunised individuals, transmission of hepatitis A is reduced by good hygiene. Intramuscular normal immunoglobulin is no longer recommended for routine prophylaxis in travellers, but it may be indicated for immunocompromised patients if their antibody response to the vaccine is unlikely to be adequate.

Intramuscular normal immunoglobulin is recommended for prevention of infection in close contacts (of confirmed cases of hepatitis A) who have chronic liver disease or HIV infection, or who are immunosuppressed or over 50 years of age; normal immunoglobulin should be given as soon as possible, preferably within 14 days of exposure to the primary case. However, normal immunoglobulin can still be given to contacts at risk of severe disease up to 28 days after exposure to the primary case. Hepatitis A vaccine can be given at the same time, but it should be given at a separate injection site.

**Measles** Intravenous or subcutaneous normal immunoglobulin may be given to prevent or attenuate an attack of measles in individuals who do not have adequate immunity. Children and adults with compromised immunity who have come into contact with measles should receive intravenous or subcutaneous normal immunoglobulin as soon as possible after exposure. It is most effective if given within 72 hours but can be effective if given within 6 days.

Subcutaneous or intramuscular normal immunoglobulin should also be considered for the following individuals if they have been in contact with a confirmed case of measles or with a person associated with a local outbreak:

- non-immune pregnant women;
- infants under 9 months.

Further advice should be sought from the Centre for Infections, Public Health England (tel. (020) 8200 6868).

Individuals with normal immunity who are not in the above categories and who have not been fully immunised against measles, can be given MMR vaccine (section 14.4) for prophylaxis following exposure to measles.

**Rubella** Intramuscular immunoglobulin after exposure to rubella does **not** prevent infection in non-immune contacts and is **not** recommended for protection of pregnant women exposed to rubella. It may, however, reduce the likelihood of a clinical attack which may possibly reduce the risk to the fetus. Risk of intrauterine transmission is greatest in the first 11 weeks of pregnancy, between 16 and 20 weeks there is minimal risk of deafness only, after 20 weeks there is no increased risk. Intramuscular normal immunoglobulin should be used only if termination of pregnancy would be unacceptable to the pregnant woman—it should be given as soon as possible after exposure. Serological follow-up of recipients is essential to determine if the woman has become infected despite receiving immunoglobulin.

For routine prophylaxis against Rubella, see MMR vaccine (p. 842).

## NORMAL IMMUNOGLOBULIN

**Indications** see notes above

**Cautions** hypo- or agammaglobulinaemia with or without IgA deficiency; interference with live virus vaccines—see p. 852

**Intravenous use** thrombophilic disorders, or risk factors for arterial or venous thromboembolic events; obesity; ensure adequate hydration, renal insufficiency

**Contra-indications** patients with selective IgA deficiency who have known antibody against IgA

**Renal impairment** monitor for acute renal failure; consider discontinuation if renal function deteriorates. Intravenous preparations with added sucrose have been associated with cases of renal dysfunction and acute renal failure

**Side-effects** nausea, diarrhoea, chills, fever, headache, dizziness, arthralgia, myalgia, muscle spasms, low back pain; *rarely* hypotension, anaphylaxis, cutaneous skin reactions, aseptic meningitis, acute renal failure; also reported with *intravenous use*, injection site reactions, abdominal pain and distension, blood pressure fluctuations, haemolytic anaemia, thromboembolic events including myocardial infarction, stroke, pulmonary embolism, and deep vein thrombosis

**Note** Adverse reactions are more likely to occur in patients receiving normal immunoglobulin for the first time, or following a prolonged period between treatments, or when a different brand of normal immunoglobulin is administered.

### Dose

- See under preparations

**Note** Antibody titres can vary widely between normal immunoglobulin preparations from different manufacturers—formulations are **not interchangeable**; patients should be maintained on the same formulation throughout long-term treatment to avoid adverse effects

### For intramuscular use

#### Normal Immunoglobulin <sup>(POM)</sup>

Normal immunoglobulin injection. 250-mg vial; 750-mg vial

**Dose by deep intramuscular injection**, to control outbreaks of hepatitis A (see notes above), 500 mg; **CHILD** under 10 years 250 mg

Rubella in pregnancy, prevention of clinical attack, 750 mg Available from the Centre for Infections and other regional Health Protection Agency offices (for contacts and control of outbreaks only, see above)

### For subcutaneous use

#### Gammanorm<sup>®</sup> (Octapharma) <sup>(POM)</sup>

Normal immunoglobulin (protein 16.5%) injection, net price 1.65 g (10 mL) = £96.77, 3.3 g (20 mL) = £193.55

**Electrolytes** Na<sup>+</sup> 1.09 mmol/10-mL vial

**Dose by subcutaneous infusion**, antibody deficiency syndromes, consult product literature

**Note** May be administered by intramuscular injection (if subcutaneous route not possible) but **not** for patients with thrombocytopenia or other bleeding disorders

#### Hizentra<sup>®</sup> (CSL Behring) <sup>(POM)</sup>

Normal immunoglobulin (protein 20%) injection, net price 1 g (5 mL) = £45.90, 2 g (10 mL) = £91.80, 4 g (20 mL) = £183.60

**Note** Contains L-proline; contra-indicated in patients with hyperprolinaemia

**Dose by subcutaneous infusion**, antibody deficiency syndromes, consult product literature

**Subcuvia**<sup>®</sup> (Baxter) (PoM)

Normal immunoglobulin (protein 16%) injection, net price 800 mg (5 mL) = £32.56, 1.6 g (10 mL) = £65.12

**Dose** by subcutaneous infusion, **ADULT** and **CHILD** over 12 years antibody deficiency syndromes, consult product literature

**Note** May be administered by intramuscular injection (if subcutaneous route not possible) but **not** for patients with thrombocytopenia or other bleeding disorders

**Subgam**<sup>®</sup> (BPL) (PoM)

Normal immunoglobulin (protein 14%–18%) injection, net price 250-mg vial = £11.20, 750-mg vial = £34.20, 1.5-g vial = £68.40

**Dose** by subcutaneous infusion, antibody deficiency syndromes, consult product literature

By intramuscular injection, Hepatitis A prophylaxis in outbreaks (see notes above), **ADULT** and **CHILD** over 10 years, 750 mg, **CHILD** under 10 years, 500 mg  
Rubella, in pregnancy, prevention of clinical attack (see also notes above), 750 mg

**Note** *Subgam*<sup>®</sup> is not licensed for prophylactic use, but due to difficulty in obtaining suitable immunoglobulin products, the Health Protection Agency recommends intramuscular use for prophylaxis against Hepatitis A or rubella

▲ **For intravenous use**

**Note** Dose recommendation for Kawasaki disease, see *BNF for Children*; other indications—consult product literature for dosage regimens

**Aragam**<sup>®</sup> (Oxbridge) (PoM)

Intravenous infusion, human normal immunoglobulin, protein 5%, net price 2.5 g (50 mL) = £145.00, 5 g (100 mL) = £290.00, 10 g (200 mL) = £580.00, 20 g (400 mL) = £1160.00

**Excipients** include glucose 50 mg/mL

**Flebogamma**<sup>®</sup> DIF (Grifols) (PoM)

Intravenous infusion, human normal immunoglobulin, protein 5%, net price 0.5 g (10 mL) = £30.00, 2.5 g (50 mL) = £150.00, 5 g (100 mL) = £300.00, 10 g (200 mL) = £600.00, 20 g (400 mL) = £1200.00; protein 10%, 5 g (50 mL) = £300.00, 10 g (100 mL) = £600.00, 20 g (200 mL) = £1200.00

**Note** Both strengths contain sorbitol 50 mg/mL; contra-indicated in patients with hereditary fructose intolerance

**Gammagard S/D**<sup>®</sup> (Baxter) (PoM)

Intravenous infusion, (providing protein 5% or 10%), net price 5 g (with diluent) = £200.50, 10 g (with diluent) = £401.00

**Gammaplex**<sup>®</sup> (BPL) (PoM)

Intravenous infusion, human normal immunoglobulin (protein 5%), net price 2.5 g (50 mL) = £104.50, 5 g (100 mL) = £209.00, 10 g (200 mL) = £418.00

**Note** Contains sorbitol 50 mg/mL, contra-indicated in patients with hereditary fructose intolerance

**Gamunex**<sup>®</sup> (Grifols) (PoM)

Intravenous infusion, human normal immunoglobulin (protein 10%), net price 5 g (50 mL) = £250.00, 10 g (100 mL) = £500.00, 20 g (200 mL) = £1000.00

**Note** Use Glucose 5% intravenous infusion if dilution prior to infusion is required

**Intratect**<sup>®</sup> (Biotest UK) (PoM)

Intravenous infusion, human normal immunoglobulin, protein 5%, net price 1 g (20 mL) = £45.00, 2.5 g (50 mL) = £112.50, 5 g (100 mL) = £225.00, 10 g (200 mL) = £450.00; protein 10%, 1 g (10 mL) = £45.00, 5 g (50 mL) = £225.00, 10 g (100 mL) = £450.00, 20 g (200 mL) = £900.00

**Kiovig**<sup>®</sup> (Baxter) (PoM)

Intravenous infusion, human normal immunoglobulin (protein 10%), net price 1 g (10 mL) = £49.00, 2.5 g (25 mL) = £122.50, 5 g (50 mL) = £245.00, 10 g (100 mL) = £490.00, 20 g (200 mL) = £980.00, 30 g (300 mL) = £1470.00

**Note** Use Glucose 5% intravenous infusion, if dilution prior to administration is required

**Octagam**<sup>®</sup> (Octapharma) (PoM)

Intravenous infusion, human normal immunoglobulin, protein 5%, net price 2.5 g (50 mL) = £1.02, 5 g (100 mL) = £2.04, 10 g (200 mL) = £4.08; protein 10%, 2 g (20 mL) = £117.30, 5 g (50 mL) = £293.25, 10 g (100 mL) = £586.50, 20 g (200 mL) = £1173.00

**Note** Contains maltose (may cause falsely elevated results with blood glucose testing systems)

**Privigen**<sup>®</sup> (CSL Behring) (PoM)

Intravenous infusion, human normal immunoglobulin (protein 10%), net price 2.5 g (25 mL) = £114.75, 5 g (50 mL) = £229.50, 10 g (100 mL) = £459.00, 20 g (200 mL) = £918.00

**Note** Contains L-proline; contra-indicated in patients with hyperprolinaemia

**Vigam**<sup>®</sup> (BPL) (PoM)

Intravenous infusion, human normal immunoglobulin (protein 5%), net price 2.5 g (50 mL) = £95.00, 5 g (100 mL) = £209.00, 10 g (200 mL) = £418.00

**Note** Contains sucrose (see Renal impairment, above)

## 14.5.2 Disease-specific immunoglobulins

Specific immunoglobulins are prepared by pooling the plasma of selected human donors with high levels of the specific antibody required. For further information, see Immunoglobulin Handbook ([www.hpa.org.uk](http://www.hpa.org.uk)).

There are no specific immunoglobulins for hepatitis A, measles, or rubella—normal immunoglobulin, section 14.5.1 is used in certain circumstances. There is no specific immunoglobulin for mumps; neither normal immunoglobulin nor MMR vaccine is effective as post-exposure prophylaxis.

### Hepatitis B

Disease-specific hepatitis B immunoglobulin ('HBIG') is available for use in association with hepatitis B vaccine for the prevention of infection in laboratory and other personnel who have been accidentally inoculated with hepatitis B virus, and in infants born to mothers who have become infected with this virus in pregnancy or who are high-risk carriers (see Hepatitis B Vaccine, p. 838). Hepatitis B immunoglobulin will not inhibit the antibody response when given at the same time as hepatitis B vaccine but should be given at different sites.

An intravenous and subcutaneous preparation of hepatitis B-specific immunoglobulin is licensed for the prevention of hepatitis B recurrence in HBV-DNA negative patients who have undergone liver transplantation for liver failure caused by the virus.

### HEPATITIS B IMMUNOGLOBULIN

**Indications** prophylaxis against hepatitis B infection

**Cautions** IgA deficiency; interference with live virus vaccines see under Normal Immunoglobulin, p. 852.

**Side-effects** injection site reactions; less frequently, buccal ulceration, glossitis, abdominal pain, chest pain, dyspnoea, anaphylaxis, tremor, dizziness, headache, arthralgia; for side-effects associated with intravenous immunoglobulin, see section 14.5.1

#### Dose

- See under preparations and see also notes above

#### For intramuscular use

##### Hepatitis B Immunoglobulin (PoM)

**Injection**, hepatitis B-specific immunoglobulin, 100 units/mL. Vials containing 200 units or 500 units, available from selected Health Protection Agency and NHS laboratories (except for Transplant Centres, see p. 852), also available from BPL

**Dose** by intramuscular injection (as soon as possible after exposure; ideally within 12–48 hours, but no later than 7 days after exposure), **ADULT** and **CHILD** over 10 years 500 units; **CHILD** under 5 years 200 units, 5–9 years 300 units; **NEONATE** 200 units

Prevention of transmitted infection at birth, **NEONATE** 200 units as soon as possible after birth; for full details consult *Immunisation against Infectious Disease* ([www.dh.gov.uk](http://www.dh.gov.uk))

#### For intravenous use

##### Hepatect<sup>®</sup> CP (Biotest UK) (PoM)

**Intravenous infusion**, hepatitis B-specific immunoglobulin 50 units/mL, net price 500 units (10 mL) = £300.00, 2000 units (40 mL) = £1100.00, 5000 units (100 mL) = £3000.00

**Dose** by intravenous infusion, after exposure to hepatitis B virus-contaminated material—consult product literature  
Prevention of transmitted infection at birth—consult product literature

Prevention of hepatitis B in haemodialysed patients, prophylaxis against re-infection of transplanted liver—consult product literature

#### For subcutaneous use

##### Zutectra<sup>®</sup> (Biotest UK) (PoM)

**Injection**, hepatitis B-specific immunoglobulin, 500 units/mL, net price 5 × 1-mL prefilled syringes = £1500.00

**Dose** prevention of hepatitis B re-infection more than 6 months after liver transplantation in stable HBV-DNA negative patients starting 2–3 weeks after last dose of intravenous hepatitis B immunoglobulin, by subcutaneous injection, **ADULT** body-weight under 75 kg 500 units once weekly, increased if necessary up to 1000 units once weekly; body-weight over 75 kg 1000 units once weekly

## Rabies

Following exposure of an unimmunised individual to an animal in or from a country where the risk of rabies is high the site of the bite should be washed with soapy water and specific rabies immunoglobulin of human origin administered. All of the dose should be injected around the site of the wound; if this is difficult or the wound has completely healed it can be given in the anterolateral thigh (remote from the site used for vaccination).

Rabies vaccine should also be given intramuscularly at a different site (for details see Rabies vaccine p. 847). If there is delay in giving the rabies immunoglobulin, it should be given within 7 days of starting the course of rabies vaccine.

## RABIES IMMUNOGLOBULIN

**Indications** post-exposure prophylaxis against rabies infection

**Cautions** IgA deficiency; interference with live virus vaccines—see p. 852 under Normal Immunoglobulin

**Side-effects** injection site swelling and pain; very rarely anaphylaxis; buccal ulceration, glossitis, chest tightness, dyspnoea, tremor, dizziness, arthralgia, and facial oedema also reported

#### Dose

- See under preparation

##### Rabies Immunoglobulin (PoM)

(Antirabies Immunoglobulin Injection)

See notes above

**Dose** 20 units/kg by infiltration in and around the cleansed wound; if wound not visible or healed or if infiltration of whole volume not possible, give remainder by intramuscular injection into anterolateral thigh (remote from vaccination site)

**Note** The potency of individual batches of rabies immunoglobulin from the manufacturer may vary; potency may also be described differently by different manufacturers. It is therefore critical to know the potency of the batch to be used and the weight of the patient in order to calculate the specific volume required to provide the necessary dose  
Available from Specialist and Reference Microbiology Division, Public Health England (see section 14.5 under availability) (also from BPL)

## Tetanus

For the management of tetanus-prone wounds, tetanus immunoglobulin should be used in addition to wound cleansing and, where appropriate, antibacterial prophylaxis and a tetanus-containing vaccine (see Diphtheria-containing Vaccines, section 14.4). Tetanus immunoglobulin, together with metronidazole (section 5.1.11) and wound cleansing, should also be used for the treatment of established cases of tetanus.

## TETANUS IMMUNOGLOBULIN

**Indications** post-exposure prophylaxis and treatment of tetanus infection

**Cautions** IgA deficiency; interference with live virus vaccines—see p. 852

**Side-effects** injection site swelling and pain; rarely anaphylaxis

#### Dose

- Post-exposure prophylaxis, by intramuscular injection 250 units, increased to 500 units if more than 24 hours have elapsed or there is risk of heavy contamination or following burns
- Treatment of tetanus infection, by intramuscular injection 150 units/kg (multiple sites)

##### Tetanus Immunoglobulin (PoM)

(Antitetanus Immunoglobulin Injection)

Available from BPL

**Note** May be difficult to obtain

## Varicella–zoster

Varicella–zoster immunoglobulin (VZIG) is recommended for individuals who are at increased risk of severe varicella and who have no antibodies to vari-

cella-zoster virus *and* who have significant exposure to chickenpox or herpes zoster. Those at increased risk include:

- neonates whose mothers develop chickenpox in the period 7 days before to 7 days after delivery;
- susceptible neonates exposed in the first 7 days of life;
- susceptible neonates or infants exposed whilst requiring intensive or prolonged special care nursing;
- susceptible women exposed at any stage of pregnancy (but when supplies of VZIG are short, may only be issued to those exposed in the first 20 weeks' gestation or to those near term) providing VZIG is given within 10 days of contact;
- immunocompromised individuals including those who have received corticosteroids in the previous 3 months at the following dose equivalents of prednisolone; *children* 2 mg/kg daily for at least 1 week or 1 mg/kg daily for 1 month; *adults* about 40 mg daily for more than 1 week.

**Important:** for full details consult *Immunisation against Infectious Disease*. **Varicella-zoster vaccine** is available—see section 14.4. For treatment of varicella-zoster infections, see section 5.3.2.1

## VARICELLA-ZOSTER IMMUNOGLOBULIN

**Indications** prophylaxis against varicella infection

**Cautions** IgA deficiency; interference with live virus vaccines—see p. 852

**Side-effects** injection site swelling and pain; *rarely* anaphylaxis

### Dose

- **By intramuscular injection**, prophylaxis (as soon as possible—not later than 10 days after exposure), **ADULT** and **CHILD** over 14 years, 1 g; **NEONATE, INFANT** and **CHILD** up to 5 years 250 mg, 5–10 years 500 mg, 10–14 years 750 mg; give second dose if further exposure occurs more than 3 weeks after first dose
- Note** No evidence that effective in treatment of severe disease. Normal immunoglobulin for intravenous use (section 14.5.1) may be used in those unable to receive intramuscular injections

### Varicella-Zoster Immunoglobulin (PoM) (Antivaricella-zoster Immunoglobulin)

Available from selected Health Protection Agency and NHS laboratories; (see section 14.5 under Availability); also from BPL

## 14.5.3 Anti-D (Rh<sub>0</sub>) immunoglobulin

Anti-D (Rh<sub>0</sub>) immunoglobulin is prepared from plasma taken from rhesus-negative donors who have been immunised against the anti-D-antigen. Anti-D (Rh<sub>0</sub>) immunoglobulin is used to prevent a rhesus-negative mother from forming antibodies to fetal rhesus-positive cells which may pass into the maternal circulation. The objective is to protect any subsequent child from the hazard of haemolytic disease of the newborn.

Anti-D immunoglobulin should be administered to the mother following any sensitising episode (e.g. abortion,

miscarriage and birth); it should be injected within 72 hours of the episode but even if a longer period has elapsed it may still give protection and should be administered. Anti-D (Rh<sub>0</sub>) immunoglobulin is also given when significant fetomaternal haemorrhage occurs in rhesus-negative women during delivery. The dose of anti-D immunoglobulin is determined according to the level of exposure to rhesus-positive blood.

For routine antenatal prophylaxis NICE recommends that two doses of either 500 units or 1000–1650 units of anti-D immunoglobulin should be given, the first at 28 weeks' gestation and the second at 34 weeks; alternatively a single dose of 1500 units given between 28 and 30 weeks gestation can be used (see also NICE guidance below).

Use of routine *antenatal* anti-D prophylaxis should be given irrespective of previous anti-D prophylaxis for a sensitising event early in the same pregnancy. Similarly, *postpartum* anti-D prophylaxis should be given irrespective of previous routine antenatal anti-D prophylaxis or antenatal anti-D prophylaxis for a sensitising event in the same pregnancy.

### NICE guidance

#### Routine antenatal anti-D prophylaxis for rhesus-negative women (August 2008)

Routine antenatal anti-D prophylaxis should be offered to all non-sensitised pregnant women who are rhesus negative.

[www.nice.org.uk/TA156](http://www.nice.org.uk/TA156)

### MMR vaccine

MMR vaccine may be given in the postpartum period with anti-D (Rh<sub>0</sub>) immunoglobulin injection provided that separate syringes are used and the products are administered into different limbs. If blood is transfused, the antibody response to the vaccine may be inhibited—measure rubella antibodies after 6–8 weeks and revaccinate if necessary.

Anti-D (Rh<sub>0</sub>) immunoglobulin is also given to women of child-bearing potential after the inadvertent transfusion of rhesus-incompatible blood components and is used for the treatment of idiopathic thrombocytopenia purpura.

## ANTI-D (Rh<sub>0</sub>) IMMUNOGLOBULIN

**Indications** see notes above

**Cautions** immunoglobulin A deficiency; possible interference with live virus vaccines, see under p. 852, but see notes above about administration with MMR vaccine

**Contra-indications** treatment of idiopathic thrombocytopenia purpura in rhesus negative or splenectomised patients

**Side-effects** nausea, vomiting, diarrhoea, abdominal pain; hypotension, hypertension, headache, fever, malaise, asthenia, drowsiness, dizziness, back pain, arthralgia, myalgia; pruritus, rash, sweating, injection site pain; *rarely* tachycardia, anaphylaxis, dyspnoea, hypotension, and urticaria; (for side-effects associated with *intravenous* immunoglobulins, see section 14.5.1

### Dose

- See preparations below

**Anti-D (Rh<sub>0</sub>) Immunoglobulin** (POM)

**Injection**, anti-D (Rh<sub>0</sub>) immunoglobulin, net price 250-unit vial = £23.75, 500-unit vial = £33.75, 1500-unit vial = £58.00, 2500-unit vial = £94.40

**Dose** by deep intramuscular injection, to rhesus-negative woman for prevention of Rh<sub>0</sub>(D) sensitisation:

Following birth of rhesus-positive infant, 500 units immediately or within 72 hours; for transplacental bleed of over 4 mL fetal red cells, extra 100–125 units per mL fetal red cells

Following any potentially sensitising episode (e.g. stillbirth, abortion, amniocentesis) up to 20 weeks' gestation 250 units per episode (after 20 weeks, 500 units) immediately or within 72 hours

Antenatal prophylaxis, 500 units given at weeks 28 and 34 of pregnancy; if infant rhesus-positive, a further dose is still needed immediately or within 72 hours of delivery

Following Rh<sub>0</sub>(D) incompatible blood transfusion, 100–125 units per mL transfused rhesus-positive red cells

**Note** Subcutaneous route used for patients with bleeding disorders

Available from Blood Centres and from BPL (*D-Gam*®)

**Rhophylac**® (CSL Behring) (POM)

**Injection**, anti-D (Rh<sub>0</sub>) immunoglobulin 750 units/ mL (150 micrograms/mL), net price 2-mL (1500-unit) prefilled syringe = £39.52.

**Dose** by intramuscular or intravenous injection, to rhesus-negative woman for prevention of Rh<sub>0</sub>(D) sensitisation:

Following birth of rhesus-positive infant, 1000–1500 units immediately or within 72 hours; for large transplacental bleed, extra 100 units per mL fetal red cells (preferably by intravenous injection)

Following any potentially sensitising episode (e.g. abortion, amniocentesis, chorionic villous sampling) up to 12 weeks' gestation 1000 units per episode (after 12 weeks, higher doses may be required) immediately or within 72 hours

Antenatal prophylaxis, 1500 units given between weeks 28–30 of pregnancy; if infant rhesus-positive, a further dose is still needed immediately or within 72 hours of delivery

Following Rh<sub>0</sub>(D) incompatible blood transfusion, by intravenous injection, 50 units per mL transfused rhesus-positive blood (or 100 units per mL of erythrocyte concentrate)

**Note** Intravenous route recommended for patients with bleeding disorders.

## 14.6 International travel

**Note** For advice on malaria chemoprophylaxis, see section 5.4.1.

No special immunisation is required for travellers to the United States, Europe, Australia, or New Zealand, although all travellers should have immunity to tetanus and poliomyelitis (and childhood immunisations should be up to date); see also Tick-borne Encephalitis, p. 850. Certain special precautions are required in non-European areas surrounding the Mediterranean, in Africa, the Middle East, Asia, and South America.

Travellers to areas that have a high incidence of poliomyelitis or tuberculosis should be immunised with the appropriate vaccine; in the case of poliomyelitis previously immunised adults may be given a booster dose of a preparation containing inactivated poliomyelitis vaccine (see p. 847). BCG immunisation (see p. 832) is recommended for travellers aged under 16 years<sup>1</sup> proposing to stay for longer than 3 months (or in close

contact with the local population) in countries with an incidence of tuberculosis greater than 40 per 100 000<sup>2</sup>; it should preferably be given 3 months or more before departure.

**Yellow fever immunisation** (see p. 851) is recommended for travel to the endemic zones of Africa and South America. Many countries require an International Certificate of Vaccination from individuals arriving from, or who have been travelling through, endemic areas; other countries require a certificate from all entering travellers (consult the Department of Health handbook, *Health Information for Overseas Travel*, [www.dh.gov.uk](http://www.dh.gov.uk)).

Immunisation against meningococcal meningitis is recommended for a number of areas of the world (for details, see p. 844).

Protection against hepatitis A is recommended for travellers to high-risk areas outside Northern and Western Europe, North America, Japan, Australia and New Zealand. Hepatitis A vaccine (see p. 836) is preferred and it is likely to be effective even if given shortly before departure; normal immunoglobulin is no longer given routinely but may be indicated in the immunocompromised (see p. 853). Special care must also be taken with food hygiene (see below).

**Hepatitis B vaccine** (see p. 838) is recommended for those travelling to areas of high or intermediate prevalence who intend to seek employment as healthcare workers or who plan to remain there for lengthy periods and who may therefore be at increased risk of acquiring infection as the result of medical or dental procedures carried out in those countries. Short-term tourists or business travellers are not generally at increased risk of infection but may put themselves at risk by their sexual behaviour when abroad.

Prophylactic immunisation against rabies (see p. 847) is recommended for travellers to enzootic areas on long journeys or to areas out of reach of immediate medical attention.

Travellers who have not had a tetanus booster in the last 10 years and are visiting areas where medical attention may not be accessible should receive a booster dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine (see p. 834), even if they have received 5 doses of a tetanus-containing vaccine previously.

**Typhoid vaccine** (see p. 850) is indicated for travellers to countries where typhoid is endemic, but the vaccine is no substitute for personal precautions (see below).

There is no requirement for cholera vaccination as a condition for entry into any country, but oral cholera vaccine (see p. 833) should be considered for backpackers and those travelling to situations where the risk is greatest (e.g. refugee camps). Regardless of vaccination, travellers to areas where cholera is endemic should take special care with food hygiene (see below).

Advice on diphtheria (see p. 834), on Japanese encephalitis (see p. 842), and on tick-borne encephalitis (see p. 850) is included in *Health Information for Overseas Travel*, see below.

1. There is inadequate evidence of protection by BCG vaccine in adults aged over 35 years; however, vaccination is recommended for healthcare workers irrespective of age because of the increased risk to them or their patients

2. List of countries where the incidence of tuberculosis is greater than 40 cases per 100 000 is available at [www.hpa.org.uk](http://www.hpa.org.uk)

**Food hygiene** In areas where sanitation is poor, good food hygiene is important to help prevent hepatitis A, typhoid, cholera, and other diarrhoeal diseases (including travellers' diarrhoea). Food should be freshly prepared and hot, and uncooked vegetables (including green salads) should be avoided; only fruits which can be peeled should be eaten. Only suitable bottled water, or tap water that has been boiled or treated with sterilising tablets, should be used for drinking.

#### Information on health advice for travellers

Health professionals and travellers can find the latest information on immunisation requirements and precautions for avoiding disease while travelling from:

[www.nathnac.org](http://www.nathnac.org)

The handbook, *Health Information for Overseas Travel* (2010), which draws together essential information for healthcare professionals regarding health advice for travellers, can also be obtained from this website.

Immunisation requirements change from time to time, and information on the current requirements for any particular country may be obtained from the embassy or legation of the appropriate country or from:

National Travel Health Network and Centre  
UCLH NHS Foundation Trust

# 15 Anaesthesia

<b>15.1</b>	<b>General anaesthesia</b>	<b>859</b>
15.1.1	Intravenous anaesthetics	860
15.1.2	Inhalational anaesthetics	863
15.1.3	Antimuscarinic drugs	864
15.1.4	Sedative and analgesic peri-operative drugs	866
15.1.4.1	Benzodiazepines	866
15.1.4.2	Non-opioid analgesics	868
15.1.4.3	Opioid analgesics	869
15.1.4.4	Other drugs for sedation	870
15.1.5	Neuromuscular blocking drugs	871
15.1.6	Drugs for reversal of neuromuscular blockade	874
15.1.7	Antagonists for central and respiratory depression	875
15.1.8	Drugs for malignant hyperthermia	876
<b>15.2</b>	<b>Local anaesthesia</b>	<b>876</b>

## 15.1 General anaesthesia

15.1.1	Intravenous anaesthetics
15.1.2	Inhalational anaesthetics
15.1.3	Antimuscarinic drugs
15.1.4	Sedative and analgesic peri-operative drugs
15.1.5	Neuromuscular blocking drugs
15.1.6	Drugs for reversal of neuromuscular blockade
15.1.7	Antagonists for central and respiratory depression
15.1.8	Drugs for malignant hyperthermia

### Important

The drugs in section 15.1 should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

Several different types of drug are given together during general anaesthesia. Anaesthesia is induced with either a volatile drug given by inhalation (section 15.1.2) or with an intravenously administered drug (section 15.1.1); anaesthesia is maintained with an intravenous or inhalational anaesthetic. Analgesics (section 15.1.4), usually short-acting opioids, are also used. The use of neuromuscular blocking drugs (section 15.1.5) necessitates intermittent positive-pressure ventilation. Following surgery, anticholinesterases (section 15.1.6) can be given to reverse the effects of neuromuscular blocking drugs; specific antagonists (section 15.1.7) can be used to reverse central and respiratory depression caused by some drugs used in surgery. A local topical anaesthetic (section 15.2) can be used to reduce pain at the injection site.

Individual requirements vary considerably and the recommended doses are only a guide. Smaller doses are indicated in ill, shocked, or debilitated patients and in significant hepatic impairment, while robust individuals may require larger doses. The required dose of induction agent may be less if the patient has been premedicated with a sedative agent or if an opioid analgesic has been used.

**Surgery and long-term medication** The risk of losing disease control on stopping long-term medication before surgery is often greater than the risk posed by continuing it during surgery. It is vital that the anaesthetist knows about all drugs that a patient is (or has been) taking.

Patients with adrenal atrophy resulting from long-term corticosteroid use (section 6.3.2) may suffer a precipitous fall in blood pressure unless corticosteroid cover is provided during anaesthesia and in the immediate post-operative period. Anaesthetists must therefore know whether a patient is, or has been, receiving corticosteroids (including high-dose inhaled corticosteroids).

Other drugs that should normally not be stopped before surgery include antiepileptics, antiparkinsonian drugs, antipsychotics, anxiolytics, bronchodilators, cardiovascular drugs (but see potassium-sparing diuretics, angiotensin-converting enzyme inhibitors, and angiotensin-II receptor antagonists below), glaucoma drugs, immunosuppressants, drugs of dependence, and thyroid or anti-thyroid drugs. Expert advice is required for patients receiving antivirals for HIV infection. For general advice on surgery in diabetic patients see section 6.1.1, p. 457.

Patients taking antiplatelet medication or an oral anticoagulant present an increased risk for surgery. In these circumstances, the anaesthetist and surgeon should assess the relative risks and decide jointly whether the antiplatelet or the anticoagulant drug should be stopped or replaced with unfractionated or low molecular weight heparin therapy.

Drugs that should be stopped before surgery include combined oral contraceptives (see Surgery, section 7.3.1 for details); for advice on hormone replacement therapy, see section 6.4.1.1. If antidepressants need to be stopped, they should be withdrawn gradually to avoid withdrawal symptoms. MAOIs can have important interactions with some drugs used during surgery, such as pethidine (for interactions of MAOIs, see Appendix 1, MAOIs). Tricyclic antidepressants need not be stopped, but there may be an increased risk of arrhythmias and hypotension (and dangerous interactions with vasopressor drugs); therefore, the anaesthetist should be informed if they are not stopped. Lithium should be stopped 24 hours before major surgery but the normal dose can be continued for minor surgery (with careful monitoring of fluids and electrolytes). Potassium-sparing diuretics may need to be withheld on the morning of surgery because hyperkalaemia may develop if renal perfusion is impaired or if there is tissue damage. Angiotensin-converting enzyme (ACE) inhibitors and angiotensin-II receptor antagonists can be associated with severe hypotension after induction of anaesthesia; these drugs may need to be discontinued 24 hours before surgery. Herbal medicines may be associated with adverse effects when given with anaesthetic drugs and consideration should be given to stopping them before surgery.

**Anaesthesia and driving** Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving afterwards. For intravenous benzodiazepines and for a short general anaesthetic the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

**Prophylaxis of acid aspiration** Regurgitation and aspiration of gastric contents (Mendelson's syndrome) can be an important complication of general anaesthesia, particularly in obstetrics and during emergency surgery, and requires prophylaxis against acid aspiration. Prophylaxis is also needed in those with gastro-oesophageal reflux disease and in circumstances where gastric emptying may be delayed.

A **H<sub>2</sub>-receptor antagonist** (section 1.3.1) can be used before surgery to increase the pH and reduce the volume of gastric fluid. It does not affect the pH of fluid already in the stomach and this limits its value in emergency procedures; an oral H<sub>2</sub>-receptor antagonist can be given 1–2 hours before the procedure. Antacids are frequently used to neutralise the acidity of the fluid

already in the stomach; 'clear' (non-particulate) antacids such as sodium citrate are preferred. Sodium citrate 300 mmol/litre (88.2 mg/mL) oral solution is licensed for use before general anaesthesia for caesarean section (available from Viridian).

## Anaesthesia, sedation, and resuscitation in dental practice

For details see *A Conscious Decision: A review of the use of general anaesthesia and conscious sedation in primary dental care*, report by a group chaired by the Chief Medical Officer and Chief Dental Officer, July 2000 and associated documents. Further details can also be found in *Conscious Sedation in the Provision of Dental Care*, report of an Expert Group on Sedation for Dentistry (commissioned by the Department of Health), 2003.

Guidance is also included in *Conscious Sedation in Dentistry: Dental Clinical Guidance*, Scottish Dental Clinical Effectiveness Programme, June 2012 ([www.sdcep.org.uk](http://www.sdcep.org.uk)).

### 15.1.1 Intravenous anaesthetics

#### Important

The drugs in this section should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

Intravenous anaesthetics may be used either to induce anaesthesia or for maintenance of anaesthesia throughout surgery. Intravenous anaesthetics nearly all produce their effect in one arm-brain circulation time and can cause apnoea and hypotension, and so adequate resuscitative facilities **must** be available. They are **contraindicated** if the anaesthetist is not confident of being able to maintain the airway (e.g. in the presence of a tumour in the pharynx or larynx). Extreme care is required in surgery of the mouth, pharynx, or larynx and in patients with acute circulatory failure (shock) or fixed cardiac output.

To facilitate tracheal intubation, induction is usually followed by a neuromuscular blocking drug (section 15.1.5) or a short-acting opioid (section 15.1.4.3).

The doses of all intravenous anaesthetic drugs should be titrated to effect (except when using 'rapid sequence induction'). The doses and rates of administration should be reduced in the elderly, and particularly in those with hypovolaemia or cardiovascular disease; lower doses may also be required in premedicated patients.

**Total intravenous anaesthesia** This is a technique in which major surgery is carried out with all drugs given intravenously. Respiration can be spontaneous, or controlled with oxygen-enriched air. Neuromuscular blocking drugs can be used to provide relaxation and prevent reflex muscle movements. The main problem to be overcome is the assessment of depth of anaesthesia. Target Controlled Infusion (TCI) systems can be used to titrate intravenous anaesthetic infusions to predicted plasma-drug concentrations in ventilated adult patients.

**Anaesthesia and driving** See section 15.1.

## Drugs used for intravenous anaesthesia

**Propofol**, the most widely used intravenous anaesthetic, can be used for induction or maintenance of anaesthesia in adults and children, but it is not commonly used in neonates.

Propofol is associated with rapid recovery and less hangover effect than other intravenous anaesthetics. It causes pain on intravenous injection, which can be reduced by intravenous lidocaine. Significant extraneous muscle movements can occur. Rarely, convulsions, anaphylaxis, and delayed recovery from anaesthesia can occur after propofol administration; the onset of convulsions can be delayed. Propofol is associated with bradycardia, occasionally profound; intravenous administration of an antimuscarinic drug is used to treat this.

Propofol can be used for sedation during diagnostic procedures. In adults, it can be used for sedation in intensive care, but it is contra-indicated in children under 16 years receiving intensive care because of the risk of propofol infusion syndrome (potentially fatal effects, including metabolic acidosis, arrhythmias, cardiac failure, rhabdomyolysis, hyperlipidaemia, hyperkalaemia, hepatomegaly, and renal failure).

**Thiopental sodium** is a barbiturate that is used for induction of anaesthesia, but has no analgesic properties. Induction is generally smooth and rapid, but dose-related cardiovascular and respiratory depression can occur. Awakening from a moderate dose of thiopental is rapid because the drug redistributes into other tissues, particularly fat. However, metabolism is slow and sedative effects can persist for 24 hours. Repeated doses have a cumulative effect and recovery is much slower.

**Etomidate** is an intravenous agent associated with rapid recovery without a hangover effect. Etomidate causes less hypotension than thiopental and propofol during induction. It produces a high incidence of extraneous muscle movements, which can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction. Pain on injection can be reduced by injecting into a larger vein or by giving an opioid analgesic just before induction. Etomidate suppresses adrenocortical function, particularly during continuous administration, and it should not be used for maintenance of anaesthesia. It should be used with caution in patients with underlying adrenal insufficiency, for example, those with sepsis.

**Ketamine** is used rarely. Ketamine causes less hypotension than thiopental and propofol during induction. It is used mainly for paediatric anaesthesia, particularly when repeated administration is required (such as for serial burns dressings); recovery is relatively slow and there is a high incidence of extraneous muscle movements. The main disadvantage of ketamine is the high incidence of hallucinations, nightmares, and other transient psychotic effects; these can be reduced by a benzodiazepine such as diazepam or midazolam.

### ETOMIDATE

**Indications** induction of anaesthesia

**Cautions** see under Intravenous Anaesthetics and notes above; avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (anaesthetics, general)

**Contra-indications** see under Intravenous Anaesthetics and notes above

**Hepatic impairment** reduce dose in liver cirrhosis

**Pregnancy** may depress neonatal respiration if used during delivery

**Breast-feeding** breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

**Side-effects** see notes above; also nausea, vomiting, hypotension, apnoea, hyperventilation, stridor, rash; *less commonly* hypersalivation, arrhythmias, hypertension, hiccups, cough, phlebitis; AV block, cardiac arrest, respiratory depression, seizures, shivering, and Stevens-Johnson syndrome also reported

#### Dose

● **ADULT, by slow intravenous injection** over 30–60 seconds, 150–300 micrograms/kg (max. total dose 60 mg); **ELDERLY** 150–200 micrograms/kg (max. total dose 60 mg); **CHILD** see *BNF for Children*

**Note** Administer over 60 seconds in patients in whom hypotension might be hazardous

**Etomidate-Lipuro**<sup>®</sup> (B. Braun) (PoM)

**Injection** (emulsion), etomidate 2 mg/mL, net price 10-mL amp = £1.56

**Hypnomidate**<sup>®</sup> (Janssen) (PoM)

**Injection**, etomidate 2 mg/mL, net price 10-mL amp = £1.38

**Excipients** include propylene glycol (see Excipients, p. 2)

## KETAMINE

**Indications** induction and maintenance of anaesthesia (but rarely used)

**Cautions** see under Intravenous Anaesthetics and notes above; dehydration; hypertension; respiratory tract infection; increased cerebrospinal fluid pressure; predisposition to seizures, hallucinations, or nightmares; psychotic disorders; head injury or intracranial mass lesions; thyroid dysfunction; raised intra-ocular pressure; **interactions:** Appendix 1 (anaesthetics, general)

**Contra-indications** see under Intravenous Anaesthetics; hypertension, pre-eclampsia or eclampsia, severe cardiac disease, stroke; raised intracranial pressure; head trauma; acute porphyria (section 9.8.2)

**Hepatic impairment** consider dose reduction

**Pregnancy** may depress neonatal respiration if used during delivery

**Breast-feeding** avoid for at least 12 hours after last dose

**Side-effects** see notes above; also nausea, vomiting, tachycardia, hypertension, diplopia, nystagmus, rash; *less commonly* arrhythmias, hypotension, bradycardia, respiratory depression, laryngospasm; rarely hypersalivation, apnoea, insomnia, cystitis (including haemorrhagic); raised intra-ocular pressure also reported

#### Dose

● **By intramuscular injection**, short procedures, **ADULT**, initially 6.5–13 mg/kg, adjusted according to response (10 mg/kg usually produces 12–25 minutes of surgical anaesthesia); **CHILD** under 18 years see *BNF for Children*

Diagnostic manoeuvres and procedures not involving intense pain, initially 4 mg/kg

● **By intravenous injection** over at least 60 seconds, short procedures, **ADULT**, initially 1–4.5 mg/kg, adjusted according to response (2 mg/kg usually produces 5–10 minutes of surgical anaesthesia); **CHILD** under 18 years see *BNF for Children*

- **By intravenous infusion** of a solution containing 1 mg/mL, longer procedures, **ADULT**, induction, total dose of 0.5–2 mg/kg; maintenance, 10–45 micrograms/kg/minute, rate adjusted according to response; **CHILD** under 18 years see *BNF for Children*

**Ketalar®** (Pfizer) (CD4-1)

**Injection**, ketamine (as hydrochloride) 10 mg/mL, net price 20-mL vial = £5.06; 50 mg/mL, 10-mL vial = £8.77; 100 mg/mL, 10-mL vial = £16.10

**Administration** For intravenous injection, dilute 100 mg/mL strength to a concentration of not more than 50 mg/mL with Glucose 5% or Sodium Chloride 0.9% or Water for Injections

**Note** May be difficult to obtain

**PROPOFOL**

**Indications** see under Dose

**Cautions** see under Intravenous Anaesthetics and notes above; cardiac impairment; respiratory impairment; elderly; hypovolaemia; epilepsy; hypotension; raised intracranial pressure; monitor blood-lipid concentration if risk of fat overload or if sedation longer than 3 days; **interactions:** Appendix 1 (anaesthetics, general)

**Contra-indications** see under Intravenous Anaesthetics and notes above

**Hepatic impairment** use with caution

**Renal impairment** use with caution

**Pregnancy** may depress neonatal respiration if used during delivery; max. dose for maintenance of anaesthesia 6 mg/kg/hour

**Breast-feeding** breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

**Side-effects** see notes above; also hypotension, tachycardia, transient apnoea, headache; *less commonly* thrombosis, phlebitis; *rarely* arrhythmia, euphoria; *very rarely* pancreatitis, pulmonary oedema, sexual disinhibition, and discoloration of urine; propofol infusion syndrome (potentially fatal effects, including metabolic acidosis, arrhythmias, cardiac failure, rhabdomyolysis, hyperlipidaemia, hyperkalaemia, hepatomegaly, and renal failure) reported with prolonged infusion of doses exceeding 4 mg/kg/hour

**Dose**

- Induction of anaesthesia using 0.5% or 1% injection, **by slow intravenous injection or infusion**, **ADULT** under 55 years, 1.5–2.5 mg/kg at a rate of 20–40 mg every 10 seconds until response; **ADULT** over 55 years or debilitated, 1–1.5 mg/kg at a rate of 20 mg every 10 seconds until response; **CHILD** 1 month–18 years see *BNF for Children*
- Induction of anaesthesia using 2% injection, **by intravenous infusion**, **ADULT** under 55 years, 1.5–2.5 mg/kg at a rate of 20–40 mg every 10 seconds; **ADULT** over 55 years or debilitated, 1–1.5 mg/kg at a rate of 20 mg every 10 seconds until response; **CHILD** 3–18 years see *BNF for Children*
- Maintenance of anaesthesia using 1% injection, **by intravenous infusion**, 4–12 mg/kg/hour (3–6 mg/kg/hour in **ELDERLY** or debilitated) or **by slow intravenous injection**, 25–50 mg repeated according to response; **CHILD** 1 month–18 years see *BNF for Children*
- Maintenance of anaesthesia using 2% injection, **by intravenous infusion**, 4–12 mg/kg/hour (3–6 mg/kg/hour in **ELDERLY** or debilitated); **CHILD** 3–18 years see *BNF for Children*

- Sedation of ventilated patients in intensive care using 1% or 2% injection, **by intravenous infusion**, **ADULT** and **CHILD** over 16 years, 0.3–4 mg/kg/hour
- Induction of sedation for surgical and diagnostic procedures using 0.5% or 1% injection, **ADULT**, initially **by slow intravenous injection** over 1–5 minutes, 0.5–1 mg/kg, dose and rate of administration adjusted according to desired level of sedation and response; **CHILD** 1 month–18 years see *BNF for Children*
- Maintenance of sedation for surgical and diagnostic procedures using 0.5% injection, **by intravenous infusion**, **ADULT**, 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response (additionally, if rapid increase in sedation required, **by slow intravenous injection**, 10–20 mg); patients over 55 years or debilitated may require lower dose and rate of administration; **CHILD** 17–18 years see *BNF for Children*
- Maintenance of sedation for surgical and diagnostic procedures using 1% injection, **by intravenous infusion**, **ADULT**, 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response (additionally, if rapid increase in sedation required, **by slow intravenous injection**, 10–20 mg); patients over 55 years or debilitated may require lower dose and rate of administration; **CHILD** 1 month–18 years see *BNF for Children*
- Maintenance of sedation for surgical and diagnostic procedures using 2% injection, **by intravenous infusion**, **ADULT**, 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response (additionally, if rapid increase in sedation required, **by slow intravenous injection** using 0.5% or 1% injection, 10–20 mg); patients over 55 years or debilitated may require lower dose and rate of administration; **CHILD** 3–18 years see *BNF for Children*

**Propofol** (Non-proprietary) (PoM)

**0.5% injection** (emulsion), propofol 5 mg/mL, net price 20-mL amp = £3.46

**Brands include** Propofol-Lipuro®

**1% injection** (emulsion), propofol 10 mg/mL, net price 20-mL amp = £4.18, 50-mL bottle = £10.10, 100-mL bottle = £19.40

**Brands include** Propofol-Lipuro®, Propoven®

**2% injection** (emulsion), propofol 20 mg/mL, net price 50-mL vial = £21.30

**Brands include** Propofol-Lipuro®, Propoven®

**Diprivan®** (AstraZeneca) (PoM)

**1% injection** (emulsion), propofol 10 mg/mL, net price 20-mL amp = £3.07, 50-mL prefilled syringe (for use with Diprifusor® TCI system) = £10.68

**2% injection** (emulsion), propofol 20 mg/mL, net price 50-mL prefilled syringe (for use with Diprifusor® TCI system) = £15.16

**THIOPENTAL SODIUM**

(Thiopentone sodium)

**Indications** induction of general anaesthesia; anaesthesia of short duration; reduction of raised intracranial pressure if ventilation controlled; status epilepticus (see also section 4.8.2)

**Cautions** see under Intravenous Anaesthetics and notes above; cardiovascular disease; reconstituted solution is highly alkaline—extravasation causes tissue necrosis and severe pain; avoid intra-arterial injection; **interactions:** Appendix 1 (anaesthetics, general)

**Contra-indications** see notes above; acute porphyria (section 9.8.2); myotonic dystrophy

**Hepatic impairment** use with caution—reduce dose

**Renal impairment** caution in severe impairment

**Pregnancy** may depress neonatal respiration when used during delivery

**Breast-feeding** breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

**Side-effects** hypotension, arrhythmias, myocardial depression, laryngeal spasm, cough, headache, sneezing, hypersensitivity reactions, rash

#### Dose

- Induction of general anaesthesia, by **slow intravenous injection** usually as a 2.5% (25 mg/mL) solution, **ADULT**, fit and premedicated, initially 100–150 mg (reduced in elderly or debilitated) over 10–15 seconds (longer in elderly or debilitated), followed by further quantity if necessary according to response after 30–60 seconds; or up to 4 mg/kg (max. 500 mg); **CHILD** under 18 years see *BNF for Children*
- Raised intracranial pressure, by **slow intravenous injection**, 1.5–3 mg/kg, repeated as required
- Status epilepticus (only if other measures fail, see section 4.8.2), by **slow intravenous injection** as a 2.5% (25 mg/mL) solution, **ADULT**, 75–125 mg as a single dose; **CHILD** under 18 years see *BNF for Children*

**Thiopental** (Archimedes) [POM]

**Injection**, powder for reconstitution, thiopental sodium, net price 500-mg vial = £5.75

## 15.1.2 Inhalational anaesthetics

### Important

The drugs in this section should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

Inhalational anaesthetics include gases and volatile liquids. *Gaseous anaesthetics* require suitable equipment for storage and administration. *Volatile liquid anaesthetics* are administered using calibrated vaporisers, using air, oxygen, or nitrous oxide-oxygen mixtures as the carrier gas. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times. Higher concentrations of oxygen (greater than 30%) are usually required during inhalational anaesthesia when nitrous oxide is being administered, see Nitrous Oxide, p. 864.

**Anaesthesia and driving** See section 15.1.

### Volatile liquid anaesthetics

Volatile liquid anaesthetics can be used for induction and maintenance of anaesthesia, and following induction with an intravenous anaesthetic (section 15.1.1).

Volatile liquid anaesthetics can trigger malignant hyperthermia (section 15.1.8) and are contra-indicated in those susceptible to malignant hyperthermia. They can increase cerebrospinal pressure and should be used with caution in those with raised intracranial pressure. They can also cause hepatotoxicity in those sensitised to halogenated anaesthetics. In children with

neuromuscular disease, inhalational anaesthetics are very rarely associated with hyperkalaemia, resulting in cardiac arrhythmias and death. Cardiorespiratory depression, hypotension, and arrhythmias are common side-effects of volatile liquid anaesthetics; convulsions have also been reported. They may also cause mood changes that can last for several days.

**Isoflurane** is a volatile liquid anaesthetic. Heart rhythm is generally stable during isoflurane anaesthesia, but heart-rate can rise, particularly in younger patients. Systemic arterial pressure and cardiac output can fall, owing to a decrease in systemic vascular resistance. Muscle relaxation occurs and the effects of muscle relaxant drugs are potentiated. Isoflurane can irritate mucous membranes, causing cough, breath-holding, and laryngospasm. Isoflurane is the preferred inhalational anaesthetic for use in obstetrics.

**Desflurane** is a rapid acting volatile liquid anaesthetic; it is reported to have about one-fifth the potency of isoflurane. Emergence and recovery from anaesthesia are particularly rapid because of its low solubility. Desflurane is not recommended for induction of anaesthesia as it is irritant to the upper respiratory tract; cough, breath-holding, apnoea, laryngospasm, and increased secretions can occur.

**Sevoflurane** is a rapid acting volatile liquid anaesthetic and is more potent than desflurane. Emergence and recovery are particularly rapid, but slower than desflurane. Sevoflurane is non-irritant and is therefore often used for inhalational induction of anaesthesia; it has little effect on heart rhythm compared with other volatile liquid anaesthetics. Sevoflurane can interact with carbon dioxide absorbents to form compound A, a potentially nephrotoxic vinyl ether. However, in spite of extensive use, no cases of sevoflurane-induced permanent renal injury have been reported and the carbon dioxide absorbents used in the UK produce very low concentrations of compound A, even in low-flow anaesthetic systems.

### DESFLURANE

**Indications** see notes above

**Cautions** see notes above; **interactions:** Appendix 1 (anaesthetics, general)

**Contra-indications** see notes above

**Pregnancy** may depress neonatal respiration if used during delivery

**Breast-feeding** breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

**Side-effects** see notes above

#### Dose

- Induction of anaesthesia (but not recommended—see notes above), by **inhalation** through specifically calibrated vaporiser, **ADULT** 4–11%
- Maintenance of anaesthesia, by **inhalation** through specifically calibrated vaporiser, **ADULT** 2–6% in nitrous oxide-oxygen; 2.5–8.5% in oxygen or oxygen-enriched air; **CHILD** 1 month–18 years see *BNF for Children*

### ISOFLURANE

**Indications** see notes above

**Cautions** see notes above; **interactions:** Appendix 1 (anaesthetics, general)

**Contra-indications** see notes above

**Pregnancy** may depress neonatal respiration if used during delivery

**Breast-feeding** breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

**Side-effects** see notes above

#### Dose

- Induction of anaesthesia, **by inhalation** using specifically calibrated vaporiser, in oxygen or nitrous oxide–oxygen, increased gradually according to response from 0.5% to 3%
- Maintenance of anaesthesia, **by inhalation** using specifically calibrated vaporiser, 1–2.5% in nitrous oxide–oxygen; an additional 0.5–1% may be required when given with oxygen alone; caesarean section, 0.5–0.75% in nitrous oxide–oxygen

## SEVOFLURANE

**Indications** see notes above

**Cautions** see notes above; susceptibility to QT-interval prolongation; **interactions:** Appendix 1 (anaesthetics, general)

**Contra-indications** see notes above

**Renal impairment** use with caution

**Pregnancy** may depress neonatal respiration if used during delivery

**Breast-feeding** breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

**Side-effects** see notes above; also urinary retention, leucopenia, agitation in children; cardiac arrest, torsade de pointes, and dystonia also reported

#### Dose

- Induction of anaesthesia, **by inhalation** using a specifically calibrated vaporiser, in oxygen or nitrous oxide–oxygen, adjusted according to response, **ADULT** and **CHILD** over 1 month initially 0.5–1% then increased gradually up to 8%
- Maintenance of anaesthesia, **by inhalation** using a specifically calibrated vaporiser, in oxygen or nitrous oxide–oxygen, adjusted according to response, **ADULT** and **CHILD** over 1 month 0.5–3%

## Nitrous oxide

**Nitrous oxide** is used for maintenance of anaesthesia and, in sub-anaesthetic concentrations, for analgesia. For *anaesthesia*, nitrous oxide is commonly used in a concentration of 50 to 66% in oxygen as part of a balanced technique in association with other inhalational or intravenous agents. Nitrous oxide is unsatisfactory as a sole anaesthetic owing to lack of potency, but is useful as part of a combination of drugs since it allows a significant reduction in dosage.

For *analgesia* (without loss of consciousness), a mixture of nitrous oxide and oxygen containing 50% of each gas (*Entonox*<sup>®</sup>, *Equanox*<sup>®</sup>) is used. Self-administration using a demand valve is popular in obstetric practice, for changing painful dressings, as an aid to postoperative physiotherapy, and in emergency ambulances.

Nitrous oxide may have a deleterious effect if used in patients with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge

to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intra-ocular gas injection.

Hypoxia can occur immediately following the administration of nitrous oxide; additional oxygen should always be given for several minutes after stopping the flow of nitrous oxide.

Exposure of patients to nitrous oxide for prolonged periods, either by continuous or by intermittent administration, may result in megaloblastic anaemia owing to interference with the action of vitamin B<sub>12</sub>; neurological toxic effects can occur without preceding overt haematological changes. For the same reason, exposure of theatre staff to nitrous oxide should be minimised. Depression of white cell formation may also occur.

Assessment of plasma-vitamin B<sub>12</sub> concentration should be considered in those at risk of deficiency, including the elderly, those who have a poor, vegetarian, or vegan diet, and those with a history of anaemia. Nitrous oxide should **not** be given continuously for longer than 24 hours or more frequently than every 4 days without close supervision and haematological monitoring.

## NITROUS OXIDE

**Indications** see notes above

**Cautions** see notes above; **interactions:** Appendix 1 (anaesthetics, general)

**Pregnancy** may depress neonatal respiration if used during delivery

**Breast-feeding** breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

**Side-effects** see notes above

#### Dose

- Maintenance of anaesthesia in conjunction with other anaesthetic agents, **by inhalation** using suitable anaesthetic apparatus, 50–66% in oxygen
- Analgesia, **by inhalation** using suitable apparatus, up to 50% in oxygen, according to the patient's needs

## 15.1.3 Antimuscarinic drugs

### Important

The drugs in this section should only be administered by, or under the direct supervision of, personnel experienced in their use.

Antimuscarinic drugs are used (less commonly nowadays) as premedicants to dry bronchial and salivary secretions which are increased by intubation, upper airway surgery, or some inhalational anaesthetics. They are also used before or with neostigmine (section 15.1.6) to prevent bradycardia, excessive salivation, and other muscarinic actions of neostigmine. They also prevent bradycardia and hypotension associated with drugs such as propofol and suxamethonium.

**Atropine sulfate** is now rarely used for premedication but still has an emergency role in the treatment of vagotonic side-effects. For its role in acute arrhythmias after myocardial infarction, see section 2.3.1.

**Hyoscine hydrobromide** reduces secretions and also provides a degree of amnesia, sedation, and anti-emesis. Unlike atropine it may produce bradycardia rather than

tachycardia. In some patients, especially the elderly, hyoscine may cause the central anticholinergic syndrome (excitement, ataxia, hallucinations, behavioural abnormalities, and drowsiness).

**Glycopyrronium bromide** reduces salivary secretions. When given intravenously it produces less tachycardia than atropine. It is widely used with neostigmine for reversal of non-depolarising neuromuscular blocking drugs (section 15.1.5).

**Phenothiazines** do not effectively reduce secretions when used alone.

## ATROPINE SULFATE

**Indications** premedication; intra-operative bradycardia; with anticholinesterases for reversal of non-depolarising neuromuscular block; antidote to organophosphorous poisoning (see Emergency Treatment of Poisoning p. 42); symptomatic relief of gastrointestinal disorders characterised by smooth muscle spasm (section 1.2); bradycardia (section 2.3.1); cardiopulmonary resuscitation (section 2.7.3); cycloplegia, anterior uveitis (section 11.5)

**Cautions** see notes in section 1.2

**Duration of action** Since atropine has a shorter duration of action than neostigmine, late unopposed bradycardia may result; close monitoring of the patient is necessary

**Contra-indications** see notes in section 1.2

**Pregnancy** not known to be harmful; manufacturer advises caution

**Breast-feeding** small amount present in milk—manufacturer advises caution

**Side-effects** see notes in section 1.2

### Dose

- Premedication, **by intravenous injection**, 300–600 micrograms immediately before induction of anaesthesia; **CHILD** under 12 years see *BNF for Children*  
**By subcutaneous or intramuscular injection**, 300–600 micrograms 30–60 minutes before induction of anaesthesia; **CHILD** under 12 years see *BNF for Children*
- Intra-operative bradycardia, **by intravenous injection**, 300–600 micrograms (larger doses in emergencies); **CHILD** under 12 years see *BNF for Children*
- Control of muscarinic side-effects of neostigmine in reversal of competitive neuromuscular block, **by intravenous injection**, 0.6–1.2 mg; **CHILD** under 12 years see *BNF for Children*
- Arrhythmias after myocardial infarction, see section 2.3.1

### <sup>1</sup>Atropine (Non-proprietary) <sup>(PoM)</sup>

**Injection**, atropine sulfate 600 micrograms/mL, net price 1-mL amp = 86p

**Note** Other strengths also available

**Injection**, prefilled disposable syringe, atropine sulfate 100 micrograms/mL, net price 5 mL = £4.58, 10 mL = £5.39, 30 mL = £8.95

**Injection**, prefilled disposable syringe, atropine sulfate 200 micrograms/mL, net price 5 mL = £6.78; 300 micrograms/mL, 10 mL = £6.47; 600 micrograms/mL, 1 mL = £6.78

### <sup>1</sup>Minijet<sup>®</sup> Atropine (UCB Pharma) <sup>(PoM)</sup>

**Injection**, atropine sulfate 100 micrograms/mL, net price 5 mL = £6.34, 10 mL = £7.11, 30 mL = £11.19

1. <sup>(PoM)</sup> restriction does not apply where administration is for saving life in emergency

## GLYCOPYRRONIUM BROMIDE

(Glycopyrrolate)

**Indications** drying secretions (see Prescribing in Palliative Care, p. 21); premedication; intra-operative bradycardia; *with neostigmine* for reversal of non-depolarising neuromuscular block; maintenance treatment of chronic obstructive pulmonary disease (section 3.1.2); hyperhidrosis (section 13.12)

**Cautions** see notes in section 1.2 (Antimuscarinics)

**Contra-indications** see notes in section 1.2 (Antimuscarinics)

**Side-effects** see notes in section 1.2 (Antimuscarinics)

### Dose

- Premedication, **by intramuscular or intravenous injection**, 200–400 micrograms or 4–5 micrograms/kg (max. 400 micrograms); **CHILD** 1 month–12 years, 4–8 micrograms/kg (max. 200 micrograms)
- Intra-operative bradycardia, **by intravenous injection**, 200–400 micrograms or 4–5 micrograms/kg (max. 400 micrograms), repeated if necessary; **CHILD** 1 month–18 years, 4–8 micrograms/kg (max. 200 micrograms), repeated if necessary
- Control of muscarinic side-effects of neostigmine in reversal of non-depolarising neuromuscular block, **by intravenous injection**, 200 micrograms per 1 mg of neostigmine, or 10–15 micrograms/kg; **CHILD** 1 month–12 years, 10 micrograms/kg (max. 500 micrograms)

**Glycopyrronium bromide** (Non-proprietary) <sup>(PoM)</sup>

**Injection**, glycopyrronium bromide 200 micrograms/mL, net price 1-mL amp = 54p, 3-mL amp = £1.50

### ▲With neostigmine metilsulfate

Section 15.1.6

## HYOSCINE HYDROBROMIDE

(Scopolamine hydrobromide)

**Indications** premedication, motion sickness, hypersalivation associated with clozapine therapy (section 4.6); excessive respiratory secretions (see Prescribing in Palliative Care, p. 21)

**Cautions** see notes in section 1.2 and notes above; also epilepsy

**Contra-indications** see notes in section 1.2

**Hepatic impairment** use with caution

**Renal impairment** use with caution

**Pregnancy** use only if potential benefit outweighs risk; injection may depress neonatal respiration

**Breast-feeding** amount too small to be harmful

**Side-effects** see notes in section 1.2

### Dose

- Premedication, **by subcutaneous or intramuscular injection**, 200–600 micrograms 30–60 minutes before induction of anaesthesia; **CHILD** 15 micrograms/kg

**Hyoscine** (Non-proprietary) <sup>(PoM)</sup>

**Injection**, hyoscine hydrobromide 400 micrograms/mL, net price 1-mL amp = £2.88; 600 micrograms/mL, 1-mL amp = £2.53

### ▲With papaveretum

Section 4.7.2

## 15.1.4 Sedative and analgesic peri-operative drugs

### 15.1.4.1 Benzodiazepines

### 15.1.4.2 Non-opioid analgesics

### 15.1.4.3 Opioid analgesics

### 15.1.4.4 Other drugs for sedation

#### Important

The drugs in this section should only be administered, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

**Premedication** Fear and anxiety before a procedure (including the night before) can be minimised by using a sedative drug, usually a **benzodiazepine**. Premedication may also augment the action of anaesthetics and provide some degree of pre-operative amnesia. The choice of drug depends on the individual, the nature of the procedure, the anaesthetic to be used, and other prevailing circumstances such as outpatients, obstetrics, and availability of recovery facilities. Sedative premedication with benzodiazepines should be avoided in patients with a compromised airway, CNS depression, or a history of sleep apnoea.

Premedicants can be given the night before major surgery; a further, smaller dose may be required before surgery. Alternatively, the first dose may be given on the day of the procedure.

**Premedication in children** Oral administration is preferred; the rectal route should only be used in exceptional circumstances. For further details, consult *BNF for Children*.

#### Conscious sedation for clinical procedures

Sedation of patients during diagnostic and therapeutic procedures is used to reduce fear and anxiety, to control pain, and to minimise excessive movement. The choice of sedative drug will depend upon the intended procedure; some procedures are safer and more successful under anaesthesia. The patient should be *monitored carefully*; monitoring should begin as soon as the sedative is given or when the patient becomes drowsy, and should be continued until the patient wakes up.

For details on sedation for clinical procedures in children, see *BNF for Children*.

**Dental procedures** Sedation for dental procedures should be limited to conscious sedation. Diazepam and temazepam are effective anxiolytics for dental treatment in adults. For further information on hypnotics used for dental procedures, see section 4.1.1.

For details on sedation for dental procedures in children, see *BNF for Children*.

**Anaesthesia and driving** See section 15.1.

### 15.1.4.1 Benzodiazepines

Benzodiazepines possess useful properties for premedication including relief of anxiety, sedation, and amnesia; short-acting benzodiazepines taken by mouth are the most common premedicants. Benzodiazepines are also used in intensive care units for sedation, particularly in those receiving assisted ventilation.

Benzodiazepines may occasionally cause marked respiratory depression and facilities for its treatment are essential; flumazenil (section 15.1.7) is used to antagonise the effects of benzodiazepines.

**Diazepam** is used to produce mild sedation with amnesia. It is a long-acting drug with active metabolites and a second period of drowsiness can occur several hours after its administration. Peri-operative use of diazepam in children is not recommended; its effect and timing of response are unreliable and paradoxical effects may occur.

Diazepam is relatively insoluble in water and preparations formulated in organic solvents are painful on intravenous injection and give rise to a high incidence of venous thrombosis (which may not be noticed for several days after the injection). Intramuscular injection of diazepam is painful and absorption is erratic. An emulsion formulated for intravenous injection is less irritant and reduces the risk of venous thrombosis; it is not suitable for intramuscular injection.

**Temazepam** is given by mouth for premedication and has a shorter duration of action and a more rapid onset than oral diazepam; anxiolytic and sedative effects last about 90 minutes although there may be residual drowsiness.

**Lorazepam** produces more prolonged sedation than temazepam and it has marked amnesic effects.

**Midazolam** is a water-soluble benzodiazepine that is often used in preference to intravenous diazepam; recovery is faster than from diazepam, but may be significantly longer in the elderly, in patients with a low cardiac output, or after repeated dosing. Midazolam is associated with profound sedation when high doses are given intravenously or when it is used with certain other drugs.

#### Overdosage with midazolam

There have been reports of overdosage when high strength midazolam has been used for conscious sedation. The use of high-strength midazolam (5 mg/mL in 2 mL and 10 mL ampoules, or 2 mg/mL in 5 mL ampoules) should be restricted to general anaesthesia, intensive care, palliative care, or other situations where the risk has been assessed. It is advised that flumazenil (section 15.1.7) is available when midazolam is used, to reverse the effects if necessary.

## DIAZEPAM

**Indications** premedication; conscious sedation for procedures, and in conjunction with local anaesthesia; short-term use in anxiety or insomnia, adjunct in acute alcohol withdrawal (section 4.1.2); status epilepticus (section 4.8.2); muscle spasms (section 10.2.2)

**Cautions** see notes above, section 4.1.2, and section 4.8.2; **interactions:** Appendix 1 (anxiolytics and hypnotics)

**Contra-indications** see section 4.1.2

**Hepatic impairment** see Benzodiazepines, section 4.1.2

**Renal impairment** see Benzodiazepines, section 4.1.2

**Pregnancy** see Benzodiazepines, section 4.1.2

**Breast-feeding** see Benzodiazepines, section 4.1.2

**Side-effects** see notes above and section 4.1.2

**Dose**

- **By mouth, ADULT** over 18 years, 5–10 mg 1–2 hours before procedure (up to max. 20 mg for dental procedures carried out in hospital); **ELDERLY** (or debilitated), half adult dose
- **By intravenous injection** into a large vein (emulsion preparation preferred), sedative cover for minor surgical and medical procedures, **ADULT** over 18 years, 10–20 mg over 2–4 minutes, immediately before procedure; premedication 100–200 micrograms/kg

**Preparations**

Section 4.1.2

**LORAZEPAM**

**Indications** conscious sedation for procedures; premedication; short-term use in anxiety or insomnia (section 4.1.2); status epilepticus (section 4.8.2)

**Cautions** see notes above and section 4.1.2; **interactions:** Appendix 1 (anxiolytics and hypnotics)

**Contra-indications** see Diazepam, section 4.1.2

**Hepatic impairment** see Benzodiazepines, section 4.1.2

**Renal impairment** see Benzodiazepines, section 4.1.2

**Pregnancy** see Benzodiazepines, section 4.1.2

**Breast-feeding** see Benzodiazepines, section 4.1.2

**Side-effects** see notes above and Diazepam, section 4.1.2

**Dose**

- **By mouth**, 2–3 mg the night before operation; 2–4 mg 1–2 hours before operation
- **By slow intravenous injection**, preferably diluted with an equal volume of sodium chloride intravenous infusion 0.9% or water for injections, 50 micrograms/kg 30–45 minutes before operation
- **By intramuscular injection**, diluted as above, 50 micrograms/kg 60–90 minutes before operation

**Preparations**

Section 4.1.2

**MIDAZOLAM**

**Indications** conscious sedation for procedures; sedation in intensive care; sedation in anaesthesia; premedication; induction of anaesthesia; status epilepticus (section 4.8.2)

**Cautions** see notes above; cardiac disease; respiratory disease; myasthenia gravis; neonates; children (particularly if cardiovascular impairment); risk of airways obstruction and hypoventilation in children under 6 months (monitor respiratory rate and oxygen saturation); history of drug or alcohol abuse; reduce dose in elderly and debilitated; risk of severe hypotension in hypovolaemia, vasoconstriction, hypothermia; avoid prolonged use (and abrupt withdrawal thereafter); concentration of midazolam in children under 15 kg not to exceed 1 mg/mL; **interactions:** Appendix 1 (anxiolytics and hypnotics)

**Contra-indications** marked neuromuscular respiratory weakness including unstable myasthenia gravis; severe respiratory depression; acute pulmonary insufficiency; sleep apnoea syndrome

**Hepatic impairment** use with caution; can precipitate coma

**Renal impairment** use with caution in chronic renal failure—increased cerebral sensitivity

**Pregnancy** avoid regular use (risk of neonatal withdrawal symptoms); use only if clear indication such as seizure control (high doses during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression)

**Breast-feeding** small amount present in milk—avoid breast-feeding for 24 hours after administration (although amount probably too small to be harmful after single doses)

**Side-effects** see notes above; gastro-intestinal disturbances, dry mouth, hiccups, increased appetite, jaundice; hypotension, cardiac arrest, heart rate changes, anaphylaxis, thrombosis; laryngospasm, bronchospasm, respiratory depression and respiratory arrest (particularly with high doses or on rapid injection); drowsiness, confusion, ataxia, amnesia, headache, euphoria, hallucinations, convulsions (more common in neonates), dizziness, vertigo, involuntary movements, paradoxical excitement and aggression (especially in children and elderly), dysarthria; urinary retention, incontinence, changes in libido; blood disorders; muscle weakness; visual disturbances; salivation changes; skin reactions; injection-site reactions

**Dose**

- Conscious sedation for procedures, **by slow intravenous injection** (approx. 2 mg/minute) 5–10 minutes before procedure, initially 2–2.5 mg (**ELDERLY** 0.5–1 mg), increased if necessary in steps of 1 mg (**ELDERLY** 0.5–1 mg); usual total dose 3.5–5 mg (max. 7.5 mg), **ELDERLY** max. 3.5 mg; **CHILD** 1 month–18 years see *BNF for Children*

**By rectum, CHILD** 6 months–18 years see *BNF for Children*

**By mouth, CHILD** 1 month–18 years see *BNF for Children*

**By buccal administration, CHILD** 6 months–18 years see *BNF for Children*

- Sedative in combined anaesthesia, **by intravenous injection**, 30–100 micrograms/kg repeated as required or **by continuous intravenous infusion**, 30–100 micrograms/kg/hour (**ELDERLY** lower doses needed); **CHILD** not recommended
- Premedication, **by deep intramuscular injection, ADULT** over 18 years, 70–100 micrograms/kg (**ELDERLY** or debilitated 25–50 micrograms/kg) 20–60 minutes before induction
  - By intravenous injection, ADULT** over 18 years, 1–2 mg 5–30 minutes before procedure, repeated as required (**ELDERLY** or debilitated 0.5 mg, repeat dose slowly as required)
  - By rectum, CHILD** 6 months–12 years see *BNF for Children*
  - By mouth, CHILD** 1 month–18 years see *BNF for Children*
- Induction (but rarely used), **by slow intravenous injection**, 150–200 micrograms/kg (**ELDERLY** or debilitated 50–150 micrograms/kg) given in divided doses (max. 5 mg) at intervals of 2 minutes; max. total dose 600 micrograms/kg; **CHILD** 7–18 years initially 150 micrograms/kg (max. 7.5 mg) given in steps of 50 micrograms/kg (max. 2.5 mg) over 2–5 minutes; wait for 2–5 minutes then give additional doses of 50 micrograms/kg (max. 2.5 mg) every 2 minutes if necessary; max. total dose 500 micrograms/kg (not exceeding 25 mg)

- Sedation of patients receiving intensive care, **by slow intravenous injection**, initially 30–300 micrograms/kg given in steps of 1–2.5 mg every 2 minutes, then **by slow intravenous injection or by continuous intravenous infusion**, 30–200 micrograms/kg/hour; reduce dose (or reduce or omit initial dose) in hypovolaemia, vasoconstriction, or hypothermia; lower doses may be adequate if opioid analgesic also used; **CHILD** under 12 years see *BNF for Children*

#### Midazolam (Non-proprietary) <sup>(CD3)</sup>

**Injection**, midazolam (as hydrochloride) 1 mg/mL, net price 2-mL amp = 45p, 5-mL amp = 60p, 50-mL vial = £9.56; 2 mg/mL, 5-mL amp = 65p; 5 mg/mL, 2-mL amp = 63p, 10-mL amp = £2.50

#### Hypnovel<sup>®</sup> (Roche) <sup>(CD3)</sup>

**Injection**, midazolam (as hydrochloride) 5 mg/mL, 2-mL amp = 71p

## TEMAZEPAM

**Indications** premedication before surgery or investigatory procedures; conscious sedation for dental procedures [unlicensed]; hypnotic (section 4.1.1)

**Cautions** see notes above and Diazepam, section 4.1.2; **interactions:** Appendix 1 (anxiolytics and hypnotics)

**Contra-indications** see Diazepam, section 4.1.2

**Hepatic impairment** see Benzodiazepines, section 4.1.1

**Renal impairment** see Benzodiazepines, section 4.1.1

**Pregnancy** see Benzodiazepines, section 4.1.1

**Breast-feeding** see Benzodiazepines, section 4.1.1

**Side-effects** see notes above and Diazepam, section 4.1.2

#### Dose

- **By mouth**, premedication, **ADULT**, 10–20 mg (up to 30 mg in exceptional circumstances) 1–2 hours before procedure; **ELDERLY** 10 mg (up to 20 mg in exceptional circumstances); **CHILD** 12–18 years see *BNF for Children*
- **By mouth**, conscious sedation for dental procedures, **ADULT** over 18 years, 15–30 mg 30–60 minutes before procedure

**Note** Temazepam doses in BNF may differ from those in product literature

#### Preparations

Section 4.1.1

### 15.1.4.2 Non-opioid analgesics

Since non-steroidal anti-inflammatory drugs (NSAIDs) do not depress respiration, do not impair gastro-intestinal motility, and do not cause dependence, they may be useful alternatives or adjuncts to opioids for the relief of postoperative pain. NSAIDs may be inadequate for the relief of severe pain.

Acemetacin, diclofenac, flurbiprofen, ibuprofen, ketoprofen (section 10.1.1), paracetamol (section 4.7.1), parecoxib, and ketorolac are licensed for post-operative use. Diclofenac and paracetamol can be given by injection as well as by mouth. Diclofenac can be given by intravenous infusion for the treatment or prevention of postoperative pain. Intramuscular injections of diclofenac and ketoprofen are rarely used; they are given deep into the gluteal muscle to minimise pain and tissue damage. Ketorolac is less irritant on intramuscular injection but pain has been reported; it can also be given by intravenous injection.

Parecoxib (a selective inhibitor of cyclo-oxygenase-2) can be given by intramuscular or intravenous injection (but see also NSAIDs and Cardiovascular Events, section 10.1.1). The *Scottish Medicines Consortium* (p. 4) has advised (January 2003) that parecoxib is not recommended for use within NHS Scotland.

Suppositories of diclofenac and ketoprofen may be effective alternatives to the parenteral use of these drugs.

## KETOROLAC TROMETAMOL

**Indications** short-term management of moderate to severe acute postoperative pain only

**Cautions** section 10.1.1; **interactions:** Appendix 1 (NSAIDs)

**Contra-indications** section 10.1.1; also complete or partial syndrome of nasal polyps; haemorrhagic diatheses (including coagulation disorders) and following operations with high risk of haemorrhage or incomplete haemostasis; confirmed or suspected cerebrovascular bleeding; hypovolaemia or dehydration

**Hepatic impairment** section 10.1.1

**Renal impairment** max. 60 mg daily by intramuscular or intravenous injection; avoid if serum creatinine greater than 160 micromol/litre; see also section 10.1.1

**Pregnancy** section 10.1.1

**Breast-feeding** amount too small to be harmful

**Side-effects** section 10.1.1; also gastro-intestinal disturbances, taste disturbances, dry mouth; flushing, bradycardia, palpitation, chest pain, hypertension, pallor; dyspnoea, asthma; malaise, euphoria, psychosis, paraesthesia, convulsions, abnormal dreams, hyperkinesia, confusion, hallucinations; urinary frequency, thirst, sweating; hyponatraemia, hyperkalaemia, myalgia; visual disturbances (including optic neuritis); purpura, pain at injection site

#### Dose

- **ADULT** and **CHILD** over 16 years, **by intramuscular injection or by intravenous injection** over at least 15 seconds, initially 10 mg, then 10–30 mg every 4–6 hours as required (up to every 2 hours during initial postoperative period); max. 90 mg daily (**ELDERLY** and patients weighing less than 50 kg max. 60 mg daily); max. duration of treatment 2 days; **CHILD** 6 months–16 years see *BNF for Children*

#### Ketorolac (Non-proprietary) <sup>(PoM)</sup>

**Injection**, ketorolac trometamol 30 mg/mL, net price 1-mL amp = £1.09

#### Toradol<sup>®</sup> (Roche) <sup>(PoM)</sup>

**Injection**, ketorolac trometamol 30 mg/mL, net price 1-mL amp = £1.07

## PARECOXIB

**Indications** short-term management of acute postoperative pain

**Cautions** section 10.1.1; dehydration; following coronary artery bypass graft surgery; **interactions:** Appendix 1 (NSAIDs)

**Contra-indications** section 10.1.1; also history of allergic drug reactions including sulfonamide hypersensitivity; inflammatory bowel disease

**Hepatic impairment** halve dose in moderate impairment (max. 40 mg daily); see also section 10.1.1

**Renal impairment** section 10.1.1

**Pregnancy** section 10.1.1

**Breast-feeding** avoid—present in milk

**Side-effects** section 10.1.1; also flatulence, hypotension, hypoaesthesia, alveolar osteitis, postoperative anaemia, hypokalaemia, sweating; *less commonly* bradycardia, cardiovascular events, pulmonary embolism, anorexia, malaise, hyperglycaemia, arthralgia, ecchymosis; also reported tachycardia, circulatory collapse

#### Dose

- By deep intramuscular injection or by intravenous injection, initially 40 mg, then 20–40 mg every 6–12 hours when required for up to 3 days; max. 80 mg daily; **ELDERLY** weighing less than 50 kg, initially 20 mg, then max. 40 mg daily; **CHILD** under 18 years, not recommended

**Dynastat**<sup>®</sup> (Pharmacia) (PoM)

**Injection**, powder for reconstitution, parecoxib (as sodium salt), net price 40-mg vial = £4.96, 40-mg vial (with solvent) = £5.67

### 15.1.4.3 Opioid analgesics

Opioid analgesics are now rarely used as premedicants; they are more likely to be administered at induction. Pre-operative use of opioid analgesics is generally limited to those patients who require control of existing pain. The main side-effects of opioid analgesics are respiratory depression, cardiovascular depression, nausea, and vomiting; for general notes on opioid analgesics and their use in postoperative pain, see section 4.7.2.

For the management of opioid-induced respiratory depression, see section 15.1.7.

**Intra-operative analgesia** Opioid analgesics given in small doses before or with induction reduce the dose requirement of some drugs used during anaesthesia.

**Alfentanil, fentanyl, and remifentanyl** are particularly useful because they act within 1–2 minutes and have short durations of action. The initial doses of alfentanil or fentanyl are followed either by successive intravenous injections or by an intravenous infusion; prolonged infusions increase the duration of effect. Repeated intra-operative doses of alfentanil or fentanyl should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive. Alfentanil, fentanyl, and remifentanyl can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

In contrast to other opioids which are metabolised in the liver, remifentanyl undergoes rapid metabolism by non-specific blood and tissue esterases; its short duration of action allows prolonged administration at high dosage, without accumulation, and with little risk of residual postoperative respiratory depression. Remifentanyl should not be given by intravenous injection intra-operatively, but it is well suited to continuous infusion; a supplementary analgesic is given before stopping the infusion of remifentanyl.

### ALFENTANIL

**Indications** analgesia especially during short operative procedure and outpatient surgery; enhancement of anaesthesia; analgesia and suppression of respiratory activity in patients receiving intensive care, with assisted ventilation, for up to 4 days

**Cautions** section 4.7.2 and notes above

**Contra-indications** section 4.7.2

**Hepatic impairment** section 4.7.2

**Renal impairment** section 4.7.2

**Pregnancy** section 4.7.2

**Breast-feeding** present in milk—withhold breast-feeding for 24 hours

**Side-effects** section 4.7.2 and notes above; also hypertension, myoclonic movements; *less commonly* arrhythmias, hiccups, laryngospasm; *rarely* epistaxis; also reported cardiac arrest, cough, convulsions, and pyrexia

#### Dose

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

- Spontaneous respiration: analgesia and enhancement of anaesthesia for short procedures, **by intravenous injection, ADULT**, initially up to 500 micrograms over 30 seconds; supplemental doses 250 micrograms
- Assisted ventilation: analgesia and enhancement of anaesthesia for short procedures, **by intravenous injection, ADULT**, initially 30–50 micrograms/kg; supplemental doses 15 micrograms/kg; **CHILD** under 18 years see *BNF for Children*
- Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia for longer procedures, **by intravenous infusion, ADULT**, initially 50–100 micrograms/kg over 10 minutes or as a bolus, followed by maintenance of 30–60 micrograms/kg/hour; **CHILD** under 18 years see *BNF for Children*
- Assisted ventilation: analgesia and suppression of respiratory activity during intensive care, **by intravenous infusion, ADULT** over 18 years, initially 2 mg/hour subsequently adjusted according to response (usual range 0.5–10 mg/hour); more rapid initial control may be obtained with an intravenous dose of 5 mg given in divided portions over 10 minutes (reduce rate of administration if hypotension or bradycardia occur); additional doses of 0.5–1 mg may be given by intravenous injection during short painful procedures

**Alfentanil** (Non-proprietary) (CD2)

**Injection**, alfentanil (as hydrochloride) 500 micrograms/mL, net price 2-mL amp = 70p, 10-mL amp = £3.20

**Injection**, alfentanil (as hydrochloride) 5 mg/mL, net price 1-mL amp = £2.50

**Note** To be diluted before use

**Rapifen**<sup>®</sup> (Janssen) (CD2)

**Injection**, alfentanil (as hydrochloride) 500 micrograms/mL, net price 2-mL amp = 63p; 10-mL amp = £2.90

**Intensive care injection**, alfentanil (as hydrochloride) 5 mg/mL, net price 1-mL amp = £2.32

**Note** To be diluted before use

## FENTANYL

**Indications** analgesia during operation, enhancement of anaesthesia; analgesia and respiratory depression in assisted respiration in intensive care; analgesia in other situations (section 4.7.2)

**Cautions** see Fentanyl, section 4.7.2 and notes above

**Contra-indications** see notes in section 4.7.2

**Hepatic impairment** see notes in section 4.7.2

**Renal impairment** see notes in section 4.7.2

**Pregnancy** see notes in section 4.7.2

**Breast-feeding** see Fentanyl, section 4.7.2

**Side-effects** see Fentanyl, section 4.7.2 and notes above; also myoclonic movements; *less commonly* laryngospasm; *rarely* asystole and insomnia

### Dose

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

- Spontaneous respiration: analgesia and enhancement of anaesthesia during operation, **by slow intravenous injection, ADULT**, initially 50–100 micrograms (max. 200 micrograms on specialist advice), then 25–50 micrograms as required, **by intravenous infusion, ADULT**, 3–4.8 micrograms/kg/hour adjusted according to response; **CHILD** 1 month–18 years see *BNF for Children*
- Assisted ventilation: analgesia and enhancement of anaesthesia during operation, analgesia and respiratory depression in intensive care, **by slow intravenous injection, ADULT**, initially 300–3500 micrograms, then 100–200 micrograms as required, **by intravenous infusion, ADULT**, initially 10 micrograms/kg over 10 minutes, then 6 micrograms/kg/hour adjusted according to response; may require up to 180 micrograms/kg/hour during cardiac surgery; **CHILD** under 18 years see *BNF for Children*

**Fentanyl** (Non-proprietary) CD2

**Injection**, fentanyl (as citrate) 50 micrograms/mL, net price 2-mL amp = 30p, 10-mL amp = 75p

**Sublimaze**<sup>®</sup> (Janssen) CD2

**Injection**, fentanyl (as citrate) 50 micrograms/mL, net price 10-mL amp = £1.31

## REMIFENTANIL

**Indications** analgesia and enhancement of anaesthesia during induction and maintenance of anaesthesia (consult product literature for use in patients undergoing cardiac surgery); analgesia and sedation in ventilated, intensive care patients

**Cautions** section 4.7.2 (but no dose adjustment necessary in renal impairment) and notes above

**Contra-indications** section 4.7.2 and notes above; analgesia in conscious patients

**Hepatic impairment** section 4.7.2

**Pregnancy** no information available: see also section 4.7.2

**Breast-feeding** avoid breast-feeding for 24 hours after administration—present in milk in *animal* studies

**Side-effects** section 4.7.2 and notes above; also hypertension; *less commonly* hypoxia; *rarely* asystole; AV block and convulsions also reported

### Dose

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- Analgesia and enhancement of anaesthesia at induction, **by intravenous infusion, ADULT**, 30–60 micrograms/kg/hour, *with or without* an initial dose **by intravenous injection** of 0.25–1 micrograms/kg over at least 30 seconds; **CHILD** 12–18 years see *BNF for Children*

**Note** If patient to be intubated more than 8 minutes after start of intravenous infusion, initial intravenous injection dose is not necessary

- Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia, **by intravenous infusion, ADULT**, 3–120 micrograms/kg/hour, *with or without* an initial dose **by intravenous injection** of 0.25–1 micrograms/kg over at least 30 seconds, according to anaesthetic technique and adjusted according to response; in light anaesthesia supplemental doses **by intravenous injection** every 2–5 minutes; **CHILD** under 18 years see *BNF for Children*
  - Spontaneous respiration: analgesia and enhancement of anaesthesia during maintenance of anaesthesia, **by intravenous infusion, ADULT**, initially 2.4 micrograms/kg/hour adjusted according to response, usual range 1.5–6 micrograms/kg/hour; **CHILD** 12–18 years see *BNF for Children*
  - Assisted ventilation: analgesia and sedation in intensive-care patients, for max. 3 days, **by intravenous infusion, ADULT** over 18 years, initially 6–9 micrograms/kg/hour adjusted according to response in steps of 1.5 micrograms/kg/hour (allow at least 5 minutes between dose adjustments); usual range 0.36–44.4 micrograms/kg/hour; if an infusion rate of 12 micrograms/kg/hour does not produce adequate sedation add another sedative (consult product literature for details)
  - Assisted ventilation: additional analgesia during stimulating or painful procedures in intensive-care patients, **by intravenous infusion, ADULT** over 18 years, maintain infusion rate of at least 6 micrograms/kg/hour for at least 5 minutes before procedure and adjust every 2–5 minutes according to requirements, usual range 15–45 micrograms/kg/hour
  - Cardiac surgery, consult product literature
- Note** Remifentanyl doses in BNF may differ from those in product literature

**Remifentanyl** (Non-proprietary) CD2

**Injection**, powder for reconstitution, remifentanyl (as hydrochloride), net price 1-mg vial = £4.61; 2-mg vial = £9.21; 5-mg vial = £23.02

**Ultiva**<sup>®</sup> (GSK) CD2

**Injection**, powder for reconstitution, remifentanyl (as hydrochloride), net price 1-mg vial = £5.12; 2-mg vial = £10.23; 5-mg vial = £25.58

### 15.1.4.4 Other drugs for sedation

Dexmedetomidine and clonidine (section 2.5.2) are  $\alpha_2$ -adrenergic agonists with sedative properties. Dexmedetomidine is licensed for the sedation of patients receiving intensive care who need to remain responsive to verbal stimulation. Clonidine [unlicensed indication] can be used by mouth or by intravenous injection as a sedative agent when adequate sedation cannot be achieved with standard treatment.

## DEXMEDETOMIDINE

**Indications** maintenance of sedation during intensive care

**Cautions** monitor cardiac function; monitor respiratory function in non-intubated patients; severe neurological disorders; bradycardia; ischaemic heart disease or severe cerebrovascular disease (especially at higher doses); spinal cord injury; abrupt withdrawal after prolonged use; malignant hyperthermia

**Contra-indications** second- or third-degree AV block (unless pacemaker fitted); uncontrolled hypotension; acute cerebrovascular disorders

**Hepatic impairment** manufacturer advises caution—dose reduction may be required

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies

**Breast-feeding** manufacturer advises avoid unless potential benefit outweighs risk—present in milk in animal studies

**Side-effects** nausea, vomiting, dry mouth, bradycardia, myocardial ischaemia, myocardial infarction, tachycardia, blood pressure changes, agitation, changes in blood sugar, hyperthermia; *less commonly* abdominal distension, AV block, decreased cardiac output, dyspnoea, hallucination, metabolic acidosis, hypoalbuminaemia, thirst

### Dose

- By intravenous infusion, ADULT over 18 years, 0.7 micrograms/kg/hour adjusted according to response (usual range 0.2–1.4 micrograms/kg/hour)

**Dexdor**<sup>®</sup> (Orion) (PoM)

**Injection**, dexmedetomidine (as hydrochloride) 100 micrograms/mL, net price 2-mL amp = £15.66; 4-mL vial = £31.32; 10-mL vial = £78.30

**Note** To be diluted before use

## 15.1.5 Neuromuscular blocking drugs

### Important

The drugs in this section should only be administered by, or under direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

Neuromuscular blocking drugs used in anaesthesia are also known as **muscle relaxants**. By specific blockade of the neuromuscular junction they enable light anaesthesia to be used with adequate relaxation of the muscles of the abdomen and diaphragm. They also relax the vocal cords and allow the passage of a tracheal tube. Their action differs from the muscle relaxants used in musculoskeletal disorders (section 10.2.2) that act on the spinal cord or brain.

Patients who have received a neuromuscular blocking drug should **always** have their respiration assisted or controlled until the drug has been inactivated or antagonised (section 15.1.6). They should also receive sufficient concomitant inhalational or intravenous anaesthetic or sedative drugs to prevent awareness.

## Non-depolarising neuromuscular blocking drugs

Non-depolarising neuromuscular blocking drugs (also known as competitive muscle relaxants) compete with acetylcholine for receptor sites at the neuromuscular junction and their action can be reversed with anticholinesterases such as neostigmine (section 15.1.6). Non-depolarising neuromuscular blocking drugs can be divided into the **aminosteroid** group, comprising pancuronium, rocuronium, and vecuronium, and the **benzylisoquinolinium** group, comprising atracurium, cisatracurium, and mivacurium.

Non-depolarising neuromuscular blocking drugs have a slower onset of action than suxamethonium. These drugs can be classified by their duration of action as short-acting (15–30 minutes), intermediate-acting (30–40 minutes), and long-acting (60–120 minutes), although duration of action is dose-dependent. Drugs with a shorter or intermediate duration of action, such as atracurium and vecuronium, are more widely used than those with a longer duration of action, such as pancuronium.

Non-depolarising neuromuscular blocking drugs have no sedative or analgesic effects and are not considered to trigger malignant hyperthermia.

For patients receiving intensive care and who require tracheal intubation and mechanical ventilation, a non-depolarising neuromuscular blocking drug is chosen according to its onset of effect, duration of action, and side-effects. Rocuronium, with a rapid onset of effect, may facilitate intubation. Atracurium or cisatracurium may be suitable for long-term neuromuscular blockade since their duration of action is not dependent on elimination by the liver or the kidneys.

**Cautions** Allergic cross-reactivity between neuromuscular blocking drugs has been reported; caution is advised in cases of hypersensitivity to these drugs. Their activity is prolonged in patients with myasthenia gravis and in hypothermia, and lower doses are required. Non-depolarising neuromuscular blocking drugs should be used with great care in those with other neuromuscular disorders and those with fluid and electrolyte disturbances, as response is unpredictable. Resistance can develop in patients with burns, who may require increased doses; low plasma cholinesterase activity in these patients requires dose titration for mivacurium. The rate of administration of neuromuscular blocking drugs should be reduced in patients with cardiovascular disease. **Interactions:** Appendix 1 (muscle relaxants).

**Pregnancy** Non-depolarising neuromuscular blocking drugs are highly ionised at physiological pH and are therefore unlikely to cross the placenta in significant amounts.

**Breast-feeding** Because they are ionised at physiological pH, non-depolarising neuromuscular blocking drugs are unlikely to be present in milk in significant amounts. Breast-feeding may be resumed once the mother has recovered from neuromuscular block.

**Side-effects** Benzylisoquinolinium non-depolarising neuromuscular blocking drugs (except cisatracurium) are associated with histamine release, which can cause skin flushing, hypotension, tachycardia, bronchospasm, and very rarely anaphylactoid reactions. Most aminosteroid neuromuscular blocking drugs produce minimal histamine release. Drugs with vagolytic activity

can counteract any bradycardia that occurs during surgery. Acute myopathy has also been reported after prolonged use in intensive care.

**Atracurium**, a mixture of 10 isomers, is a benzyliisoquinolinium neuromuscular blocking drug with an intermediate duration of action. It undergoes non-enzymatic metabolism which is independent of liver and kidney function, thus allowing its use in patients with hepatic or renal impairment. Cardiovascular effects are associated with significant histamine release; histamine release can be minimised by administering slowly or in divided doses over at least 1 minute.

**Cisatracurium** is a single isomer of atracurium. It is more potent and has a slightly longer duration of action than atracurium and provides greater cardiovascular stability because cisatracurium lacks histamine-releasing effects.

**Mivacurium**, a benzyliisoquinolinium neuromuscular blocking drug, has a short duration of action. It is metabolised by plasma cholinesterase and muscle paralysis is prolonged in individuals deficient in this enzyme. It is not associated with vagolytic activity or ganglionic blockade although histamine release can occur, particularly with rapid injection.

**Pancuronium**, an aminosteroid neuromuscular blocking drug, has a long duration of action and is often used in patients receiving long-term mechanical ventilation in intensive care units. It lacks a histamine-releasing effect, but vagolytic and sympathomimetic effects can cause tachycardia and hypertension.

**Rocuronium** exerts an effect within 2 minutes and has the most rapid onset of any of the non-depolarising neuromuscular blocking drugs. It is an aminosteroid neuromuscular blocking drug with an intermediate duration of action. It is reported to have minimal cardiovascular effects; high doses produce mild vagolytic activity.

**Vecuronium**, an aminosteroid neuromuscular blocking drug, has an intermediate duration of action. It does not generally produce histamine release and lacks cardiovascular effects.

## ATRACURIUM BESILATE

(Atracurium besylate)

**Indications** neuromuscular blockade (short to intermediate duration) for surgery or during intensive care

**Cautions** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; seizures also reported

### Dose

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- Intubation and surgery, **ADULT**, by **intravenous injection**, initially 300–600 micrograms/kg, then 100–200 micrograms/kg as required or initially by **intravenous injection**, 300–600 micrograms/kg followed by **intravenous infusion**, 300–600 micrograms/kg/hour; **CHILD** under 18 years see *BNF for Children*
- Intensive care, **ADULT**, by **intravenous injection**, initially 300–600 micrograms/kg (optional) then by **intravenous infusion** 270–1770 micrograms/kg/hour (usual dose 650–780 micrograms/kg/hour); **CHILD** under 18 years see *BNF for Children*

**Atracurium** (Non-proprietary) (PoM)

**Injection**, atracurium besilate 10 mg/mL, net price 2.5-mL amp = £1.70; 5-mL amp = £3.00; 25-mL vial = £14.45

**Tracurium**® (GSK) (PoM)

**Injection**, atracurium besilate 10 mg/mL, net price 2.5-mL amp = £1.66; 5-mL amp = £3.00; 25-mL vial = £12.91

## CISATRACURIUM

**Indications** neuromuscular blockade (intermediate duration) for surgery or during intensive care

**Cautions** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also bradycardia

### Dose

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- Intubation and surgery, **ADULT**, by **intravenous injection**, initially 150 micrograms/kg; maintenance, by **intravenous injection**, 30 micrograms/kg approx. every 20 minutes or by **intravenous infusion**, initially 180 micrograms/kg/hour, then after stabilisation, 60–120 micrograms/kg/hour; **CHILD** 1 month–18 years see *BNF for Children*
- Intensive care, **ADULT**, by **intravenous injection**, initially 150 micrograms/kg (optional), then by **intravenous infusion** 180 micrograms/kg/hour adjusted according to response (usual range 30–600 micrograms/kg/hour)

**Cisatracurium** (Non-proprietary) (PoM)

**Injection**, cisatracurium (as besilate) 2 mg/mL, net price 10-mL vial = £7.55; 5 mg/mL, 30-mL vial = £31.09

**Nimbex**® (GSK) (PoM)

**Injection**, cisatracurium (as besilate) 2 mg/mL, net price 10-mL amp = £7.55

**Forte injection**, cisatracurium (as besilate) 5 mg/mL, net price 30-mL vial = £31.09

## MIVACURIUM

**Indications** neuromuscular blockade (short duration) for surgery

**Cautions** see notes above; low plasma cholinesterase activity; elderly

**Hepatic impairment** reduce dose in severe impairment

**Renal impairment** clinical effect prolonged in renal failure—reduce dose according to response

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

### Dose

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- Intubation and surgery, **ADULT**, by **intravenous injection**, 70–250 micrograms/kg; maintenance, by **intravenous injection**, 100 micrograms/kg every 15 minutes or by **intravenous infusion**, 8–10 micrograms/kg/minute, adjusted if necessary every 3 minutes by

1 microgram/kg/minute to usual dose of 6–7 micrograms/kg/minute; **CHILD** 2 months–18 years see *BNF for Children*

**Note** Doses up to 150 micrograms/kg may be given over 5–15 seconds, higher doses should be given over 30 seconds. In patients with asthma, cardiovascular disease or those who are sensitive to falls in arterial blood pressure give over 60 seconds

**Mivacron**<sup>®</sup> (GSK) **[PoM]**

**Injection**, mivacurium (as chloride) 2 mg/mL, net price 5-mL amp = £2.79; 10-mL amp = £4.51

## PANCURONIUM BROMIDE

**Indications** neuromuscular blockade (long duration) for surgery or during intensive care

**Cautions** see notes above

**Hepatic impairment** possibly slower onset, higher dose requirement, and prolonged recovery time

**Renal impairment** use with caution; prolonged duration of block

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

### Dose

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- Intubation and surgery, **ADULT**, by **intravenous injection**, initially 100 micrograms/kg then 20 micrograms/kg as required; **CHILD** under 18 years see *BNF for Children*
- Intensive care, **ADULT**, by **intravenous injection**, initially 100 micrograms/kg (optional) then 60 micrograms/kg every 60–90 minutes

**Pancuronium** (Non-proprietary) **[PoM]**

**Injection**, pancuronium bromide 2 mg/mL, net price 2-mL amp = £4.00

## ROCURONIUM BROMIDE

**Indications** neuromuscular blockade (intermediate duration) for surgery or during intensive care

**Cautions** see notes above

**Hepatic impairment** reduce dose

**Renal impairment** reduce maintenance dose; prolonged paralysis

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

### Dose

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- Intubation and surgery, **ADULT**, by **intravenous injection**, initially 600 micrograms/kg; maintenance, by **intravenous injection**, 150 micrograms/kg (**ELDERLY** 75–100 micrograms/kg) or by **intravenous infusion**, 300–600 micrograms/kg/hour (**ELDERLY** up to 400 micrograms/kg/hour) adjusted according to response; **CHILD** under 18 years see *BNF for Children*
- Intensive care, **ADULT**, by **intravenous injection**, initially 600 micrograms/kg (optional); maintenance by **intravenous infusion**, 300–600 micrograms/kg/hour for first hour, then adjusted according to response; **CHILD** 1 month–18 years see *BNF for Children*

**Rocuronium** (Non-proprietary) **[PoM]**

**Injection**, rocuronium bromide 10 mg/mL, net price 5-mL vial = £3.00, 10-mL vial = £6.00

**Esmeron**<sup>®</sup> (MSD) **[PoM]**

**Injection**, rocuronium bromide 10 mg/mL, net price 5-mL vial = £2.89, 10-mL vial = £5.79

## VECURONIUM BROMIDE

**Indications** neuromuscular blockade (intermediate duration) for surgery

**Cautions** see notes above

**Hepatic impairment** use with caution in significant impairment

**Renal impairment** use with caution in renal failure

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

### Dose

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- Intubation and surgery, **ADULT**, by **intravenous injection**, 80–100 micrograms/kg; maintenance, by **intravenous injection**, 20–30 micrograms/kg, adjusted according to response (max. 100 micrograms/kg in caesarian section) or by **intravenous infusion**, 0.8–1.4 micrograms/kg/minute, adjusted according to response; **CHILD** under 18 years see *BNF for Children*

**Norcuron**<sup>®</sup> (MSD) **[PoM]**

**Injection**, powder for reconstitution, vecuronium bromide, net price 10-mg vial = £3.37 (with water for injections)

## Depolarising neuromuscular blocking drugs

**Suxamethonium** has the most rapid onset of action of any of the neuromuscular blocking drugs and is ideal if fast onset and brief duration of action are required, e.g. with tracheal intubation.

Suxamethonium acts by mimicking acetylcholine at the neuromuscular junction but hydrolysis is much slower than for acetylcholine; depolarisation is therefore prolonged, resulting in neuromuscular blockade. Unlike the non-depolarising neuromuscular blocking drugs, its action cannot be reversed and recovery is spontaneous; anticholinesterases such as neostigmine potentiate the neuromuscular block.

Suxamethonium should be given after anaesthetic induction because paralysis is usually preceded by painful muscle fasciculations. While tachycardia occurs with single use, bradycardia may occur with repeated doses in adults and with the first dose in children. Premedication with atropine reduces bradycardia as well as the excessive salivation associated with suxamethonium use.

Prolonged paralysis may occur in **dual block**, which occurs with high or repeated doses of suxamethonium and is caused by the development of a non-depolarising block following the initial depolarising block. Individuals with myasthenia gravis are resistant to suxamethonium but can develop dual block resulting in delayed recovery. Prolonged paralysis may also occur in those with low or atypical plasma cholinesterase. Assisted ventilation should be continued until muscle function is restored.

## SUXAMETHONIUM CHLORIDE

(Succinylcholine chloride)

**Indications** neuromuscular blockade (short duration) for surgery

**Cautions** see notes above; hypersensitivity to other neuromuscular blocking drugs; patients with cardiac, respiratory, or neuromuscular disease; raised intra-ocular pressure (avoid in penetrating eye injury); severe sepsis (risk of hyperkalaemia); **interactions:** Appendix 1 (muscle relaxants)

**Contra-indications** family history of malignant hyperthermia, hyperkalaemia; major trauma, severe burns, neurological disease involving acute wasting of major muscle, prolonged immobilisation—risk of hyperkalaemia, personal or family history of congenital myotonic disease, Duchenne muscular dystrophy, low plasma-cholinesterase activity (including severe liver disease, see Hepatic Impairment)

**Hepatic impairment** prolonged apnoea may occur in severe liver disease because of reduced hepatic synthesis of pseudo-cholinesterase

**Pregnancy** mildly prolonged maternal neuromuscular blockade may occur

**Breast-feeding** unlikely to be present in breast milk in significant amounts (ionised at physiological pH); breast-feeding may be resumed once the mother recovered from neuromuscular block

**Side-effects** see notes above; also increased gastric pressure; hyperkalaemia; postoperative muscle pain, myoglobinuria, myoglobinaemia; increased intra-ocular pressure; flushing, rash; *rarely* arrhythmias, cardiac arrest, bronchospasm, apnoea, prolonged respiratory depression; limited jaw mobility; *very rarely* anaphylactic reactions, malignant hyperthermia; *also reported* hypertension, hypotension, rhabdomyolysis

### Dose

- Intubation and surgery, **ADULT**, by intravenous injection, 1–1.5 mg/kg; **CHILD** under 18 years, see *BNF for Children*

**Note** Doses of suxamethonium in BNF may differ from those in product literature

**Suxamethonium Chloride** (Non-proprietary) **(PoM)**

**Injection**, suxamethonium chloride 50 mg/mL, net price 2-mL amp = 58p, 2-mL prefilled syringe = £8.45

**Anectine**<sup>®</sup> (GSK) **(PoM)**

**Injection**, suxamethonium chloride 50 mg/mL, net price 2-mL amp = 71p

## 15.1.6 Drugs for reversal of neuromuscular blockade

### Important

The drugs in this section should only be administered by, or under the direct supervision of, personnel experienced in their use.

### Anticholinesterases

Anticholinesterases reverse the effects of the non-depolarising (competitive) neuromuscular blocking drugs such as pancuronium but they prolong the action of the depolarising neuromuscular blocking drug suxamethonium.

**Neostigmine** is used specifically for reversal of non-depolarising (competitive) blockade. It acts within one minute of intravenous injection and its effects last for 20 to 30 minutes; a second dose may then be necessary. Glycopyrronium or alternatively atropine (section 15.1.3), given before or with neostigmine, prevent bradycardia, excessive salivation, and other muscarinic effects of neostigmine.

## NEOSTIGMINE METILSULFATE

(Neostigmine methylsulfate)

**Indications** see under Dose

**Cautions** section 10.2.1 and notes above; glycopyrronium or atropine should also be given

**Contra-indications** section 10.2.1 and notes above

**Renal impairment** section 10.2.1

**Pregnancy** section 10.2.1

**Breast-feeding** section 10.2.1

**Side-effects** section 10.2.1 and notes above

### Dose

- Reversal of non-depolarising neuromuscular blockade, by intravenous injection over 1 minute, **ADULT** over 18 years, 2.5 mg repeated if necessary (max. 5 mg) after or with glycopyrronium or atropine; **CHILD** under 18 years see *BNF for Children*
- Myasthenia gravis, see section 10.2.1

**Neostigmine** (Non-proprietary) **(PoM)**

**Injection**, neostigmine metilsulfate 2.5 mg/mL, net price 1-mL amp = 50p

### With glycopyrronium bromide

**Glycopyrronium–Neostigmine** (Non-proprietary) **(PoM)**

**Injection**, neostigmine metilsulfate 2.5 mg, glycopyrronium bromide 500 micrograms/mL, net price 1-mL amp = £1.15

**Dose** reversal of non-depolarising neuromuscular blockade, by intravenous injection over 10–30 seconds, 1–2 mL or 0.02 mL/kg, dose may be repeated if required (total max. 2 mL); **CHILD** 0.02 mL/kg (or 0.2 mL/kg of a 1 in 10 dilution using water for injections or sodium chloride injection 0.9%), dose may be repeated if required (total max. 2 mL)

### Other drugs for reversal of neuromuscular blockade

**Sugammadex** is a modified gamma cyclodextrin that can be used for rapid reversal of neuromuscular blockade induced by rocuronium or vecuronium (section 15.1.5). In practice, sugammadex is used mainly for rapid reversal of neuromuscular blockade in an emergency.

The *Scottish Medicines Consortium*, p. 4 has advised (February 2013) that sugammadex (*Bridion*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the routine reversal of neuromuscular blockade in high-risk patients only, or where prompt reversal of neuromuscular block is required.

## SUGAMMADEX

**Indications** reversal of neuromuscular blockade induced by rocuronium or vecuronium

**Cautions** recurrence of neuromuscular blockade—monitor respiratory function until fully recovered; recovery may be delayed in cardiovascular disease and elderly; pre-existing coagulation disorders or use of anticoagulants (unrelated to surgery); wait 24 hours

before re-administering rocuronium or vecuronium; **interactions:** Appendix 1 (sugammadex)

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** use with caution—no information available

**Side-effects** bronchospasm, bradycardia, cardiac arrest, hypersensitivity reactions

#### Dose

- Routine reversal of neuromuscular blockade induced by rocuronium or vecuronium, **by intravenous injection**, **ADULT** over 18 years, 2–4 mg/kg (consult product literature); a further dose of 4 mg/kg may be required if recurrence of neuromuscular blockade occurs
- Routine reversal of neuromuscular blockade induced by rocuronium, **by intravenous injection**, **CHILD** 2–18 years, 2 mg/kg (consult product literature)
- Immediate reversal of neuromuscular blockade induced by rocuronium, **by intravenous injection**, **ADULT** over 18 years, 16 mg/kg (consult product literature)

**Bridion**<sup>®</sup> (MSD) (PoM)

**Injection**, sugammadex (as sodium salt) 100 mg/mL, net price 2-mL amp = £59.64, 5-mL amp = £149.10  
**Electrolytes** Na<sup>+</sup> 0.42 mmol/mL

## 15.1.7 Antagonists for central and respiratory depression

### Important

The drugs in this section should only be administered by, or under the direct supervision of, personnel experienced in their use.

Respiratory depression is a major concern with opioid analgesics and it may be treated by artificial ventilation or be reversed by **naloxone**. Naloxone will immediately reverse opioid-induced respiratory depression but the dose may have to be repeated because of the short duration of action of naloxone; however, naloxone will also antagonise the analgesic effect.

**Flumazenil** is a benzodiazepine antagonist for the reversal of the central sedative effects of benzodiazepines after anaesthetic and similar procedures. Flumazenil has a shorter half-life and duration of action than diazepam or midazolam so patients may become re-sedated.

**Doxapram** (section 3.5.1) is a central and respiratory stimulant but is of limited value in anaesthesia.

### FLUMAZENIL

**Indications** reversal of sedative effects of benzodiazepines in anaesthetic, intensive care, and clinical procedures; overdosage with benzodiazepines (see Emergency Treatment of Poisoning)

**Cautions** short-acting (repeat doses may be necessary—benzodiazepine effects may persist for at least 24 hours); benzodiazepine dependence (may precipitate withdrawal symptoms); prolonged benzodiazepine therapy for epilepsy (risk of convulsions); history of panic disorders (risk of recurrence); ensure neuromuscular blockade cleared before giving; avoid rapid injection in high-risk or anxious patients and following major surgery; head injury (rapid reversal of benzodiazepine sedation may cause convulsions); elderly; children

**Contra-indications** life-threatening condition (e.g. raised intracranial pressure, status epilepticus) controlled by benzodiazepines

**Hepatic impairment** carefully titrate dose

**Pregnancy** not known to be harmful

**Breast-feeding** avoid breast-feeding for 24 hours

**Side-effects** nausea and vomiting; *less commonly* palpitation, anxiety, fear; *also reported* transient hypertension, tachycardia, flushing, agitation, convulsions (particularly in those with epilepsy), dizziness, sensory disturbance, chills, sweating

#### Dose

- Anaesthesia and clinical procedures, **by intravenous injection**, 200 micrograms over 15 seconds, then 100 micrograms at 60-second intervals if required; usual dose range, 300–600 micrograms; max. total dose 1 mg; **CHILD** 1 month–18 years see *BNF for Children*
- Intensive care, **by intravenous injection**, 300 micrograms over 15 seconds, then 100 micrograms at 60-second intervals if required; max. total dose 2 mg; then if drowsiness recurs *either*, **by intravenous injection**, 300 micrograms, *or by intravenous infusion*, 100–400 micrograms/hour, adjusted according to response; **CHILD** 1 month–18 years see *BNF for Children*

**Flumazenil** (Non-proprietary) (PoM)

**Injection**, flumazenil 100 micrograms/mL, net price 5-mL amp = £13.50

## NALOXONE HYDROCHLORIDE

**Indications** see under Dose

**Cautions** cardiovascular disease or those receiving cardiotoxic drugs (serious adverse cardiovascular effects reported); physical dependence on opioids (precipitates withdrawal); pain (see also under Titration of Dose, below); has short duration of action (repeated doses or infusion may be necessary to reverse effects of opioids with longer duration of action)

**Titration of dose** In postoperative use, the dose should be titrated for each patient in order to obtain sufficient respiratory response; however, naloxone antagonises analgesia

**Pregnancy** use only if potential benefit outweighs risk

**Breast-feeding** not orally bioavailable

**Side-effects** nausea, vomiting, hypotension, hypertension, tachycardia, headache, dizziness; *less commonly* diarrhoea, dry mouth, bradycardia, arrhythmia, hyperventilation, tremor, sweating; *rarely* seizures; *very rarely* ventricular fibrillation, cardiac arrest, pulmonary oedema, erythema multiforme, and hypersensitivity reactions including anaphylaxis; *also reported* agitation

#### Dose

- Reversal of postoperative respiratory depression, **ADULT** and **CHILD** over 12 years, **by intravenous injection**, 100–200 micrograms (1.5–3 micrograms/kg); if response inadequate, give subsequent dose of 100 micrograms every 2 minutes; alternatively, subsequent doses can be given **by intramuscular injection** every 1–2 hours; **CHILD** 1 month–12 years see *BNF for Children*
- Reversal of respiratory and CNS depression resulting from opioid administration to mother during labour, **NEONATE**, **by intramuscular injection**, 200 micrograms (60 micrograms/kg) as a single dose at birth; alter-

natively by **subcutaneous or intravenous injection**, 10 micrograms/kg, repeated every 2–3 minutes

- Opioid overdose, see Emergency Treatment of Poisoning, p. 38

**Note** Naloxone doses in BNF may differ from those in product literature

#### Preparations

See Emergency Treatment of Poisoning, p. 38

## 15.1.8 Drugs for malignant hyperthermia

### Important

The drugs in this section should only be administered by, or under the direct supervision of, personnel experienced in their use.

Malignant hyperthermia is a rare but potentially lethal complication of anaesthesia. It is characterised by a rapid rise in temperature, increased muscle rigidity, tachycardia, and acidosis. The most common triggers of malignant hyperthermia are the volatile anaesthetics. Suxamethonium has also been implicated, but malignant hyperthermia is more likely if it is given following a volatile anaesthetic. Volatile anaesthetics and suxamethonium should be avoided during anaesthesia in patients at high risk of malignant hyperthermia.

**Dantrolene** is used in the treatment of malignant hyperthermia. It acts on skeletal muscle cells by interfering with calcium efflux, thereby stopping the contractile process.

### DANTROLENE SODIUM

**Indications** malignant hyperthermia; chronic severe spasticity of voluntary muscle (section 10.2.2)

**Cautions** avoid extravasation (risk of tissue necrosis); **interactions:** Appendix 1 (muscle relaxants)

**Pregnancy** use only if potential benefit outweighs risk

**Breast-feeding** present in milk—use only if potential benefit outweighs risk

**Side-effects** hepatotoxicity, pulmonary oedema, dizziness, weakness, and injection-site reactions including erythema, rash, swelling, and thrombophlebitis

#### Dose

- By **rapid intravenous injection**, **ADULT**, initially 2–3 mg/kg, then 1 mg/kg repeated as required to a cumulative max. of 10 mg/kg; **CHILD** 1 month–18 years see *BNF for Children*

**Dantrium Intravenous**<sup>®</sup> (SpePharm) (POM)  
**Injection**, powder for reconstitution, dantrolene sodium, net price 20-mg vial = £51.00 (hosp. only)

## 15.2 Local anaesthesia

### Important

The drugs in section 15.2 should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

The use of local anaesthetics by injection or by application to mucous membranes to produce local analgesia is discussed in this section.

See also section 1.7 (anus), section 11.7 (eye), section 12.3 (oropharynx), and section 13.3 (skin).

**Use of local anaesthetics** Local anaesthetic drugs act by causing a reversible block to conduction along nerve fibres. They vary widely in their potency, toxicity, duration of action, stability, solubility in water, and ability to penetrate mucous membranes. These factors determine their application, e.g. topical (surface), infiltration, peripheral nerve block, intravenous regional anaesthesia (Bier's block), plexus, epidural (extradural), or spinal (intrathecal or subarachnoid) block. Local anaesthetics may also be used for postoperative pain relief, thereby reducing the need for analgesics such as opioids.

**Administration** The dose of local anaesthetic depends on the injection site and the procedure used. In determining the safe dosage, it is important to take account of the rate of absorption and excretion, and of the potency. The patient's age, weight, physique, and clinical condition, and the vascularity of the administration site and the duration of administration, must also be considered.

Uptake of local anaesthetics into the systemic circulation determines their duration of action and produces toxicity.

Great care must be taken to avoid accidental intravascular injection; local anaesthetic injections should be given slowly in order to detect inadvertent intravascular administration. When prolonged analgesia is required, a long-acting local anaesthetic is preferred to minimise the likelihood of cumulative systemic toxicity. Local anaesthesia around the oral cavity may impair swallowing and therefore increases the risk of aspiration.

Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so **careful surveillance** for toxic effects (see Toxicity and Side-effects, p. 877) is necessary during the first 30 minutes after injection.

Epidural anaesthesia is commonly used during surgery, often combined with general anaesthesia, because of its protective effect against the stress response of surgery. It is often used when good postoperative pain relief is essential (e.g. major thoracic or intra-abdominal surgery).

**Use of vasoconstrictors** Local anaesthetics cause dilatation of blood vessels. The addition of a vasoconstrictor such as **adrenaline (epinephrine)** to the local anaesthetic preparation diminishes local blood flow, slowing the rate of absorption and thereby prolonging the anaesthetic effect. Great care should be taken to avoid inadvertent intravenous administration of a preparation containing adrenaline, and it is **not** advisable to give adrenaline with a local anaesthetic injection in digits or appendages because of the risk of ischaemic necrosis.

Adrenaline must be used in a low concentration when administered with a local anaesthetic (but see also Dental Anaesthesia, p. 877). The total dose of adrenaline should **not** exceed 500 micrograms and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture

is to be injected. Care must also be taken to calculate a safe maximum dose of local anaesthetic when using combination products. For prescribing information on adrenaline, see section 2.7.3. For drug interactions of adrenaline, see Appendix 1 (sympathomimetics).

In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline with a local anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline should be used.

**Dental anaesthesia** **Lidocaine** is widely used in dental procedures; it is most often used in combination with **adrenaline** (epinephrine). Lidocaine 2% combined with adrenaline 1 in 80 000 (12.5 micrograms/mL) is a safe and effective preparation; there is no justification for using higher concentrations of adrenaline. See also Use of Vasoconstrictors, p. 876.

The local anaesthetics **articaine** and **mepivacaine** are also used in dentistry; they are available in cartridges suitable for dental use. Mepivacaine is available with or without adrenaline and articaine is available with adrenaline.

In patients with severe hypertension or unstable cardiac rhythm, mepivacaine without adrenaline may be used. Alternatively, **prilocaine** with or without felypressin can be used but there is no evidence that it is any safer. Felypressin can cause coronary vasoconstriction when used at high doses; limit dose in patients with coronary artery disease.

**Cautions of local anaesthetics** Local anaesthetics should be administered with caution in children, elderly or debilitated patients (consider dose reduction), or in patients with impaired cardiac conduction, cardiovascular disease, hypovolaemia, shock, impaired respiratory function, epilepsy, or myasthenia gravis. See also Administration and Use of Vasoconstrictors, above.

**Contra-indications of local anaesthetics** Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. In such circumstances, increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH. See also Use of Vasoconstrictors, p. 876.

Local anaesthetic preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block).

Local anaesthetics can cause ototoxicity and should not be applied to the middle ear. They are also contra-indicated in patients with complete heart block.

**Toxicity and side-effects** A single application of a topical lidocaine preparation does not generally cause systemic side-effects. Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection.

The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. CNS effects include a feeling of inebriation and lightheadedness followed by drowsiness, numbness of the tongue and perioral region, restlessness, paraesthesia (including sensations of hot and cold), dizziness, blurred vision, tinnitus, headache, nausea and vomiting, muscle twitching, tremors, and convulsions. Systemic excitation may also occur, followed by depression with

drowsiness, respiratory failure, unconsciousness, and coma. Effects on the cardiovascular system include myocardial depression and peripheral vasodilatation resulting in hypotension and bradycardia; arrhythmias and cardiac arrest can occur.

Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chlorprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

#### Management of severe local anaesthetic-induced cardiovascular toxicity

After injection of a bolus of local anaesthetic, toxicity may develop at any time in the following hour. In the event of signs of toxicity during injection, the administration of the local anaesthetic must be stopped immediately.

Cardiovascular status must be assessed and cardiopulmonary resuscitation procedures must be followed, see section 2.7.3 (Cardiopulmonary Resuscitation).

In the event of local anaesthetic-induced cardiac arrest, standard cardiopulmonary resuscitation should be initiated immediately. Lidocaine must not be used as anti-arrhythmic therapy.

If the patient does not respond rapidly to standard procedures, 20% lipid emulsion such as *Intralipid*<sup>®</sup> (unlicensed indication) should be given intravenously at an initial bolus dose of 1.5 mL/kg over 1 minute, followed by an infusion of 15 mL/kg/hour. After 5 minutes, if cardiovascular stability has not been restored or circulation deteriorates, give a maximum of two further bolus doses of 1.5 mL/kg over 1 minute, 5 minutes apart, and increase the infusion rate to 30 mL/kg/hour. Continue infusion until cardiovascular stability and adequate circulation are restored or maximum cumulative dose of 12 mL/kg is given.

Standard cardiopulmonary resuscitation must be maintained throughout lipid emulsion treatment.

Propofol is not a suitable alternative to lipid emulsion.

Further advice on ongoing treatment should be obtained from the **National Poisons Information Service**, p. 33.

Detailed treatment algorithms and accompanying notes are available at [www.toxbase.org](http://www.toxbase.org) or [www.aagbi.org](http://www.aagbi.org) (search site for: local anaesthetic toxicity).

### Articaine

**Articaine** is an amide-type local anaesthetic used for dental anaesthesia (see Dental Anaesthesia, above). It is available in a preparation that also contains adrenaline (see Use of Vasoconstrictors, p. 876).

#### ARTICAINE HYDROCHLORIDE WITH ADRENALINE

(Carticaine hydrochloride with adrenaline)

**Indications** infiltration anaesthesia in dentistry

**Cautions** see Cautions of Local Anaesthetics, above and Adrenaline, section 2.7.3

**Contra-indications** see Contra-indications of Local Anaesthetics, p. 877 and Adrenaline, section 2.7.3

**Hepatic impairment** use with caution; increased risk of side-effects in severe impairment

**Renal impairment** see Adrenaline, section 2.7.3

**Pregnancy** use only if potential benefit outweighs risk—no information available

**Breast-feeding** avoid breast-feeding for 48 hours after administration

**Side-effects** see Toxicity and Side-effects, p. 877 and Adrenaline, section 2.7.3; also methaemoglobinemia (see Prilocaine (p. 882) for treatment)

#### Dose

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

- **ADULT** and **CHILD** over 4 years, consult expert dental sources; **important:** see also Administration, p. 876

#### Septanest® (Septodont) (POM)

**Injection**, articaine hydrochloride 40 mg/mL, adrenaline 1 in 200 000 (5 micrograms/mL), net price 2.2-mL cartridge = 41p

**Excipients** include sulfites

**Injection**, articaine hydrochloride 40 mg/mL, adrenaline 1 in 100 000 (10 micrograms/mL), net price 2.2-mL cartridge = 41p

**Excipients** include sulfites

## Bupivacaine

**Bupivacaine** has a longer duration of action than other local anaesthetics. It has a slow onset of action, taking up to 30 minutes for full effect. It is often used in lumbar epidural blockade and is particularly suitable for continuous epidural analgesia in labour, or for postoperative pain relief. It is the principal drug used for spinal anaesthesia. Hyperbaric solutions containing glucose may be used for spinal block.

### BUPIVACAINE HYDROCHLORIDE

**Indications** see under Dose

**Cautions** see Cautions of Local Anaesthetics, p. 877; myocardial depression may be more severe and more resistant to treatment; cardiovascular disease; hypertension; hypotension; cerebral arteriopathy; **interactions:** Appendix 1 (bupivacaine)

**Contra-indications** see Contra-indications of Local Anaesthetics, p. 877

**Hepatic impairment** use with caution in severe impairment

**Renal impairment** use with caution in severe impairment

**Pregnancy** large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block; use lower doses for intrathecal use during late pregnancy

**Breast-feeding** amount too small to be harmful

**Side-effects** see Toxicity and Side-effects, p. 877

#### Dose

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

**Note** Doses should be adjusted according to patient's physical status and nature of procedure—**important:** see also under Administration, p. 876

- Surgical anaesthesia

**Lumbar epidural block**, **ADULT** and **CHILD** over 12 years, 75–150 mg using a 5 mg/mL (0.5%) solution

**Thoracic epidural block**, **ADULT** and **CHILD** over 12 years, 12.5–50 mg using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

**Caudal epidural block**, **ADULT** and **CHILD** over 12 years, 50–150 mg using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

**Major nerve block**, **ADULT** and **CHILD** over 12 years, 50–175 mg using a 5 mg/mL (0.5%) solution

**Field block**, **ADULT** and **CHILD** over 12 years, up to max. 150 mg using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

**Intrathecal injection**, see *Marcaïn Heavy*®

- Acute pain

**Lumbar epidural block**, **ADULT** and **CHILD** over 12 years, by **intermittent injection**, 15–37.5 mg using a 2.5 mg/mL (0.25%) solution, repeated when required (at intervals of at least 30 minutes) or by **continuous epidural infusion**, 12.5–18.8 mg/hour using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; labour pain, by **continuous epidural infusion**, 6.25–12.5 mg/hour using a 1.25 mg/mL (0.125%) solution; max. 400 mg in 24 hours

**Thoracic epidural block**, **ADULT** and **CHILD** over 12 years, by **continuous epidural infusion**, 6.3–18.8 mg/hour using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; max. 400 mg in 24 hours

**Intra-articular block**, **ADULT** and **CHILD** over 12 years, up to max. 100 mg using a 2.5 mg/mL (0.25%) solution; when co-administered with bupivacaine by another route, total max. 150 mg

**Field block**, **ADULT** and **CHILD** over 12 years, up to max. 150 mg using a 2.5 mg/mL (0.25%) solution

**With fentanyl**, see *Buflor*®

#### Important

The licensed doses stated above may not be appropriate in some settings and expert advice should be sought

#### Bupivacaine (Non-proprietary) (POM)

**Injection**, anhydrous bupivacaine hydrochloride 2.5 mg/mL (0.25%), net price 10 mL = 88p; 5 mg/mL (0.5%), 10 mL = 92p

**Infusion (epidural)**, anhydrous bupivacaine hydrochloride 1 mg/mL (0.1%), net price 100 mL = £8.41, 250 mL = £10.59; 1.25 mg/mL (0.125%), 250 mL = £10.80

#### Marcaïn® (AstraZeneca) (POM)

**Injection**, anhydrous bupivacaine hydrochloride 2.5 mg/mL (*Marcaïn*® 0.25%), net price 10-mL *Polyamp*® = £1.06; 5 mg/mL (*Marcaïn*® 0.5%), 10-mL *Polyamp*® = £1.21

**Marcaïn Heavy®** (AstraZeneca) (PoM)

**Injection**, anhydrous bupivacaine hydrochloride 5 mg/mL (0.5%), glucose 80 mg/mL, net price 4-mL amp = £1.45

**Dose** **ADULT** and **CHILD** over 12 years, intrathecal anaesthesia for surgery, 10–20 mg bupivacaine hydrochloride; dose may need to be reduced in elderly and in late pregnancy

#### ▲ With adrenaline

For prescribing information on adrenaline, see section 2.7.3; see also Use of Vasoconstrictors, p. 876.

**Bupivacaine and Adrenaline** (Non-proprietary) (PoM)

**Injection**, anhydrous bupivacaine hydrochloride 2.5 mg/mL (0.25%), adrenaline 1 in 200 000 (5 micrograms/mL), net price 10-mL amp = £1.40

**Injection**, anhydrous bupivacaine hydrochloride 5 mg/mL (0.5%), adrenaline 1 in 200 000 (5 micrograms/mL), net price 10-mL amp = £2.10

#### ▲ With fentanyl

For prescribing information on fentanyl, see section 15.1.4.3

**Buflolol®** (AMCo) (CD2)

**Infusion (epidural)**, bupivacaine hydrochloride 1 mg/mL (0.1%), fentanyl (as citrate) 2 micrograms/mL, net price 250 mL = £8.50, 500 mL = £9.20

**Infusion (epidural)**, bupivacaine hydrochloride 1.25 mg/mL (0.125%), fentanyl (as citrate) 2 micrograms/mL, net price 250 mL = £9.05, 500 mL = £9.20

**Electrolytes** Na<sup>+</sup> < 0.5 mmol/mL

**Dose** **ADULT**, continuous lumbar epidural infusion during labour (once epidural block established), 10–18.75 mg/hour bupivacaine, 16–30 micrograms/hour fentanyl; continuous thoracic, upper abdominal, or lower abdominal epidural infusion for postoperative pain (once epidural block established), 4–18.75 mg/hour bupivacaine, 8–30 micrograms/hour fentanyl; max. 400 mg bupivacaine or 720 micrograms fentanyl in 24 hours; not recommended for use in children

## Chloroprocaine

**Chloroprocaine**, a para-aminobenzoic acid ester, is used for spinal anaesthesia in adults where the planned procedure should not exceed 40 minutes.

## CHLOROPROCAINE HYDROCHLORIDE

**Indications** intrathecal anaesthesia for surgical procedures lasting up to 40 minutes

**Cautions** see Cautions of Local Anaesthetics, p. 877; also acute porphyria (section 9.8.2); **interactions:** Appendix 1 (chloroprocaine)

**Contra-indications** see Contra-indications of Local Anaesthetics, p. 877; also severe anaemia

**Hepatic impairment** use with caution in severe impairment

**Renal impairment** use with caution in severe impairment

**Pregnancy** avoid—no information available

**Breast-feeding** avoid—no information available

**Side-effects** see Toxicity and Side-effects, p. 877; also less commonly hypertension

## Dose

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

**Note** Doses should be adjusted according to patient's physical status and nature of the procedure—**important:** see also under Administration, p. 876

- **ADULT** over 18 years, by slow intrathecal injection, 40–50 mg depending on desired length of block

## Important

The licensed doses stated above may not be appropriate in some settings and expert advice should be sought

**Ampres®** (AMCo) ▼ (PoM)

**Injection**, chloroprocaine hydrochloride 10 mg/mL, net price 5-mL amp = £8.75

## Levobupivacaine

**Levobupivacaine**, an isomer of bupivacaine, has anaesthetic and analgesic properties similar to bupivacaine, but is thought to have fewer adverse effects.

## LEVOBUPIVACAIN

**Note** Levobupivacaine is an isomer of bupivacaine

**Indications** see under Dose

**Cautions** see Cautions of Local Anaesthetics, p. 877; cardiovascular disease; **interactions:** Appendix 1 (levobupivacaine)

**Contra-indications** see Contra-indications of Local Anaesthetics, p. 877

**Hepatic impairment** use with caution

**Pregnancy** large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block; avoid if possible in the first trimester—toxicity in animal studies; may cause fetal distress syndrome; do not use for para-cervical block in obstetrics; do not use 7.5 mg/mL strength in obstetrics

**Breast-feeding** amount too small to be harmful

**Side-effects** see Toxicity and Side-effects, p. 877; also sweating, pyrexia, anaemia

## Dose

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

**Note** Doses should be adjusted according to patient's physical status and nature of procedure—**important:** see also under Administration, p. 876

- Surgical anaesthesia

**Lumbar epidural**, **ADULT**, 50–150 mg using a 5 mg/mL (0.5%) or 7.5 mg/mL (0.75%) solution, given over 5 minutes; caesarean section, 75–150 mg using a 5 mg/mL (0.5%) solution, given over 15–20 minutes

**Intrathecal injection**, **ADULT**, 15 mg using a 5 mg/mL (0.5%) solution

**Peripheral nerve block**, **ADULT**, 2.5–150 mg using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

**Peribulbar block**, **ADULT**, 37.5–112.5 mg using a 7.5 mg/mL (0.75%) solution

**Local infiltration, ADULT**, 2.5–150 mg using a 2.5 mg/mL (0.25%) solution

● **Acute pain**

**Lumbar epidural, ADULT**, labour pain, by **intermittent injection**, 15–25 mg using a 2.5 mg/mL (0.25%) solution, repeated as required at intervals of at least 15 minutes or by **continuous epidural infusion**, 5–12.5 mg/hour using a 1.25 mg/mL (0.125%) solution; postoperative pain, by **continuous epidural infusion**, 12.5–18.75 mg/hour using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; max. 400 mg in 24 hours

### Important

The licensed doses stated above may not be appropriate in some settings and expert advice should be sought

### Chirocaine® (AbbVie) (PoM)

**Injection**, levobupivacaine (as hydrochloride) 2.5 mg/mL, net price 10-mL amp = £1.41; 5 mg/mL, 10-mL amp = £1.62; 7.5 mg/mL, 10-mL amp = £2.42

**Note** For 1.25 mg/mL concentration dilute standard solutions with sodium chloride 0.9%

**Epidural infusion**, levobupivacaine (as hydrochloride) 1.25 mg/mL, net price 100 mL = £7.26, 200 mL = £12.20

### Lidocaine

**Lidocaine** is effectively absorbed from mucous membranes and is a useful surface anaesthetic in concentrations up to 10%. Except for surface anaesthesia and dental anaesthesia, solutions should **not** usually exceed 1% in strength. The duration of the block (with adrenaline) is about 90 minutes.

### LIDOCAINE HYDROCHLORIDE

(Lignocaine hydrochloride)

**Indications** see under Dose; ventricular arrhythmias (section 2.3.2); eye (section 11.7); oral lesions (section 12.3.1)

**Cautions** See Cautions of Local Anaesthetics, p. 877 and section 2.3.2; hypertension; topical preparations can damage plastic cuffs of endotracheal tubes

**Contra-indications** see notes above, Contra-indications of Local Anaesthetics, p. 877, and section 2.3.2

**Hepatic impairment** section 2.3.2

**Renal impairment** section 2.3.2

**Pregnancy** large doses can cause fetal bradycardia; large doses during delivery can cause neonatal respiratory depression, hypotonia, or bradycardia after paracervical or epidural block

**Breast-feeding** section 2.3.2

**Side-effects** see Toxicity and Side-effects, p. 877 and section 2.3.2; also methaemoglobinaemia (see under Prilocaine (p. 882) for treatment), nystagmus, rash; hypoglycaemia also reported following intrathecal or extradural administration

### Dose

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

- Infiltration anaesthesia, **ADULT**, according to patient's weight and nature of procedure, max. 200 mg (or 500 mg if given in solutions containing adrenaline)—

see also Administration, p. 876 and **important** warning below; **CHILD** under 18 years see *BNF for Children*

- Intravenous regional anaesthesia and nerve blocks, seek expert advice
- Surface anaesthesia, see preparations below

### Important

The licensed doses stated above may not be appropriate in some settings and expert advice should be sought

### ▲ Lidocaine hydrochloride injections

#### Lidocaine (Non-proprietary) (PoM)

**Injection**, lidocaine hydrochloride 5 mg/mL (0.5%), net price 10-mL amp = 50p; 10 mg/mL (1%), 2-mL amp = 27p, 5-mL amp = 27p, 10-mL amp = 40p, 10-mL pre-filled syringe = £8.48; 20-mL amp = 76p; 20 mg/mL (2%), 2-mL amp = 31p, 5-mL amp = 31p

#### ▲ With adrenaline

For prescribing information on adrenaline see section 2.7.3; see also Use of Vasoconstrictors, p. 876.

#### Xylocaine® (AstraZeneca) (PoM)

**Injection**, anhydrous lidocaine hydrochloride 10 mg/mL (1%), adrenaline 1 in 200 000 (5 micrograms/mL), net price 20-mL vial = £1.93

**Excipients** include sulfites

**Injection**, anhydrous lidocaine hydrochloride 20 mg/mL (2%), adrenaline 1 in 200 000 (5 micrograms/mL), net price 20-mL vial = £1.77

**Excipients** include sulfites

### ▲ Lidocaine injections for dental use

A variety of lidocaine injections with adrenaline is available in dental cartridges; brands include *Lignospas Special®*, *Rexocaine®*, and *Xylocaine®*.

For prescribing information on adrenaline see section 2.7.3; see also Use of Vasoconstrictors, p. 876.

**Note** Consult expert dental sources for specific advice in relation to dose of lidocaine for dental anaesthesia

### ▲ Lidocaine for surface anaesthesia

#### Lidocaine (Non-proprietary)

**Ointment**, lidocaine 5%, net price 15 g = £6.18

**Dose** dental practice, rub gently into dry gum

Sore nipples from breast-feeding, apply using gauze and wash off immediately before next feed

Pain relief (in anal fissures, haemorrhoids, pruritus ani, pruritus vulvae, herpes zoster, or herpes labialis), lubricant in cystoscopy or proctoscopy, apply 1–2 mL when necessary; avoid long-term use

**Dental prescribing on NHS** Lidocaine Ointment, 5% may be prescribed

#### Instillagel® (CliniMed)

**Gel**, lidocaine hydrochloride 2%, chlorhexidine gluconate solution 0.25%, in a sterile lubricant basis in disposable syringe, net price 6-mL syringe = 23p, 11-mL syringe = 14p

**Excipients** include hydroxybenzoates (parabens)

**Dose** urethral sounding and catheterisation, 6–11 mL into urethra

Cystoscopy, 11 mL (a further instillation of 6–11 mL may be required)

**Laryngojet**<sup>®</sup> (UCB Pharma) (PoM)

**Solution**, lidocaine hydrochloride 40 mg/mL (4%), net price per unit (4-mL vial and disposable sterile cannula with cover and vial injector) = £5.10

**Note** May be difficult to obtain

**Dose** anaesthesia of mucous membranes of oropharynx, trachea, or respiratory tract, 40–200 mg (1–5 mL) as a single dose sprayed, instilled (if a cavity), or applied with a swab (reduce dose according to size, age and condition of patient), usual dose 160 mg (4 mL); **CHILD** up to 3 mg/kg

**LMX 4**<sup>®</sup> (Ferndale)

**Cream**, lidocaine 4%, net price 5-g tube = £2.98, 30-g tube = £14.90; 12 × 5-g tube with 24 waterproof dressings = £38.16

**Excipients** include benzyl alcohol and propylene glycol  
**Dose ADULT** and **CHILD** over 1 month, anaesthesia before venous cannulation or venepuncture, apply thick layer (1–2.5 g; **CHILD** under 1 year max. 1 g) to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 5 hours (**CHILD** 1–3 months, 60 minutes; **CHILD** 3 months–1 year, 4 hours); remove cream with gauze and perform procedure after approximately 5 minutes

**Versatis**<sup>®</sup> (Grünenthal) (PoM)

**Plasters**, lidocaine 5% (700 mg/medicated plaster), net price 30 = £72.40

**Excipients** include hydroxybenzoates (parabens), propylene glycol

**Dose** postherpetic neuralgia, **ADULT** over 18 years, apply to intact, dry, non-hairy, non-irritated skin once daily for up to 12 hours, followed by a 12-hour plaster-free period; discontinue if no response after 4 weeks

**Note** Up to 3 plasters may be used to cover large areas; plasters may be cut

**Note** The *Scottish Medicines Consortium* (p. 4) has advised (July 2008) that *Versatis*<sup>®</sup> is accepted for restricted use within NHS Scotland for the treatment of postherpetic neuralgia in patients who are intolerant of first-line systemic therapies or when they have been ineffective

**Xylocaine**<sup>®</sup> (AstraZeneca)

**Spray**, lidocaine 10% (100 mg/g) supplying 10 mg lidocaine/dose; 500 spray doses per container, net price 50-mL bottle = £6.29

**Dose** dental practice, 1–5 doses

Maxillary sinus puncture, 3 doses

During delivery in obstetrics, up to 20 doses

Bronchoscopy, laryngoscopy, oesophagoscopy, endotracheal intubation, up to 20 doses; **CHILD** up to 3 mg/kg

**With prilocaine**

For prescribing information on prilocaine, see p. 882

**Lidocaine with prilocaine** (Non-proprietary)

**Cream**, lidocaine 2.5%, prilocaine 2.5%, net price 5-g tube = £2.84; 30-g tube (surgical pack) = £14.75; 5-g tube with 2 occlusive dressings = £3.29; 5-g tube with 12 occlusive dressings (premedication pack) = £12.99

**Brands include** *Denela*<sup>®</sup>

**Contra-indications** use in child less than 37 weeks corrected gestational age

**Dose ADULT** and **CHILD** over 1 year, anaesthesia before minor skin procedures including venepuncture, apply thick layer under occlusive dressing 1–5 hours before procedure (2–5 hours before procedures on large areas e.g. split skin grafting); max. 2 doses in 24 hours for **CHILD** 1–12 years; **CHILD** under 3 months, apply max. 1 g under occlusive dressing for max. 1 hour before procedure; max. 1 dose in 24 hours, **CHILD** 3–12 months, apply max. 2 g under occlusive dressing for max. 4 hours before procedure; max. 2 doses in 24 hours

**Note** Shorter application time of 15–30 minutes is

recommended for children with atopic dermatitis (30 minutes before removal of mollusca)

Anaesthesia on genital skin before injection of local anaesthetics, apply under occlusive dressing for 15 minutes (in adult men) and 60 minutes (in adult women)

Anaesthesia before surgical treatment of lesions on genital mucosa in adults, apply up to 10 g 5–10 minutes before procedure

Anaesthesia before cervical curettage in adults, administer 10 g in lateral vaginal fornices for 10 minutes

Anaesthesia before mechanical cleansing or debridement of leg ulcer in adults, apply up to 10 g under occlusive dressing for 30–60 minutes

**EMLA**<sup>®</sup> (AstraZeneca)

**Cream**, lidocaine 2.5%, prilocaine 2.5%, net price 5-g tube = £2.25; 30-g tube (surgical pack) = £12.30; 5 × 5-g tube with 12 occlusive dressings (premedication pack) = £11.70

**Contra-indications** use in child less than 37 weeks corrected gestational age

**Dose ADULT** and **CHILD** over 1 year, anaesthesia before minor skin procedures including venepuncture, apply thick layer under occlusive dressing 1–5 hours before procedure (2–5 hours before procedures on large areas e.g. split skin grafting); max. 2 doses in 24 hours for **CHILD** 1–12 years; **CHILD** under 3 months, apply max. 1 g under occlusive dressing for max. 1 hour before procedure; max. 1 dose in 24 hours, **CHILD** 3–12 months, apply max. 2 g under occlusive dressing for max. 4 hours before procedure; max. 2 doses in 24 hours

**Note** Shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca)

Anaesthesia on genital skin before injection of local anaesthetics, apply under occlusive dressing for 15 minutes (in adult men) and 60 minutes (in adult women)

Anaesthesia before surgical treatment of lesions on genital mucosa in adults, apply up to 10 g 5–10 minutes before procedure

Anaesthesia before cervical curettage in adults, administer 10 g in lateral vaginal fornices for 10 minutes

Anaesthesia before mechanical cleansing or debridement of leg ulcer in adults, apply up to 10 g under occlusive dressing for 30–60 minutes

**With tetracaine**

For prescribing information on tetracaine, see p. 883

**Pliaglis**<sup>®</sup> (Galderma) (PoM)

**Cream**, lidocaine 7% (70 mg/g), tetracaine 7% (70 mg/g), net price 15-g tube = £22.95

**Excipients** include hydroxybenzoates (parabens)

**Dose ADULT** anaesthesia before dermatological procedures and venepuncture, apply 1 mm layer using a spatula 30 minutes before procedure, then peel off immediately before procedure; max. application area 400 cm<sup>2</sup>

**Note** Application time of 60 minutes indicated for certain procedures, such as laser-assisted tattoo removal and laser leg vein ablation

**Lidocaine for ear, nose, and oropharyngeal use**

For prescribing information on phenylephrine, see section 2.7.2

**Lidocaine with phenylephrine** (Non-proprietary)

**Topical solution**, lidocaine hydrochloride 5%, phenylephrine hydrochloride 0.5%, net price 2.5 mL (with nasal applicator) = £11.48

**Dose** anaesthesia before nasal surgery, endoscopy, laryngoscopy, or removal of foreign bodies from the nose, **ADULT** and **CHILD** over 12 years, up to max. 8 sprays

## Mepivacaine

**Mepivacaine** is an amide-type local anaesthetic used for dental anaesthesia (see Dental Anaesthesia, p. 877).

### MEPIVACAINE HYDROCHLORIDE

**Indications** infiltration anaesthesia and nerve block in dentistry

**Cautions** see Cautions of Local Anaesthetics, p. 877

**Contra-indications** see Contra-indications of Local Anaesthetics, p. 877

**Hepatic impairment** use with caution; increased risk of side-effects in severe impairment

**Renal impairment** use with caution; increased risk of side-effects

**Pregnancy** use with caution in early pregnancy

**Breast-feeding** use with caution

**Side-effects** see Toxicity and Side-effects, p. 877

#### Dose

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

- **ADULT** and **CHILD** over 3 years, consult expert dental sources; **important:** see also Administration, p. 876

**Scandonest® 3% Plain** (Septodont) (PoM)

**Injection**, mepivacaine hydrochloride 30 mg/mL, net price 2.2-mL cartridge = 36p

#### With adrenaline

For prescribing information on adrenaline, see section 2.7.3; see also Use of Vasoconstrictors, p. 876.

**Scandonest® 2% Special** (Septodont) (PoM)

**Injection**, mepivacaine hydrochloride 20 mg/mL, adrenaline 1 in 100 000 (10 micrograms/mL), net price 2.2-mL cartridge = 36p  
**Excipients** include sulfites

## Prilocaine

**Prilocaine** is a local anaesthetic of low toxicity which is similar to lidocaine. If used in high doses, methaemoglobinemia may occur, which can be treated with an intravenous injection of **methylthioninium chloride** (see Emergency Treatment of Poisoning, p. 34). Infants under 6 months are particularly susceptible to methaemoglobinemia. A hyperbaric solution of prilocaine (containing glucose) may be used for spinal anaesthesia.

### PRILOCAINE HYDROCHLORIDE

**Indications** see under preparations

**Cautions** see Cautions of Local Anaesthetics, p. 877; severe or untreated hypertension; concomitant use of drugs that cause methaemoglobinemia; acute porphyria (section 9.8.2); **interactions:** Appendix 1 (prilocaine)

**Contra-indications** see Contra-indications of Local Anaesthetics, p. 877; anaemia or congenital or acquired methaemoglobinemia

**Hepatic impairment** use with caution; lower doses may be required for intrathecal anaesthesia

**Renal impairment** use with caution; lower doses may be required for intrathecal anaesthesia

**Pregnancy** large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block; avoid paracervical or pudendal block in obstetrics (neonatal methaemoglobinemia reported); use lower doses for intrathecal use during late pregnancy

**Breast-feeding** present in milk but not known to be harmful

**Side-effects** see notes above and Toxicity and Side-effects, p. 877; also hypertension

#### Dose

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

- See under preparations—**important:** see also Administration, p. 876

**Citanest 1%®** (AstraZeneca) (PoM)

**Injection**, prilocaine hydrochloride 10 mg/mL, net price 50-mL multidose vial = £5.06

**Dose** infiltration anaesthesia and nerve block, adjusted according to site of administration and response, 100–200 mg/minute, or in incremental doses, to max. total dose 400 mg (dose may need to be adjusted in **ELDERLY** or debilitated patients); **CHILD** over 6 months up to 5 mg/kg

**Prilotekal®** (AMCo) (PoM)

**Injection**, prilocaine hydrochloride 20 mg/mL (2%), glucose 60 mg/mL, net price 5-mL amp = £7.88

**Dose** spinal anaesthesia, by intrathecal injection, **ADULT** over 18 years, usually 40–60 mg, max. 80 mg (dose may need to be reduced in **ELDERLY** or debilitated patients, or in late pregnancy)

**Note** The *Scottish Medicines Consortium* (p. 4) has advised (December 2010) that prilocaine 2% hyperbaric solution for injection (*Prilotekal®*) is accepted for restricted use within NHS Scotland for use in spinal anaesthesia in ambulatory surgery settings.

#### With lidocaine

See Lidocaine, p. 881

#### For dental use

**Note** Consult expert dental sources for specific advice in relation to dose of prilocaine for dental anaesthesia.

**Citanest 3% with Octapressin®** (Dentsply) (PoM)

**Injection**, prilocaine hydrochloride 30 mg/mL, felypressin 0.03 unit/mL, net price 2.2-mL cartridge and self-aspirating cartridge (both) = 47p

## Ropivacaine

**Ropivacaine** is an amide-type local anaesthetic agent similar to bupivacaine. It is less cardiotoxic than bupivacaine, but also less potent.

### ROIPIVACAINE HYDROCHLORIDE

**Indications** see under Dose

**Cautions** see Cautions of Local Anaesthetics, p. 877; also acute porphyria (section 9.8.2); **interactions:** Appendix 1 (ropivacaine)

**Contra-indications** see Contra-indications of Local Anaesthetics, p. 877

**Hepatic impairment** use with caution in severe impairment

**Renal impairment** caution in severe impairment; increased risk of systemic toxicity in chronic renal failure

**Pregnancy** not known to be harmful; do not use for paracervical block in obstetrics

**Breast-feeding** not known to be harmful

**Side-effects** see Toxicity and Side-effects, p. 877; also hypertension, pyrexia; *less commonly* syncope and hyperthermia

#### Dose

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

**Note** Doses should be adjusted according to patient's physical status and nature of procedure—**important** see also under Administration, p. 876

#### • Surgical anaesthesia

**Lumbar epidural block**, **ADULT** and **CHILD** over 12 years, 113–200 mg using a 7.5 mg/mL (0.75%) or 10 mg/mL (1%) solution; caesarean section, 113–150 mg in incremental doses using a 7.5 mg/mL (0.75%) solution

**Thoracic epidural block** (to establish block for post-operative pain), **ADULT** and **CHILD** over 12 years, 38–113 mg using a 7.5 mg/mL (0.75%) solution

**Major nerve block** (brachial plexus block), **ADULT** and **CHILD** over 12 years, 225–300 mg using a 7.5 mg/mL (0.75%) solution

**Field block**, **ADULT** and **CHILD** over 12 years, 7.5–225 mg using a 7.5 mg/mL (0.75%) solution

#### • Acute pain, using a 2 mg/mL (0.2%) solution

**Lumbar epidural block**, **ADULT** and **CHILD** over 12 years, 20–40 mg followed by 20–30 mg at intervals of at least 30 minutes; or as a **continuous epidural infusion** (labour pain) 12–20 mg/hour (up to 28 mg/hour for postoperative pain)

**Thoracic epidural block** (for postoperative pain), **ADULT** and **CHILD** over 12 years, 12–28 mg/hour as a **continuous epidural infusion**

**Field block**, **ADULT** and **CHILD** over 12 years, 2–200 mg

**Peripheral nerve block**, **ADULT** and **CHILD** over 12 years, 10–20 mg/hour as a **continuous infusion** or by **intermittent injection**

#### Ropivacaine (Non-proprietary) (PoM)

**Injection**, ropivacaine hydrochloride 2 mg/mL, net price 10 mL = £1.65; 7.5 mg/mL, 10 mL = £2.50; 10 mg/mL, 10 mL = £3.00

**Infusion**, ropivacaine hydrochloride 2 mg/mL, net price 200 mL = £13.70

#### Naropin® (AstraZeneca) (PoM)

**Injection**, ropivacaine hydrochloride 2 mg/mL, net price 10-mL *Polyamp*® = £1.37; 7.5 mg/mL, 10-mL *Polyamp*® = £2.65; 10 mg/mL, 10-mL *Polyamp*® = £3.20

**Electrolytes** Na<sup>+</sup> <0.5 mmol/mL

**Infusion**, ropivacaine hydrochloride 2 mg/mL, net price 200-mL *Polybag*® = £17.34

**Electrolytes** Na<sup>+</sup> <0.5 mmol/mL

## TETRACAINE

(Amethocaine)

**Indications** see under preparation; eye (section 11.7)

**Cautions** see Cautions of Local Anaesthetics, p. 877

**Contra-indications** see Contra-indications of Local Anaesthetics, p. 877

**Breast-feeding** not known to be harmful

**Side-effects** see Toxicity and Side-effects, p. 877

**Important** Rapid and extensive absorption may result in systemic side-effects (see also notes above)

#### Ametop® (S&N Hlth.)

Gel, tetracaine 4%, net price 1.5-g tube = £1.08

**Excipients** include hydroxybenzoates (parabens)

**Dose** **ADULT** and **CHILD** over 1 month, apply contents of tube to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation; **NEONATE** see *BNF for Children*

**Note** **ADULT** and **CHILD** over 5 years, contents of max.

5 tubes applied at separate sites at a single time; **CHILD** 1 month–5 years, contents of max. 1 tube applied at separate sites at a single time

#### ▲ With lidocaine

See Lidocaine, p. 881

## Tetracaine

**Tetracaine**, a para-aminobenzoic acid ester, is an effective local anaesthetic for topical application; a 4% gel is indicated for anaesthesia before venepuncture or venous cannulation. It is rapidly absorbed from mucous membranes and should **never** be applied to inflamed, traumatised, or highly vascular surfaces. It should never be used to provide anaesthesia for bronchoscopy or cystoscopy because lidocaine is a safer alternative.

# A1 Interactions

Two or more drugs given at the same time may exert their effects independently or may interact. The interaction may be potentiation or antagonism of one drug by another, or occasionally some other effect. Adverse drug interactions should be reported to the Medicines and Healthcare products Regulatory Agency (MHRA), through the Yellow Card Scheme (see Adverse Reactions to Drugs, p. 12), as for other adverse drug reactions.

Drug interactions may be **pharmacodynamic** or **pharmacokinetic**.

## Pharmacodynamic interactions

These are interactions between drugs which have similar or antagonistic pharmacological effects or side-effects. They may be due to competition at receptor sites, or occur between drugs acting on the same physiological system. They are usually predictable from a knowledge of the pharmacology of the interacting drugs; in general, those demonstrated with one drug are likely to occur with related drugs. They occur to a greater or lesser extent in most patients who receive the interacting drugs.

## Pharmacokinetic interactions

These occur when one drug alters the absorption, distribution, metabolism, or excretion of another, thus increasing or reducing the amount of drug available to produce its pharmacological effects. They are not easily predicted and many of them affect only a small proportion of patients taking the combination of drugs. Pharmacokinetic interactions occurring with one drug cannot be assumed to occur with related drugs unless their pharmacokinetic properties are known to be similar.

Pharmacokinetic interactions are of several types:

**Affecting absorption** The rate of absorption or the total amount absorbed can both be altered by drug interactions. Delayed absorption is rarely of clinical importance unless high peak plasma concentrations are required (e.g. when giving an analgesic). Reduction in the total amount absorbed, however, may result in ineffective therapy.

**Due to changes in protein binding** To a variable extent most drugs are loosely bound to plasma proteins. Protein-binding sites are non-specific and one drug can displace another thereby increasing its proportion free to diffuse from plasma to its site of action. This only produces a detectable increase in effect if it is an extensively bound drug (more than 90%) that is not widely distributed throughout the body. Even so displacement rarely produces more than transient potentiation because this increased concentration of free drug results in an increased rate of elimination.

Displacement from protein binding plays a part in the potentiation of warfarin by sulfonamides and tolbutamide but the importance of these interactions is due mainly to the fact that warfarin metabolism is also inhibited.

**Affecting metabolism** Many drugs are metabolised in the liver. Induction of the hepatic microsomal enzyme system by one drug can gradually increase the rate of metabolism of another, resulting in lower plasma concentrations and a reduced effect. On withdrawal of the inducer plasma concentrations increase and toxicity may occur. Barbiturates, griseofulvin, many antiepileptics, and rifampicin are the most important enzyme inducers. Drugs affected include warfarin and the oral contraceptives.

Conversely when one drug inhibits the metabolism of another higher plasma concentrations are produced, rapidly resulting in an increased effect with risk of toxicity. Some drugs which potentiate warfarin and phenytoin do so by this mechanism.

Isoenzymes of the hepatic cytochrome P450 system interact with a wide range of drugs. Drugs may be substrates, inducers or inhibitors of the different isoenzymes. A great deal of *in-vitro* information is available on the effect of drugs on the isoenzymes; however, since drugs are eliminated by a number of different metabolic routes as well as renal excretion, the clinical effects of interactions cannot be predicted accurately from laboratory data on the cytochrome P450 isoenzymes. Except where a combination of drugs is specifically contra-indicated, the BNF presents only interactions that have been reported in clinical practice. In all cases the possibility of an interaction must be considered if toxic effects occur or if the activity of a drug diminishes.

**Affecting renal excretion** Drugs are eliminated through the kidney both by glomerular filtration and by active tubular secretion. Competition occurs between those which share active transport mechanisms in the proximal tubule. For example, salicylates and some other NSAIDs delay the excretion of methotrexate; serious methotrexate toxicity is possible.

## Relative importance of interactions

Many drug interactions are harmless and many of those which are potentially harmful only occur in a small proportion of patients; moreover, the severity of an interaction varies from one patient to another. Drugs with a small therapeutic ratio (e.g. phenytoin) and those which require careful control of dosage (e.g. anticoagulants, antihypertensives, and antidiabetics) are most often involved.

Patients at increased risk from drug interactions include the elderly and those with impaired renal or liver function.

**Serious interactions** The symbol ● has been placed against interactions that are **potentially serious** and where concomitant administration of the drugs involved should be **avoided** (or only undertaken with caution and appropriate monitoring).

Interactions that have no symbol do not usually have serious consequences.

## List of drug interactions

The following is an alphabetical list of drugs and their interactions; to avoid excessive cross-referencing each drug or group is listed twice: in the alphabetical list and also against the drug or group with which it interacts. For explanation of symbol ● see above

### Abacavir

Analgesics: abacavir possibly reduces plasma concentration of **methadone**

Antibacterials: plasma concentration of abacavir possibly reduced by **rifampicin**

Antiepileptics: plasma concentration of abacavir possibly reduced by **phenobarbital** and **phenytoin**

- Antivirals: abacavir possibly reduces effects of ●**ribavirin**; plasma concentration of abacavir reduced by ●**tipranavir**
- Orlistat: absorption of abacavir possibly reduced by ●**orlistat**

### Abatacept

Adalimumab: increased risk of side-effects when abatacept given with **adalimumab**

- Certolizumab pegol: avoid concomitant use of abatacept with ●**certolizumab pegol**
- Etanercept: avoid concomitant use of abatacept with ●**etanercept**
- Golimumab: avoid concomitant use of abatacept with ●**golimumab**
- Infliximab: avoid concomitant use of abatacept with ●**infliximab**
- Vaccines: avoid concomitant use of abatacept with live ●**vaccines** (see p. 828)

### Abiraterone

- Antibacterials: plasma concentration of abiraterone possibly reduced by ●**rifabutin**—manufacturer of abiraterone advises avoid concomitant use; plasma concentration of abiraterone reduced by ●**rifampicin**—manufacturer of abiraterone advises avoid concomitant use
- Antidepressants: plasma concentration of abiraterone possibly reduced by ●**St John's wort**—manufacturer of abiraterone advises avoid concomitant use
- Antiepileptics: plasma concentration of abiraterone possibly reduced by ●**carbamazepine**, ●**phenobarbital** and ●**phenytoin**—manufacturer of abiraterone advises avoid concomitant use

**Acarbose** see Antidiabetics

### ACE Inhibitors

Alcohol: enhanced hypotensive effect when ACE inhibitors given with **alcohol**

Aldesleukin: enhanced hypotensive effect when ACE inhibitors given with **aldesleukin**

- Aliskiren: avoid concomitant use of ACE inhibitors with ●**aliskiren** (see also under Renin inhibitors, p. 128)
- Allopurinol: manufacturers state possible increased risk of leucopenia and hypersensitivity reactions when ACE inhibitors given with **allopurinol** especially in renal impairment
- Alpha-blockers: enhanced hypotensive effect when ACE inhibitors given with **alpha-blockers**
- Anaesthetics, General: enhanced hypotensive effect when ACE inhibitors given with **general anaesthetics**
- Analgesics: increased risk of renal impairment when ACE inhibitors given with **NSAIDs**, also hypotensive effect antagonised
- Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when ACE inhibitors given with ●**angiotensin-II receptor antagonists**

### ACE Inhibitors (continued)

Antacids: absorption of ACE inhibitors possibly reduced by **antacids**; absorption of captopril, enalapril and fosinopril reduced by **antacids**

Antibacterials: plasma concentration of active metabolite of imidapril reduced by **rifampicin** (reduced antihypertensive effect); quinapril tablets reduce absorption of **tetracyclines** (quinapril tablets contain magnesium carbonate); possible increased risk of hyperkalaemia when ACE inhibitors given with **trimethoprim**

Anticoagulants: increased risk of hyperkalaemia when ACE inhibitors given with **heparins**

Antidepressants: hypotensive effect of ACE inhibitors possibly enhanced by **MAOIs**

Antidiabetics: ACE inhibitors possibly enhance hypoglycaemic effect of **insulin**, **metformin** and **sulfonylureas**

Antipsychotics: enhanced hypotensive effect when ACE inhibitors given with **antipsychotics**

Anxiolytics and Hypnotics: enhanced hypotensive effect when ACE inhibitors given with **anxiolytics** and **hypnotics**

Avanafil: hypotensive effect of enalapril possibly enhanced by **avanafil**

Azathioprine: increased risk of anaemia or leucopenia when captopril given with **azathioprine** especially in renal impairment; increased risk of anaemia when enalapril given with **azathioprine** especially in renal impairment

Beta-blockers: enhanced hypotensive effect when ACE inhibitors given with **beta-blockers**

Calcium-channel Blockers: enhanced hypotensive effect when ACE inhibitors given with **calcium-channel blockers**

Cardiac Glycosides: captopril possibly increases plasma concentration of **digoxin**

- Cyclosporin: increased risk of hyperkalaemia when ACE inhibitors given with ●**cyclosporin**

Clonidine: enhanced hypotensive effect when ACE inhibitors given with **clonidine**; antihypertensive effect of captopril possibly delayed by previous treatment with **clonidine**

Corticosteroids: hypotensive effect of ACE inhibitors antagonised by **corticosteroids**

Diazoxide: enhanced hypotensive effect when ACE inhibitors given with **diazoxide**

- Diuretics: enhanced hypotensive effect when ACE inhibitors given with ●**diuretics**; increased risk of severe hyperkalaemia when ACE inhibitors given with ●**potassium-sparing diuretics** and **aldosterone antagonists**

Dopaminergics: enhanced hypotensive effect when ACE inhibitors given with **levodopa**

- Gold: flushing and hypotension reported when ACE inhibitors given with ●**sodium aurothiomalate**

- Lithium: ACE inhibitors reduce excretion of ●**lithium** (increased plasma concentration)

Methyldopa: enhanced hypotensive effect when ACE inhibitors given with **methyldopa**

Moxisylyte: enhanced hypotensive effect when ACE inhibitors given with **moxisylyte**

Moxonidine: enhanced hypotensive effect when ACE inhibitors given with **moxonidine**

Muscle Relaxants: enhanced hypotensive effect when ACE inhibitors given with **baclofen** or **tizanidine**

Nitrates: enhanced hypotensive effect when ACE inhibitors given with **nitrates**

Oestrogens: hypotensive effect of ACE inhibitors antagonised by **oestrogens**

- Potassium Salts: increased risk of severe hyperkalaemia when ACE inhibitors given with ●**potassium salts**

Probenecid: excretion of captopril reduced by **probenecid**

**ACE Inhibitors** (*continued*)

Prostaglandins: enhanced hypotensive effect when ACE inhibitors given with **alprostadil**

Vasodilator Antihypertensives: enhanced hypotensive effect when ACE inhibitors given with **hydralazine**, **minoxidil** or **sodium nitroprusside**

**Acebutolol** *see* Beta-blockers**Aceclofenac** *see* NSAIDs**Acemetacin** *see* NSAIDs**Acenocoumarol** *see* Coumarins**Acetazolamide** *see* Diuretics**Aciclovir**

**Note** Interactions do not apply to topical aciclovir preparations

**Note** Valaciclovir interactions as for aciclovir

Ciclosporin: increased risk of nephrotoxicity when aciclovir given with **ciclosporin**

Mycophenolate: plasma concentration of aciclovir increased by **mycophenolate**, also plasma concentration of inactive metabolite of mycophenolate increased

Probenecid: excretion of aciclovir reduced by **probenecid** (increased plasma concentration)

Tacrolimus: possible increased risk of nephrotoxicity when aciclovir given with **tacrolimus**

Theophylline: aciclovir possibly increases plasma concentration of **theophylline**

**Acitretin** *see* Retinoids**Acrivastine** *see* Antihistamines**Adalimumab**

Abatacept: increased risk of side-effects when adalimumab given with **abatacept**

- Anakinra: avoid concomitant use of adalimumab with **anakinra**
- Vaccines: avoid concomitant use of adalimumab with live **vaccines** (see p. 828)

**Adefovir**

Antivirals: avoidance of adefovir advised by manufacturer of **tenofovir**

Interferons: manufacturer of adefovir advises caution with **peginterferon alfa**

**Adenosine**

**Note** Possibility of interaction with drugs tending to impair myocardial conduction

Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with **bupivacaine**, **levobupivacaine**, **prilocaine** or **ropivacaine**

- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other **anti-arrhythmics**
  - Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with **antipsychotics** that prolong the QT interval
  - Beta-blockers: increased myocardial depression when anti-arrhythmics given with **beta-blockers**
- Caffeine citrate: anti-arrhythmic effect of adenosine antagonised by **caffeine citrate**—manufacturer of adenosine advises avoid caffeine citrate for at least 12 hours before adenosine
- Dipyridamol: effect of adenosine enhanced and extended by **dipyridamol** (important risk of toxicity)—reduce dose of adenosine, see Dose under Adenosine, p. 96

Nicotine: effects of adenosine possibly enhanced by **nicotine**

Theophylline: anti-arrhythmic effect of adenosine antagonised by **theophylline**—manufacturer of adenosine advises avoid theophylline for 24 hours before adenosine

**Adrenaline (epinephrine)** *see* Sympathomimetics**Adrenergic Neurone Blockers**

Alcohol: enhanced hypotensive effect when adrenergic neurone blockers given with **alcohol**

**Adrenergic Neurone Blockers** (*continued*)

Alpha-blockers: enhanced hypotensive effect when adrenergic neurone blockers given with **alpha-blockers**

- Anaesthetics, General: enhanced hypotensive effect when adrenergic neurone blockers given with **general anaesthetics**

Analgesics: hypotensive effect of adrenergic neurone blockers antagonised by **NSAIDs**

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when adrenergic neurone blockers given with **angiotensin-II receptor antagonists**

Antidepressants: enhanced hypotensive effect when adrenergic neurone blockers given with **MAOIs**; hypotensive effect of adrenergic neurone blockers antagonised by **tricyclics**

Antipsychotics: hypotensive effect of adrenergic neurone blockers antagonised by **haloperidol**; hypotensive effect of adrenergic neurone blockers antagonised by higher doses of **chlorpromazine**; enhanced hypotensive effect when adrenergic neurone blockers given with **phenothiazines**

Anxiolytics and Hypnotics: enhanced hypotensive effect when adrenergic neurone blockers given with **anxiolytics and hypnotics**

Beta-blockers: enhanced hypotensive effect when adrenergic neurone blockers given with **beta-blockers**

Calcium-channel Blockers: enhanced hypotensive effect when adrenergic neurone blockers given with **calcium-channel blockers**

Clonidine: enhanced hypotensive effect when adrenergic neurone blockers given with **clonidine**

Corticosteroids: hypotensive effect of adrenergic neurone blockers antagonised by **corticosteroids**

Diazoxide: enhanced hypotensive effect when adrenergic neurone blockers given with **diazoxide**

Diuretics: enhanced hypotensive effect when adrenergic neurone blockers given with **diuretics**

Dopaminergics: enhanced hypotensive effect when adrenergic neurone blockers given with **levodopa**

Methyldopa: enhanced hypotensive effect when adrenergic neurone blockers given with **methyldopa**

Moxisylyte: enhanced hypotensive effect when adrenergic neurone blockers given with **moxisylyte**

Moxonidine: enhanced hypotensive effect when adrenergic neurone blockers given with **moxonidine**

Muscle Relaxants: enhanced hypotensive effect when adrenergic neurone blockers given with **baclofen** or **tizanidine**

Nitrates: enhanced hypotensive effect when adrenergic neurone blockers given with **nitrates**

Oestrogens: hypotensive effect of adrenergic neurone blockers antagonised by **oestrogens**

Pizotifen: hypotensive effect of adrenergic neurone blockers antagonised by **pizotifen**

Prostaglandins: enhanced hypotensive effect when adrenergic neurone blockers given with **alprostadil**

- Sympathomimetics: hypotensive effect of guanethidine antagonised by **dexamfetamine** and **lisdex-amfetamine**; hypotensive effect of adrenergic neurone blockers antagonised by **ephedrine**, **isometheptene**, **metaraminol**, **methylphenidate**, **noradrenaline (norepinephrine)**, **oxymetazoline**, **phenylephrine**, **pseudoephedrine** and **xylometazoline**

Vasodilator Antihypertensives: enhanced hypotensive effect when adrenergic neurone blockers given with **hydralazine**, **minoxidil** or **sodium nitroprusside**

**Adsorbents** *see* Kaolin**Afatinib**

Anti-arrhythmics: plasma concentration of afatinib possibly increased by **amiodarone**—manufacturer of afatinib advises separating administration of amiodarone by 6 to 12 hours

Antibacterials: plasma concentration of afatinib possibly increased by **erythromycin**—manufacturer of

**Afatinib****Antibacterials (continued)**

afatinib advises separating administration of erythromycin by 6 to 12 hours; plasma concentration of afatinib reduced by **rifampicin**

**Antifungals:** plasma concentration of afatinib possibly increased by **itraconazole**—manufacturer of afatinib advises separating administration of itraconazole by 6 to 12 hours

- **Antipsychotics:** avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Antivirals:** plasma concentration of afatinib increased by **ritonavir**—manufacturer of afatinib advises separating administration of ritonavir by 6 to 12 hours; plasma concentration of afatinib possibly increased by **saquinavir**—manufacturer of afatinib advises separating administration of saquinavir by 6 to 12 hours

**Calcium-channel Blockers:** plasma concentration of afatinib possibly increased by **verapamil**—manufacturer of afatinib advises separating administration of verapamil by 6 to 12 hours

**Ciclosporin:** plasma concentration of afatinib possibly increased by **ciclosporin**—manufacturer of afatinib advises separating administration of ciclosporin by 6 to 12 hours

**Tacrolimus:** plasma concentration of afatinib possibly increased by **tacrolimus**—manufacturer of afatinib advises separating administration of tacrolimus by 6 to 12 hours

**Agalsidase Alfa and Beta**

**Anti-arrhythmics:** effects of agalsidase alfa and beta possibly inhibited by **amiodarone** (manufacturers of agalsidase alfa and beta advise avoid concomitant use)

**Antibacterials:** effects of agalsidase alfa and beta possibly inhibited by **gentamicin** (manufacturers of agalsidase alfa and beta advise avoid concomitant use)

**Antimalarials:** effects of agalsidase alfa and beta possibly inhibited by **chloroquine** and **hydroxychloroquine** (manufacturers of agalsidase alfa and beta advise avoid concomitant use)

**Agomelatine**

- **Antibacterials:** manufacturer of agomelatine advises avoid concomitant use with **ciprofloxacin**
- **Antidepressants:** metabolism of agomelatine inhibited by **fluvoxamine** (increased plasma concentration)
- **Antimalarials:** avoidance of antidepressants advised by manufacturer of **artemether with lumefantrine** and **piperazine with arteminol**
- Atomoxetine:** possible increased risk of convulsions when antidepressants given with **atomoxetine**

**Alcohol**

**ACE Inhibitors:** enhanced hypotensive effect when alcohol given with **ACE inhibitors**

**Adrenergic Neurone Blockers:** enhanced hypotensive effect when alcohol given with **adrenergic neurone blockers**

**Alpha-blockers:** increased sedative effect when alcohol given with **indoramin**; enhanced hypotensive effect when alcohol given with **alpha-blockers**

**Analgesics:** enhanced hypotensive and sedative effects when alcohol given with **opioid analgesics**

**Angiotensin-II Receptor Antagonists:** enhanced hypotensive effect when alcohol given with **angiotensin-II receptor antagonists**

- **Antibacterials:** disulfiram-like reaction when alcohol given with **metronidazole**; possibility of disulfiram-like reaction when alcohol given with **tinidazole**; increased risk of convulsions when alcohol given with **cycloserine**
- **Anticoagulants:** major changes in consumption of alcohol may affect anticoagulant control with **coumarins** or **phenindione**

**Alcohol (continued)**

- **Antidepressants:** some beverages containing alcohol and some decaffeinated beverages contain tyramine which interacts with **MAOIs** (hypertensive crisis)—if no tyramine, enhanced hypotensive effect; sedative effects possibly increased when alcohol given with **SSRIs**; increased sedative effect when alcohol given with **mirtazapine**, **tricyclic-related antidepressants** or **tricyclics**

**Antidiabetics:** alcohol enhances hypoglycaemic effect of **antidiabetics**; increased risk of lactic acidosis when alcohol given with **metformin**

**Antiepileptics:** alcohol possibly increases CNS side-effects of **carbamazepine**; increased sedative effect when alcohol given with **phenobarbital**; chronic heavy consumption of alcohol possibly reduces plasma concentration of **phenytoin**; increased risk of blurred vision when alcohol given with **retigabine**

**Antifungals:** effects of alcohol possibly enhanced by **griseofulvin**

**Antihistamines:** increased sedative effect when alcohol given with **antihistamines** (possibly less effect with non-sedating antihistamines)

**Antimuscarinics:** increased sedative effect when alcohol given with **hyoscine**

**Antipsychotics:** increased sedative effect when alcohol given with **antipsychotics**

**Anxiolytics and Hypnotics:** increased sedative effect when alcohol given with **anxiolytics and hypnotics**

**Avanafil:** possible enhanced hypotensive effect when alcohol given with **avanafil**

**Beta-blockers:** enhanced hypotensive effect when alcohol given with **beta-blockers**

**Calcium-channel Blockers:** enhanced hypotensive effect when alcohol given with **calcium-channel blockers**; plasma concentration of alcohol possibly increased by **verapamil**

**Clonidine:** enhanced hypotensive effect when alcohol given with **clonidine**

**Cytotoxics:** disulfiram-like reaction when alcohol given with **procarbazine**

- **Dapoxetine:** increased sedative effect when alcohol given with **dapoxetine**

**Diazoxide:** enhanced hypotensive effect when alcohol given with **diazoxide**

**Disulfiram:** disulfiram reaction when alcohol given with **disulfiram** (see p. 334)

**Diuretics:** enhanced hypotensive effect when alcohol given with **diuretics**

**Dopaminergics:** alcohol reduces tolerance to **bromocriptine**

**Levamisole:** possibility of disulfiram-like reaction when alcohol given with **levamisole**

**Lipid-regulating Drugs:** avoidance of alcohol advised by manufacturer of **lomitapide**

**Lofexidine:** increased sedative effect when alcohol given with **lofexidine**

**Methyldopa:** enhanced hypotensive effect when alcohol given with **methyldopa**

**Metoclopramide:** absorption of alcohol possibly increased by **metoclopramide**

**Moxonidine:** enhanced hypotensive effect when alcohol given with **moxonidine**

**Muscle Relaxants:** increased sedative effect when alcohol given with **baclofen**, **methocarbamol** or **tizanidine**

**Nicorandil:** alcohol possibly enhances hypotensive effect of **nicorandil**

**Nitrates:** enhanced hypotensive effect when alcohol given with **nitrates**

- **Paraldehyde:** increased sedative effect when alcohol given with **paraldehyde**

- **Retinoids:** presence of alcohol causes etretinate to be formed from **acitretin** (increased risk of teratogenicity in women of child-bearing potential)

**Alcohol** (continued)

Sympathomimetics: alcohol possibly enhances effects of **methylphenidate**

Vasodilator Antihypertensives: enhanced hypotensive effect when alcohol given with **hydralazine**, **minoxidil** or **sodium nitroprusside**

**Aldesleukin**

ACE Inhibitors: enhanced hypotensive effect when aldesleukin given with **ACE inhibitors**

Alpha-blockers: enhanced hypotensive effect when aldesleukin given with **alpha-blockers**

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when aldesleukin given with **angiotensin-II receptor antagonists**

Antivirals: aldesleukin possibly increases plasma concentration of **indinavir**

Beta-blockers: enhanced hypotensive effect when aldesleukin given with **beta-blockers**

Calcium-channel Blockers: enhanced hypotensive effect when aldesleukin given with **calcium-channel blockers**

Clonidine: enhanced hypotensive effect when aldesleukin given with **clonidine**

- Corticosteroids: manufacturer of aldesleukin advises avoid concomitant use with ●**corticosteroids**

- Cytotoxics: manufacturer of aldesleukin advises avoid concomitant use with ●**cisplatin**, ●**dacarbazine** and ●**vinblastine**

Diazoxide: enhanced hypotensive effect when aldesleukin given with **diazoxide**

Diuretics: enhanced hypotensive effect when aldesleukin given with **diuretics**

Methyldopa: enhanced hypotensive effect when aldesleukin given with **methyldopa**

Moxonidine: enhanced hypotensive effect when aldesleukin given with **moxonidine**

Nitrates: enhanced hypotensive effect when aldesleukin given with **nitrates**

Vasodilator Antihypertensives: enhanced hypotensive effect when aldesleukin given with **hydralazine**, **minoxidil** or **sodium nitroprusside**

**Alemtuzumab**

- Vaccines: avoid concomitant use of alemtuzumab with live ●**vaccines** (see p. 828)

**Alendronic Acid** see Bisphosphonates**Alfentanil** see Opioid Analgesics**Alfuzosin** see Alpha-blockers**Alimemazine** see Antihistamines**Aliskiren**

- ACE Inhibitors: avoid concomitant use of aliskiren with ●**ACE inhibitors** (see also under Renin inhibitors, p. 128)

Analgesics: hypotensive effect of aliskiren possibly antagonised by **NSAIDs**

- Angiotensin-II Receptor Antagonists: avoid concomitant use of aliskiren with ●**angiotensin-II receptor antagonists** (see also under Renin inhibitors, p. 128); plasma concentration of aliskiren possibly reduced by **irbesartan**

Antibacterials: plasma concentration of aliskiren reduced by **rifampicin**

Anticoagulants: increased risk of hyperkalaemia when aliskiren given with **heparins**

- Antifungals: plasma concentration of aliskiren increased by ●**itraconazole**—avoid concomitant use

Calcium-channel Blockers: plasma concentration of aliskiren increased by **verapamil**

- Ciclosporin: plasma concentration of aliskiren increased by ●**ciclosporin**—avoid concomitant use
- Diuretics: aliskiren reduces plasma concentration of **furosemide**; increased risk of hyperkalaemia when aliskiren given with **potassium-sparing diuretics and aldosterone antagonists**

- Grapefruit Juice: plasma concentration of aliskiren reduced by ●**grapefruit juice**—avoid concomitant use

**Aliskiren** (continued)

Potassium Salts: increased risk of hyperkalaemia when aliskiren given with **potassium salts**

**Altretretinoin** see Retinoids**Alkylating Drugs** see Bendamustine, Busulfan, Carmustine, Cyclophosphamide, Estramustine, Ifosfamide, Lomustine, Melphalan, and Thiotepea**Allopurinol**

ACE Inhibitors: manufacturers state possible increased risk of leucopenia and hypersensitivity reactions when allopurinol given with **ACE inhibitors** especially in renal impairment

Antibacterials: increased risk of rash when allopurinol given with **amoxicillin** or **ampicillin**

Anticoagulants: allopurinol possibly enhances anticoagulant effect of **coumarins**

- Antivirals: allopurinol increases plasma concentration of ●**didanosine** (risk of toxicity)—avoid concomitant use
- Azathioprine: allopurinol enhances effects and increases toxicity of ●**azathioprine** (reduce dose of azathioprine to one quarter of usual dose)
- Ciclosporin: allopurinol possibly increases plasma concentration of **ciclosporin** (risk of nephrotoxicity)
- Cytotoxics: allopurinol enhances effects and increases toxicity of ●**mercaptopurine** (reduce dose of mercaptopurine to one quarter of usual dose); avoidance of allopurinol advised by manufacturer of ●**capecitabine**
- Diuretics: increased risk of hypersensitivity when allopurinol given with **thiazides and related diuretics** especially in renal impairment
- Theophylline: allopurinol possibly increases plasma concentration of **theophylline**

**Almotriptan** see 5HT<sub>1</sub>-receptor Agonists (under HT)**Allogliptin** see Antidiabetics**Alpha<sub>2</sub>-adrenoceptor Stimulants** see Apraclonidine, Brimonidine, Clonidine, and Methyldopa**Alpha-blockers**

ACE Inhibitors: enhanced hypotensive effect when alpha-blockers given with **ACE inhibitors**

Adrenergic Neurone Blockers: enhanced hypotensive effect when alpha-blockers given with **adrenergic neurone blockers**

Alcohol: enhanced hypotensive effect when alpha-blockers given with **alcohol**; increased sedative effect when indoramin given with **alcohol**

Aldesleukin: enhanced hypotensive effect when alpha-blockers given with **aldesleukin**

- Anaesthetics, General: enhanced hypotensive effect when alpha-blockers given with ●**general anaesthetics**

Analgesics: hypotensive effect of alpha-blockers antagonised by **NSAIDs**

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alpha-blockers given with **angiotensin-II receptor antagonists**

- Antidepressants: manufacturer of indoramin advises avoid concomitant use with ●**MAOIs**; enhanced hypotensive effect when alpha-blockers given with **MAOIs**

Antipsychotics: enhanced hypotensive effect when alpha-blockers given with **antipsychotics**

- Antivirals: plasma concentration of alfuzosin possibly increased by ●**ritonavir**—avoid concomitant use; avoidance of alfuzosin advised by manufacturer of ●**telaprevir**

Anxiolytics and Hypnotics: enhanced hypotensive and sedative effects when alpha-blockers given with **anxiolytics and hypnotics**

- Avanafil: enhanced hypotensive effect when alpha-blockers given with ●**avanafil**—see also p. 558
- Beta-blockers: enhanced hypotensive effect when alpha-blockers given with ●**beta-blockers**, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin

**Alpha-blockers (continued)**

- Calcium-channel Blockers: enhanced hypotensive effect when alpha-blockers given with **calcium-channel blockers**, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin; plasma concentration of tamsulosin increased by **verapamil**
- Cardiac Glycosides: prazosin increases plasma concentration of **digoxin**
- Clonidine: enhanced hypotensive effect when alpha-blockers given with **clonidine**
- Cobicistat: plasma concentration of alfuzosin possibly increased by **cobicistat**—manufacturer of cobicistat advises avoid concomitant use
- Corticosteroids: hypotensive effect of alpha-blockers antagonised by **corticosteroids**
- Diazoxide: enhanced hypotensive effect when alpha-blockers given with **diazoxide**
- Diuretics: enhanced hypotensive effect when alpha-blockers given with **diuretics**, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
- Dopaminergics: enhanced hypotensive effect when alpha-blockers given with **levodopa**
- Methylodopa: enhanced hypotensive effect when alpha-blockers given with **methylodopa**
- Moxisylyte: possible severe postural hypotension when alpha-blockers given with **moxisylyte**
- Moxonidine: enhanced hypotensive effect when alpha-blockers given with **moxonidine**
- Muscle Relaxants: enhanced hypotensive effect when alpha-blockers given with **baclofen** or **tizanidine**
- Nitrates: enhanced hypotensive effect when alpha-blockers given with **nitrates**
- Oestrogens: hypotensive effect of alpha-blockers antagonised by **oestrogens**
- Prostaglandins: enhanced hypotensive effect when alpha-blockers given with **alprostadil**
- Sildenafil: enhanced hypotensive effect when alpha-blockers given with **sildenafil** (avoid alpha-blockers for 4 hours after sildenafil)—see also p. 558
- Sympathomimetics: avoid concomitant use of tolazoline with **adrenaline (epinephrine)** or **dopamine**
- Tadalafil: enhanced hypotensive effect when alpha-blockers given with **tadalafil**—see also p. 558; enhanced hypotensive effect when doxazosin given with **tadalafil**—manufacturer of tadalafil advises avoid concomitant use
- Ulcer-healing Drugs: effects of tolazoline antagonised by **cimetidine** and **ranitidine**
- Vardenafil: enhanced hypotensive effect when alpha-blockers given with **vardenafil**—separate doses by 6 hours (except with tamsulosin)—see also p. 558
- Vasodilator Antihypertensives: enhanced hypotensive effect when alpha-blockers given with **hydralazine**, **minoxidil** or **sodium nitroprusside**

**Alpha-blockers (post-synaptic)** see Alpha-blockers**Alprazolam** see Anxiolytics and Hypnotics**Alprostadil** see Prostaglandins**Aluminium Hydroxide** see Antacids**Amantadine**

- Antimalarials: plasma concentration of amantadine possibly increased by **quinine**
- Antipsychotics: increased risk of extrapyramidal side-effects when amantadine given with **antipsychotics**
- Bupropion: increased risk of side-effects when amantadine given with **bupropion**
- Memantine: increased risk of CNS toxicity when amantadine given with **memantine** (manufacturer of memantine advises avoid concomitant use); effects of dopaminergics possibly enhanced by **memantine**
- Methylodopa: increased risk of extrapyramidal side-effects when amantadine given with **methylodopa**; antiparkinsonian effect of dopaminergics antagonised by **methylodopa**

**Amantadine (continued)**

Tetrabenazine: increased risk of extrapyramidal side-effects when amantadine given with **tetrabenazine**

**Ambrisentan**

Antibacterials: plasma concentration of ambrisentan possibly increased by **rifampicin**

- Ciclosporin: plasma concentration of ambrisentan increased by **ciclosporin** (see Dose under Ambrisentan, p. 110)

**Amikacin** see Aminoglycosides**Amiloride** see Diuretics**Aminoglycosides**

Agalsidase Alfa and Beta: gentamicin possibly inhibits effects of **agalsidase alfa and beta** (manufacturers of agalsidase alfa and beta advise avoid concomitant use)

Analgesics: plasma concentration of amikacin and gentamicin in neonates possibly increased by **indometacin**

- Antibacterials: neomycin reduces absorption of **phenoxymethylpenicillin**; increased risk of nephrotoxicity when aminoglycosides given with **colistimethate sodium** or **polymyxins**; increased risk of nephrotoxicity and ototoxicity when aminoglycosides given with **capreomycin** or **vancomycin**; possible increased risk of nephrotoxicity when aminoglycosides given with **cephalosporins**
- Anticoagulants: experience in anticoagulant clinics suggests that INR possibly altered when neomycin (given for local action on gut) is given with **coumarins** or **phenindione**
- Antidiabetics: neomycin possibly enhances hypoglycaemic effect of **acarbose**, also severity of gastrointestinal effects increased
- Antifungals: increased risk of nephrotoxicity when aminoglycosides given with **amphotericin**
- Bisphosphonates: increased risk of hypocalcaemia when aminoglycosides given with **bisphosphonates**
- Cardiac Glycosides: gentamicin possibly increases plasma concentration of **digoxin**; neomycin reduces absorption of **digoxin**
- Ciclosporin: increased risk of nephrotoxicity when aminoglycosides given with **ciclosporin**
- Cytotoxics: neomycin possibly reduces absorption of **methotrexate**; neomycin reduces bioavailability of **sorafenib**; increased risk of nephrotoxicity and possibly of ototoxicity when aminoglycosides given with **platinum compounds**
- Diuretics: increased risk of ototoxicity when aminoglycosides given with **loop diuretics**
- Mannitol: manufacturer of tobramycin advises avoid concomitant use with **mannitol**
- Muscle Relaxants: aminoglycosides enhance effects of **non-depolarising muscle relaxants** and **suxamethonium**
- Parasympathomimetics: aminoglycosides antagonise effects of **neostigmine** and **pyridostigmine**
- Tacrolimus: increased risk of nephrotoxicity when aminoglycosides given with **tacrolimus**
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 850
- Vitamins: neomycin possibly reduces absorption of **vitamin A**

**Aminophylline** see Theophylline**Aminosaliclates**

Azathioprine: possible increased risk of leucopenia when aminosaliclates given with **azathioprine**

Cardiac Glycosides: sulfasalazine possibly reduces absorption of **digoxin**

Cytotoxics: possible increased risk of leucopenia when aminosaliclates given with **mercaptopurine**

Folates: sulfasalazine possibly reduces absorption of **folic acid**

## Amiodarone

**Note** Amiodarone has a long half-life; there is a potential for drug interactions to occur for several weeks (or even months) after treatment with it has been stopped

Agalsidase Alfa and Beta: amiodarone possibly inhibits effects of **agalsidase alfa and beta** (manufacturers of agalsidase alfa and beta advise avoid concomitant use)

Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with **bupivacaine**, **levobupivacaine**, **prilocaine** or **ropivacaine**

- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other ●**anti-arrhythmics**; increased risk of ventricular arrhythmias when amiodarone given with ●**disopyramide** or ●**dronedarone**—avoid concomitant use; amiodarone increases plasma concentration of ●**flecainide** (halve dose of flecainide)
- Antibacterials: increased risk of ventricular arrhythmias when amiodarone given with *parenteral* ●**erythromycin**—avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with ●**levofloxacin** or ●**moxifloxacin**—avoid concomitant use; possible increased risk of ventricular arrhythmias when amiodarone given with **sulfamethoxazole** and **trimethoprim** (as co-trimoxazole)—manufacturer of amiodarone advises avoid concomitant use of co-trimoxazole; possible increased risk of ventricular arrhythmias when amiodarone given with ●**telithromycin**
- Anticoagulants: amiodarone inhibits metabolism of ●**coumarins** and ●**phenindione** (enhanced anticoagulant effect); amiodarone increases plasma concentration of ●**dabigatran** (see Dose under Dabigatran, p. 154)
- Anti-depressants: avoidance of amiodarone advised by manufacturer of ●**citalopram** and ●**escitalopram** (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when amiodarone given with ●**tricyclics**—avoid concomitant use
- Antiepileptics: amiodarone inhibits metabolism of ●**phenytoin** (increased plasma concentration)
- Antihistamines: increased risk of ventricular arrhythmias when amiodarone given with ●**mizolastine**—avoid concomitant use
- Antimalarials: avoidance of amiodarone advised by manufacturer of ●**piperaquine with arteminol** (possible risk of ventricular arrhythmias); avoidance of amiodarone advised by manufacturer of ●**artemether with lumefantrine** (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when amiodarone given with ●**chloroquine and hydroxychloroquine**, ●**nefloquine** or ●**quinine**—avoid concomitant use
- Antimuscarinics: increased risk of ventricular arrhythmias when amiodarone given with ●**tolterodine**
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with ●**antipsychotics** that prolong the QT interval; increased risk of ventricular arrhythmias when amiodarone given with ●**benperidol**—manufacturer of benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with ●**amisulpride**, ●**droperidol**, ●**haloperidol**, ●**phenothiazines**, ●**pimozide** or ●**zuclopenthixol**—avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with ●**sulpiride**
- Antivirals: plasma concentration of amiodarone possibly increased by ●**atazanavir**; plasma concentration of amiodarone possibly increased by ●**fosamprenavir** (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of amiodarone possibly increased by ●**indinavir**—avoid concomitant use; plasma concentration of amiodarone increased by ●**ritonavir** (increased risk of

## Amiodarone

● Antivirals (*continued*)

- ventricular arrhythmias—avoid concomitant use); increased risk of ventricular arrhythmias when amiodarone given with ●**saquinavir**—avoid concomitant use; avoidance of amiodarone advised by manufacturer of ●**telaprevir** (risk of ventricular arrhythmias)
  - Atomoxetine: increased risk of ventricular arrhythmias when amiodarone given with ●**atomoxetine**
  - Beta-blockers: increased risk of bradycardia, AV block and myocardial depression when amiodarone given with ●**beta-blockers**; increased myocardial depression when anti-arrhythmics given with ●**beta-blockers**; increased risk of ventricular arrhythmias when amiodarone given with ●**sotalol**—avoid concomitant use
  - Calcium-channel Blockers: increased risk of bradycardia, AV block and myocardial depression when amiodarone given with ●**diltiazem** or ●**verapamil**
  - Cardiac Glycosides: amiodarone increases plasma concentration of ●**digoxin** (halve dose of digoxin)
 

Ciclosporin: amiodarone possibly increases plasma concentration of **ciclosporin**
  - Cobicistat: plasma concentration of amiodarone possibly increased by ●**cobicistat**—manufacturer of cobicistat advises avoid concomitant use
  - Colchicine: amiodarone possibly increases risk of ●**colchicine** toxicity
  - Cytotoxics: amiodarone possibly increases the plasma concentration of **afatinib**—manufacturer of afatinib advises separating administration of amiodarone by 6 to 12 hours; possible increased risk of ventricular arrhythmias when amiodarone given with ●**bosutinib**; possible increased risk of ventricular arrhythmias when amiodarone given with ●**vandetanib**—avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with ●**arsenic trioxide**
  - Diuretics: increased cardiac toxicity with amiodarone if hypokalaemia occurs with **acetazolamide**, **loop diuretics** or **thiazides and related diuretics**; amiodarone increases plasma concentration of **eplerenone** (reduce dose of eplerenone)
  - Fidaxomicin: avoidance of amiodarone advised by manufacturer of **fidaxomicin**
  - Fingolimod: possible increased risk of bradycardia when amiodarone given with ●**fingolimod**
  - Grapefruit Juice: plasma concentration of amiodarone increased by **grapefruit juice**
  - Ivabradine: increased risk of ventricular arrhythmias when amiodarone given with ●**ivabradine**
  - Lipid-regulating Drugs: increased risk of myopathy when amiodarone given with ●**simvastatin** (see Dose under Simvastatin, p. 173)
  - Lithium: manufacturer of amiodarone advises avoid concomitant use with ●**lithium** (risk of ventricular arrhythmias)
  - Orlistat: plasma concentration of amiodarone possibly reduced by **orlistat**
  - Pentamidine Isetionate: increased risk of ventricular arrhythmias when amiodarone given with ●**pentamidine isetionate**—avoid concomitant use
  - Thyroid Hormones: for concomitant use of amiodarone and **thyroid hormones** see p. 97
  - Ulcer-healing Drugs: plasma concentration of amiodarone increased by **cimetidine**
- Amisulpride** *see* Antipsychotics  
**Amitriptyline** *see* Antidepressants, Tricyclic  
**Amiodipine** *see* Calcium-channel Blockers  
**Amoxicillin** *see* Penicillins  
**Amphotericin**  
*Note* Close monitoring required with concomitant administration of nephrotoxic drugs or cytotoxics  
 Antibacterials: increased risk of nephrotoxicity when amphotericin given with **aminoglycosides** or **poly-**

**Amphotericin**Antibacterials (*continued*)

**myxins**; possible increased risk of nephrotoxicity when amphotericin given with **vancomycin**

Antifungals: amphotericin reduces renal excretion and increases cellular uptake of **flucytosine** (toxicity possibly increased); effects of amphotericin possibly antagonised by **imidazoles** and **triazoles**; plasma concentration of amphotericin possibly increased by **micafungin**

- Cardiac Glycosides: hypokalaemia caused by amphotericin increases cardiac toxicity with **cardiac glycosides**
- Ciclosporin: increased risk of nephrotoxicity when amphotericin given with **ciclosporin**
- Corticosteroids: increased risk of hypokalaemia when amphotericin given with **corticosteroids**—avoid concomitant use unless corticosteroids needed to control reactions
- Cytotoxics: increased risk of ventricular arrhythmias when amphotericin given with **arsenic trioxide**
- Diuretics: increased risk of hypokalaemia when amphotericin given with **loop diuretics** or **thiazides and related diuretics**
- Pentamidine Isetionate: possible increased risk of nephrotoxicity when amphotericin given with **pentamidine isetionate**
- Sodium Stibogluconate: possible increased risk of arrhythmias when amphotericin given after **sodium stibogluconate**—manufacturer of sodium stibogluconate advises giving 14 days apart
- Tacrolimus: increased risk of nephrotoxicity when amphotericin given with **tacrolimus**

**Ampicillin** *see* Penicillins**Anabolic Steroids**

• Anticoagulants: anabolic steroids enhance anticoagulant effect of **coumarins** and **phenindione**

Antidiabetics: anabolic steroids possibly enhance hypoglycaemic effect of **antidiabetics**

**Anaesthetics, General**

*Note See also Surgery and Long-term Medication, p. 859*

ACE Inhibitors: enhanced hypotensive effect when general anaesthetics given with **ACE inhibitors**

- Adrenergic Neurone Blockers: enhanced hypotensive effect when general anaesthetics given with **adrenergic neurone blockers**
- Alpha-blockers: enhanced hypotensive effect when general anaesthetics given with **alpha-blockers**
- Analgesics: metabolism of etomidate inhibited by **fentanyl** (consider reducing dose of etomidate); effects of thiopental possibly enhanced by **aspirin**; effects of intravenous general anaesthetics and volatile liquid general anaesthetics possibly enhanced by **opioid analgesics**
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when general anaesthetics given with **angiotensin-II receptor antagonists**
- Antibacterials: increased risk of hepatotoxicity when isoflurane given with **isoniazid**; effects of thiopental enhanced by **sulfonamides**; hypersensitivity-like reactions can occur when general anaesthetics given with **intravenous vancomycin**
- Antidepressants: increased risk of arrhythmias and hypotension when general anaesthetics given with **tricyclics**
- Antipsychotics: enhanced hypotensive effect when general anaesthetics given with **antipsychotics**; effects of thiopental enhanced by **droperidol**
- Anxiolytics and Hypnotics: increased sedative effect when general anaesthetics given with **anxiolytics and hypnotics**
- Beta-blockers: enhanced hypotensive effect when general anaesthetics given with **beta-blockers**
- Calcium-channel Blockers: enhanced hypotensive effect when general anaesthetics or isoflurane given with **calcium-channel blockers**; general anaesthetics

**Anaesthetics, General**• Calcium-channel Blockers (*continued*)

enhance hypotensive effect of **verapamil** (also AV delay)

Clonidine: enhanced hypotensive effect when general anaesthetics given with **clonidine**

- Cytotoxics: nitrous oxide increases antifolate effect of **methotrexate**—avoid concomitant use
  - Diazoxide: enhanced hypotensive effect when general anaesthetics given with **diazoxide**
  - Diuretics: enhanced hypotensive effect when general anaesthetics given with **diuretics**
  - Dopaminergics: increased risk of arrhythmias when volatile liquid general anaesthetics given with **levodopa**
  - Doxapram: increased risk of arrhythmias when volatile liquid general anaesthetics given with **doxapram** (avoid doxapram for at least 10 minutes after volatile liquid general anaesthetics)
  - Memantine: increased risk of CNS toxicity when ketamine given with **memantine** (manufacturer of memantine advises avoid concomitant use)
  - Methyldopa: enhanced hypotensive effect when general anaesthetics given with **methyldopa**
  - Metoclopramide: effects of thiopental enhanced by **metoclopramide**
  - Moxonidine: enhanced hypotensive effect when general anaesthetics given with **moxonidine**
  - Muscle Relaxants: increased risk of myocardial depression and bradycardia when propofol given with **suxamethonium**; volatile liquid general anaesthetics enhance effects of **non-depolarising muscle relaxants** and **suxamethonium**; ketamine enhances effects of **atracurium**
  - Nitrates: enhanced hypotensive effect when general anaesthetics given with **nitrates**
  - Oxytocin: oxytocic effect possibly reduced, also enhanced hypotensive effect and risk of arrhythmias when volatile liquid general anaesthetics given with **oxytocin**
  - Probencid: effects of thiopental possibly enhanced by **probencid**
  - Sympathomimetics: manufacturer of isoflurane advises avoid concomitant use with **sympathomimetics** (risk of ventricular arrhythmias); increased risk of arrhythmias when volatile liquid general anaesthetics given with **adrenaline** (epinephrine) or **noradrenaline** (norepinephrine); increased risk of hypertension when volatile liquid general anaesthetics given with **methylphenidate**
  - Theophylline: increased risk of convulsions when ketamine given with **theophylline**
  - Vasodilator Antihypertensives: enhanced hypotensive effect when general anaesthetics given with **hydralazine**, **minoxidil** or **sodium nitroprusside**
- Anaesthetics, General (intravenous)** *see* Anaesthetics, General
- Anaesthetics, General (volatile liquids)** *see* Anaesthetics, General
- Anaesthetics, Local** *see* Bupivacaine, Chloroprocaine, Levobupivacaine, Lidocaine, Prilocaine, and Ropivacaine
- Anagrelide**
- Cilostazol: manufacturer of anagrelide advises avoid concomitant use with **cilostazol**
  - Phosphodiesterase Type-3 Inhibitors: manufacturer of anagrelide advises avoid concomitant use with **enoximone** and **milrinone**
- Anakinra**
- Adalimumab: avoid concomitant use of anakinra with **adalimumab**
  - Certolizumab pegol: avoid concomitant use of anakinra with **certolizumab pegol**
  - Etanercept: avoid concomitant use of anakinra with **etanercept**

**Anakinra** (*continued*)

- Golimumab: avoid concomitant use of anakinra with ●**golimumab**
- Infliximab: avoid concomitant use of anakinra with ●**infliximab**
- Vaccines: avoid concomitant use of anakinra with live ●**vaccines** (see p. 828)

**Analgesics** see Aspirin, Nefopam, NSAIDs, Opioid Analgesics, and Paracetamol

**Angiotensin-II Receptor Antagonists**

- ACE Inhibitors: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with ●**ACE inhibitors**

Adrenergic Neurone Blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **adrenergic neurone blockers**

Alcohol: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **alcohol**

Aldesleukin: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **aldesleukin**

- Aliskiren: avoid concomitant use of angiotensin-II receptor antagonists with ●**aliskiren** (see also under Renin inhibitors, p. 128); irbesartan possibly reduces plasma concentration of **aliskiren**

Alpha-blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **alpha-blockers**

Anaesthetics, General: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **general anaesthetics**

Analgesics: increased risk of renal impairment when angiotensin-II receptor antagonists given with **NSAIDs**, also hypotensive effect antagonised

Antibacterials: plasma concentration of losartan and its active metabolite reduced by **rifampicin**; possible increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with **trimethoprim**

Anticoagulants: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with **heparins**

Antidepressants: hypotensive effect of angiotensin-II receptor antagonists possibly enhanced by **MAOIs**

Antipsychotics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **anti-psychotics**

Anxiolytics and Hypnotics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **anxiolytics and hypnotics**

Beta-blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **beta-blockers**

Calcium-channel Blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **calcium-channel blockers**

- Cyclosporin: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with ●**cyclosporin**

Clonidine: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **clonidine**

Corticosteroids: hypotensive effect of angiotensin-II receptor antagonists antagonised by **corticosteroids**

Diazoxide: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **diazoxide**

- Diuretics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with ●**diuretics**; increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with ●**potassium-sparing diuretics and aldosterone antagonists**

Dopaminergics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **levodopa**

- Lithium: angiotensin-II receptor antagonists reduce excretion of ●**lithium** (increased plasma concentration)

**Angiotensin-II Receptor Antagonists** (*continued*)

Methyldopa: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **methyldopa**

Moxisylyte: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **moxisylyte**

Moxonidine: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **moxonidine**

Muscle Relaxants: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **baclofen** or **tizanidine**

Nitrates: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **nitrates**

Oestrogens: hypotensive effect of angiotensin-II receptor antagonists antagonised by **oestrogens**

- Potassium Salts: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with ●**potassium salts**

Prostaglandins: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **alprostadil**

Tacrolimus: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with **tacrolimus**

Vasodilator Antihypertensives: enhanced hypotensive effect when angiotensin-II receptor antagonists given with **hydralazine**, **minoxidil** or **sodium nitroprusside**

**Antacids**

**Note** Antacids should preferably not be taken at the same time as other drugs since they may impair absorption  
ACE Inhibitors: antacids possibly reduce absorption of **ACE inhibitors**; antacids reduce absorption of **captopril**, **enalapril** and **fosinopril**

Analgesics: antacids possibly reduce absorption of **acemetacin**; alkaline urine due to some antacids increases excretion of **aspirin**

Antibacterials: antacids reduce absorption of **azithromycin**, **cefalor**, **ciprofloxacin**, **isoniazid**, **levofloxacin**, **moxifloxacin**, **norfloxacin**, **ofloxacin**, **rifampicin** and **tetracyclines**; avoid concomitant use of antacids with **methanamine**; oral magnesium salts (as magnesium trisilicate) reduce absorption of **nitrofurantoin**

Antiepileptics: antacids reduce absorption of **gabapentin** and **phenytoin**

Antifungals: antacids reduce absorption of **itraconazole**

Antihistamines: antacids reduce absorption of **fenofenadine**

Antimalarials: antacids reduce absorption of **chloroquine** and **hydroxychloroquine**; oral magnesium salts (as magnesium trisilicate) reduce absorption of **proguanil**

Antipsychotics: antacids reduce absorption of **phenothiazines** and **sulpiride**

Antivirals: antacids reduce absorption of **atazanavir** (give at least 2 hours before or 1 hour after antacids); oral magnesium salts possibly reduce absorption of **dolutegravir**—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after oral magnesium salts; aluminium hydroxide possibly reduces absorption of **dolutegravir**—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after aluminium hydroxide; antacids reduce absorption of **elvitegravir** (give at least 4 hours apart); antacids possibly reduce absorption of **raltegravir** (give at least 2 hours apart); manufacturer of rilpivirine advises give antacids 2 hours before or 4 hours after **rilpivirine**; antacids reduce absorption of **tipranavir**

Bile Acids: antacids possibly reduce absorption of **bile acids**

Bisphosphonates: antacids reduce absorption of **bisphosphonates**

**Antacids** (*continued*)

- Cardiac Glycosides: antacids possibly reduce absorption of **digoxin**
- Corticosteroids: antacids reduce absorption of **deflazacort**
- Cytotoxics: aluminium hydroxide and oral magnesium salts possibly reduce absorption of **estramustine**—manufacturer of **estramustine** advises avoid concomitant administration; separating administration with antacids by about 12 hours advised by manufacturer of **bosutinib**; antacids possibly reduce plasma concentration of **erlotinib**—give antacids at least 4 hours before or 2 hours after **erlotinib**
- Deferasirox: antacids containing aluminium possibly reduce absorption of **deferasirox** (manufacturer of **deferasirox** advises avoid concomitant use)
- Deferiprone: antacids containing aluminium possibly reduce absorption of **deferiprone** (manufacturer of **deferiprone** advises avoid concomitant use)
- Dipyridamole: antacids possibly reduce absorption of **dipyridamole**
- Eltrombopag: antacids reduce absorption of **eltrombopag** (give at least 4 hours apart)
- Iron: oral magnesium salts (as magnesium trisilicate) reduce absorption of **oral iron**
- Lipid-regulating Drugs: antacids reduce absorption of **rosuvastatin**
- Lithium: sodium bicarbonate increases excretion of **lithium** (reduced plasma concentration)
- Mycophenolate: antacids reduce absorption of **mycophenolate**
- Penicillamine: antacids reduce absorption of **penicillamine**
- Polystyrene Sulfonate Resins: risk of intestinal obstruction when aluminium hydroxide given with **polystyrene sulfonate resins**; risk of metabolic alkalosis when oral magnesium salts given with **polystyrene sulfonate resins**
- Riociguat: antacids reduce absorption of **riociguat** (give at least 2 hours before or 1 hour after **riociguat**)
- Sympathomimetics: aluminium hydroxide possibly increases absorption of **pseudoephedrine**
- Thyroid Hormones: antacids possibly reduce absorption of **levothyroxine**
- Ulcer-healing Drugs: antacids possibly reduce absorption of **lansoprazole**
- Ulipristal: avoidance of antacids advised by manufacturer of **high-dose ulipristal** (contraceptive effect of **ulipristal** possibly reduced)

**Antazoline** *see* Antihistamines

**Anti-arrhythmics** *see* Adenosine, Amiodarone, Disopyramide, Dronedaron, Flecainide, Lidocaine, and Propafenone

**Antibacterials** *see* individual drugs

**Antibiotics (cytotoxic)** *see* Bleomycin, Doxorubicin, Epirubicin, Idarubicin, Mitomycin, and Mitoxantrone

**Anticoagulants** *see* Apixaban, Coumarins, Dabigatran, Heparins, Phenindione, and Rivaroxaban

**Antidepressants** *see* Agomelatine; Antidepressants, SSRI; Antidepressants, Tricyclic; Antidepressants, Tricyclic (related); MAOIs; Mirtazapine; Moclobemide; Reboxetine; St John's Wort; Venlafaxine

**Antidepressants, Noradrenaline Re-uptake Inhibitors** *see* Reboxetine

**Antidepressants, SSRI**

*Note see also* Dapoxetine

Alcohol: sedative effects possibly increased when SSRIs given with **alcohol**

Anaesthetics, Local: fluvoxamine inhibits metabolism of **ropivacaine**—avoid prolonged administration of **ropivacaine**

- Analgesics: increased risk of bleeding when SSRIs given with **NSAIDs** or **aspirin**; possible increased

**Antidepressants, SSRI**

• Analgesics (*continued*)

serotonergic effects when SSRIs given with **fenyltolerololamine**, fluvoxamine, paroxetine and sertraline possibly increase plasma concentration of **methadone**; increased risk of CNS toxicity when SSRIs given with **tramadol**

- Anti-arrhythmics: manufacturer of citalopram and escitalopram advises avoid concomitant use with **amiodarone** (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with **disopyramide** (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with **dronedaron** (risk of ventricular arrhythmias); fluoxetine increases plasma concentration of **flecainide**; fluoxetine and paroxetine possibly inhibit metabolism of **propafenone**

- Antibacterials: manufacturer of citalopram and escitalopram advises avoid concomitant use with **intravenous erythromycin** (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with **moxifloxacin** (risk of ventricular arrhythmias); possible increased risk of ventricular arrhythmias when citalopram given with **telithromycin**

- Anticoagulants: SSRIs possibly enhance anticoagulant effect of **coumarins**; possible increased risk of bleeding when SSRIs given with **dabigatran**

- Antidepressants: avoidance of fluvoxamine advised by manufacturer of **reboxetine**; possible increased serotonergic effects when SSRIs given with **duloxetine**; fluvoxamine inhibits metabolism of **duloxetine**—avoid concomitant use; citalopram, escitalopram, fluvoxamine, paroxetine or sertraline should not be started until 2 weeks after stopping **MAOIs**, also MAOIs should not be started until at least 1 week after stopping citalopram, escitalopram, fluvoxamine, paroxetine or sertraline; fluoxetine should not be started until 2 weeks after stopping **MAOIs**, also MAOIs should not be started until at least 5 weeks after stopping fluoxetine; CNS effects of SSRIs increased by **MAOIs** (risk of serious toxicity); increased risk of CNS toxicity when escitalopram given with **moclobemide**, preferably avoid concomitant use; after stopping citalopram, fluvoxamine, paroxetine or sertraline do not start **moclobemide** for at least 1 week; after stopping fluoxetine do not start **moclobemide** for 5 weeks; increased serotonergic effects when SSRIs given with **St John's wort**—avoid concomitant use; fluvoxamine inhibits metabolism of **agomelatine** (increased plasma concentration); possible increased serotonergic effects when fluoxetine or fluvoxamine given with **mirtazapine**; SSRIs increase plasma concentration of some **tricyclics**; manufacturer of citalopram and escitalopram advises avoid concomitant use with **tricyclics** (risk of ventricular arrhythmias)
- Antiepileptics: SSRIs antagonise anticonvulsant effect of **antiepileptics** (convulsive threshold lowered); fluoxetine and fluvoxamine increase plasma concentration of **carbamazepine**; plasma concentration of paroxetine reduced by **phenobarbital** and **phenytoin**; fluoxetine and fluvoxamine increase plasma concentration of **phenytoin**; plasma concentration of sertraline possibly reduced by **phenytoin**, also plasma concentration of phenytoin possibly increased

Antifungals: plasma concentration of paroxetine possibly increased by **terbinafine**

- Antihistamines: manufacturer of citalopram and escitalopram advises avoid concomitant use with **mizolastine** (risk of ventricular arrhythmias); antidepressant effect of SSRIs possibly antagonised by **cyproheptadine**

## Antidepressants, SSRI (continued)

- Antimalarials: manufacturer of citalopram and escitalopram advises avoid concomitant use with ●antimalarials (risk of ventricular arrhythmias); avoidance of antidepressants advised by manufacturer of ●artermeter with lumefantrine and ●piperazine with arteminimol

Antimuscarinics: paroxetine increases plasma concentration of ●darifenacin and ●procyclidine

- Antipsychotics: avoidance of fluoxetine, fluvoxamine and sertraline advised by manufacturer of ●droperidol (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with ●haloperidol (risk of ventricular arrhythmias); fluoxetine increases plasma concentration of ●clozapine, ●haloperidol and ●risperidone; fluvoxamine possibly increases plasma concentration of ●asenapine and ●haloperidol; paroxetine inhibits metabolism of ●perphenazine (reduce dose of perphenazine); fluoxetine and paroxetine possibly increase plasma concentration of ●aripiprazole (reduce dose of aripiprazole—consult aripiprazole product literature); plasma concentration of paroxetine possibly increased by ●asenapine; fluvoxamine, paroxetine and sertraline increase plasma concentration of ●clozapine; citalopram possibly increases plasma concentration of ●clozapine (increased risk of toxicity); fluvoxamine increases plasma concentration of ●olanzapine; manufacturer of citalopram and escitalopram advises avoid concomitant use with ●phenothiazines (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with ●pimozide (risk of ventricular arrhythmias); SSRIs possibly increase plasma concentration of ●pimozide (increased risk of ventricular arrhythmias—avoid concomitant use); paroxetine possibly increases plasma concentration of ●risperidone (increased risk of toxicity)

- Antivirals: plasma concentration of paroxetine and sertraline possibly reduced by ●darunavir; plasma concentration of paroxetine possibly reduced by ●ritonavir; plasma concentration of SSRIs possibly increased by ●ritonavir

- Anxiolytics and Hypnotics: fluoxetine increases plasma concentration of ●alprazolam; fluvoxamine increases plasma concentration of some ●benzodiazepines; fluvoxamine increases plasma concentration of ●melatonin—avoid concomitant use; sedative effects possibly increased when sertraline given with ●zolpidem

Atomoxetine: possible increased risk of convulsions when antidepressants given with ●atomoxetine; fluoxetine and paroxetine possibly inhibit metabolism of ●atomoxetine

- Beta-blockers: citalopram and escitalopram increase plasma concentration of ●metoprolol; paroxetine possibly increases the plasma concentration of ●metoprolol—increased risk of AV block (manufacturer of paroxetine advises avoid concomitant use in cardiac insufficiency); fluvoxamine increases plasma concentration of ●propranolol; manufacturer of escitalopram advises avoid concomitant use with ●sotalol (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when citalopram given with ●sotalol—avoid concomitant use

Bupropion: plasma concentration of citalopram possibly increased by ●bupropion

Calcium-channel Blockers: fluoxetine possibly inhibits metabolism of ●nifedipine (increased plasma concentration)

- Clopidogrel: fluoxetine and fluvoxamine possibly reduce antiplatelet effect of ●clopidogrel
- Dapoxetine: possible increased risk of serotonergic effects when SSRIs given with ●dapoxetine (manufacturer of dapoxetine advises SSRIs should not be

## Antidepressants, SSRI

- Dapoxetine (continued)

started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping SSRIs)

- Dopaminergics: increased risk of CNS toxicity when SSRIs given with ●rasagiline; fluvoxamine should not be started until 2 weeks after stopping ●rasagiline; fluoxetine should not be started until 2 weeks after stopping ●rasagiline, also rasagiline should not be started until at least 5 weeks after stopping fluoxetine; increased risk of hypertension and CNS excitation when paroxetine given with ●selegiline (selegiline should not be started until 2 weeks after stopping paroxetine, avoid paroxetine for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when fluvoxamine or sertraline given with ●selegiline (selegiline should not be started until 1 week after stopping fluvoxamine or sertraline, avoid fluvoxamine or sertraline for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when fluoxetine given with ●selegiline (selegiline should not be started until 5 weeks after stopping fluoxetine, avoid fluoxetine for 2 weeks after stopping selegiline); avoidance of citalopram and escitalopram advised by manufacturer of ●selegiline

Grapefruit Juice: plasma concentration of sertraline possibly increased by ●grapefruit juice

- Hormone Antagonists: fluoxetine and paroxetine possibly inhibit metabolism of ●tamoxifen to active metabolite (avoid concomitant use)
- 5HT<sub>1</sub>-receptor Agonists: increased risk of CNS toxicity when citalopram given with ●5HT<sub>1</sub> agonists (manufacturer of citalopram advises avoid concomitant use); fluvoxamine inhibits the metabolism of ●frovatriptan; possible increased serotonergic effects when SSRIs given with ●naratriptan; increased risk of CNS toxicity when citalopram, escitalopram, fluoxetine, fluvoxamine or paroxetine given with ●sumatriptan; CNS toxicity reported when sertraline given with ●sumatriptan; fluvoxamine possibly inhibits metabolism of ●zolmitriptan (reduce dose of zolmitriptan)
- Lithium: Increased risk of CNS effects when SSRIs given with ●lithium (lithium toxicity reported)
- Methylthionium: risk of CNS toxicity when SSRIs given with ●methylthionium—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthionium and observe patient for up to 4 hours after administration)

Metoclopramide: CNS toxicity reported when SSRIs given with ●metoclopramide

- Muscle Relaxants: fluvoxamine increases plasma concentration of ●tizanidine (increased risk of toxicity)—avoid concomitant use

Parasympathomimetics: paroxetine increases plasma concentration of ●galantamine

- Pentamidine Isetionate: manufacturer of citalopram and escitalopram advises avoid concomitant use with ●pentamidine isetionate (risk of ventricular arrhythmias)
- Pirfenidone: fluvoxamine increases plasma concentration of ●pirfenidone—manufacturer of pirfenidone advises avoid concomitant use
- Pomalidomide: fluvoxamine increases plasma concentration of ●pomalidomide

Ranolazine: paroxetine increases plasma concentration of ●ranolazine

Roflumilast: fluvoxamine inhibits the metabolism of ●roflumilast

Sympathomimetics: metabolism of SSRIs possibly inhibited by ●methylphenidate

- Theophylline: fluvoxamine increases plasma concentration of ●theophylline (concomitant use should usually be avoided, but where not possible halve

**Antidepressants, SSRI**

- Theophylline (*continued*)  
theophylline dose and monitor plasma-theophylline concentration)
- Ticagrelor: possible increased risk of bleeding when citalopram, paroxetine or sertraline given with **ticagrelor**
- Ulcer-healing Drugs: plasma concentration of citalopram, escitalopram and sertraline increased by **cimetidine**; fluvoxamine possibly increases plasma concentration of **lansoprazole**; plasma concentration of escitalopram increased by **omeprazole**

**Antidepressants, SSRI (related)** *see* Duloxetine and Venlafaxine

**Antidepressants, Tricyclic**

- Adrenergic Neurone Blockers: tricyclics antagonise hypotensive effect of **adrenergic neurone blockers**
  - Alcohol: increased sedative effect when tricyclics given with **alcohol**
  - Alpha<sub>2</sub>-adrenoceptor Stimulants: avoidance of tricyclics advised by manufacturer of **apraclonidine** and **brimonidine**
  - Anaesthetics, General: increased risk of arrhythmias and hypotension when tricyclics given with **general anaesthetics**
  - Analgesics: increased risk of CNS toxicity when tricyclics given with **tramadol**; side-effects possibly increased when tricyclics given with **nefopam**; sedative effects possibly increased when tricyclics given with **opioid analgesics**
  - Anti-arrhythmics: increased risk of ventricular arrhythmias when tricyclics given with **amiodarone**—avoid concomitant use; increased risk of ventricular arrhythmias when tricyclics given with **disopyramide** or **flecainide**; avoidance of tricyclics advised by manufacturer of **dronedarone** (risk of ventricular arrhythmias); increased risk of arrhythmias when tricyclics given with **propafenone**
  - Antibacterials: increased risk of ventricular arrhythmias when tricyclics given with **moxifloxacin**—avoid concomitant use; possible increased risk of ventricular arrhythmias when tricyclics given with **telithromycin**
  - Anticoagulants: tricyclics may enhance or reduce anticoagulant effect of **coumarins**
  - Antidepressants: avoidance of tricyclics advised by manufacturer of **citalopram** and **escitalopram** (risk of ventricular arrhythmias); possible increased serotonergic effects when amitriptyline or clomipramine given with **duloxetine**; increased risk of hypertension and CNS excitation when tricyclics given with **MAOIs**, tricyclics should not be started until 2 weeks after stopping MAOIs (3 weeks if starting clomipramine or imipramine), also MAOIs should not be started for at least 1–2 weeks after stopping tricyclics (3 weeks in the case of clomipramine or imipramine); after stopping tricyclics do not start **moclobemide** for at least 1 week; plasma concentration of some tricyclics increased by **SSRIs**; plasma concentration of amitriptyline reduced by **St John's wort**
  - Antiepileptics: tricyclics antagonise anticonvulsant effect of **antiepileptics** (convulsive threshold lowered); metabolism of tricyclics accelerated by **carbamazepine** (reduced plasma concentration and reduced effect); metabolism of tricyclics possibly accelerated by **phenobarbital** (reduced plasma concentration); plasma concentration of tricyclics possibly reduced by **phenytoin**
  - Antifungals: plasma concentration of amitriptyline and nortriptyline possibly increased by **fluconazole**; plasma concentration of tricyclics possibly increased by **terbinafine**
  - Antihistamines: increased antimuscarinic and sedative effects when tricyclics given with **antihistamines**
- Antidepressants, Tricyclic (*continued*)**
- Antimalarials: avoidance of antidepressants advised by manufacturer of **artemether with lumefantrine** and **piperazine with arteminol**
  - Antimuscarinics: increased risk of antimuscarinic side-effects when tricyclics given with **antimuscarinics**
  - Antipsychotics: avoidance of tricyclics advised by manufacturer of **droperidol**, **fluphenazine**, **haloperidol**, **sulpiride** and **zuclopentixol** (risk of ventricular arrhythmias); possible increased antimuscarinic side-effects when tricyclics given with **clozapine**; increased risk of antimuscarinic side-effects when tricyclics given with **phenothiazines**; possible increased risk of ventricular arrhythmias when tricyclics given with **risperidone**
  - Antivirals: plasma concentration of tricyclics possibly increased by **ritonavir**; increased risk of ventricular arrhythmias when tricyclics given with **saquinavir**—avoid concomitant use
  - Anxiolytics and Hypnotics: increased sedative effect when tricyclics given with **anxiolytics** and **hypnotics**
  - Atomoxetine: increased risk of ventricular arrhythmias when tricyclics given with **atomoxetine**; possible increased risk of convulsions when antidepressants given with **atomoxetine**
  - Beta-blockers: plasma concentration of imipramine increased by **labetalol** and **propranolol**; increased risk of ventricular arrhythmias when tricyclics given with **sotalol**
  - Bupropion: plasma concentration of tricyclics possibly increased by **bupropion** (possible increased risk of convulsions)
  - Calcium-channel Blockers: plasma concentration of tricyclics possibly increased by **diltiazem** and **verapamil**; plasma concentration of imipramine increased by **diltiazem** and **verapamil**
  - Cannabis Extract: possible increased risk of hypertension and tachycardia when tricyclics given with **cannabis extract**
  - Clonidine: tricyclics antagonise hypotensive effect of **clonidine**, also increased risk of hypertension on clonidine withdrawal
  - Cytotoxics: increased risk of ventricular arrhythmias when amitriptyline or clomipramine given with **arsenic trioxide**
  - Dapoxetine: possible increased risk of serotonergic effects when tricyclics given with **dapoxetine** (manufacturer of dapoxetine advises tricyclics should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping tricyclics)
  - Disulfiram: metabolism of tricyclics inhibited by **disulfiram** (increased plasma concentration); concomitant amitriptyline reported to increase **disulfiram** reaction with alcohol
  - Diuretics: increased risk of postural hypotension when tricyclics given with **diuretics**
  - Dopaminergics: caution with tricyclics advised by manufacturer of **entacapone**; increased risk of CNS toxicity when tricyclics given with **rasagiline**; CNS toxicity reported when tricyclics given with **selegiline**
  - Histamine: tricyclics theoretically antagonise effects of **histamine**—manufacturer of histamine advises avoid concomitant use
  - Lithium: risk of toxicity when tricyclics given with **lithium**
  - Methylthioninium: risk of CNS toxicity when clomipramine given with **methylthioninium**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)
  - Moxonidine: tricyclics possibly antagonise hypotensive effect of **moxonidine** (manufacturer of moxonidine advises avoid concomitant use)

**Antidepressants, Tricyclic** (continued)

- Muscle Relaxants: tricyclics enhance muscle relaxant effect of **baclofen**
- Nicorandil: tricyclics possibly enhance hypotensive effect of **nicorandil**
- Nitrates: tricyclics reduce effects of sublingual tablets of **nitrates** (failure to dissolve under tongue owing to dry mouth)
- Oestrogens: antidepressant effect of tricyclics antagonised by **oestrogens** (but side-effects of tricyclics possibly increased due to increased plasma concentration)
- Pentamidine Isetionate: increased risk of ventricular arrhythmias when tricyclics given with **pentamidine isetionate**
- Sodium Oxybate: increased risk of side-effects when tricyclics given with **sodium oxybate**
- Sympathomimetics: increased risk of hypertension and arrhythmias when tricyclics given with **adrenaline** (**epinephrine**) (but local anaesthetics with adrenaline appear to be safe); metabolism of tricyclics possibly inhibited by **methylphenidate**; increased risk of hypertension and arrhythmias when tricyclics given with **noradrenaline** (**norepinephrine**) or **phenylephrine**
- Thyroid Hormones: effects of tricyclics possibly enhanced by **thyroid hormones**; effects of amitriptyline and imipramine enhanced by **thyroid hormones**
- Ulcer-healing Drugs: plasma concentration of tricyclics possibly increased by **cimetidine**; metabolism of amitriptyline, doxepin, imipramine and nortriptyline inhibited by **cimetidine** (increased plasma concentration)

**Antidepressants, Tricyclic (related)**

- Alcohol: increased sedative effect when tricyclic-related antidepressants given with **alcohol**
- Alpha<sub>2</sub>-adrenoceptor Stimulants: avoidance of tricyclic-related antidepressants advised by manufacturer of **apraclonidine** and **brimonidine**
- Antibacterials: plasma concentration of trazodone possibly increased by **clarithromycin**
- Anticoagulants: trazodone may enhance or reduce anticoagulant effect of **warfarin**
- Antidepressants: tricyclic-related antidepressants should not be started until 2 weeks after stopping **MAOIs**, also **MAOIs** should not be started until at least 1–2 weeks after stopping tricyclic-related antidepressants; after stopping tricyclic-related antidepressants do not start **moclobemide** for at least 1 week
  - Antiepileptics: tricyclic-related antidepressants possibly antagonise anticonvulsant effect of **antiepileptics** (convulsive threshold lowered); plasma concentration of mianserin and trazodone reduced by **carbamazepine**; metabolism of mianserin accelerated by **phenobarbital** (reduced plasma concentration); plasma concentration of mianserin reduced by **phenytoin**
- Antihistamines: possible increased antimuscarinic and sedative effects when tricyclic-related antidepressants given with **antihistamines**
- Antimalarials: avoidance of antidepressants advised by manufacturer of **artemether with lumefantrine** and **piperaquine with arteminol**
- Antimuscarinics: possible increased antimuscarinic side-effects when tricyclic-related antidepressants given with **antimuscarinics**
- Antivirals: plasma concentration of trazodone increased by **ritonavir** (increased risk of toxicity); increased risk of ventricular arrhythmias when trazodone given with **saquinavir**—avoid concomitant use; plasma concentration of trazodone possibly increased by **telaprevir**
- Anxiolytics and Hypnotics: increased sedative effect when tricyclic-related antidepressants given with **anxiolytics and hypnotics**

**Antidepressants, Tricyclic (related)** (continued)

- Atomoxetine: possible increased risk of convulsions when antidepressants given with **atomoxetine**
- Diazoxide: enhanced hypotensive effect when tricyclic-related antidepressants given with **diazoxide**
- Nitrates: tricyclic-related antidepressants possibly reduce effects of sublingual tablets of **nitrates** (failure to dissolve under tongue owing to dry mouth)
- Vasodilator Antihypertensives: enhanced hypotensive effect when tricyclic-related antidepressants given with **hydralazine** or **sodium nitroprusside**

**Antidiabetics**

- Note** Other drugs administered orally may need to be taken at least 1 hour before or 4 hours after lixisenatide injection, or taken with a meal when lixisenatide is not administered, to minimise possible interference with absorption
- Note** Other drugs administered orally may need to be taken at least 1 hour before or 4 hours after exenatide injection, or taken with a meal when exenatide is not administered, to minimise possible interference with absorption
- ACE Inhibitors: hypoglycaemic effect of insulin, metformin and sulfonylureas possibly enhanced by **ACE inhibitors**
- Alcohol: hypoglycaemic effect of antidiabetics enhanced by **alcohol**; increased risk of lactic acidosis when metformin given with **alcohol**
- Anabolic Steroids: hypoglycaemic effect of antidiabetics possibly enhanced by **anabolic steroids**
- Analgesics: effects of sulfonylureas possibly enhanced by **NSAIDs**; lixisenatide possibly reduces the absorption of **paracetamol** when given 1 to 4 hours before paracetamol
- Anti-arrhythmics: hypoglycaemic effect of gliclazide, insulin and metformin possibly enhanced by **disopyramide**
- Antibacterials: hypoglycaemic effect of acarbose possibly enhanced by **neomycin**, also severity of gastro-intestinal effects increased; effects of repaglinide enhanced by **clarithromycin**; effects of glibenclamide possibly enhanced by **norfloxacin**; plasma concentration of canagliflozin and neteliglinde reduced by **rifampicin**; effects of linagliptin possibly reduced by **rifampicin**; hypoglycaemic effect of repaglinide possibly antagonised by **rifampicin**; effects of sulfonylureas enhanced by **chlorthalidone**; metabolism of tolbutamide accelerated by **rifampicin** (reduced effect); metabolism of sulfonylureas possibly accelerated by **rifampicin** (reduced effect); effects of sulfonylureas rarely enhanced by **sulfonamides** and **trimethoprim**; hypoglycaemic effect of sulfonylureas possibly enhanced by **tetracyclines**; hypoglycaemic effect of repaglinide possibly enhanced by **trimethoprim**—manufacturer advises avoid concomitant use
  - Anticoagulants: exenatide possibly enhances anticoagulant effect of **warfarin**; hypoglycaemic effect of sulfonylureas possibly enhanced by **coumarins**, also possible changes to anticoagulant effect
- Antidepressants: hypoglycaemic effect of antidiabetics possibly enhanced by **MAOIs**; hypoglycaemic effect of insulin, metformin and sulfonylureas enhanced by **MAOIs**
- Antidiabetics: manufacturer of dapagliflozin advises avoid concomitant use with **pioglitazone**
- Antiepileptics: tolbutamide transiently increases plasma concentration of **phenytoin** (possibility of toxicity); plasma concentration of metformin possibly increased by **topiramate**; plasma concentration of glibenclamide possibly reduced by **topiramate**
- Antifungals: plasma concentration of sulfonylureas increased by **fluconazole** and **micronazole**; hypoglycaemic effect of gliclazide and glipizide enhanced by **micronazole**—avoid concomitant use; hypoglycaemic effect of neteliglinde possibly enhanced by **fluconazole**; hypoglycaemic effect of repaglinide possibly enhanced by **itraconazole**; hypoglycaemic effect of glipizide possibly enhanced by **posaconazole**

**Antidiabetics**

- **Antifungals (continued)**  
**zole**; plasma concentration of sulfonyleureas possibly increased by **voriconazole**
- Antihistamines: thrombocyte count depressed when metformin given with **ketotifen** (manufacturer of ketotifen advises avoid concomitant use)
- Antipsychotics: hypoglycaemic effect of sulfonyleureas possibly antagonised by **phenothiazines**
- Antivirals: plasma concentration of tolbutamide possibly increased by **ritonavir**
- Aprepitant: plasma concentration of tolbutamide reduced by **aprepitant**
- Beta-blockers: warning signs of hypoglycaemia (such as tremor) with antidiabetics may be masked when given with **beta-blockers**; hypoglycaemic effect of insulin enhanced by **beta-blockers**
- **Bosentan**: increased risk of hepatotoxicity when glibenclamide given with **bosentan**—avoid concomitant use
- Calcium-channel Blockers: glucose tolerance occasionally impaired when insulin given with **nifedipine**
- Cardiac Glycosides: canagliflozin and sitagliptin increase plasma concentration of **digoxin**; acarbose possibly reduces plasma concentration of **digoxin**
- Ciclosporin: hypoglycaemic effect of repaglinide possibly enhanced by **ciclosporin**
- Corticosteroids: hypoglycaemic effect of antidiabetics antagonised by **corticosteroids**
- **Cytotoxics**: avoidance of repaglinide advised by manufacturer of **lapatinib**; plasma concentration of metformin possibly increased by **vandetanib** (consider reducing dose of metformin)
- Deferasirox: plasma concentration of repaglinide increased by **deferasirox**
- Diazoxide: hypoglycaemic effect of antidiabetics antagonised by **diazoxide**
- Diuretics: canagliflozin possibly enhances diuretic effect of **diuretics**; manufacturer of canagliflozin advises avoid concomitant use with **loop diuretics**; hypoglycaemic effect of antidiabetics antagonised by **loop diuretics** and **thiazides and related diuretics**; dapagliflozin possibly enhances diuretic effect of **loop diuretics** and **thiazides and related diuretics**
- Hormone Antagonists: requirements for antidiabetics possibly reduced by **lanreotide**, **octreotide** and **pasireotide**
- Leflunomide: hypoglycaemic effect of tolbutamide possibly enhanced by **leflunomide**
- **Lipid-regulating Drugs**: absorption of glibenclamide and glipizide reduced by **colessevelam**; absorption of glimepiride reduced by **colessevelam**—manufacturer of glimepiride advises give at least 4 hours before colessevelam; hypoglycaemic effect of acarbose possibly enhanced by **colestyramine**; hypoglycaemic effect of nateglinide possibly enhanced by **gemfibrozil**; increased risk of severe hypoglycaemia when repaglinide given with **gemfibrozil**—avoid concomitant use; plasma concentration of glibenclamide possibly increased by **fluvastatin**; manufacturer of canagliflozin advises give at least 1 hour before or 4–6 hours after **bile acid sequestrants**; may be improved glucose tolerance and an additive effect when insulin or sulfonyleureas given with **fibrates**
- Oestrogens: hypoglycaemic effect of antidiabetics antagonised by **oestrogens**
- Orlistat: avoidance of acarbose advised by manufacturer of **orlistat**
- Pancreatin: hypoglycaemic effect of acarbose antagonised by **pancreatin**
- Progestogens: hypoglycaemic effect of antidiabetics antagonised by **progestogens**
- **Sulfonpyrazone**: effects of sulfonyleureas enhanced by **sulfonpyrazone**
- Terflunomide: plasma concentration of repaglinide increased by **terflunomide**

**Antidiabetics (continued)**

- Testosterone: hypoglycaemic effect of antidiabetics possibly enhanced by **testosterone**
- Ulcer-healing Drugs: excretion of metformin reduced by **cimetidine** (increased plasma concentration); hypoglycaemic effect of sulfonyleureas enhanced by **cimetidine**
- Antiepileptics** see Carbamazepine, Eslicarbazepine, Ethosuximide, Gabapentin, Lacosamide, Lamotrigine, Levetiracetam, Oxcarbazepine, Perampanel, Phenobarbital, Phenytoin, Pregabalin, Retigabine, Rufinamide, Stiripentol, Tiagabine, Topiramate, Valproate, Vigabatrin, and Zonisamide
- Antifungals** see Amphotericin, Antifungals, Imidazole, Antifungals, Triazole; Caspofungin; Flucytosine; Griseofulvin; Micafungin; Terbinafine
- Antifungals, Imidazole**
- **Anticoagulants**: miconazole enhances anticoagulant effect of **coumarins** (miconazole oral gel and possibly vaginal and topical formulations absorbed)
- **Antidepressants**: avoidance of imidazoles advised by manufacturer of **reboxetine**
- **Antidiabetics**: miconazole enhances hypoglycaemic effect of **gliclazide** and **glipizide**—avoid concomitant use; miconazole increases plasma concentration of **sulfonyleureas**
- **Antiepileptics**: miconazole possibly increases plasma concentration of **carbamazepine**; miconazole enhances anticonvulsant effect of **phenytoin** (plasma concentration of phenytoin increased)
- Antifungals: imidazoles possibly antagonise effects of **amphotericin**
- **Antihistamines**: imidazoles possibly inhibit metabolism of **mizolastine** (avoid concomitant use)
- **Antimalarials**: avoidance of imidazoles advised by manufacturer of **piperaquine with arteminol** (possible risk of ventricular arrhythmias); avoidance of imidazoles advised by manufacturer of **artemether with lumefantrine**
- **Antipsychotics**: increased risk of ventricular arrhythmias when imidazoles given with **pimozide**—avoid concomitant use; imidazoles possibly increase plasma concentration of **quetiapine**—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: imidazoles possibly increase plasma concentration of **saquinavir**
- **Ciclosporin**: miconazole possibly inhibits metabolism of **ciclosporin** (increased plasma concentration)
- **Ergot Alkaloids**: increased risk of ergotism when imidazoles given with **ergotamine**—avoid concomitant use
- **Lipid-regulating Drugs**: possible increased risk of myopathy when imidazoles given with **atorvastatin**; possible increased risk of myopathy when miconazole given with **simvastatin**
- Oestrogens: anecdotal reports of contraceptive failure when imidazoles given with **oestrogens**
- **Sirolimus**: miconazole increases plasma concentration of **sirolimus**
- **Tacrolimus**: miconazole *oral gel* possibly increases plasma concentration of **tacrolimus**
- Antifungals, Polyene** see Amphotericin
- Antifungals, Triazole**
- Note In general, fluconazole interactions relate to multiple-dose treatment
- **Aliskiren**: itraconazole increases plasma concentration of **aliskiren**—avoid concomitant use
- **Analgesics**: fluconazole increases plasma concentration of **celecoxib** (halve dose of celecoxib); voriconazole increases plasma concentration of **diclofenac**, **ibuprofen** and **oxycodone**; fluconazole increases plasma concentration of **flurbiprofen**, **ibuprofen** and **methadone**; fluconazole increases plasma concentration of **parecoxib** (reduce dose of parecoxib); voriconazole increases plasma concentration of **alfentanil** and **methadone** (consider

**Antifungals, Triazole**

- Analgesics (*continued*)  
reducing dose of alfentanil and methadone); fluconazole inhibits metabolism of **alfentanil** (risk of prolonged or delayed respiratory depression); itraconazole possibly inhibits metabolism of **alfentanil**; triazoles possibly increase plasma concentration of ●**fentanyl**; itraconazole possibly increases plasma concentration of ●**methadone** (increased risk of ventricular arrhythmias); itraconazole increases plasma concentration of **oxycodone**

Antacids: absorption of itraconazole reduced by **antacids**

- Anti-arrhythmics: manufacturer of itraconazole advises avoid concomitant use with ●**disopyramide**; avoidance of itraconazole, posaconazole and voriconazole advised by manufacturer of ●**dronedarone**
- Antibacterials: plasma concentration of itraconazole increased by ●**clarithromycin**; manufacturer of fluconazole advises avoid concomitant use with ●**erythromycin**; triazoles possibly increase plasma concentration of ●**rifabutin** (increased risk of uveitis—reduce rifabutin dose); posaconazole increases plasma concentration of ●**rifabutin** (also plasma concentration of posaconazole reduced); voriconazole increases plasma concentration of ●**rifabutin**, also rifabutin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for rifabutin toxicity); fluconazole increases plasma concentration of ●**rifabutin** (increased risk of uveitis—reduce rifabutin dose); plasma concentration of itraconazole reduced by ●**rifabutin** and ●**rifampicin**—manufacturer of itraconazole advises avoid concomitant use; plasma concentration of posaconazole reduced by ●**rifampicin**; plasma concentration of voriconazole reduced by ●**rifampicin**—avoid concomitant use; metabolism of fluconazole accelerated by ●**rifampicin** (reduced plasma concentration)
- Anticoagulants: avoidance of itraconazole, posaconazole and voriconazole advised by manufacturer of ●**apixaban**; fluconazole, itraconazole and voriconazole enhance anticoagulant effect of ●**coumarins**; avoidance of itraconazole advised by manufacturer of ●**dabigatran** and ●**rivaroxaban**; avoidance of posaconazole and voriconazole advised by manufacturer of ●**rivaroxaban**
- Antidepressants: avoidance of triazoles advised by manufacturer of ●**reboxetine**; fluconazole possibly increases plasma concentration of ●**amitriptyline** and ●**nortriptyline**; plasma concentration of voriconazole reduced by ●**St John's wort**—avoid concomitant use
- Antidiabetics: posaconazole possibly enhances hypoglycaemic effect of ●**glipizide**; fluconazole possibly enhances hypoglycaemic effect of ●**ateglinide**; itraconazole possibly enhances hypoglycaemic effect of ●**repaglinide**; voriconazole possibly increases plasma concentration of ●**sulfonylureas**; fluconazole increases plasma concentration of ●**sulfonylureas**
- Antiepileptics: fluconazole possibly increases plasma concentration of ●**carbamazepine**; plasma concentration of voriconazole possibly reduced by ●**carbamazepine** and ●**phenobarbital**—avoid concomitant use; plasma concentration of itraconazole and posaconazole possibly reduced by ●**carbamazepine**; plasma concentration of itraconazole and posaconazole possibly reduced by ●**phenobarbital**; voriconazole increases plasma concentration of ●**phenytoin**, also phenytoin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for phenytoin toxicity); plasma concentration of posaconazole reduced by ●**phenytoin**; plasma concentration of itraconazole reduced by ●**phenytoin**—avoid concomitant use; fluconazole

**Antifungals, Triazole**

- Antiepileptics (*continued*)  
increases plasma concentration of ●**phenytoin** (consider reducing dose of phenytoin)
- Antifungals: triazoles possibly antagonise effects of ●**amphotericin**; monitoring for increased voriconazole side effects advised by manufacturer of **fluconazole** if voriconazole given after fluconazole; plasma concentration of itraconazole increased by ●**miconazole** (consider reducing dose of itraconazole); plasma concentration of fluconazole increased by **terbinafine**
- Antihistamines: itraconazole inhibits metabolism of ●**mizolastine**—avoid concomitant use
  - Antimalarials: avoidance of triazoles advised by manufacturer of ●**piperazine with artemisinin** (possible risk of ventricular arrhythmias); avoidance of triazoles advised by manufacturer of ●**artemether with lumefantrine**
  - Antimuscarinics: avoidance of itraconazole advised by manufacturer of ●**darifenacin** and ●**tolterodine**; manufacturer of fesoterodine advises dose reduction when itraconazole given with **fesoterodine**—consult fesoterodine product literature; itraconazole possibly increases plasma concentration of ●**solifenacin**—see Dose under Solifenacin, p. 553
  - Antipsychotics: itraconazole possibly increases plasma concentration of ●**haloperidol**; itraconazole possibly increases plasma concentration of ●**aripiprazole** (reduce dose of aripiprazole—consult aripiprazole product literature); increased risk of ventricular arrhythmias when triazoles given with ●**pimozide**—avoid concomitant use; triazoles possibly increase plasma concentration of ●**quetiapine**—manufacturer of quetiapine advises avoid concomitant use; itraconazole possibly increases side-effects of **risperidone**
  - Antivirals: posaconazole increases plasma concentration of ●**atazanavir**; plasma concentration of voriconazole increased or decreased by ●**atazanavir** and plasma concentration of atazanavir also reduced; plasma concentration of voriconazole reduced by ●**efavirenz**, also plasma concentration of efavirenz increased (increase voriconazole dose and reduce efavirenz dose); plasma concentration of itraconazole and posaconazole reduced by ●**efavirenz**; plasma concentration of both drugs may increase when itraconazole given with **fosamprenavir**; plasma concentration of posaconazole possibly reduced by **fosamprenavir**; itraconazole increases plasma concentration of ●**indinavir** (consider reducing dose of indinavir); fluconazole increases plasma concentration of ●**nevirapine**, **ritonavir** and **tipranavir**; plasma concentration of itraconazole possibly reduced by **nevirapine**—consider increasing dose of itraconazole; plasma concentration of voriconazole reduced by ●**ritonavir**—avoid concomitant use; combination of itraconazole with ●**ritonavir** may increase plasma concentration of either drug (or both); triazoles possibly increase plasma concentration of ●**saquinavir**; plasma concentration of itraconazole possibly increased by **telaprevir**; plasma concentration of voriconazole possibly affected by ●**telaprevir** (possible increased risk of ventricular arrhythmias); plasma concentration of posaconazole possibly increased by ●**telaprevir** (increased risk of ventricular arrhythmias); fluconazole increases plasma concentration of ●**zidovudine** (increased risk of toxicity)
  - Anxiolytics and Hypnotics: itraconazole increases plasma concentration of ●**alprazolam**; fluconazole and voriconazole increase plasma concentration of ●**diazepam** (risk of prolonged sedation); fluconazole, itraconazole, posaconazole and voriconazole increase plasma concentration of ●**midazolam** (risk of prolonged sedation); itraconazole increases

**Antifungals, Triazole**

- Anxiolytics and Hypnotics (*continued*)
  - plasma concentration of **buspiron** (reduce dose of buspiron)
- Avanafil: itraconazole and voriconazole possibly increase plasma concentration of **avanafil**—manufacturer of avanafil advises avoid concomitant use; fluconazole possibly increases plasma concentration of **avanafil**—see Dose under Avanafil, p. 559
- Bosentan: fluconazole possibly increases plasma concentration of **bosentan**—avoid concomitant use; itraconazole possibly increases plasma concentration of **bosentan**
- Calcium-channel Blockers: negative inotropic effect possibly increased when itraconazole given with **calcium-channel blockers**; itraconazole inhibits metabolism of **felodipine** (increased plasma concentration); avoidance of itraconazole advised by manufacturer of **lercanidipine**; itraconazole possibly inhibits metabolism of **dihydropyridines** (increased plasma concentration)
- Cardiac Glycosides: itraconazole increases plasma concentration of **digoxin**
- Ciclosporin: fluconazole, itraconazole, posaconazole and voriconazole inhibit metabolism of **ciclosporin** (increased plasma concentration)
- Cilostazol: itraconazole possibly increases plasma concentration of **cilostazol** (see Dose under Cilostazol, p. 140)
- Clopidogrel: fluconazole, itraconazole and voriconazole possibly reduce antiplatelet effect of **clopidogrel**
- Cobicistat: plasma concentration of itraconazole possibly increased by **cobicistat**—manufacturer of cobicistat advises reduce dose of itraconazole
- Colchicine: itraconazole possibly increases risk of **colchicine** toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids: itraconazole possibly inhibits metabolism of **corticosteroids** and **methylprednisolone**; itraconazole increases the plasma concentration of **inhaled** and **oral** (and possibly also **intranasal and rectal**) **budesonide**; itraconazole increases plasma concentration of **inhaled fluticasone**
- Cytotoxics: itraconazole inhibits metabolism of **busulfan** (increased risk of toxicity); itraconazole and itraconazole possibly increase side-effects of **cyclophosphamide**; itraconazole possibly increases the plasma concentration of **afatinib**—manufacturer of afatinib advises separating administration of itraconazole by 6 to 12 hours; itraconazole possibly increases plasma concentration of **axitinib** (reduce dose of axitinib—consult axitinib product literature); fluconazole, itraconazole, posaconazole and voriconazole possibly increase the plasma concentration of **bosutinib**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; itraconazole and voriconazole possibly increase plasma concentration of **crizotinib**—manufacturer of crizotinib advises avoid concomitant use; itraconazole, posaconazole and voriconazole possibly increase plasma concentration of **everolimus**—manufacturer of everolimus advises avoid concomitant use; itraconazole increases plasma concentration of **gefitinib**; avoidance of itraconazole, posaconazole and voriconazole advised by manufacturer of **lapatinib**; avoidance of voriconazole advised by manufacturer of **nilotinib**; itraconazole and voriconazole possibly increase plasma concentration of **pazopanib** (reduce dose of pazopanib); manufacturer of ruxolitinib advises dose reduction when fluconazole, itraconazole, posaconazole and voriconazole given with **ruxolitinib**—consult ruxolitinib product literature; avoidance of itraconazole advised by manufacturer of **temsirolimus** (plasma concentration of

**Antifungals, Triazole**

- Cytotoxics (*continued*)
  - temsirolimus possibly increased); itraconazole and voriconazole possibly increase the plasma concentration of **cabazitaxel**—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel; increased risk of toxicity when itraconazole given with **irinotecan**—avoid concomitant use; posaconazole possibly inhibits metabolism of **vinblastine** and **vincristine** (increased risk of neurotoxicity); itraconazole possibly increases risk of **vinblastine**, **vindesine**, **vinflunine** and **vinorelbine** toxicity; itraconazole increases risk of **vincristine** toxicity
- Dapoxetine: manufacturer of dapoxetine advises dose reduction when fluconazole given with **dapoxetine** (see Dose under Dapoxetine, p. 560); avoidance of itraconazole advised by manufacturer of **dapoxetine** (increased risk of toxicity)
- Diuretics: fluconazole increases plasma concentration of **eplerenone** (reduce dose of eplerenone); itraconazole increases plasma concentration of **eplerenone**—avoid concomitant use; plasma concentration of fluconazole increased by **hydrochlorothiazide**
- Domperidone: possible increased risk of ventricular arrhythmias when itraconazole or voriconazole given with **domperidone**—avoid concomitant use
- Ergot Alkaloids: manufacturer of itraconazole advises avoid concomitant use with **ergometrine** (increased risk of ergotism); increased risk of ergotism when triazoles given with **ergotamine**—avoid concomitant use
- 5HT<sub>1</sub>-receptor Agonists: itraconazole increases plasma concentration of **eletriptan** (risk of toxicity)—avoid concomitant use
- Ivabradine: fluconazole increases plasma concentration of **ivabradine**—reduce initial dose of ivabradine; itraconazole possibly increases plasma concentration of **ivabradine**—avoid concomitant use
- Ivacaftor: itraconazole, posaconazole and voriconazole possibly increase plasma concentration of **ivacaftor** (see Dose under Ivacaftor, p. 216); fluconazole increases plasma concentration of **ivacaftor** (see Dose under Ivacaftor, p. 216)
- Lenalidomide: itraconazole possibly increases plasma concentration of **lenalidomide** (increased risk of toxicity)
- Leukotriene Receptor Antagonists: fluconazole increases plasma concentration of **zafirlukast**
- Lipid-regulating Drugs: increased risk of myopathy when itraconazole, posaconazole or voriconazole given with **atorvastatin**; possible increased risk of myopathy when fluconazole given with **atorvastatin** or **simvastatin**; fluconazole increases plasma concentration of **fluvastatin**—possible increased risk of myopathy; itraconazole increases plasma concentration of **rosuvastatin**—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when itraconazole or posaconazole given with **simvastatin** (avoid concomitant use); increased risk of myopathy when voriconazole given with **simvastatin**; avoidance of triazoles advised by manufacturer of **lomitapide** (plasma concentration of lomitapide possibly increased)
- Mirabegron: when given with itraconazole avoid or reduce dose of **mirabegron** in hepatic or renal impairment—see Mirabegron, p. 552
- Oestrogens: plasma concentration of voriconazole increased by **oestrogens**
- Progestogens: plasma concentration of voriconazole possibly increased by **progestogens**
- Ranolazine: itraconazole, posaconazole and voriconazole possibly increase plasma concentration of **ranolazine**—manufacturer of ranolazine advises avoid concomitant use

**Antifungals, Triazole** (*continued*)

- Retinoids: fluconazole and voriconazole possibly increase risk of ●**retinoin** toxicity  
Riociguat: avoidance of itraconazole and voriconazole advised by manufacturer of **riociguat**  
Sildenafil: itraconazole increases plasma concentration of **sildenafil**—reduce initial dose of sildenafil
- Sirolimus: fluconazole and posaconazole possibly increase plasma concentration of **sirolimus**; itraconazole and voriconazole increase plasma concentration of ●**sirolimus**—avoid concomitant use
- Tacrolimus: fluconazole, itraconazole, posaconazole and voriconazole increase plasma concentration of ●**tacrolimus** (consider reducing dose of tacrolimus)  
Tadalafil: itraconazole possibly increases plasma concentration of **tadalafil**
- Theophylline: fluconazole possibly increases plasma concentration of ●**theophylline**
- Ulcer-healing Drugs: plasma concentration of posaconazole reduced by ●**cimetidine** and ●**esomeprazole**—manufacturer of posaconazole *suspension* advises avoid concomitant use; plasma concentration of posaconazole possibly reduced by ●**famotidine**, ●**lansoprazole**, ●**nizatidine**, ●**omeprazole**, ●**pantoprazole**, ●**rabeprazole** and ●**ranitidine**—manufacturer of posaconazole *suspension* advises avoid concomitant use; voriconazole possibly increases plasma concentration of **esomeprazole**; voriconazole increases plasma concentration of **omeprazole** (consider reducing dose of omeprazole); absorption of itraconazole reduced by **histamine H<sub>2</sub>-antagonists** and **proton pump inhibitors**  
Ulipristal: avoidance of itraconazole advised by manufacturer of **ulipristal**
- Vardenafil: itraconazole possibly increases plasma concentration of ●**vardenafil**—avoid concomitant use

**Antihistamines**

**Note** Sedative interactions apply to a lesser extent to the non-sedating antihistamines. Interactions do not generally apply to antihistamines used for topical action (including inhalation)

- Alcohol: increased sedative effect when antihistamines given with **alcohol** (possibly less effect with non-sedating antihistamines)
- Analgesics: sedative effects possibly increased when sedating antihistamines given with ●**opioid analgesics**
  - Antacids: absorption of fexofenadine reduced by **antacids**
  - Anti-arrhythmics: increased risk of ventricular arrhythmias when mizolastine given with ●**amiodarone**, ●**disopyramide** or ●**flecainide**—avoid concomitant use; manufacturer of mizolastine advises avoid concomitant use with **propafenone** (possible risk of ventricular arrhythmias)
  - Antibacterials: plasma concentration of rupatadine increased by **erythromycin**; manufacturer of loratadine advises plasma concentration possibly increased by **erythromycin**; metabolism of mizolastine inhibited by ●**erythromycin**—avoid concomitant use; increased risk of ventricular arrhythmias when mizolastine given with ●**moxifloxacin**—avoid concomitant use; effects of fexofenadine possibly reduced by **rifampicin**; metabolism of mizolastine possibly inhibited by ●**macrolides** (avoid concomitant use)
  - Antidepressants: avoidance of mizolastine advised by manufacturer of ●**citalopram** and ●**escitalopram** (risk of ventricular arrhythmias); manufacturer of promethazine advises avoid for 2 weeks after stopping **MAOIs**; manufacturer of hydroxyzine advises avoid concomitant use with **MAOIs**; increased antimuscarinic and sedative effects when antihistamines given with **MAOIs** or **tricyclics**; cyproheptadine

**Antihistamines**

- Antidepressants (*continued*)  
possibly antagonises antidepressant effect of **SSRIs**; possibly increased antimuscarinic and sedative effects when antihistamines given with **tricyclic-related antidepressants**
  - Antidiabetics: thrombocyte count depressed when ketotifen given with **metformin** (manufacturer of ketotifen advises avoid concomitant use)
  - Antifungals: metabolism of mizolastine inhibited by ●**itraconazole**—avoid concomitant use; metabolism of mizolastine possibly inhibited by ●**imidazoles** (avoid concomitant use)
  - Antimalarials: avoidance of mizolastine advised by manufacturer of ●**piperquine with arteminol** (possible risk of ventricular arrhythmias)
  - Antimuscarinics: increased risk of antimuscarinic side-effects when antihistamines given with **antimuscarinics**
  - Antivirals: plasma concentration of chlorphenamine possibly increased by **lopinavir**; plasma concentration of non-sedating antihistamines possibly increased by **ritonavir**; increased risk of ventricular arrhythmias when mizolastine given with ●**saquinavir**—avoid concomitant use
  - Anxiolytics and Hypnotics: increased sedative effect when antihistamines given with **anxiolytics and hypnotics**
  - Beta-blockers: increased risk of ventricular arrhythmias when mizolastine given with ●**sotalol**—avoid concomitant use
  - Bethahistine: antihistamines theoretically antagonise effect of **bethahistine**
  - Cytotoxics: possible increased risk of ventricular arrhythmias when mizolastine given with ●**vandetanib**—avoid concomitant use
  - Grapefruit Juice: plasma concentration of bilastine reduced by **grapefruit juice**; plasma concentration of rupatadine increased by ●**grapefruit juice**—avoid concomitant use
  - Histamine: antihistamines theoretically antagonise effects of **histamine**—manufacturer of histamine advises avoid concomitant use
  - Ulcer-healing Drugs: manufacturer of loratadine advises plasma concentration possibly increased by **cimetidine**; plasma concentration of hydroxyzine increased by **cimetidine**
  - Ulipristal: manufacturer of ulipristal advises give fexofenadine at least 1.5 hours before or after **ulipristal**
- Antihistamines, Non-sedating** *see* Antihistamines
- Antihistamines, Sedating** *see* Antihistamines
- Antimalarials** *see* Artemether with Lumefantrine, Chloroquine and Hydroxychloroquine, Mefloquine, Piperquine with Arteminol, Primaquine, Proguanil, Pyrimethamine, and Quinine
- Antimetabolites** *see* Cladribine, Cytarabine, Decitabine, Fludarabine, Fluorouracil, Gemcitabine, Mercaptopurine, Methotrexate, Pemetrexed, Raltitrexed, and Tioguanine
- Antimuscarinics**
- Note** Many drugs have antimuscarinic effects; concomitant use of two or more such drugs can increase side-effects such as dry mouth, urine retention, and constipation; concomitant use can also lead to confusion in the elderly. Interactions do not generally apply to antimuscarinics used by inhalation
- Alcohol: increased sedative effect when hyoscine given with **alcohol**
- Analgesics: possible increased risk of antimuscarinic side-effects when antimuscarinics given with **codeine**; increased risk of antimuscarinic side-effects when antimuscarinics given with **nefopam**
- Anti-arrhythmics: increased risk of ventricular arrhythmias when tolterodine given with ●**amiodarone**, ●**disopyramide** or ●**flecainide**; increased risk of antimuscarinic side-effects when antimuscarinics given with **disopyramide**

**Antimuscarinics** (continued)

- Antibacterials: manufacturer of fesoterodine advises dose reduction when fesoterodine given with **clarithromycin** and **telithromycin**—consult fesoterodine product literature; manufacturer of tolterodine advises avoid concomitant use with **clarithromycin** and **erythromycin**; plasma concentration of darifenacin possibly increased by **erythromycin**; plasma concentration of active metabolite of fesoterodine reduced by **rifampicin**
- Antidepressants: plasma concentration of darifenacin and procydiline increased by **paroxetine**; increased risk of antimuscarinic side-effects when antimuscarinics given with **MAOIs** or **tricyclics**; possible increased antimuscarinic side-effects when antimuscarinics given with **tricyclic-related antidepressants**
- Antifungals: manufacturer of fesoterodine advises dose reduction when fesoterodine given with **itraconazole**—consult fesoterodine product literature; manufacturer of darifenacin and tolterodine advises avoid concomitant use with **itraconazole**; plasma concentration of solifenacin possibly increased by **itraconazole**—see Dose under Solifenacin, p. 553
- Antihistamines: increased risk of antimuscarinic side-effects when antimuscarinics given with **antihistamines**
- Antipsychotics: antimuscarinics possibly reduce effects of **haloperidol**; increased risk of antimuscarinic side-effects when antimuscarinics given with **clozapine**; antimuscarinics reduce plasma concentration of **phenothiazines**, but risk of antimuscarinic side-effects increased
- Antivirals: manufacturer of fesoterodine advises dose reduction when fesoterodine given with **atazanavir**, **indinavir**, **ritonavir** and **saquinavir**—consult fesoterodine product literature; manufacturer of darifenacin advises avoid concomitant use with **atazanavir**, **fosamprenavir**, **indinavir**, **lopinavir**, **ritonavir**, **saquinavir** and **tipranavir**; manufacturer of tolterodine advises avoid concomitant use with **fosamprenavir**, **indinavir**, **lopinavir**, **ritonavir** and **saquinavir**; plasma concentration of solifenacin possibly increased by **ritonavir**—see Dose under Solifenacin, p. 553
  - Beta-blockers: increased risk of ventricular arrhythmias when tolterodine given with **sotalol**
- Calcium-channel Blockers: plasma concentration of solifenacin increased by **verapamil**; manufacturer of darifenacin advises avoid concomitant use with **verapamil**
- Cardiac Glycosides: darifenacin possibly increases plasma concentration of **digoxin**
- Ciclosporin: manufacturer of darifenacin advises avoid concomitant use with **ciclosporin**
- Domperidone: antimuscarinics antagonise effects of **domperidone** on gastro-intestinal activity
- Dopaminergics: antimuscarinics possibly reduce absorption of **levodopa**
- Hormone Antagonists: possible increased risk of bradycardia when ipratropium or oxybutynin given with **pasireotide**
- Memantine: effects of antimuscarinics possibly enhanced by **memantine**
- Metoclopramide: antimuscarinics antagonise effects of **metoclopramide** on gastro-intestinal activity
- Nitrates: antimuscarinics possibly reduce effects of sublingual tablets of **nitrates** (failure to dissolve under tongue owing to dry mouth)
- Parasympathomimetics: antimuscarinics antagonise effects of **parasympathomimetics**

**Antipsychotics**

- Note** Increased risk of toxicity with myelosuppressive drugs
- Note** Avoid concomitant use of clozapine with drugs that have a substantial potential for causing agranulocytosis
- ACE Inhibitors:** enhanced hypotensive effect when antipsychotics given with **ACE inhibitors**

**Antipsychotics** (continued)

- Adrenergic Neuron Blockers: enhanced hypotensive effect when phenothiazines given with **adrenergic neuron blockers**; higher doses of chlorpromazine antagonise hypotensive effect of **adrenergic neuron blockers**; haloperidol antagonises hypotensive effect of **adrenergic neuron blockers**
- Adsorbents: absorption of phenothiazines possibly reduced by **kaolin**
- Alcohol: increased sedative effect when antipsychotics given with **alcohol**
- Alpha-blockers: enhanced hypotensive effect when antipsychotics given with **alpha-blockers**
- Anaesthetics, General: droperidol enhances effects of **thiopental**; enhanced hypotensive effect when antipsychotics given with **general anaesthetics**
  - Analgesics: possible severe drowsiness when haloperidol given with **acemetacin** or **indometacin**; increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with **methadone**; increased risk of ventricular arrhythmias when amisulpride given with **methadone**—avoid concomitant use; increased risk of convulsions when antipsychotics given with **tramadol**; enhanced hypotensive and sedative effects when antipsychotics given with **opioid analgesics**
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when antipsychotics given with **angiotensin-II receptor antagonists**
- Antacids: absorption of phenothiazines and sulpiride reduced by **antacids**
- Anti-arrhythmics: increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with **anti-arrhythmics** that prolong the QT interval; increased risk of ventricular arrhythmias when amisulpride, droperidol, haloperidol, phenothiazines, pimozone or zuclopentixol given with **amiodarone**—avoid concomitant use; increased risk of ventricular arrhythmias when benperidol given with **amiodarone**—manufacturer of benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias when sulpiride given with **amiodarone** or **disopyramide**; increased risk of ventricular arrhythmias when amisulpride, droperidol, pimozone or zuclopentixol given with **disopyramide**—avoid concomitant use; possible increased risk of ventricular arrhythmias when haloperidol given with **disopyramide**—avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines given with **disopyramide**; avoidance of phenothiazines advised by manufacturer of **dronedarone** (risk of ventricular arrhythmias); increased risk of arrhythmias when clozapine given with **flecainide**
  - Antibacterials: increased risk of ventricular arrhythmias when pimozone given with **clarithromycin**, **moxifloxacin** or **telithromycin**—avoid concomitant use; plasma concentration of quetiapine possibly increased by **clarithromycin**—manufacturer of quetiapine advises avoid concomitant use; increased risk of ventricular arrhythmias when amisulpride given with **erythromycin**—avoid concomitant use; plasma concentration of clozapine possibly increased by **erythromycin** (possible increased risk of convulsions); possible increased risk of ventricular arrhythmias when pimozone given with **erythromycin**—avoid concomitant use; plasma concentration of quetiapine increased by **erythromycin**—manufacturer of quetiapine advises avoid concomitant use; increased risk of ventricular arrhythmias when sulpiride given with **parenteral erythromycin**; increased risk of ventricular arrhythmias when zuclopentixol given with **parenteral erythromycin**—avoid concomitant use; plasma concentration of clozapine increased by **ciprofloxacin**; plasma concentration of olanzapine possibly

## Antipsychotics

● Antibacterials (*continued*)

increased by **ciprofloxacin**; increased risk of ventricular arrhythmias when droperidol, haloperidol, phenothiazines or zuclopenthixol given with ●**moxifloxacin**—avoid concomitant use; increased risk of ventricular arrhythmias when benperidol given with ●**moxifloxacin**—manufacturer of benperidol advises avoid concomitant use; plasma concentration of aripiprazole possibly reduced by ●**rifabutin** and ●**rifampicin** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of clozapine possibly reduced by **rifampicin**; metabolism of haloperidol accelerated by ●**rifampicin** (reduced plasma concentration); avoid concomitant use of clozapine with ●**chloramphenicol** or ●**sulfonamides** (increased risk of agranulocytosis); manufacturer of droperidol advises avoid concomitant use with ●**macrolides** (risk of ventricular arrhythmias); possible increased risk of ventricular arrhythmias when chlorpromazine given with ●**telithromycin**; plasma concentration of quetiapine possibly increased by **telithromycin**

- Antidepressants: plasma concentration of clozapine possibly increased by **citralopram** (increased risk of toxicity); avoidance of haloperidol, phenothiazines and pimozide advised by manufacturer of ●**citralopram** (risk of ventricular arrhythmias); avoidance of haloperidol, phenothiazines and pimozide advised by manufacturer of ●**escitalopram** (risk of ventricular arrhythmias); plasma concentration of aripiprazole possibly increased by ●**fluoxetine** and ●**paroxetine** (reduce dose of aripiprazole—consult aripiprazole product literature); plasma concentration of clozapine, haloperidol and risperidone increased by ●**fluoxetine**; manufacturer of droperidol advises avoid concomitant use with ●**fluoxetine**, ●**fluvoxamine**, ●**sertraline** and ●**tricyclics** (risk of ventricular arrhythmias); plasma concentration of asenapine and haloperidol possibly increased by **fluvoxamine**; plasma concentration of clozapine and olanzapine increased by ●**fluvoxamine**; asenapine possibly increases plasma concentration of **paroxetine**; plasma concentration of clozapine increased by ●**paroxetine** and **sertraline**; plasma concentration of risperidone possibly increased by **paroxetine** (increased risk of toxicity); metabolism of perphenazine inhibited by **paroxetine** (reduce dose of perphenazine); plasma concentration of haloperidol increased by **venlafaxine**; clozapine possibly increases CNS effects of ●**MAOIs**; plasma concentration of pimozide possibly increased by ●**SSRIs** (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of aripiprazole possibly reduced by ●**St John's wort** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); possible increased risk of ventricular arrhythmias when risperidone given with ●**tricyclics**; possible increased antimuscarinic side-effects when clozapine given with **tricyclics**; manufacturer of fluphenazine, haloperidol, sulpiride and zuclopenthixol advises avoid concomitant use with **tricyclics** (risk of ventricular arrhythmias); increased risk of antimuscarinic side-effects when phenothiazines given with **tricyclics**

Antidiabetics: phenothiazines possibly antagonise hypoglycaemic effect of **sulfonylureas**

- Antiepileptics: antipsychotics antagonise anti-convulsant effect of ●**antiepileptics** (convulsive threshold lowered); plasma concentration of paliperidone reduced by **carbamazepine**; metabolism of haloperidol, olanzapine, quetiapine and risperidone accelerated by **carbamazepine** (reduced plasma concentration); metabolism of clozapine accelerated

## Antipsychotics

● Antiepileptics (*continued*)

by ●**carbamazepine** (reduced plasma concentration), also avoid concomitant use of drugs with substantial potential for causing agranulocytosis; plasma concentration of aripiprazole reduced by ●**carbamazepine** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of aripiprazole possibly reduced by ●**phenobarbital** and ●**phenytoin** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); metabolism of haloperidol accelerated by **phenobarbital** (reduced plasma concentration); plasma concentration of both drugs reduced when chlorpromazine given with **phenobarbital**; plasma concentration of clozapine possibly reduced by **phenobarbital**; plasma concentration of haloperidol reduced by **phenytoin**; chlorpromazine possibly increases or decreases plasma concentration of **phenytoin**; metabolism of clozapine and quetiapine accelerated by **phenytoin** (reduced plasma concentration); increased risk of side-effects including neutropenia when olanzapine given with ●**valproate**; plasma concentration of clozapine possibly increased or decreased by **valproate**

- Antifungals: plasma concentration of aripiprazole possibly increased by ●**itraconazole** (reduce dose of aripiprazole—consult aripiprazole product literature); side-effects of risperidone possibly increased by **itraconazole**; plasma concentration of haloperidol possibly increased by **itraconazole**; plasma concentration of quetiapine possibly increased by ●**imidazoles** and ●**triazoles**—manufacturer of quetiapine advises avoid concomitant use; increased risk of ventricular arrhythmias when pimozide given with ●**imidazoles** or ●**triazoles**—avoid concomitant use
- Antimalarials: avoidance of droperidol, haloperidol, phenothiazines and pimozide advised by manufacturer of ●**piperazine with arteminimol** (possible risk of ventricular arrhythmias); avoidance of antipsychotics advised by manufacturer of ●**artemether with lumefantrine**; increased risk of ventricular arrhythmias when droperidol given with ●**chloroquine** and **hydroxychloroquine** or ●**quinine**—avoid concomitant use; increased risk of ventricular arrhythmias when pimozide given with ●**mefloquine** or ●**quinine**—avoid concomitant use; manufacturer of amisulpride advises avoid concomitant use with **mefloquine**; possible increased risk of ventricular arrhythmias when haloperidol given with ●**mefloquine** or ●**quinine**—avoid concomitant use; manufacturer of risperidone advises possible risk of ventricular arrhythmias when risperidone given with ●**mefloquine**; possible increased risk of ventricular arrhythmias when risperidone given with ●**quinine**
- Antimuscarinics: increased risk of antimuscarinic side-effects when clozapine given with **antimuscarinics**; plasma concentration of phenothiazines reduced by **antimuscarinics**, but risk of antimuscarinic side-effects increased; effects of haloperidol possibly reduced by **antimuscarinics**
- Antipsychotics: increased risk of ventricular arrhythmias when amisulpride, pimozide or sulpiride given with ●**droperidol**—avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines that prolong the QT interval given with ●**droperidol**—avoid concomitant use; avoid concomitant use of clozapine with depot formulation of ●**flupentixol**, ●**fluphenazine**, ●**haloperidol**, ●**pipotiazine**, ●**risperidone** or ●**zuclopenthixol** as cannot be withdrawn quickly if neutropenia occurs; increased risk of ventricular arrhythmias when sulpiride given with ●**haloperidol**; chlorpromazine possibly increases plasma concentration of **haloperidol**; increased risk

**Antipsychotics**● Antipsychotics (*continued*)

of ventricular arrhythmias when droperidol given with ●haloperidol—avoid concomitant use; increased risk of ventricular arrhythmias when pimozide given with ●phenothiazines—avoid concomitant use; possible increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with ●risperidone; increased risk of ventricular arrhythmias when pimozide given with ●sulpiride

- Antivirals: plasma concentration of pimozide possibly increased by ●atazanavir—avoid concomitant use; plasma concentration of aripiprazole possibly increased by ●atazanavir, ●darunavir, ●fosamprenavir, ●indinavir, ●lopinavir, ●ritonavir, ●saquinavir and ●tipranavir (reduce dose of aripiprazole—consult aripiprazole product literature); plasma concentration of quetiapine possibly increased by ●atazanavir, ●boceprevir, ●darunavir, ●fosamprenavir, ●indinavir, ●lopinavir, ●ritonavir, ●saquinavir, ●telaprevir and ●tipranavir—manufacturer of quetiapine advises avoid concomitant use; avoidance of pimozide advised by manufacturer of ●boceprevir and ●telaprevir; plasma concentration of aripiprazole possibly reduced by ●efavirenz and ●nevirapine (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of pimozide possibly increased by ●efavirenz, ●indinavir and ●saquinavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of pimozide increased by ●fosamprenavir and ●ritonavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of antipsychotics possibly increased by ●ritonavir; plasma concentration of olanzapine reduced by ●ritonavir—consider increasing dose of olanzapine; avoidance of clozapine advised by manufacturer of ●ritonavir (increased risk of toxicity); increased risk of ventricular arrhythmias when clozapine, haloperidol or phenothiazines given with ●saquinavir—avoid concomitant use
- Anxiolytics and Hypnotics: increased sedative effect when antipsychotics given with ●anxiolytics and ●hypnotics; plasma concentration of haloperidol possibly increased by ●alprazolam; increased risk of hypotension, bradycardia and respiratory depression when *intramuscular* olanzapine given with *parenteral* ●benzodiazepines; serious adverse events reported with concomitant use of clozapine and ●benzodiazepines (causality not established); plasma concentration of haloperidol increased by ●buspirone
- Aprepitant: avoidance of pimozide advised by manufacturer of ●aprepitant
- Atomoxetine: increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with ●atomoxetine
- Beta-blockers: enhanced hypotensive effect when phenothiazines given with ●beta-blockers; plasma concentration of both drugs may increase when chlorpromazine given with ●propranolol; increased risk of ventricular arrhythmias when droperidol or zuclopenthixol given with ●sotalol—avoid concomitant use; possible increased risk of ventricular arrhythmias when haloperidol given with ●sotalol—avoid concomitant use; increased risk of ventricular arrhythmias when amisulpride, phenothiazines, pimozide or sulpiride given with ●sotalol; possible increased risk of ventricular arrhythmias when risperidone given with ●sotalol

Calcium-channel Blockers: enhanced hypotensive effect when antipsychotics given with ●calcium-channel blockers

**Antipsychotics (*continued*)**

Clonidine: enhanced hypotensive effect when phenothiazines given with ●clonidine

- Cobicistat: plasma concentration of pimozide possibly increased by ●cobicistat—manufacturer of cobicistat advises avoid concomitant use
- Cytotoxics: avoid concomitant use of clozapine with ●cytotoxics (increased risk of agranulocytosis); possible increased risk of ventricular arrhythmias when haloperidol given with ●bosutinib; caution with pimozide advised by manufacturer of ●crizotinib; avoidance of pimozide advised by manufacturer of ●lapatinib; possible increased risk of ventricular arrhythmias when amisulpride, chlorpromazine, haloperidol, pimozide, sulpiride or zuclopenthixol given with ●vandetanib—avoid concomitant use; increased risk of ventricular arrhythmias when haloperidol given with ●arsenic trioxide; increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with ●arsenic trioxide
- Deferasirox: avoidance of clozapine advised by manufacturer of ●deferasirox
- Desferrioxamine: manufacturer of levomepromazine advises avoid concomitant use with ●desferrioxamine; avoidance of prochlorperazine advised by manufacturer of ●desferrioxamine
- Diazoxide: enhanced hypotensive effect when phenothiazines given with ●diazoxide
- Diuretics: risk of ventricular arrhythmias with amisulpride increased by hypokalaemia caused by ●diuretics; risk of ventricular arrhythmias with pimozide increased by hypokalaemia caused by ●diuretics (avoid concomitant use); enhanced hypotensive effect when phenothiazines given with ●diuretics
- Dopaminergics: increased risk of extrapyramidal side-effects when antipsychotics given with ●amantadine; antipsychotics antagonise effects of ●apomorphine, ●levodopa and ●ergolide; antipsychotics antagonise hypoprolactinaemic and antiparkinsonian effects of ●bromocriptine and ●cabergoline; manufacturer of amisulpride advises avoid concomitant use of ●levodopa (antagonism of effect); avoidance of antipsychotics advised by manufacturer of ●pramipexole, ●ropinirole and ●rotigotine (antagonism of effect)
- Grapefruit Juice: plasma concentration of quetiapine possibly increased by ●grapefruit juice—manufacturer of quetiapine advises avoid concomitant use
- Histamine: antipsychotics theoretically antagonise effects of ●histamine—manufacturer of histamine advises avoid concomitant use
- Hormone Antagonists: manufacturer of droperidol advises avoid concomitant use with ●tamoxifen (risk of ventricular arrhythmias)
- Ivabradine: increased risk of ventricular arrhythmias when pimozide given with ●ivabradine
- Lithium: increased risk of extrapyramidal side-effects and possibly neurotoxicity when clozapine, flupentixol, haloperidol, phenothiazines, risperidone or zuclopenthixol given with ●lithium; possible risk of toxicity when olanzapine given with ●lithium; increased risk of extrapyramidal side-effects when sulpiride given with ●lithium
- Memantine: effects of antipsychotics possibly reduced by ●memantine
- Methyldopa: enhanced hypotensive effect when antipsychotics given with ●methyldopa (also increased risk of extrapyramidal effects)
- Metoclopramide: increased risk of extrapyramidal side-effects when antipsychotics given with ●metoclopramide
- Moxonidine: enhanced hypotensive effect when phenothiazines given with ●moxonidine
- Muscle Relaxants: promazine possibly enhances effects of ●suxamethonium
- Nitrates: enhanced hypotensive effect when phenothiazines given with ●nitrates

**Antipsychotics** (*continued*)

- Penicillamine: avoid concomitant use of clozapine with ●**penicillamine** (increased risk of agranulocytosis)
- Pentamidine Isetionate: increased risk of ventricular arrhythmias when amisulpride or droperidol given with ●**pentamidine isetionate**—avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines given with ●**pentamidine isetionate**
- Sodium Benzoate: haloperidol possibly reduces effects of **sodium benzoate**
- Sodium Oxybate: antipsychotics possibly enhance effects of **sodium oxybate**
- Sodium Phenylbutyrate: haloperidol possibly reduces effects of **sodium phenylbutyrate**
- Sympathomimetics: antipsychotics antagonise hypertensive effect of **sympathomimetics**; antipsychotic effects of chlorpromazine possibly antagonised by **dexamfetamine**; chlorpromazine possibly reduces effects of **lisdexamfetamine**; side-effects of risperidone possibly increased by **methylphenidate**
- Tacrolimus: manufacturer of droperidol advises avoid concomitant use with ●**tacrolimus** (risk of ventricular arrhythmias)
- Tetrabenazine: increased risk of extrapyramidal side-effects when antipsychotics given with **tetrabenazine**
- Ulcer-healing Drugs: effects of antipsychotics, chlorpromazine and clozapine possibly enhanced by **cimetidine**; plasma concentration of clozapine possibly reduced by **omeprazole**; absorption of sulphuride reduced by **sucralfate**
- Vasodilator Antihypertensives: enhanced hypotensive effect when phenothiazines given with **hydralazine**, **minoxidil** or **sodium nitropruside**

**Antivirals** see individual drugs

**Anxiolytics and Hypnotics**

- ACE Inhibitors: enhanced hypotensive effect when anxiolytics and hypnotics given with **ACE inhibitors**
  - Adrenergic Neurone Blockers: enhanced hypotensive effect when anxiolytics and hypnotics given with **adrenergic neurone blockers**
  - Alcohol: increased sedative effect when anxiolytics and hypnotics given with **alcohol**
  - Alpha-blockers: enhanced hypotensive and sedative effects when anxiolytics and hypnotics given with **alpha-blockers**
  - Anaesthetics, General: increased sedative effect when anxiolytics and hypnotics given with **general anaesthetics**
  - Analgesics: metabolism of midazolam possibly inhibited by **fentanyl**; increased sedative effect when anxiolytics and hypnotics given with **opioid analgesics**
  - Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when anxiolytics and hypnotics given with **angiotensin-II receptor antagonists**
  - Antibacterials: metabolism of midazolam inhibited by ●**clarithromycin**, ●**erythromycin** and ●**telithromycin** (increased plasma concentration with increased sedation); plasma concentration of buspirone increased by **erythromycin** (reduce dose of buspirone); metabolism of zopiclone inhibited by **erythromycin**; metabolism of benzodiazepines possibly accelerated by **rifampicin** (reduced plasma concentration); metabolism of diazepam and zaleplon accelerated by **rifampicin** (reduced plasma concentration); metabolism of buspirone possibly accelerated by **rifampicin**; metabolism of zolpidem accelerated by **rifampicin** (reduced plasma concentration and reduced effect); plasma concentration of zopiclone significantly reduced by **rifampicin**; metabolism of diazepam inhibited by **isoniazid**
  - Anticoagulants: chloral may transiently enhance anticoagulant effect of **coumarins**
- Anxiolytics and Hypnotics** (*continued*)
- Antidepressants: plasma concentration of alprazolam increased by **fluoxetine**; plasma concentration of melatonin increased by ●**fluvoxamine**—avoid concomitant use; plasma concentration of some benzodiazepines increased by **fluvoxamine**; sedative effects possibly increased when zolpidem given with **sertraline**; manufacturer of buspirone advises avoid concomitant use with **MAOIs**; avoidance of buspirone for 14 days after stopping ●**tranylcypromine** advised by manufacturer of tranylcypromine; plasma concentration of *oral* midazolam possibly reduced by **St John's wort**; increased sedative effect when anxiolytics and hypnotics given with **mirtazapine**, **tricyclic-related antidepressants** or **tricyclics**
  - Antiepileptics: plasma concentration of clonazepam often reduced by **carbamazepine**, **phenobarbital** and **phenytoin**; plasma concentration of midazolam reduced by **carbamazepine** and **perampanel**; increased sedative effect when anxiolytics and hypnotics given with **phenobarbital**; diazepam increases or decreases plasma concentration of **phenytoin**; benzodiazepines possibly increase or decrease plasma concentration of **phenytoin**; plasma concentration of clobazam increased by **stiripentol**; increased risk of side-effects when clonazepam given with **valproate**; clobazam possibly increases plasma concentration of **valproate**; plasma concentration of diazepam and lorazepam possibly increased by **valproate**
  - Antifungals: plasma concentration of diazepam and midazolam increased by ●**fluconazole** (risk of prolonged sedation); plasma concentration of alprazolam increased by **itraconazole**; plasma concentration of midazolam increased by ●**itraconazole**, ●**posaconazole** and ●**voriconazole** (risk of prolonged sedation); plasma concentration of buspirone increased by **itraconazole** (reduce dose of buspirone); plasma concentration of diazepam increased by ●**voriconazole** (risk of prolonged sedation)
  - Antihistamines: increased sedative effect when anxiolytics and hypnotics given with **antihistamines**
  - Antipsychotics: increased sedative effect when anxiolytics and hypnotics given with **antipsychotics**; alprazolam possibly increases plasma concentration of **haloperidol**; buspirone increases plasma concentration of **haloperidol**; serious adverse events reported with concomitant use of benzodiazepines and ●**clozapine** (causality not established); increased risk of hypotension, bradycardia and respiratory depression when *parenteral* benzodiazepines given with *intramuscular* ●**olanzapine**
  - Antivirals: plasma concentration of midazolam possibly increased by ●**atazanavir**—avoid concomitant use of *oral* midazolam; plasma concentration of *oral* midazolam increased by ●**boceprevir**—manufacturer of boceprevir advises avoid concomitant use; increased risk of prolonged sedation when midazolam given with ●**efavirenz**—avoid concomitant use; plasma concentration of midazolam possibly increased by ●**fosamprenavir**, ●**indinavir**, ●**ritonavir** and ●**telaprevir** (risk of prolonged sedation—avoid concomitant use of *oral* midazolam); increased risk of prolonged sedation when alprazolam given with ●**indinavir**—avoid concomitant use; plasma concentration of anxiolytics and hypnotics possibly increased by ●**ritonavir**; plasma concentration of alprazolam, diazepam, flurazepam and zolpidem possibly increased by ●**ritonavir** (risk of extreme sedation and respiratory depression—avoid concomitant use); plasma concentration of buspirone increased by **ritonavir** (increased risk of toxicity); plasma concentration of midazolam increased by ●**saquinavir** (risk of prolonged sedation—avoid concomitant use of *oral* midazolam)

**Anxiolytics and Hypnotics** (*continued*)

- Aprepitant: plasma concentration of midazolam increased by **aprepitant** (risk of prolonged sedation)
- Beta-blockers: enhanced hypotensive effect when anxiolytics and hypnotics given with **beta-blockers**
- Calcium-channel Blockers: enhanced hypotensive effect when anxiolytics and hypnotics given with **calcium-channel blockers**; midazolam increases absorption of **lercanidipine**; plasma concentration of buspirone increased by **diltiazem** and **verapamil** (reduce dose of buspirone); metabolism of midazolam inhibited by **diltiazem** and **verapamil** (increased plasma concentration with increased sedation)
- Cardiac Glycosides: alprazolam increases plasma concentration of **digoxin** (increased risk of toxicity)
- Clonidine: enhanced hypotensive effect when anxiolytics and hypnotics given with **clonidine**
- Cobicistat: avoidance of *oral* midazolam advised by manufacturer of **cobicistat**
  - Cytotoxics: plasma concentration of midazolam increased by ● **crizotinib** and **nilotinib**
- Deferasirox: plasma concentration of midazolam possibly reduced by **deferasirox**
- Diazoxide: enhanced hypotensive effect when anxiolytics and hypnotics given with **diazoxide**
- Disulfiram: metabolism of benzodiazepines inhibited by **disulfiram** (increased sedative effects); increased risk of temazepam toxicity when given with **disulfiram**
- Diuretics: enhanced hypotensive effect when anxiolytics and hypnotics given with **diuretics**; administration of chloral with **parenteral furosemide** may displace thyroid hormone from binding sites
- Dopaminergics: benzodiazepines possibly antagonise effects of **levodopa**
- Grapefruit Juice: plasma concentration of *oral* midazolam possibly increased by **grapefruit juice**; plasma concentration of buspirone increased by **grapefruit juice**
- Ivacaftor: plasma concentration of midazolam increased by **ivacaftor**
- Lipid-regulating Drugs: plasma concentration of midazolam possibly increased by **atorvastatin**
- Lithium: increased risk of neurotoxicity when clonazepam given with **lithium**
- Lofexidine: increased sedative effect when anxiolytics and hypnotics given with **lofexidine**
- Methylodopa: enhanced hypotensive effect when anxiolytics and hypnotics given with **methylodopa**
- Methylthioninium: possible risk of CNS toxicity when buspirone given with ● **methylthioninium**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)
- Moxonidine: enhanced hypotensive effect when anxiolytics and hypnotics given with **moxonidine**; sedative effects possibly increased when benzodiazepines given with **moxonidine**
- Muscle Relaxants: increased sedative effect when anxiolytics and hypnotics given with **baclofen** or **tizanidine**
- Nitrates: enhanced hypotensive effect when anxiolytics and hypnotics given with **nitrates**
- Oestrogens: plasma concentration of melatonin increased by **oestrogens**; plasma concentration of chlorthalidopoxide, diazepam and nitrazepam possibly increased by **oestrogens**; plasma concentration of lorazepam, oxazepam and temazepam possibly reduced by **oestrogens**
- Probenecid: excretion of lorazepam reduced by **probenecid** (increased plasma concentration); excretion of nitrazepam possibly reduced by **probenecid** (increased plasma concentration)
- Progestogens: plasma concentration of chlorthalidopoxide, diazepam and nitrazepam possibly

**Anxiolytics and Hypnotics****Progestogens** (*continued*)

- increased by **progestogens**; plasma concentration of lorazepam, oxazepam and temazepam possibly reduced by **progestogens**
- Sodium Oxybate: benzodiazepines enhance effects of ● **sodium oxybate** (avoid concomitant use)
- Theophylline: effects of benzodiazepines possibly reduced by **theophylline**
- Ulcer-healing Drugs: plasma concentration of melatonin increased by **cimetidine**; metabolism of benzodiazepines, clomethiazole and zaleplon inhibited by **cimetidine** (increased plasma concentration); metabolism of diazepam possibly inhibited by **esomeprazole** and **omeprazole** (increased plasma concentration)
- Vasodilator Antihypertensives: enhanced hypotensive effect when anxiolytics and hypnotics given with **hydralazine**, **minoxidil** or **sodium nitroprusside**
- Apixaban**
- Analgesics: increased risk of haemorrhage when anticoagulants given with *intravenous* ● **diclofenac** (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with ● **ketorolac** (avoid concomitant use, including low-dose heparins)
  - Antibacterials: plasma concentration of apixaban reduced by **rifampicin**
  - Anticoagulants: increased risk of haemorrhage when apixaban given with other ● **anticoagulants** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency); increased risk of haemorrhage when other anticoagulants given with ●  **dabigatran** and ●  **rivaroxaban** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
  - Antidepressants: plasma concentration of apixaban possibly reduced by ● **St John's wort**
  - Antiepileptics: plasma concentration of apixaban possibly reduced by ●  **carbamazepine**, ●  **phenobarbital** and ●  **phenytoin**
  - Antifungals: manufacturer of apixaban advises avoid concomitant use with **itraconazole**, **posaconazole** and **voriconazole**
  - Antivirals: manufacturer of apixaban advises avoid concomitant use with  **atazanavir**,  **boceprevir**,  **darunavir**,  **fosamprenavir**,  **indinavir**,  **lopinavir**,  **ritonavir**,  **saquinavir** and  **tipranavir**
  - Sulfinpyrazone: increased risk of bleeding when apixaban given with **sulfinpyrazone**

**Apomorphine**

- Antipsychotics: effects of apomorphine antagonised by **antipsychotics**
- Dopaminergics: effects of apomorphine possibly enhanced by **entacapone**
- 5HT<sub>2</sub>-receptor Antagonists: possible increased hypotensive effect when apomorphine given with ● **ondansetron**—avoid concomitant use
- Memantine: effects of dopaminergics possibly enhanced by **memantine**
- Methylodopa: antiparkinsonian effect of dopaminergics antagonised by **methylodopa**

**Apraclonidine**

- Antidepressants: manufacturer of apraclonidine advises avoid concomitant use with **MAOIs**, **tricyclic-related antidepressants** and **tricyclics**
- Sympathomimetics: manufacturer of apraclonidine advises avoid concomitant use with **sympathomimetics**

**Aprepitant**

Note Fosaprepitant is a prodrug of aprepitant

- Antibacterials: plasma concentration of aprepitant possibly increased by **clarithromycin** and **telithromycin**; plasma concentration of aprepitant reduced by **rifampicin**

**Aprepitant** (*continued*)

- Anticoagulants: aprepitant possibly reduces anti-coagulant effect of **warfarin**
- Antidepressants: manufacturer of aprepitant advises avoid concomitant use with **St John's wort**
  - Antidiabetics: aprepitant reduces plasma concentration of **tolbutamide**
  - Antiepileptics: plasma concentration of aprepitant possibly reduced by **carbamazepine**, **phenobarbital** and **phenytoin**
  - Antipsychotics: manufacturer of aprepitant advises avoid concomitant use with **pimozide**
  - Antivirals: plasma concentration of aprepitant possibly increased by **ritonavir**
  - Anxiolytics and Hypnotics: aprepitant increases plasma concentration of **midazolam** (risk of prolonged sedation)
  - Avanafil: aprepitant possibly increases plasma concentration of **avanafil**—see Dose under Avanafil, p. 559
  - Calcium-channel Blockers: plasma concentration of both drugs may increase when aprepitant given with **diltiazem**
  - Corticosteroids: aprepitant inhibits metabolism of **dexamethasone** and **methylprednisolone** (reduce dose of dexamethasone and methylprednisolone)
  - Cytotoxics: aprepitant possibly increases the plasma concentration of **bosutinib**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
  - Dapoxetine: manufacturer of dapoxetine advises dose reduction when aprepitant given with **dapoxetine** (see Dose under Dapoxetine, p. 560)
  - Lipid-regulating Drugs: manufacturer of lomitapide advises dose reduction when fosaprepitant given with **lomitapide** (see Dose under Lomitapide, p. 177)
  - Oestrogens: aprepitant possibly causes contraceptive failure of hormonal contraceptives containing **oestrogens** (alternative contraception recommended)
  - Progestogens: aprepitant possibly causes contraceptive failure of hormonal contraceptives containing **progestogens** (alternative contraception recommended)

**Aripiprazole** *see* Antipsychotics**Arsenic Trioxide**

- Anti-arrhythmics: increased risk of ventricular arrhythmias when arsenic trioxide given with **amiodarone** or **disopyramide**
- Antibacterials: increased risk of ventricular arrhythmias when arsenic trioxide given with **erythromycin**, **levofloxacin** or **moxifloxacin**
- Antidepressants: increased risk of ventricular arrhythmias when arsenic trioxide given with **amitriptyline** or **clomipramine**
- Antifungals: increased risk of ventricular arrhythmias when arsenic trioxide given with **amphotericin**
- Antimalarials: avoidance of arsenic trioxide advised by manufacturer of **piperquine with artemimol** (possible risk of ventricular arrhythmias)
- Antipsychotics: increased risk of ventricular arrhythmias when arsenic trioxide given with **antipsychotics** that prolong the QT interval; increased risk of ventricular arrhythmias when arsenic trioxide given with **haloperidol**; avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Beta-blockers: increased risk of ventricular arrhythmias when arsenic trioxide given with **sotalol**
- Cytotoxics: possible increased risk of ventricular arrhythmias when arsenic trioxide given with **vandetanib**—avoid concomitant use
- Diuretics: risk of ventricular arrhythmias with arsenic trioxide increased by hypokalaemia caused by

**Arsenic Trioxide**

- Diuretics (*continued*)
  - **acetazolamide**, **loop diuretics** or **thiazides and related diuretics**
- Lithium: increased risk of ventricular arrhythmias when arsenic trioxide given with **lithium**

**Artemether with Lumefantrine**

- Anti-arrhythmics: manufacturer of artemether with lumefantrine advises avoid concomitant use with **amiodarone**, **disopyramide** and **flecainide** (risk of ventricular arrhythmias)
  - Antibacterials: manufacturer of artemether with lumefantrine advises avoid concomitant use with **macrolides** and **quinolones**
  - Antidepressants: avoidance of antimalarials advised by manufacturer of **citalopram** and **escitalopram** (risk of ventricular arrhythmias); manufacturer of artemether with lumefantrine advises avoid concomitant use with **antidepressants**
  - Antifungals: manufacturer of artemether with lumefantrine advises avoid concomitant use with **imidazoles** and **triazoles**
  - Antimalarials: manufacturer of artemether with lumefantrine advises avoid concomitant use with **antimalarials**; increased risk of ventricular arrhythmias when artemether with lumefantrine given with **quinine**
  - Antipsychotics: manufacturer of artemether with lumefantrine advises avoid concomitant use with **antipsychotics**
  - Antivirals: manufacturer of artemether with lumefantrine advises caution with **atazanavir**, **fosamprenavir**, **indinavir**, **lopinavir**, **ritonavir**, **saquinavir** and **tipranavir**; avoidance of artemether with lumefantrine advised by manufacturer of **boceprevir**; plasma concentration of lumefantrine increased by **darunavir**; plasma concentration of artemether with lumefantrine reduced by **efavirenz** and **etravirine**
  - Beta-blockers: manufacturer of artemether with lumefantrine advises avoid concomitant use with **metoprolol** and **sotalol**
  - Cytotoxics: possible increased risk of ventricular arrhythmias when artemether with lumefantrine given with **vandetanib**—avoid concomitant use
  - Grapefruit Juice: plasma concentration of artemether with lumefantrine possibly increased by **grapefruit juice**
  - Histamine: avoidance of antimalarials advised by manufacturer of **histamine**
  - Ulcer-healing Drugs: manufacturer of artemether with lumefantrine advises avoid concomitant use with **cimetidine**
  - Vaccines: antimalarials inactivate **oral typhoid vaccine**—see p. 850
- Ascorbic acid** *see* Vitamins
- Asenapine** *see* Antipsychotics
- Aspirin**
- Adsorbents: absorption of aspirin possibly reduced by **kaolin**
- Anaesthetics, General: aspirin possibly enhances effects of **thiopental**
- Analgesics: avoid concomitant use of aspirin with **NSAIDs** (increased side-effects); antiplatelet effect of aspirin possibly reduced by **ibuprofen**
  - Antacids: excretion of aspirin increased by alkaline urine due to some **antacids**
  - Anticoagulants: increased risk of bleeding when aspirin given with **coumarins** or **phenindione** (due to antiplatelet effect); aspirin enhances anti-coagulant effect of **heparins**
  - Antidepressants: increased risk of bleeding when aspirin given with **SSRIs** or **venlafaxine**
  - Antiepileptics: aspirin enhances effects of **phenytoin** and **valproate**
  - Clopidogrel: increased risk of bleeding when aspirin given with **clopidogrel**

**Aspirin** (*continued*)

Corticosteroids: increased risk of gastro-intestinal bleeding and ulceration when aspirin given with **corticosteroids**, also corticosteroids reduce plasma concentration of salicylate

- Cytotoxics: aspirin reduces excretion of **methotrexate** (increased risk of toxicity)—but for concomitant use in rheumatic disease see p. 718; aspirin possibly reduces renal excretion of **metrexed**—consult product literature
  - Diuretics: increased risk of toxicity when high-dose aspirin given with **acetazolamide**; aspirin antagonises diuretic effect of **spironolactone**; possible increased risk of toxicity when high-dose aspirin given with **loop diuretics** (also possible reduced effect of loop diuretics)
- Ilprost: increased risk of bleeding when aspirin given with **ilprost**

Leukotriene Receptor Antagonists: aspirin increases plasma concentration of **zafirlukast**

Metoclopramide: rate of absorption of aspirin increased by **metoclopramide** (enhanced effect)

Probenecid: aspirin antagonises effects of **probenecid**

Sulfapyrazone: aspirin antagonises effects of **sulfapyrazone**

**Atazanavir**

Antacids: absorption of atazanavir reduced by **antacids** (give at least 2 hours before or 1 hour after antacids)

- Anti-arrhythmics: atazanavir possibly increases plasma concentration of **amiodarone** and **lidocaine**
  - Antibacterials: plasma concentration of both drugs increased when atazanavir given with **clarithromycin**; atazanavir increases plasma concentration of **rifabutin** (reduce dose of rifabutin); plasma concentration of atazanavir reduced by **rifampicin**—avoid concomitant use; avoidance of concomitant atazanavir in severe renal and hepatic impairment advised by manufacturer of **telithromycin**
- Anticoagulants: atazanavir may enhance or reduce anticoagulant effect of **warfarin**; avoidance of atazanavir advised by manufacturer of **apixaban** and **rivaroxaban**
- Antidepressants: plasma concentration of atazanavir reduced by **St John's wort**—avoid concomitant use
  - Antifungals: plasma concentration of atazanavir increased by **posaconazole**; atazanavir increases or decreases the plasma concentration of **voriconazole** and plasma concentration of atazanavir also reduced
  - Antimalarials: caution with atazanavir advised by manufacturer of **artemether with lumefantrine**; atazanavir possibly increases plasma concentration of **quinine** (increased risk of toxicity)

Antimuscarinics: avoidance of atazanavir advised by manufacturer of **darifenacin**; manufacturer of fesoterodine advises dose reduction when atazanavir given with **fesoterodine**—consult fesoterodine product literature

- Antipsychotics: atazanavir possibly increases plasma concentration of **aripiprazole** (reduce dose of aripiprazole—consult aripiprazole product literature); atazanavir possibly increases plasma concentration of **pimozide**—avoid concomitant use; atazanavir possibly increases plasma concentration of **quetiapine**—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: plasma concentration of atazanavir reduced by **boceprevir**; absorption of atazanavir reduced by **didanosine tablets** (give at least 2 hours before or 1 hour after didanosine tablets); manufacturer of atazanavir advises avoid concomitant use with **efavirenz** (plasma concentration of atazanavir reduced); atazanavir boosted with ritonavir increases plasma concentration of **elvitegravir** (reduce dose of elvi-

**Atazanavir**• Antivirals (*continued*)

tegravir); avoid concomitant use of atazanavir with **indinavir**; atazanavir increases plasma concentration of **maraviroc** (consider reducing dose of maraviroc); plasma concentration of atazanavir possibly reduced by **nevirapine**—avoid concomitant use; increased risk of ventricular arrhythmias when atazanavir given with **saquinavir**—avoid concomitant use; atazanavir possibly reduces plasma concentration of **telaprevir**, also plasma concentration of atazanavir possibly increased; plasma concentration of atazanavir reduced by **tenofovir**, also plasma concentration of tenofovir possibly increased; atazanavir increases plasma concentration of **tipranavir** (also plasma concentration of atazanavir reduced)

- Anxiolytics and Hypnotics: atazanavir possibly increases plasma concentration of **midazolam**—avoid concomitant use of *oral* midazolam
  - Avanafil: atazanavir possibly increases plasma concentration of **avanafil**—manufacturer of avanafil advises avoid concomitant use
  - Calcium-channel Blockers: atazanavir increases plasma concentration of **diltiazem** (reduce dose of diltiazem); atazanavir possibly increases plasma concentration of **verapamil**
  - Cyclosporin: atazanavir possibly increases plasma concentration of **cyclosporin**
  - Colchicine: atazanavir possibly increases risk of **colchicine** toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
  - Cytotoxics: atazanavir possibly increases plasma concentration of **axitinib** (reduce dose of axitinib—consult axitinib product literature); atazanavir possibly increases the plasma concentration of **bosutinib**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; atazanavir possibly increases plasma concentration of **crizotinib** and **everolimus**—manufacturer of crizotinib and everolimus advises avoid concomitant use; atazanavir possibly increases plasma concentration of **pazopanib** (reduce dose of pazopanib); avoidance of atazanavir advised by manufacturer of **cabazitaxel**; atazanavir possibly inhibits metabolism of **irinotecan** (increased risk of toxicity)
  - Dapoxetine: avoidance of atazanavir advised by manufacturer of **dapoxetine** (increased risk of toxicity)
  - Ergot Alkaloids: atazanavir possibly increases plasma concentration of **ergot alkaloids**—avoid concomitant use
  - Lipid-regulating Drugs: possible increased risk of myopathy when atazanavir given with **atorvastatin** or **pravastatin**; atazanavir increases plasma concentration of **rosuvastatin**—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when atazanavir given with **simvastatin** (avoid concomitant use)
- Oestrogens: atazanavir increases plasma concentration of **ethinylestradiol**
- Orlistat: absorption of atazanavir possibly reduced by **orlistat**
- Progestogens: atazanavir increases plasma concentration of **norethisterone**
- Ranolazine: atazanavir possibly increases plasma concentration of **ranolazine**—manufacturer of ranolazine advises avoid concomitant use
  - Sildenafil: atazanavir possibly increases side-effects of **sildenafil**
  - Sirolimus: atazanavir possibly increases plasma concentration of **sirolimus**
  - Tacrolimus: atazanavir possibly increases plasma concentration of **tacrolimus**
  - Ticagrelor: atazanavir possibly increases plasma concentration of **ticagrelor**—manufacturer of ticagrelor advises avoid concomitant use

**Atazanavir** (continued)

- Ulcer-healing Drugs: manufacturer of atazanavir advises adjust doses of both drugs when atazanavir given with **cimetidine** and **nizatidine**—consult atazanavir product literature; plasma concentration of atazanavir reduced by **famotidine** and **ranitidine** (adjust doses of both drugs—consult atazanavir product literature); plasma concentration of atazanavir reduced by **proton pump inhibitors**—avoid or adjust dose of both drugs (consult product literature)

**Atenolol** see Beta-blockers

**Atomoxetine**

- Analgesics: increased risk of ventricular arrhythmias when atomoxetine given with **methadone**; possible increased risk of convulsions when atomoxetine given with **tramadol**
- Anti-arrhythmics: increased risk of ventricular arrhythmias when atomoxetine given with **amiodarone** or **disopyramide**
- Antibacterials: increased risk of ventricular arrhythmias when atomoxetine given with *parenteral* **erythromycin**; increased risk of ventricular arrhythmias when atomoxetine given with **moxifloxacin**
- Antidepressants: metabolism of atomoxetine possibly inhibited by **fluoxetine** and **paroxetine**; possible increased risk of convulsions when atomoxetine given with **antidepressants**; atomoxetine should not be started until 2 weeks after stopping **MAOIs**, also MAOIs should not be started until at least 2 weeks after stopping atomoxetine; increased risk of ventricular arrhythmias when atomoxetine given with **tricyclics**
- Antimalarials: increased risk of ventricular arrhythmias when atomoxetine given with **mefloquine**
- Antipsychotics: increased risk of ventricular arrhythmias when atomoxetine given with **antipsychotics** that prolong the QT interval
- Beta-blockers: increased risk of ventricular arrhythmias when atomoxetine given with **sotalol**
- Bupropion: possible increased risk of convulsions when atomoxetine given with **bupropion**
- Diuretics: risk of ventricular arrhythmias with atomoxetine increased by hypokalaemia caused by **diuretics**
- Sympathomimetics, Beta<sub>2</sub>: Increased risk of cardiovascular side-effects when atomoxetine given with *parenteral* **salbutamol**

**Atorvastatin** see Statins

**Atovaquone**

- Antibacterials: manufacturer of atovaquone advises avoid concomitant use with **rifabutin** (plasma concentration of both drugs reduced); plasma concentration of atovaquone reduced by **rifampicin** (and concentration of rifampicin increased)—avoid concomitant use; plasma concentration of atovaquone reduced by **tetracycline**
- Antivirals: plasma concentration of atovaquone reduced by **efavirenz**—avoid concomitant use; atovaquone possibly reduces plasma concentration of **indinavir**; plasma concentration of atovaquone possibly reduced by **ritonavir**—manufacturer of atovaquone advises avoid concomitant use; atovaquone increases plasma concentration of **zidovudine** (increased risk of toxicity)
- Cytotoxics: atovaquone possibly increases plasma concentration of **etoposide**
- Histamine: avoidance of atovaquone advised by manufacturer of **histamine**
- Metoclopramide: plasma concentration of atovaquone reduced by **metoclopramide**—avoid concomitant use

**Atracurium** see Muscle Relaxants

**Atropine** see Antimuscarinics

**Avanafil**

- ACE Inhibitors: avanafil possibly enhances hypotensive effect of **enalapril**
  - Alcohol: possible enhanced hypotensive effect when avanafil given with **alcohol**
  - Alpha-blockers: enhanced hypotensive effect when avanafil given with **alpha-blockers**—see also p. 558
  - Antibacterials: plasma concentration of avanafil possibly increased by **clarithromycin** and **telithromycin**—manufacturer of avanafil advises avoid concomitant use; plasma concentration of avanafil increased by **erythromycin**—see Dose under Avanafil, p. 559; plasma concentration of avanafil possibly reduced by **rifampicin**—manufacturer of avanafil advises avoid concomitant use
  - Antiepileptics: plasma concentration of avanafil possibly reduced by **carbamazepine** and **phenobarbital**—manufacturer of avanafil advises avoid concomitant use
  - Antifungals: plasma concentration of avanafil possibly increased by **itraconazole**—see Dose under Avanafil, p. 559; plasma concentration of avanafil possibly increased by **itraconazole** and **voriconazole**—manufacturer of avanafil advises avoid concomitant use
  - Antivirals: plasma concentration of avanafil possibly increased by **atazanavir**, **indinavir** and **saquinavir**—manufacturer of avanafil advises avoid concomitant use; plasma concentration of avanafil possibly reduced by **efavirenz**—manufacturer of avanafil advises avoid concomitant use; plasma concentration of avanafil possibly increased by **fosamprenavir**—see Dose under Avanafil, p. 559; plasma concentration of avanafil significantly increased by **ritonavir**—avoid concomitant use
  - Aprepitant: plasma concentration of avanafil possibly increased by **aprepitant**—see Dose under Avanafil, p. 559
  - Bosentan: plasma concentration of avanafil possibly reduced by **bosentan**—manufacturer of avanafil advises avoid concomitant use
  - Calcium-channel Blockers: plasma concentration of avanafil possibly increased by **diltiazem** and **verapamil**—see Dose under Avanafil, p. 559
  - Grapefruit Juice: plasma concentration of avanafil possibly increased by **grapefruit juice**—manufacturer of avanafil advises avoid grapefruit juice for 24 hours before avanafil
  - Nicorandil: avanafil significantly enhances hypotensive effect of **nicorandil** (avoid concomitant use)
  - Nitrates: avanafil significantly enhances hypotensive effect of **nitrates** (avoid concomitant use)
  - Riociguat: possible enhanced hypotensive effect when avanafil given with **riociguat**—avoid concomitant use
- Axitinib**
- Antibacterials: plasma concentration of axitinib possibly increased by **clarithromycin**, **erythromycin** and **telithromycin** (reduce dose of axitinib—consult axitinib product literature); plasma concentration of axitinib possibly decreased by **rifabutin** (increase dose of axitinib—consult axitinib product literature); plasma concentration of axitinib decreased by **rifampicin** (increase dose of axitinib—consult axitinib product literature)
  - Antidepressants: plasma concentration of axitinib possibly reduced by **St John's wort**—consider increasing dose of axitinib
  - Antiepileptics: plasma concentration of axitinib possibly decreased by **carbamazepine**, **phenobarbital** and **phenytoin** (increase dose of axitinib—consult axitinib product literature)
  - Antifungals: plasma concentration of axitinib possibly increased by **itraconazole** (reduce dose of axitinib—consult axitinib product literature)

**Axitinib** (*continued*)

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Antivirals: plasma concentration of axitinib possibly increased by **atazanavir**, **indinavir**, **ritonavir** and **saquinavir** (reduce dose of axitinib—consult axitinib product literature)
- Corticosteroids: plasma concentration of axitinib possibly decreased by **dexamethasone** (increase dose of axitinib—consult axitinib product literature)
- Grapefruit Juice: plasma concentration of axitinib possibly increased by **grapefruit juice**

**Azathioprine**

- ACE Inhibitors: increased risk of anaemia or leucopenia when azathioprine given with **captopril** especially in renal impairment; increased risk of anaemia when azathioprine given with **enalapril** especially in renal impairment
- Allopurinol: enhanced effects and increased toxicity of azathioprine when given with **allopurinol** (reduce dose of azathioprine to one quarter of usual dose)
- Aminosalicylates: possible increased risk of leucopenia when azathioprine given with **aminosalicylates**
- Antibacterials: increased risk of haematological toxicity when azathioprine given with **sulfamethoxazole** (as co-trimoxazole); increased risk of haematological toxicity when azathioprine given with **trimethoprim** (also with co-trimoxazole)
  - Anticoagulants: azathioprine possibly reduces anticoagulant effect of **coumarins**
  - Antivirals: myelosuppressive effects of azathioprine possibly enhanced by **ribavirin**
  - Febuxostat: avoidance of azathioprine advised by manufacturer of **febuxostat**

**Azilsartan** *see* Angiotensin-II Receptor Antagonists

**Azithromycin** *see* Macrolides

**Aztreonam**

- Anticoagulants: aztreonam possibly enhances anticoagulant effect of **coumarins**
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 850

**Baclofen** *see* Muscle Relaxants

**Balsalazide** *see* Aminosalicylates

**Bambuterol** *see* Sympathomimetics, Beta<sub>2</sub>

**Belcometasone** *see* Corticosteroids

**Belimumab**

- Vaccines: avoid concomitant use of belimumab with live **vaccines** (see p. 828)

**Bendamustine**

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)

**Bendroflumethiazide** *see* Diuretics

**Benperidol** *see* Antipsychotics

**Benzodiazepines** *see* Anxiolytics and Hypnotics

**Benzthiazide** *see* Diuretics

**Benzylpenicillin** *see* Penicillins

**Beta-blockers**

**Note** Since systemic absorption may follow topical application of beta-blockers to the eye the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind

ACE Inhibitors: enhanced hypotensive effect when beta-blockers given with **ACE inhibitors**

Adrenergic Neurone Blockers: enhanced hypotensive effect when beta-blockers given with **adrenergic neurone blockers**

Alcohol: enhanced hypotensive effect when beta-blockers given with **alcohol**

Aldesleukin: enhanced hypotensive effect when beta-blockers given with **aldesleukin**

- Alpha-blockers: enhanced hypotensive effect when beta-blockers given with **alpha-blockers**, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin

**Beta-blockers** (*continued*)

Anaesthetics, General: enhanced hypotensive effect when beta-blockers given with **general anaesthetics**

- Anaesthetics, Local: propranolol increases risk of **bupivacaine** toxicity

Analgesics: hypotensive effect of beta-blockers antagonised by **NSAIDs**; plasma concentration of esmolol possibly increased by **morphine**

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when beta-blockers given with **angiotensin-II receptor antagonists**

- Anti-arrhythmics: increased myocardial depression when beta-blockers given with **anti-arrhythmics**; increased risk of ventricular arrhythmias when sotalol given with **amiodarone**, **disopyramide** or **dronedaron**—avoid concomitant use; increased risk of bradycardia, AV block and myocardial depression when beta-blockers given with **amiodarone**; plasma concentration of metoprolol and propranolol possibly increased by **dronedaron**; increased risk of myocardial depression and bradycardia when beta-blockers given with **flecainide**; propranolol increases risk of **lidocaine** toxicity; nadolol possibly increases risk of **lidocaine** toxicity; plasma concentration of metoprolol and propranolol increased by **propafenone**
- Antibacterials: increased risk of ventricular arrhythmias when sotalol given with **moxifloxacin**—avoid concomitant use; metabolism of bisoprolol and propranolol accelerated by **rifampicin** (plasma concentration significantly reduced); plasma concentration of carvedilol, celioprolol and metoprolol reduced by **rifampicin**
- Antidepressants: plasma concentration of metoprolol increased by **citalopram** and **escitalopram**; increased risk of ventricular arrhythmias when sotalol given with **citalopram**—avoid concomitant use; avoidance of sotalol advised by manufacturer of **escitalopram** (risk of ventricular arrhythmias); plasma concentration of propranolol increased by **fluvoxamine**; plasma concentration of metoprolol possibly increased by **paroxetine**—increased risk of AV block (manufacturer of paroxetine advises avoid concomitant use in cardiac insufficiency); labetalol and propranolol increase plasma concentration of **imipramine**; enhanced hypotensive effect when beta-blockers given with **MAOIs**; increased risk of ventricular arrhythmias when sotalol given with **tricyclics**
- Antidiabetics: beta-blockers may mask warning signs of hypoglycaemia (such as tremor) with **anti-diabetics**; beta-blockers enhance hypoglycaemic effect of **insulin**
- Antiepileptics: plasma concentration of propranolol possibly reduced by **phenobarbital**
- Antihistamines: increased risk of ventricular arrhythmias when sotalol given with **mizolastine**—avoid concomitant use
- Antimalarials: avoidance of sotalol advised by manufacturer of **piperquine with arteminol** (possible risk of ventricular arrhythmias); avoidance of metoprolol and sotalol advised by manufacturer of **artemether with lumefantrine**; increased risk of bradycardia when beta-blockers given with **mefloquine**
- Antimuscarinics: increased risk of ventricular arrhythmias when sotalol given with **tolterodine**
- Antipsychotics: increased risk of ventricular arrhythmias when sotalol given with **droperidol** or **zuclopenthixol**—avoid concomitant use; possible increased risk of ventricular arrhythmias when sotalol given with **haloperidol**—avoid concomitant use; plasma concentration of both drugs may increase when propranolol given with **chlorpromazine**; increased risk of ventricular arrhythmias when sotalol given with **amisulpride**, **phenothiazines**,

**Beta-blockers**

- Antipsychotics (*continued*)
  - **pimozide** or **sulpiride**; enhanced hypotensive effect when beta-blockers given with **phenothiazines**; possible increased risk of ventricular arrhythmias when sotalol given with **risperidone**
- Antivirals: increased risk of ventricular arrhythmias when sotalol given with **saquinavir**—avoid concomitant use; avoidance of sotalol advised by manufacturer of **telaprevir** (risk of ventricular arrhythmias); avoidance of metoprolol for heart failure advised by manufacturer of **tipranavir**
- Anxiolytics and Hypnotics: enhanced hypotensive effect when beta-blockers given with **anxiolytics and hypnotics**
- Atomoxetine: increased risk of ventricular arrhythmias when sotalol given with **atomoxetine**
- Calcium-channel Blockers: enhanced hypotensive effect when beta-blockers given with **calcium-channel blockers**; possible severe hypotension and heart failure when beta-blockers given with **nifedipine**; increased risk of AV block and bradycardia when beta-blockers given with **diltiazem**; asystole, severe hypertension and heart failure when beta-blockers given with **verapamil** (see p. 137)
- Cardiac Glycosides: increased risk of AV block and bradycardia when beta-blockers given with **cardiac glycosides**
- Ciclosporin: carvedilol increases plasma concentration of **ciclosporin**
- Clonidine: increased risk of withdrawal hypertension when beta-blockers given with **clonidine** (withdraw beta-blockers several days before slowly withdrawing clonidine)
- Corticosteroids: hypotensive effect of beta-blockers antagonised by **corticosteroids**
- Cytotoxics: possible increased risk of ventricular arrhythmias when sotalol given with **bosutinib**; possible increased risk of bradycardia when beta-blockers given with **crizotinib**; possible increased risk of ventricular arrhythmias when sotalol given with **vandetanib**—avoid concomitant use; increased risk of ventricular arrhythmias when sotalol given with **arsenic trioxide**
- Diazoxide: enhanced hypotensive effect when beta-blockers given with **diazoxide**
- Diuretics: enhanced hypotensive effect when beta-blockers given with **diuretics**; risk of ventricular arrhythmias with sotalol increased by hypokalaemia caused by **loop diuretics** or **thiazides and related diuretics**
- Dopaminergics: enhanced hypotensive effect when beta-blockers given with **levodopa**
- Ergot Alkaloids: increased peripheral vasoconstriction when beta-blockers given with **ergotamine**
- Fingolimod: possible increased risk of bradycardia when beta-blockers given with **fingolimod**
- Hormone Antagonists: possible increased risk of bradycardia when carteolol, metoprolol, propranolol or sotalol given with **pasireotide**
- 5HT<sub>1</sub>-receptor Agonists: propranolol increases plasma concentration of **rizatriptan** (manufacturer of rizatriptan advises halve dose and avoid within 2 hours of propranolol)
- Ivabradine: increased risk of ventricular arrhythmias when sotalol given with **ivabradine**
- Methylodopa: enhanced hypotensive effect when beta-blockers given with **methylodopa**
- Mirabegron: plasma concentration of metoprolol increased by **mirabegron**
- Moxisylyte: possible severe postural hypotension when beta-blockers given with **moxisylyte**
- Moxonidine: enhanced hypotensive effect when beta-blockers given with **moxonidine**
- Muscle Relaxants: propranolol enhances effects of **muscle relaxants**; enhanced hypotensive effect

**Beta-blockers****Muscle Relaxants (*continued*)**

- when beta-blockers given with **baclofen**; possible enhanced hypotensive effect and bradycardia when beta-blockers given with **tizanidine**
- Nitrates: enhanced hypotensive effect when beta-blockers given with **nitrates**
- Oestrogens: hypotensive effect of beta-blockers antagonised by **oestrogens**
- Parasympathomimetics: propranolol antagonises effects of **neostigmine** and **pyridostigmine**; increased risk of arrhythmias when beta-blockers given with **pilocarpine**
- Prostaglandins: enhanced hypotensive effect when beta-blockers given with **alprostadil**
- Ranolazine: avoidance of sotalol advised by manufacturer of **ranolazine**
- Sympathomimetics: increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with **adrenaline** (epinephrine), also reponse to adrenaline (epinephrine) may be reduced; increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with **dobutamine**; possible increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with **noradrenaline** (norepinephrine)
- Thyroid Hormones: metabolism of propranolol accelerated by **levothyroxine**
- Ulcer-healing Drugs: plasma concentration of labetalol, metoprolol and propranolol increased by **cimetidine**
- Vasodilator Antihypertensives: enhanced hypotensive effect when beta-blockers given with **hydralazine**, **minoxidil** or **sodium nitroprusside**

**Betahistine**

Antihistamines: effect of betahistine theoretically antagonised by **antihistamines**

**Betamethasone** *see* Corticosteroids

**Betaxolol** *see* Beta-blockers

**Bethanechol** *see* Parasympathomimetics

**Bevacizumab**

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)

**Bexarotene**

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Lipid-regulating Drugs: plasma concentration of bexarotene increased by **gemfibrozil**—avoid concomitant use

**Befazafibrate** *see* Fibrates

**Bicalutamide**

Anticoagulants: bicalutamide possibly enhances anticoagulant effect of **coumarins**

**Biguanides** *see* Antidiabetics

**Bilastine** *see* Antihistamines

**Bile Acid Sequestrants** *see* Colesevelam, Colestipol, and Colestyramine

**Bile Acids**

Antacids: absorption of bile acids possibly reduced by **antacids**

- Ciclosporin: ursodeoxycholic acid increases absorption of **ciclosporin**

Lipid-regulating Drugs: absorption of bile acids possibly reduced by **colestipol** and **colestyramine**

**Bisoprolol** *see* Beta-blockers

**Bisphosphonates**

Antacids: absorption of bisphosphonates reduced by **antacids**

Antibacterials: increased risk of hypocalcaemia when bisphosphonates given with **aminoglycosides**

Calcium Salts: absorption of bisphosphonates reduced by **calcium salts**

- Cytotoxics: sodium clodronate increases plasma concentration of **estramustine**

**Bisphosphonates** (*continued*)

Iron: absorption of bisphosphonates reduced by *oral iron*

**Bleomycin**

- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Cardiac Glycosides: bleomycin possibly reduces absorption of **digoxin tablets**
- Cytotoxics: increased pulmonary toxicity when bleomycin given with ●**cisplatin**; increased risk of pulmonary toxicity when bleomycin given with ●**brentuximab vedotin**—avoid concomitant use

**Boceprevir**

Analgesics: possible increased risk of prolonged sedation and respiratory depression when boceprevir given with ●**buprenorphine**; boceprevir possibly affects plasma concentration of **methadone**

- Antibacterials: manufacturer of boceprevir advises avoid concomitant use with ●**rifampicin** (plasma concentration of boceprevir possibly reduced)
- Anticoagulants: avoidance of boceprevir advised by manufacturer of **apixaban**
- Antiepileptics: manufacturer of boceprevir advises avoid concomitant use with ●**carbamazepine**, ●**phenobarbital** and ●**phenytoin** (plasma concentration of boceprevir possibly reduced)
- Antimalarials: manufacturer of boceprevir advises avoid concomitant use with ●**artemether with lumefantrine**
- Antipsychotics: manufacturer of boceprevir advises avoid concomitant use with ●**pimozide**; boceprevir possibly increases plasma concentration of ●**quetiapine**—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: boceprevir reduces plasma concentration of ●**atazanavir**; avoid concomitant use of boceprevir with ●**darunavir**; effects of both drugs possibly reduced when boceprevir given with **etravirine**; avoidance of boceprevir advised by manufacturer of ●**fosamprenavir** and **nevirapine**; manufacturers advise avoid concomitant use of boceprevir with ●**lopinavir**; boceprevir increases plasma concentration of **maraviroc** (consider reducing dose of maraviroc); plasma concentration of both drugs reduced when boceprevir given with ●**ritonavir**
- Anxiolytics and Hypnotics: boceprevir increases plasma concentration of *oral* ●**midazolam**—manufacturer of boceprevir advises avoid concomitant use
- Cardiac Glycosides: boceprevir possibly increases side-effects of **digoxin**
- Ciclosporin: boceprevir increases plasma concentration of ●**ciclosporin**
- Cilostazol: boceprevir possibly increases plasma concentration of ●**cilostazol** (see Dose under Cilostazol, p. 140)
- Cobicistat: avoidance of boceprevir advised by manufacturer of **cobicistat**
- Cytotoxics: boceprevir possibly increases the plasma concentration of ●**bosutinib**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; manufacturer of boceprevir advises avoid concomitant use with ●**dasatinib**, ●**erlotinib**, ●**gefitinib**, ●**imatinib**, ●**lapatinib**, ●**nilotinib**, ●**pazopanib**, ●**sorafenib** and ●**sunitinib**; manufacturer of ruxolitinib advises dose reduction when boceprevir given with ●**ruxolitinib**—consult ruxolitinib product literature
- Domperidone: possible increased risk of ventricular arrhythmias when boceprevir given with ●**domperidone**—avoid concomitant use
- Ergot Alkaloids: manufacturer of boceprevir advises avoid concomitant use with ●**ergot alkaloids**
- Lipid-regulating Drugs: boceprevir increases plasma concentration of **atorvastatin** (reduce dose of atorvastatin); boceprevir increases plasma concentration

**Boceprevir**

- Lipid-regulating Drugs (*continued*)

of **pravastatin**; manufacturers advise avoid concomitant use of boceprevir with ●**simvastatin**

Progestogens: boceprevir increases plasma concentration of **drosiprone** (increased risk of toxicity)

- Sirolimus: boceprevir increases plasma concentration of ●**sirolimus** (increased risk of toxicity—reduce sirolimus dose)
- Tacrolimus: boceprevir increases plasma concentration of ●**tacrolimus** (reduce dose of tacrolimus)

**Bortezomib**

- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)

**Bosentan**

- Antibacterials: plasma concentration of bosentan reduced by ●**rifampicin**—avoid concomitant use

Anticoagulants: manufacturer of bosentan recommends monitoring anticoagulant effect of **coumarins**

- Antidiabetics: increased risk of hepatotoxicity when bosentan given with ●**glibenclamide**—avoid concomitant use
- Antifungals: plasma concentration of bosentan possibly increased by ●**fluconazole**—avoid concomitant use; plasma concentration of bosentan possibly increased by **itraconazole**
- Antivirals: avoidance of bosentan advised by manufacturer of **elvitegravir** and **tipranavir**; bosentan possibly reduces plasma concentration of **indinavir**; plasma concentration of bosentan increased by ●**lopinavir** and ●**ritonavir** (consider reducing dose of bosentan); bosentan possibly reduces plasma concentration of **telaprevir**, also plasma concentration of bosentan possibly increased

Avanafil: bosentan possibly reduces plasma concentration of **avanafil**—manufacturer of avanafil advises avoid concomitant use

- Ciclosporin: plasma concentration of bosentan increased by ●**ciclosporin** (also plasma concentration of ciclosporin reduced—avoid concomitant use)
- Cobicistat: avoidance of bosentan advised by manufacturer of **cobicistat**
- Cytotoxics: bosentan possibly reduces plasma concentration of ●**bosutinib**—manufacturer of bosutinib advises avoid concomitant use
- Lipid-regulating Drugs: bosentan reduces plasma concentration of **simvastatin**
- Oestrogens: bosentan possibly causes contraceptive failure of hormonal contraceptives containing ●**oestrogens** (alternative contraception recommended)
- Progestogens: bosentan possibly causes contraceptive failure of hormonal contraceptives containing ●**progestogens** (alternative contraception recommended)
- Riociguat: bosentan reduces plasma concentration of **riociguat**
- Sildenafil: bosentan reduces plasma concentration of **sildenafil**, also plasma concentration of bosentan increased
- Tadalafil: bosentan reduces plasma concentration of **tadalafil**
- Bosutinib**
- Analgesics: possible increased risk of ventricular arrhythmias when bosutinib given with ●**methadone**
- Antacids: manufacturer of bosutinib advises separating administration with **antacids** by about 12 hours
- Anti-arrhythmics: possible increased risk of ventricular arrhythmias when bosutinib given with ●**amiodarone** and ●**disopyramide**; plasma concentration of bosutinib possibly increased by ●**dronedaron**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Antibacterials: plasma concentration of bosutinib possibly increased by ●**ciprofloxacin**, ●**clarithromycin**,

**Bosutinib**

- **Antibacterials** (*continued*)
  - **erythromycin** and ● **telithromycin**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; possible increased risk of ventricular arrhythmias when bosutinib given with ● **moxifloxacin**; plasma concentration of bosutinib possibly reduced by ● **rifabutin**—manufacturer of bosutinib advises avoid concomitant use; plasma concentration of bosutinib reduced by ● **rifampicin**—manufacturer of bosutinib advises avoid concomitant use
- **Antidepressants**: plasma concentration of bosutinib possibly reduced by ● **St John's wort**—manufacturer of bosutinib advises avoid concomitant use
- **Antiepileptics**: plasma concentration of bosutinib possibly reduced by ● **carbamazepine**, ● **phenobarbital** and ● **phenytoin**—manufacturer of bosutinib advises avoid concomitant use
- **Antifungals**: plasma concentration of bosutinib possibly increased by ● **fluconazole**, ● **itraconazole**, ● **posaconazole** and ● **voriconazole**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- **Antimalarials**: possible increased risk of ventricular arrhythmias when bosutinib given with ● **chloroquine** and ● **hydroxychloroquine**
- **Antipsychotics**: possible increased risk of ventricular arrhythmias when bosutinib given with ● **haloperidol**; avoid concomitant use of cytotoxics with ● **clozapine** (increased risk of agranulocytosis)
- **Antivirals**: plasma concentration of bosutinib possibly increased by ● **atazanavir**, ● **boceprevir**, ● **darunavir**, ● **fosamprenavir**, ● **indinavir**, ● **ritonavir**, ● **saquinavir** and ● **telaprevir**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; plasma concentration of bosutinib possibly reduced by ● **efavirenz** and ● **etravirine**—manufacturer of bosutinib advises avoid concomitant use
- **Appetitant**: plasma concentration of bosutinib possibly increased by ● **aprepitant**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- **Beta-blockers**: possible increased risk of ventricular arrhythmias when bosutinib given with ● **sotalol**
- **Bosentan**: plasma concentration of bosutinib possibly reduced by ● **bosentan**—manufacturer of bosutinib advises avoid concomitant use
- **Calcium-channel Blockers**: plasma concentration of bosutinib possibly increased by ● **diltiazem** and ● **verapamil**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- **Cytotoxics**: plasma concentration of bosutinib possibly increased by ● **imatinib**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- **Domperidone**: manufacturer of bosutinib advises avoid concomitant use with ● **domperidone** (risk of ventricular arrhythmias)
- **Grapefruit Juice**: plasma concentration of bosutinib possibly increased by ● **grapefruit juice**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- **Modafinil**: plasma concentration of bosutinib possibly reduced by ● **modafinil**—manufacturer of bosutinib advises avoid concomitant use
- **Ulcer-healing Drugs**: plasma concentration of bosutinib reduced by ● **lansoprazole**

**Brentuximab vedotin**

- Antibacterials: effects of brentuximab vedotin possibly reduced by **rifampicin**
- **Antipsychotics**: avoid concomitant use of cytotoxics with ● **clozapine** (increased risk of agranulocytosis)
  - **Cytotoxics**: increased risk of pulmonary toxicity when brentuximab vedotin given with ● **bleomycin**—avoid concomitant use

**Brimonidine**

Antidepressants: manufacturer of brimonidine advises avoid concomitant use with **MAOIs**, **tricyclic-related antidepressants** and **tricyclics**

**Brinzolamide** *see* Diuretics

**Bromocriptine**

- **Alcohol**: tolerance of bromocriptine reduced by **alcohol**
- **Antibacterials**: plasma concentration of bromocriptine increased by **erythromycin** (increased risk of toxicity); plasma concentration of bromocriptine possibly increased by **macrolides** (increased risk of toxicity)
- **Antipsychotics**: hypoprolactinaemic and anti-parkinsonian effects of bromocriptine antagonised by **antipsychotics**
- **Domperidone**: hypoprolactinaemic effect of bromocriptine possibly antagonised by **domperidone**
- **Hormone Antagonists**: plasma concentration of bromocriptine increased by **octotide**
- **Memantine**: effects of dopaminergics possibly enhanced by **memantine**
- **Methyl dopa**: antiparkinsonian effect of dopaminergics antagonised by **methyl dopa**
- **Metoclopramide**: hypoprolactinaemic effect of bromocriptine antagonised by **metoclopramide**
- **Sympathomimetics**: risk of toxicity when bromocriptine given with ● **isometheptene**

**Buclizine** *see* Antihistamines

**Budesonide** *see* Corticosteroids

**Bumetanide** *see* Diuretics

**Bupivacaine**

- **Anti-arrhythmics**: increased myocardial depression when bupivacaine given with **anti-arrhythmics**
- **Beta-blockers**: increased risk of bupivacaine toxicity when given with ● **propranolol**

**Buprenorphine** *see* Opioid Analgesics

**Bupropion**

- **Antidepressants**: bupropion possibly increases plasma concentration of **citalopram**; manufacturer of bupropion advises avoid for 2 weeks after stopping ● **MAOIs**; manufacturer of bupropion advises avoid concomitant use with ● **moclobemide**; bupropion possibly increases plasma concentration of **tricyclics** (possible increased risk of convulsions)
- **Antiepileptics**: plasma concentration of bupropion reduced by **carbamazepine** and **phenytoin**; metabolism of bupropion inhibited by **valproate**
- **Antivirals**: metabolism of bupropion accelerated by **efavirenz** (reduced plasma concentration); plasma concentration of bupropion reduced by **ritonavir**
- **Atomoxetine**: possible increased risk of convulsions when bupropion given with **atomoxetine**
- **Dopaminergics**: increased risk of side-effects when bupropion given with **amantadine** or **levodopa**
- **Hormone Antagonists**: bupropion possibly inhibits metabolism of ● **tamoxifen** to active metabolite (avoid concomitant use)
- **Methylthioninium**: possible risk of CNS toxicity when bupropion given with ● **methylthioninium**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)

**Buspiron** *see* Anxiolytics and Hypnotics

**Busulfan**

- **Analgesics**: metabolism of *intravenous* busulfan possibly inhibited by **paracetamol** (manufacturer of *intravenous* busulfan advises caution within 72 hours of paracetamol)
- **Antibacterials**: plasma concentration of busulfan increased by ● **metronidazole** (increased risk of toxicity)
- **Antiepileptics**: plasma concentration of busulfan possibly reduced by **phenytoin**

**Busulfan** (*continued*)

Antifungals: metabolism of busulfan inhibited by **itraconazole** (increased risk of toxicity)

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Cytotoxics: increased risk of hepatotoxicity when busulfan given with **tioguanine**

**Butyrophenones** *see* Antipsychotics

**Cabazitaxel**

- Antibacterials: plasma concentration of cabazitaxel possibly increased by **clarithromycin** and **telithromycin**—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel; manufacturer of cabazitaxel advises avoid concomitant use with **rifabutin**; plasma concentration of cabazitaxel reduced by **rifampicin**—manufacturer of cabazitaxel advises avoid concomitant use
- Antidepressants: manufacturer of cabazitaxel advises avoid concomitant use with **St John's wort**
- Antiepileptics: manufacturer of cabazitaxel advises avoid concomitant use with **carbamazepine**, **phenobarbital** and **phenytoin**
- Antifungals: plasma concentration of cabazitaxel possibly increased by **itraconazole** and **voriconazole**—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel
- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Antivirals: manufacturer of cabazitaxel advises avoid concomitant use with **atazanavir**; plasma concentration of cabazitaxel possibly increased by **indinavir**, **ritonavir** and **saquinavir**—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel

**Cabergoline**

Antibacterials: plasma concentration of cabergoline increased by **erythromycin** (increased risk of toxicity); plasma concentration of cabergoline possibly increased by **macrolides** (increased risk of toxicity)

Antipsychotics: hypoprolactinaemic and antiparkinsonian effects of cabergoline antagonised by **antipsychotics**

Domperidone: hypoprolactinaemic effect of cabergoline possibly antagonised by **domperidone**

Memantine: effects of dopaminergics possibly enhanced by **memantine**

Methyldopa: antiparkinsonian effect of dopaminergics antagonised by **methyldopa**

Metoclopramide: hypoprolactinaemic effect of cabergoline antagonised by **metoclopramide**

**Caffeine citrate**

Anti-arrhythmics: caffeine citrate antagonises antiarrhythmic effect of **adenosine**—manufacturer of adenosine advises avoid caffeine citrate for at least 12 hours before adenosine

Antiepileptics: caffeine citrate possibly antagonises effects of **phenobarbital**; plasma concentration of caffeine citrate reduced by **phenytoin**

Theophylline: manufacturer of caffeine citrate advises avoid concomitant use with **theophylline**

Ulcer-healing Drugs: plasma concentration of caffeine citrate increased by **cimetidine**

**Calcitriol** *see* Vitamins

**Calcium Salts**

*Note see also* Antacids

Antibacterials: calcium salts reduce absorption of **ciprofloxacin** and **tetracycline**

Antivirals: calcium salts possibly reduce absorption of **dolutegravir**—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after calcium salts; manufacturer of rilpivirine advises give calcium salts 2 hours before or 4 hours after **rilpivirine**

Bisphosphonates: calcium salts reduce absorption of **bisphosphonates**

**Calcium Salts** (*continued*)

Cardiac Glycosides: large *intravenous* doses of calcium salts can precipitate arrhythmias when given with **cardiac glycosides**

Corticosteroids: absorption of calcium salts reduced by **corticosteroids**

Cytotoxics: calcium salts reduce absorption of **estramustine** (manufacturer of estramustine advises avoid concomitant administration)

Diuretics: increased risk of hypercalcaemia when calcium salts given with **thiazides and related diuretics**

Eltrombopag: calcium salts possibly reduce absorption of **eltrombopag** (give at least 4 hours apart)

Fluorides: calcium salts reduce absorption of **fluorides**

Iron: calcium salts reduce absorption of **oral iron**

Thyroid Hormones: calcium salts reduce absorption of **levothyroxine**

Zinc: calcium salts reduce absorption of **zinc**

**Calcium-channel Blockers**

**Note** Dihydropyridine calcium-channel blockers include amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, and nimodipine

ACE Inhibitors: enhanced hypotensive effect when calcium-channel blockers given with **ACE inhibitors**

Adrenergic Neurone Blockers: enhanced hypotensive effect when calcium-channel blockers given with **adrenergic neurone blockers**

Alcohol: enhanced hypotensive effect when calcium-channel blockers given with **alcohol**; verapamil possibly increases plasma concentration of **alcohol**

Aldesleukin: enhanced hypotensive effect when calcium-channel blockers given with **aldesleukin**

Aliskiren: verapamil increases plasma concentration of **aliskiren**

- Alpha-blockers: verapamil increases plasma concentration of **tamsulosin**; enhanced hypotensive effect when calcium-channel blockers given with **alpha-blockers**, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
- Anaesthetics, General: enhanced hypotensive effect when calcium-channel blockers given with **general anaesthetics** or **isoflurane**; hypotensive effect of verapamil enhanced by **general anaesthetics** (also AV delay)
- Analgesics: hypotensive effect of calcium-channel blockers antagonised by **NSAIDs**; diltiazem inhibits metabolism of **alfentanil** (risk of prolonged or delayed respiratory depression)
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when calcium-channel blockers given with **angiotensin-II receptor antagonists**
- Anti-arrhythmics: increased risk of bradycardia, AV block and myocardial depression when diltiazem or verapamil given with **amiodarone**; increased risk of myocardial depression and asystole when verapamil given with **disopyramide** or **flecainide**; nifedipine increases plasma concentration of **dronedarone**; increased risk of bradycardia and myocardial depression when diltiazem and verapamil given with **dronedarone**
- Antibacterials: metabolism of calcium-channel blockers possibly inhibited by **clarithromycin**, **erythromycin** and **telithromycin** (increased risk of side-effects); manufacturer of lercanidipine advises avoid concomitant use with **erythromycin**; metabolism of diltiazem, nifedipine, nimodipine and verapamil accelerated by **rifampicin** (plasma concentration significantly reduced); plasma concentration of felodipine possibly reduced by **rifampicin**; metabolism of nicardipine possibly accelerated by **rifampicin** (possibly significantly reduced plasma concentration)
- Anticoagulants: verapamil possibly increases plasma concentration of **dabigatran** (*see* Dose under Dabigatran, p. 154)

**Calcium-channel Blockers** (*continued*)

- Antidepressants: metabolism of nifedipine possibly inhibited by **fluoxetine** (increased plasma concentration); diltiazem and verapamil increase plasma concentration of **imipramine**; enhanced hypotensive effect when calcium-channel blockers given with **MAOIs**; plasma concentration of nifedipine reduced by **St John's wort**; plasma concentration of amlodipine and felodipine possibly reduced by **St John's wort**; plasma concentration of verapamil significantly reduced by **St John's wort**; diltiazem and verapamil possibly increase plasma concentration of **tricyclics**

Antidiabetics: glucose tolerance occasionally impaired when nifedipine given with **insulin**

- Antiepileptics: diltiazem and verapamil enhance effects of **carbamazepine**; manufacturer of nimodipine advises avoid concomitant use with **carbamazepine** and **phenytoin** (plasma concentration of nimodipine possibly reduced); effects of dihydropyridines, nicardipine and nifedipine probably reduced by **carbamazepine**; effects of felodipine reduced by **carbamazepine** and **phenytoin**; effects of calcium-channel blockers probably reduced by **phenobarbital**; manufacturer of nimodipine advises avoid concomitant use with **phenobarbital** (plasma concentration of nimodipine reduced); diltiazem increases plasma concentration of **phenytoin** but also effect of diltiazem reduced; effects of verapamil reduced by **phenytoin**

- Antifungals: negative inotropic effect possibly increased when calcium-channel blockers given with **itraconazole**; metabolism of dihydropyridines possibly inhibited by **itraconazole** (increased plasma concentration); metabolism of felodipine inhibited by **itraconazole** (increased plasma concentration); manufacturer of lercanidipine advises avoid concomitant use with **itraconazole**; plasma concentration of nifedipine increased by **micafungin**

Antimalarials: possible increased risk of bradycardia when calcium-channel blockers given with **mefloquine**

Antimuscarinics: avoidance of verapamil advised by manufacturer of **darifenacin**; verapamil increases plasma concentration of **solifenacin**

Antipsychotics: enhanced hypotensive effect when calcium-channel blockers given with **antipsychotics**

- Antivirals: plasma concentration of diltiazem increased by **atazanavir** (reduce dose of diltiazem); plasma concentration of verapamil possibly increased by **atazanavir**; plasma concentration of diltiazem reduced by **efavirenz**; plasma concentration of calcium-channel blockers possibly increased by **ritonavir**; manufacturer of lercanidipine advises avoid concomitant use with **ritonavir**; plasma concentration of amlodipine increased by **telaprevir** (consider reducing dose of amlodipine); caution with diltiazem, felodipine, nicardipine, nifedipine and verapamil advised by manufacturer of **telaprevir**

Anxiolytics and Hypnotics: enhanced hypotensive effect when calcium-channel blockers given with **anxiolytics and hypnotics**; diltiazem and verapamil inhibit metabolism of **midazolam** (increased plasma concentration with increased sedation); absorption of lercanidipine increased by **midazolam**; diltiazem and verapamil increase plasma concentration of **bupirone** (reduce dose of bupirone)

Aprepitant: plasma concentration of both drugs may increase when diltiazem given with **aprepitant**

- Avanafil: diltiazem and verapamil possibly increase plasma concentration of **avanafil**—see Dose under Avanafil, p. 559
- Beta-blockers: enhanced hypotensive effect when calcium-channel blockers given with **beta-blockers**; increased risk of AV block and bradycardia when diltiazem given with **beta-blockers**; asystole, severe

**Calcium-channel Blockers****Beta-blockers** (*continued*)

hypotension and heart failure when verapamil given with **beta-blockers** (see p. 137); possible severe hypotension and heart failure when nifedipine given with **beta-blockers**

Calcium-channel Blockers: plasma concentration of both drugs may increase when diltiazem given with **nifedipine**

- Cardiac Glycosides: nifedipine possibly increases plasma concentration of **digoxin**; diltiazem, lercanidipine and nicardipine increase plasma concentration of **digoxin**; verapamil increases plasma concentration of **digoxin**, also increased risk of AV block and bradycardia
- Ciclosporin: diltiazem, nicardipine and verapamil increase plasma concentration of **ciclosporin**; combination of lercanidipine with **ciclosporin** may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentration of nifedipine possibly increased by **ciclosporin** (increased risk of toxicity including gingival hyperplasia)

Cilostazol: diltiazem increases plasma concentration of **cilostazol** (consider reducing dose of cilostazol)

Clonidine: enhanced hypotensive effect when calcium-channel blockers given with **clonidine**

- Colchicine: diltiazem and verapamil possibly increase risk of **colchicine** toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)

Corticosteroids: hypotensive effect of calcium-channel blockers antagonised by **corticosteroids**; diltiazem increases plasma concentration of **methylprednisolone**

- Cytotoxics: verapamil possibly increases plasma concentration of **doxorubicin**; verapamil possibly increases the plasma concentration of **afatinib**—manufacturer of afatinib advises separating administration of verapamil by 6 to 12 hours; diltiazem and verapamil possibly increase the plasma concentration of **bosutinib**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; possible increased risk of bradycardia when diltiazem or verapamil given with **crizotinib**; plasma concentration of both drugs may increase when verapamil given with **everolimus** (consider reducing the dose of everolimus—consult everolimus product literature); nifedipine possibly inhibits metabolism of **vincristine**

Dapoxetine: manufacturer of dapoxetine advises dose reduction when diltiazem and verapamil given with **dapoxetine** (see Dose under Dapoxetine, p. 560)

Diazoxide: enhanced hypotensive effect when calcium-channel blockers given with **diazoxide**

Diuretics: enhanced hypotensive effect when calcium-channel blockers given with **diuretics**; diltiazem and verapamil increase plasma concentration of **eplerenone** (reduce dose of eplerenone)

Dopaminergics: enhanced hypotensive effect when calcium-channel blockers given with **levodopa**

Fidaxomicin: avoidance of verapamil advised by manufacturer of **fidaxomicin**

- Fingolimod: possible increased risk of bradycardia when diltiazem or verapamil given with **fingolimod**
- Grapefruit Juice: plasma concentration of felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine and verapamil increased by **grapefruit juice**; plasma concentration of amlodipine possibly increased by **grapefruit juice**

Hormone Antagonists: diltiazem and verapamil increase plasma concentration of **dutasteride**; possible increased risk of bradycardia when diltiazem or verapamil given with **pasireotide**

**Calcium-channel Blockers** (continued)

- **Ivabradine**: diltiazem and verapamil increase plasma concentration of ●**ivabradine**—avoid concomitant use
- **Lenalidomide**: verapamil possibly increases plasma concentration of ●**lenalidomide** (increased risk of toxicity)
- **Lipid-regulating Drugs**: diltiazem increases plasma concentration of ●**atorvastatin**—possible increased risk of myopathy; possible increased risk of myopathy when amlodipine and diltiazem given with ●**simvastatin** (see Dose under Simvastatin, p. 173); increased risk of myopathy when verapamil given with ●**simvastatin** (see Dose under Simvastatin, p. 173); avoidance of diltiazem and verapamil advised by manufacturer of ●**lomitapide** (plasma concentration of lomitapide possibly increased)
- Lithium**: neurotoxicity may occur when diltiazem or verapamil given with **lithium** without increased plasma concentration of lithium
- **Magnesium (parenteral)**: profound hypotension reported with concomitant use of nifedipine and ●**parenteral magnesium** in pre-eclampsia
- Methyldopa**: enhanced hypotensive effect when calcium-channel blockers given with **methyldopa**
- Moxisylyte**: enhanced hypotensive effect when calcium-channel blockers given with **moxisylyte**
- Moxonidine**: enhanced hypotensive effect when calcium-channel blockers given with **moxonidine**
- Muscle Relaxants**: verapamil enhances effects of **non-depolarising muscle relaxants** and **suxamethonium**; enhanced hypotensive effect when calcium-channel blockers given with **baclofen** or **tizanidine**; manufacturer of verapamil advises avoid concomitant use of **intravenous dantrolene**; possible increased risk of ventricular arrhythmias when diltiazem given with **intravenous dantrolene**—manufacturer of diltiazem advises avoid concomitant use; calcium-channel blockers possibly enhance effects of **non-depolarising muscle relaxants**
- Nitrates**: enhanced hypotensive effect when calcium-channel blockers given with **nitrates**
- Oestrogens**: hypotensive effect of calcium-channel blockers antagonised by **oestrogens**
- Prostaglandins**: enhanced hypotensive effect when calcium-channel blockers given with **alprostadil**
- Ranolazine**: diltiazem and verapamil increase plasma concentration of **ranolazine** (consider reducing dose of ranolazine)
- Sildenafil**: enhanced hypotensive effect when amlodipine given with **sildenafil**
- **Sirolimus**: diltiazem increases plasma concentration of ●**sirolimus**; plasma concentration of both drugs increased when verapamil given with ●**sirolimus**
- Sulfinpyrazone**: plasma concentration of verapamil reduced by **sulfinpyrazone**
- **Tacrolimus**: diltiazem and nifedipine increase plasma concentration of ●**tacrolimus**; felodipine, nifedipine and verapamil possibly increase plasma concentration of **tacrolimus**
- **Theophylline**: calcium-channel blockers possibly increase plasma concentration of ●**theophylline** (enhanced effect); diltiazem increases plasma concentration of **theophylline**; verapamil increases plasma concentration of ●**theophylline** (enhanced effect)
- Ticagrelor**: diltiazem increases plasma concentration of **ticagrelor**
- Ulcer-healing Drugs**: metabolism of calcium-channel blockers possibly inhibited by **cimetidine** (increased plasma concentration)
- Ulipristal**: avoidance of verapamil advised by manufacturer of **ulipristal**
- Vardenafil**: enhanced hypotensive effect when nifedipine given with **vardenafil**

**Calcium-channel Blockers** (continued)

- Vasodilator Antihypertensives**: enhanced hypotensive effect when calcium-channel blockers given with **hydralazine**, **minoxidil** or **sodium nitropruside**
- Calcium-channel Blockers (dihydropyridines)** see Calcium-channel Blockers
- Canagliflozin** see Antidiabetics
- Candesartan** see Angiotensin-II Receptor Antagonists
- Cannabis Extract**
  - Antidepressants: possible increased risk of hypertension and tachycardia when cannabis extract given with **tricyclics**
- Capecitabine** see Fluorouracil
- Capreomycin**
  - Antibacterials: increased risk of nephrotoxicity when capreomycin given with **colistimethate sodium** or **polymyxins**; increased risk of nephrotoxicity and ototoxicity when capreomycin given with **aminoglycosides** or **vancomycin**
  - Cytotoxics: increased risk of nephrotoxicity and ototoxicity when capreomycin given with **platinum compounds**
  - Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 850
- Captopril** see ACE Inhibitors
- Carbamazepine**
  - Alcohol: CNS side-effects of carbamazepine possibly increased by **alcohol**
  - **Analgesics**: effects of carbamazepine enhanced by ●**dextropropoxyphene**; carbamazepine possibly accelerates metabolism of **fentanyl** (reduced effect); carbamazepine reduces plasma concentration of **methadone**; carbamazepine reduces effects of **tramadol**; carbamazepine possibly accelerates metabolism of **paracetamol** (also isolated reports of hepatotoxicity)
  - **Anti-arrhythmics**: carbamazepine possibly reduces plasma concentration of ●**dronedrone**—avoid concomitant use
  - **Antibacterials**: plasma concentration of carbamazepine increased by ●**clarithromycin** (consider reducing dose of carbamazepine); plasma concentration of carbamazepine increased by ●**erythromycin**; plasma concentration of carbamazepine reduced by ●**rifabutin**; carbamazepine accelerates metabolism of **doxycycline** (reduced effect); plasma concentration of carbamazepine increased by ●**isoniazid** (also possibly increased isoniazid hepatotoxicity); carbamazepine reduces plasma concentration of ●**teli-thromycin** (avoid during and for 2 weeks after carbamazepine)
  - **Anticoagulants**: carbamazepine possibly reduces plasma concentration of ●**apixaban**; carbamazepine accelerates metabolism of ●**coumarins** (reduced anticoagulant effect); carbamazepine possibly reduces plasma concentration of  **dabigatran**—manufacturer of dabigatran advises avoid concomitant use; carbamazepine possibly reduces plasma concentration of ●**rivaroxaban**—manufacturer of rivaroxaban advises monitor for signs of thrombosis
  - **Antidepressants**: carbamazepine possibly reduces plasma concentration of **reboxetine**; plasma concentration of carbamazepine increased by ●**fluoxetine** and ●**fluvoxamine**; carbamazepine reduces plasma concentration of ●**mianserin**, **mirtazapine** and **trazodone**; manufacturer of carbamazepine advises avoid for 2 weeks after stopping ●**MAOIs**, also antagonism of anticonvulsant effect; anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and ●**tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●**SSRIs** and ●**tricyclics** (convulsive threshold lowered); plasma concentration of carbamazepine possibly reduced by **St John's wort**; carbamazepine accelerates

**Carbamazepine**

- Antidepressants (*continued*)
  - metabolism of ●tricyclics (reduced plasma concentration and reduced effect)
- Antiepileptics: carbamazepine possibly reduces plasma concentration of ●**eslicarbazepine** but risk of side-effects increased; carbamazepine possibly reduces plasma concentration of ●**ethosuximide** and ●**retigabine**; carbamazepine often reduces plasma concentration of ●**lamotrigine**, also plasma concentration of an active metabolite of carbamazepine sometimes raised (but evidence is conflicting); possible increased risk of carbamazepine toxicity when given with ●**levetiracetam**; plasma concentration of carbamazepine sometimes reduced by ●**oxcarbazepine** (but concentration of an active metabolite of carbamazepine may be increased), also plasma concentration of an active metabolite of oxcarbazepine often reduced; carbamazepine reduces plasma concentration of ●**perampanel** (see Dose under Perampanel, p. 307); carbamazepine possibly increases plasma concentration of ●**phenobarbital**; plasma concentration of both drugs often reduced when carbamazepine given with ●**phenytoin**, also plasma concentration of phenytoin may be increased; plasma concentration of both drugs possibly reduced when carbamazepine given with ●**rufinamide**; plasma concentration of carbamazepine increased by ●**stiripentol**; carbamazepine reduces plasma concentration of ●**tiagabine** and ●**zonisamide**; carbamazepine often reduces plasma concentration of ●**topiramate**; carbamazepine reduces plasma concentration of ●**valproate**, also plasma concentration of active metabolite of carbamazepine increased
- Antifungals: plasma concentration of carbamazepine possibly increased by ●**fluconazole** and ●**miconazole**; carbamazepine possibly reduces plasma concentration of ●**itraconazole** and ●**posaconazole**; carbamazepine possibly reduces plasma concentration of ●**voriconazole**—avoid concomitant use; carbamazepine possibly reduces plasma concentration of ●**caspofungin**—consider increasing dose of caspofungin
- Antimalarials: avoidance of carbamazepine advised by manufacturer of ●**piperazine with arteminol**; anti-convulsant effect of antiepileptics antagonised by ●**mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ●**antipsychotics** (convulsive threshold lowered); carbamazepine accelerates metabolism of ●**haloperidol**, ●**olanzapine**, ●**quetiapine** and ●**risperidone** (reduced plasma concentration); carbamazepine reduces plasma concentration of ●**aripiprazole** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); carbamazepine accelerates metabolism of ●**clozapine** (reduced plasma concentration), also avoid concomitant use of drugs with substantial potential for causing agranulocytosis; carbamazepine reduces plasma concentration of ●**paliperidone**
- Antivirals: avoidance of carbamazepine advised by manufacturer of ●**boceprevir** and ●**rilpivirine** (plasma concentration of boceprevir and rilpivirine possibly reduced); carbamazepine possibly reduces plasma concentration of ●**darunavir**, ●**fosamprenavir**, ●**lopinavir**, ●**saguinavir** and ●**tipranavir**; avoidance of carbamazepine advised by manufacturer of ●**dolutegravir**, ●**elvitegravir**, ●**etravirine**, ●**sofosbuvir** and ●**telaprevir**; plasma concentration of both drugs reduced when carbamazepine given with ●**efavirenz**; carbamazepine possibly reduces plasma concentration of ●**indinavir**, also plasma concentration of carbamazepine possibly increased; carbamazepine reduces plasma concentration of ●**nevirapine**; plasma concentration of carbamazepine possibly increased by ●**ritonavir**

**Carbamazepine (continued)**

- Anxiolytics and Hypnotics: carbamazepine often reduces plasma concentration of ●**clonazepam**; carbamazepine reduces plasma concentration of ●**midazolam**
- Appetitant: carbamazepine possibly reduces plasma concentration of ●**aprepitant**
- Avanafil: carbamazepine possibly reduces plasma concentration of ●**avanafil**—manufacturer of avanafil advises avoid concomitant use
- Bupropion: carbamazepine reduces plasma concentration of ●**bupropion**
- Calcium-channel Blockers: carbamazepine reduces effects of ●**felodipine**; carbamazepine probably reduces effects of ●**dihydropyridines**, ●**nicardipine** and ●**nifedipine**; avoidance of carbamazepine advised by manufacturer of ●**nimodipine** (plasma concentration of nimodipine possibly reduced); effects of carbamazepine enhanced by ●**diltiazem** and ●**verapamil**
- Ciclosporin: carbamazepine accelerates metabolism of ●**ciclosporin** (reduced plasma concentration)
- Clopidogrel: carbamazepine possibly reduces anti-platelet effect of ●**clopidogrel**
- Cobicistat: carbamazepine possibly reduces plasma concentration of ●**cobicistat**—manufacturer of cobicistat advises avoid concomitant use
- Corticosteroids: carbamazepine accelerates metabolism of ●**corticosteroids** (reduced effect)
- Cytotoxics: carbamazepine possibly decreases plasma concentration of ●**axitinib** (increase dose of axitinib—consult axitinib product literature); carbamazepine possibly reduces plasma concentration of ●**bosutinib** and ●**crizotinib**—manufacturer of bosutinib and crizotinib advises avoid concomitant use; avoidance of carbamazepine advised by manufacturer of ●**cabazitaxel**, ●**dabrafenib**, ●**gefitinib** and ●**vemurafenib**; carbamazepine reduces plasma concentration of ●**imatinib** and ●**lapatinib**—avoid concomitant use; avoidance of carbamazepine advised by manufacturer of ●**vandetanib** and ●**vismodegib** (plasma concentration of vandetanib and vismodegib possibly reduced); carbamazepine possibly reduces plasma concentration of ●**eribulin**; carbamazepine reduces plasma concentration of ●**irinotecan** and its active metabolite; manufacturer of procarbazine advises possible increased risk of hypersensitivity reactions when carbamazepine given with ●**procarbazine**
- Diuretics: increased risk of hyponatraemia when carbamazepine given with ●**diuretics**; plasma concentration of carbamazepine increased by ●**acetazolamide**; carbamazepine reduces plasma concentration of ●**eplerenone**—avoid concomitant use
- Fingolimod: carbamazepine reduces plasma concentration of ●**fingolimod**
- Hormone Antagonists: carbamazepine possibly reduces plasma concentration of ●**abiraterone**—manufacturer of abiraterone advises avoid concomitant use; metabolism of carbamazepine inhibited by ●**danazol** (increased risk of toxicity); carbamazepine possibly accelerates metabolism of ●**torsemide** (reduced plasma concentration)
- 5HT<sub>2</sub>-receptor Antagonists: carbamazepine accelerates metabolism of ●**ondansetron** (reduced effect)
- Ivacaftor: carbamazepine possibly reduces plasma concentration of ●**ivacaftor**—manufacturer of ivacaftor advises avoid concomitant use
- Lipid-regulating Drugs: carbamazepine reduces plasma concentration of ●**simvastatin**—consider increasing dose of simvastatin
- Lithium: neurotoxicity may occur when carbamazepine given with ●**lithium** without increased plasma concentration of lithium
- Macitentan: avoidance of carbamazepine advised by manufacturer of ●**macitentan**

**Carbamazepine** (*continued*)

- Muscle Relaxants: carbamazepine antagonises muscle relaxant effect of **non-depolarising muscle relaxants** (accelerated recovery from neuromuscular blockade)
- Oestrogens: carbamazepine accelerates metabolism of **oestrogens** (reduced contraceptive effect—see p. 536)
  - Orlistat: possible increased risk of convulsions when antiepileptics given with **orlistat**
  - Progestogens: carbamazepine accelerates metabolism of **progestogens** (reduced contraceptive effect—see p. 536)
  - Retinoids: plasma concentration of carbamazepine possibly reduced by **isotretinoin**
  - Roflumilast: carbamazepine possibly inhibits effects of **roflumilast** (manufacturer of roflumilast advises avoid concomitant use)
  - Theophylline: carbamazepine accelerates metabolism of **theophylline** (reduced effect)
  - Thyroid Hormones: carbamazepine accelerates metabolism of **thyroid hormones** (may increase requirements for thyroid hormones in hypothyroidism)
  - Tibolone: carbamazepine accelerates metabolism of **tibolone** (reduced plasma concentration)
  - Ticagrelor: carbamazepine possibly reduces plasma concentration of **ticagrelor**
  - Ulcer-healing Drugs: metabolism of carbamazepine inhibited by **cimetidine** (increased plasma concentration)
  - Ulipristal: avoidance of carbamazepine advised by manufacturer of **ulipristal** (contraceptive effect of ulipristal possibly reduced)
  - Vitamins: carbamazepine possibly increases requirements for **vitamin D**

**Carbapenems** see Ertapenem, Imipenem with Cilastatin, and Meropenem

**Carbonic Anhydrase Inhibitors** see Diuretics

**Carboplatin** see Platinum Compounds

**Carboprost** see Prostaglandins

**Cardiac Glycosides**

- ACE Inhibitors: plasma concentration of digoxin possibly increased by **captopril**
- Alpha-blockers: plasma concentration of digoxin increased by **prazosin**
- Aminosalicylates: absorption of digoxin possibly reduced by **sulfasalazine**
- Analgesics: plasma concentration of cardiac glycosides possibly increased by **NSAIDs**, also possible exacerbation of heart failure and reduction of renal function
- Antacids: absorption of digoxin possibly reduced by **antacids**
- Anti-arrhythmics: plasma concentration of digoxin increased by **amiodarone**, **dronedronone** and **propafenone** (halve dose of digoxin)
  - Antibacterials: plasma concentration of digoxin possibly increased by **gentamicin**, **telithromycin** and **trimethoprim**; absorption of digoxin reduced by **neomycin**; plasma concentration of digoxin possibly reduced by **rifampicin**; plasma concentration of digoxin increased by **macrolides** (increased risk of toxicity)
  - Antidepressants: plasma concentration of digoxin reduced by **St John's wort**—avoid concomitant use
  - Antidiabetics: plasma concentration of digoxin possibly reduced by **acarbose**; plasma concentration of digoxin increased by **canagliflozin** and **sitagliptin**
  - Antiepileptics: plasma concentration of digoxin possibly reduced by **phenytoin**
  - Antifungals: increased cardiac toxicity with cardiac glycosides if hypokalaemia occurs with **amphotericin**; plasma concentration of digoxin increased by **itraconazole**
- Cardiac Glycosides** (*continued*)
- Antimalarials: plasma concentration of digoxin possibly increased by **chloroquine** and **hydroxychloroquine**; possible increased risk of bradycardia when digoxin given with **mefloquine**; plasma concentration of digoxin increased by **quinine**
  - Antimuscarinics: plasma concentration of digoxin possibly increased by **darifenacin**
  - Antivirals: side-effects of digoxin possibly increased by **boceprevir**; plasma concentration of digoxin increased by **etravirine** and **telaprevir**; plasma concentration of digoxin possibly increased by **ritonavir**
  - Anxiolytics and Hypnotics: plasma concentration of digoxin increased by **alprazolam** (increased risk of toxicity)
  - Beta-blockers: increased risk of AV block and bradycardia when cardiac glycosides given with **beta-blockers**
  - Calcium Salts: arrhythmias can be precipitated when cardiac glycosides given with large **intravenous** doses of **calcium salts**
  - Calcium-channel blockers: plasma concentration of digoxin increased by **diltiazem**, **lercanidipine** and **nicardipine**; plasma concentration of digoxin possibly increased by **nifedipine**; plasma concentration of digoxin increased by **verapamil**, also increased risk of AV block and bradycardia
  - Ciclosporin: plasma concentration of digoxin increased by **ciclosporin** (increased risk of toxicity)
  - Cobicistat: plasma concentration of digoxin possibly increased by **cobicistat**—reduce initial dose of digoxin
  - Colchicine: possible increased risk of myopathy when digoxin given with **colchicine**
  - Corticosteroids: increased risk of hypokalaemia when cardiac glycosides given with **corticosteroids**
  - Cytotoxics: absorption of digoxin **tablets** possibly reduced by **bleomycin**, **carmustine**, **cyclophosphamide**, **cytarabine**, **doxorubicin**, **melfalan**, **methotrexate**, **procarbazine** and **vincristine**; possible increased risk of bradycardia when digoxin given with **crizotinib**; plasma concentration of digoxin increased by **vandetanib**—possible increased risk of bradycardia
  - Diuretics: increased cardiac toxicity with cardiac glycosides if hypokalaemia occurs with **acetazolamide**, **loop diuretics** or **thiazides and related diuretics**; plasma concentration of digoxin possibly increased by **potassium canrenoate**; plasma concentration of digoxin increased by **spironolactone**
  - Lenalidomide: plasma concentration of digoxin possibly increased by **lenalidomide**
  - Lipid-regulating Drugs: absorption of cardiac glycosides possibly reduced by **colestipol** and **colestyramine**; plasma concentration of digoxin possibly increased by **atorvastatin**
  - Mirabegron: plasma concentration of digoxin increased by **mirabegron**—reduce initial dose of digoxin
  - Muscle Relaxants: risk of ventricular arrhythmias when cardiac glycosides given with **suxamethonium**; possible increased risk of bradycardia when cardiac glycosides given with **tizanidine**
  - Penicillamine: plasma concentration of digoxin possibly reduced by **penicillamine**
  - Ranolazine: plasma concentration of digoxin increased by **ranolazine**
  - Sympathomimetics, Beta<sub>2</sub>: plasma concentration of digoxin possibly reduced by **salbutamol**
  - Ticagrelor: plasma concentration of digoxin increased by **ticagrelor**
  - Tolvaptan: plasma concentration of digoxin increased by **tolvaptan** (increased risk of toxicity)
  - Ulcer-healing Drugs: plasma concentration of digoxin possibly slightly increased by **proton pump inhibitors**

**Cardiac Glycosides**

Ulcer-healing Drugs (*continued*)

**bitors**; absorption of cardiac glycosides possibly reduced by **sucralfate**

Ulipristal: manufacturer of ulipristal advises give digoxin at least 1.5 hours before or after **ulipristal**

**Carmustine**

- Antipsychotics: avoid concomitant use of cytotoxics with **●clozapine** (increased risk of agranulocytosis)

Cardiac Glycosides: carmustine possibly reduces absorption of **digoxin tablets**

Ulcer-healing Drugs: myelosuppressive effects of carmustine possibly enhanced by **cimetidine**

**Carteolol** *see* Beta-blockers

**Carvedilol** *see* Beta-blockers

**Caspofungin**

Antibacterials: plasma concentration of caspofungin initially increased and then reduced by **rifampicin** (consider increasing dose of caspofungin)

Antiepileptics: plasma concentration of caspofungin possibly reduced by **carbamazepine** and **phenytoin**—consider increasing dose of caspofungin

Antivirals: plasma concentration of caspofungin possibly reduced by **efavirenz** and **nevirapine**—consider increasing dose of caspofungin

- Cyclosporin: plasma concentration of caspofungin increased by **●cyclosporin** (manufacturer of caspofungin recommends monitoring liver enzymes)
- Corticosteroids: plasma concentration of caspofungin possibly reduced by **dexamethasone**—consider increasing dose of caspofungin

- Tacrolimus: caspofungin reduces plasma concentration of **●tacrolimus**

**Cefaclor** *see* Cephalosporins

**Cefadroxil** *see* Cephalosporins

**Cefalexin** *see* Cephalosporins

**Cefixime** *see* Cephalosporins

**Cefotaxime** *see* Cephalosporins

**Cefradine** *see* Cephalosporins

**Ceftaroline** *see* Cephalosporins

**Ceftazidime** *see* Cephalosporins

**Ceftriaxone** *see* Cephalosporins

**Cefuroxime** *see* Cephalosporins

**Celecoxib** *see* NSAIDs

**Celiprolol** *see* Beta-blockers

**Cephalosporins**

Antacids: absorption of cefaclor reduced by **antacids**

Antibacterials: possible increased risk of nephrotoxicity when cephalosporins given with **aminoglycosides**

- Anticoagulants: cephalosporins possibly enhance anticoagulant effect of **●coumarins**

Probenecid: excretion of cephalosporins reduced by **probenecid** (increased plasma concentration)

Teriflunomide: plasma concentration of cefaclor increased by **teriflunomide**

Vaccines: antibacterials inactivate **oral typhoid vaccine**—*see* p. 850

**Certolizumab pegol**

- Abatacept: avoid concomitant use of certolizumab pegol with **●abatacept**

- Anakinra: avoid concomitant use of certolizumab pegol with **●anakinra**

- Vaccines: avoid concomitant use of certolizumab pegol with live **●vaccines** (*see* p. 828)

**Cetirizine** *see* Antihistamines

**Chenodeoxycholic Acid** *see* Bile Acids

**Chloral** *see* Anxiolytics and Hypnotics

**Chloramphenicol**

Antibacterials: metabolism of chloramphenicol accelerated by **rifampicin** (reduced plasma concentration)

- Anticoagulants: chloramphenicol enhances anticoagulant effect of **●coumarins**

**Chloramphenicol** (*continued*)

- Antidiabetics: chloramphenicol enhances effects of **●sulfonylureas**

- Antiepileptics: metabolism of chloramphenicol possibly accelerated by **●phenobarbital** (reduced plasma concentration); chloramphenicol increases plasma concentration of **●phenytoin** (increased risk of toxicity)

- Antipsychotics: avoid concomitant use of chloramphenicol with **●clozapine** (increased risk of agranulocytosis)

- Cyclosporin: chloramphenicol possibly increases plasma concentration of **●cyclosporin**

- Clopidogrel: chloramphenicol possibly reduces antiplatelet effect of **●clopidogrel**

Hydroxocobalamin: chloramphenicol reduces response to **hydroxocobalamin**

- Tacrolimus: chloramphenicol possibly increases plasma concentration of **●tacrolimus**

Vaccines: antibacterials inactivate **oral typhoid vaccine**—*see* p. 850

**Chlordiazepoxide** *see* Anxiolytics and Hypnotics**Chloroprocaine**

- Antibacterials: chloroprocaine possibly inhibits effects of **●sulfonamides** (manufacturer of chloroprocaine advises avoid concomitant use)

**Chloroquine and Hydroxychloroquine**

Adsorbents: absorption of chloroquine and hydroxychloroquine reduced by **kaolin**

Agalsidase Alfa and Beta: chloroquine and hydroxychloroquine possibly inhibit effects of **agalsidase alfa and beta** (manufacturers of agalsidase alfa and beta advise avoid concomitant use)

Antacids: absorption of chloroquine and hydroxychloroquine reduced by **antacids**

- Anti-arrhythmics: increased risk of ventricular arrhythmias when chloroquine and hydroxychloroquine given with **●amiodarone**—avoid concomitant use

- Antibacterials: increased risk of ventricular arrhythmias when chloroquine and hydroxychloroquine given with **●moxifloxacin**—avoid concomitant use

- Antidepressants: avoidance of antimalarials advised by manufacturer of **●citalopram** and **●escitalopram** (risk of ventricular arrhythmias)

- Antimalarials: avoidance of antimalarials advised by manufacturer of **●artemether with lumefantrine**; increased risk of convulsions when chloroquine and hydroxychloroquine given with **●mefloquine**

- Antipsychotics: increased risk of ventricular arrhythmias when chloroquine and hydroxychloroquine given with **●droperidol**—avoid concomitant use

- Cardiac Glycosides: chloroquine and hydroxychloroquine possibly increase plasma concentration of **●digoxin**

- Cyclosporin: chloroquine and hydroxychloroquine increase plasma concentration of **●cyclosporin** (increased risk of toxicity)

- Cytotoxics: possible increased risk of ventricular arrhythmias when chloroquine and hydroxychloroquine given with **●bosutinib**

Histamine: avoidance of antimalarials advised by manufacturer of **histamine**

Lanthanum: absorption of chloroquine and hydroxychloroquine possibly reduced by **lanthanum** (give at least 2 hours apart)

Laronidase: chloroquine and hydroxychloroquine possibly inhibit effects of **laronidase** (manufacturer of laronidase advises avoid concomitant use)

Parasympathomimetics: chloroquine and hydroxychloroquine have potential to increase symptoms of myasthenia gravis and thus diminish effect of **neostigmine** and **pyridostigmine**

Ulcer-healing Drugs: metabolism of chloroquine and hydroxychloroquine inhibited by **cimetidine** (increased plasma concentration)

**Chloroquine and Hydroxychloroquine** (continued)

Vaccines: antimalarials inactivate **oral typhoid vaccine**—see p. 850

**Chlorothiazide** see Diuretics

**Chlorphenamine** see Antihistamines

**Chlorpromazine** see Antipsychotics

**Chlortalidon** see Diuretics

**Ciclesonide** see Corticosteroids

**Ciclosporin**

• ACE Inhibitors: increased risk of hyperkalaemia when ciclosporin given with **ACE inhibitors**

• Aliskiren: ciclosporin increases plasma concentration of **aliskiren**—avoid concomitant use

Allopurinol: plasma concentration of ciclosporin possibly increased by **allopurinol** (risk of nephrotoxicity)

• Ambrisentan: ciclosporin increases plasma concentration of **ambrisentan** (see Dose under Ambrisentan, p. 110)

• Analgesics: increased risk of nephrotoxicity when ciclosporin given with **NSAIDs**; ciclosporin increases plasma concentration of **diclofenac** (half dose of diclofenac)

• Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when ciclosporin given with **angiotensin-II receptor antagonists**

Anti-arrhythmics: plasma concentration of ciclosporin possibly increased by **amiodarone** and **propafenone**

• Antibacterials: metabolism of ciclosporin inhibited by **clarithromycin** and **erythromycin** (increased plasma concentration); metabolism of ciclosporin accelerated by **rifampicin** (reduced plasma concentration); plasma concentration of ciclosporin possibly reduced by **sulfadiazine**; increased risk of nephrotoxicity when ciclosporin given with

**aminoglycosides**, **polymyxins**, **quinolones**, **sulfonamides** or **vancomycin**; plasma concentration of ciclosporin possibly increased by **chloramphenicol** and **telithromycin**; increased risk of myopathy when ciclosporin given with **daptomycin** (preferably avoid concomitant use); metabolism of ciclosporin possibly inhibited by **macrolides** (increased plasma concentration); increased risk of nephrotoxicity when ciclosporin given with **trimethoprim**, also plasma concentration of ciclosporin reduced by **intravenous trimethoprim**

• Anticoagulants: ciclosporin possibly increases plasma concentration of **dabigatran**—manufacturer of dabigatran advises avoid concomitant use

• Antidepressants: plasma concentration of ciclosporin reduced by **St John's wort**—avoid concomitant use

Antidiabetics: ciclosporin possibly enhances hypoglycaemic effect of **repaglinide**

• Antiepileptics: metabolism of ciclosporin accelerated by **carbamazepine**, **phenobarbital** and **phenytoin** (reduced plasma concentration); plasma concentration of ciclosporin possibly reduced by **oxcarbazepine**

• Antifungals: metabolism of ciclosporin possibly inhibited by **micronazole** (increased plasma concentration); increased risk of nephrotoxicity when ciclosporin given with **amphotericin**; metabolism of ciclosporin inhibited by **fluconazole**, **itraconazole**, **posaconazole** and **voriconazole** (increased plasma concentration); ciclosporin increases plasma concentration of **casopfungin** (manufacturer of casopfungin recommends monitoring liver enzymes); plasma concentration of ciclosporin possibly reduced by **griseofulvin** and **terbinafine**; plasma concentration of ciclosporin possibly increased by **micafungin**

• Antimalarials: plasma concentration of ciclosporin increased by **chloroquine** and **hydroxychloroquine** (increased risk of toxicity)

Antimuscarinics: avoidance of ciclosporin advised by manufacturer of **darifenacin**

**Ciclosporin** (continued)

• Antivirals: increased risk of nephrotoxicity when ciclosporin given with **aciclovir**; plasma concentration of ciclosporin possibly increased by **atazanavir** and **ritonavir**; plasma concentration of ciclosporin increased by **boceprevir**, **fosamprenavir** and **indinavir**; plasma concentration of ciclosporin possibly reduced by **efavirenz**; plasma concentration of both drugs increased when ciclosporin given with **saquinavir**; plasma concentration of both drugs increased when ciclosporin given with **telaprevir** (reduce dose of ciclosporin)

• Beta-blockers: plasma concentration of ciclosporin increased by **carvedilol**

• Bile Acids: absorption of ciclosporin increased by **ursodeoxycholic acid**

• Bosentan: ciclosporin increases plasma concentration of **bosentan** (also plasma concentration of ciclosporin reduced—avoid concomitant use)

• Calcium-channel Blockers: combination of ciclosporin with **lercanidipine** may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentration of ciclosporin increased by **diltiazem**, **nifedipine** and **verapamil**; ciclosporin possibly increases plasma concentration of **nifedipine** (increased risk of toxicity including gingival hyperplasia)

• Cardiac Glycosides: ciclosporin increases plasma concentration of **digoxin** (increased risk of toxicity)

• Colchicine: possible increased risk of nephrotoxicity and myotoxicity when ciclosporin given with **colchicine**—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)

Colectilan: manufacturer of colectilan advises give ciclosporin at least 1 hour before or 3 hours after **colectilan**

• Corticosteroids: plasma concentration of ciclosporin increased by high-dose **methylprednisolone** (risk of convulsions); ciclosporin increases plasma concentration of **prednisolone**

• Cytotoxics: increased risk of nephrotoxicity when ciclosporin given with **melfalan**; increased risk of neurotoxicity when ciclosporin given with **doxorubicin**; ciclosporin increases plasma concentration of **epirubicin** and **idarubicin**; ciclosporin reduces excretion of **mitoxantrone** (increased plasma concentration); risk of toxicity when ciclosporin given with **methotrexate**; ciclosporin possibly increases the plasma concentration of **afatinib**—manufacturer of afatinib advises separating administration of ciclosporin by 6 to 12 hours; caution with ciclosporin advised by manufacturer of **crizotinib**; ciclosporin increases plasma concentration of **everolimus** (consider reducing the dose of everolimus—consult everolimus product literature); plasma concentration of ciclosporin possibly increased by **imatinib**; *in vitro* studies suggest a possible interaction between ciclosporin and **docetaxel** (consult docetaxel product literature); ciclosporin possibly increases plasma concentration of **etoposide** (increased risk of toxicity)

• Diuretics: plasma concentration of ciclosporin possibly increased by **acetazolamide**; increased risk of hyperkalaemia when ciclosporin given with **potassium-sparing diuretics** and **aldosterone antagonists**; increased risk of nephrotoxicity and possibly hypermagnesaemia when ciclosporin given with **thiazides** and **related diuretics**

Fidaxomicin: avoidance of ciclosporin advised by manufacturer of **fidaxomicin**

• Grapefruit Juice: plasma concentration of ciclosporin increased by **grapefruit juice** (increased risk of toxicity)

• Hormone Antagonists: metabolism of ciclosporin inhibited by **danazol** (increased plasma concentra-

**Ciclosporin**

- Hormone Antagonists (*continued*)
  - tion); plasma concentration of ciclosporin reduced by ●lanreotide and ●octreotide; plasma concentration of ciclosporin possibly reduced by ●pasireotide
- Lenalidomide: ciclosporin possibly increases plasma concentration of ●lenalidomide (increased risk of toxicity)
- Lipid-regulating Drugs: absorption of ciclosporin reduced by ●colestevlam; increased risk of renal impairment when ciclosporin given with ●bezafibrate or ●fenofibrate; increased risk of myopathy when ciclosporin given with ●atorvastatin (see Dose under Atorvastatin, p. 171); increased risk of myopathy when ciclosporin given with ●fluvastatin or ●pravastatin; increased risk of myopathy when ciclosporin given with ●rosuvastatin or ●simvastatin (avoid concomitant use); plasma concentration of both drugs may increase when ciclosporin given with ●ezetimibe
- Mannitol: possible increased risk of nephrotoxicity when ciclosporin given with ●mannitol
- Metoclopramide: plasma concentration of ciclosporin increased by ●metoclopramide
- Mifamurtide: avoidance of ciclosporin advised by manufacturer of mifamurtide
- Modafinil: plasma concentration of ciclosporin reduced by ●modafinil
- Oestrogens: plasma concentration of ciclosporin possibly increased by ●oestrogens
- Orlistat: absorption of ciclosporin possibly reduced by ●orlistat
- Potassium Salts: increased risk of hyperkalaemia when ciclosporin given with ●potassium salts
- Progestogens: plasma concentration of ciclosporin possibly increased by ●progestogens
- Ranolazine: plasma concentration of both drugs may increase when ciclosporin given with ●ranolazine
- Sevelamer: plasma concentration of ciclosporin possibly reduced by ●sevelamer
- Sirrolimus: ciclosporin increases plasma concentration of ●sirrolimus
- Sulfapyrazone: plasma concentration of ciclosporin reduced by ●sulfapyrazone
- Tacrolimus: plasma concentration of ciclosporin increased by ●tacrolimus (increased risk of nephrotoxicity)—avoid concomitant use
- Ticagrelor: ciclosporin increases plasma concentration of ●ticagrelor
- Ulcer-healing Drugs: plasma concentration of ciclosporin possibly increased by ●cimetidine; plasma concentration of ciclosporin possibly affected by ●omeprazole
- Vitamins: plasma concentration of ciclosporin possibly affected by ●vitamin E

**Cidofovir**

- Antivirals: manufacturers advise avoid concomitant use of cidofovir with ●tenofovir

**Cilazapril** *see* ACE Inhibitors**Cilostazol**

- Anagrelide: avoidance of cilostazol advised by manufacturer of ●anagrelide
- Antibacterials: plasma concentration of cilostazol possibly increased by ●clarithromycin (see Dose under Cilostazol, p. 140); plasma concentration of cilostazol increased by ●erythromycin (see Dose under Cilostazol, p. 140)
- Antifungals: plasma concentration of cilostazol possibly increased by ●itraconazole (see Dose under Cilostazol, p. 140)
- Antivirals: plasma concentration of cilostazol possibly increased by ●boceprevir, ●ritonavir and ●telaprevir (see Dose under Cilostazol, p. 140)
- Calcium-channel Blockers: plasma concentration of cilostazol increased by ●diltiazem (consider reducing dose of cilostazol)

**Cilostazol** (*continued*)

- Ulcer-healing Drugs: plasma concentration of cilostazol increased by ●omeprazole (see Dose under Cilostazol, p. 140)

**Cimetidine** *see* Histamine H<sub>2</sub>-antagonists**Cinacalcet**

- Hormone Antagonists: cinacalcet possibly inhibits metabolism of ●tamoxifen to active metabolite (avoid concomitant use)

**Cinnarizine** *see* Antihistamines**Ciprofibrate** *see* Fibrates**Ciprofloxacin** *see* Quinolones**Cisatracurium** *see* Muscle Relaxants**Cisplatin** *see* Platinum Compounds**Citalopram** *see* Antidepressants, SSRI**Cladribine**

- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)
- Antivirals: avoidance of cladribine advised by manufacturer of ●lamivudine

**Clarithromycin** *see* Macrolides**Clemastine** *see* Antihistamines**Clindamycin**

- Muscle Relaxants: clindamycin enhances effects of ●non-depolarising muscle relaxants and ●suxamethonium
- Parasympathomimetics: clindamycin antagonises effects of ●neostigmine and ●pyridostigmine
- Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850

**Clobazam** *see* Anxiolytics and Hypnotics**Clomethiazole** *see* Anxiolytics and Hypnotics**Clomipramine** *see* Antidepressants, Tricyclic**Clonazepam** *see* Anxiolytics and Hypnotics**Clonidine**

- ACE Inhibitors: enhanced hypotensive effect when clonidine given with ●ACE inhibitors; previous treatment with clonidine possibly delays antihypertensive effect of ●captopril
- Adrenergic Neurone Blockers: enhanced hypotensive effect when clonidine given with ●adrenergic neurone blockers
- Alcohol: enhanced hypotensive effect when clonidine given with ●alcohol
- Aldesleukin: enhanced hypotensive effect when clonidine given with ●aldesleukin
- Alpha-blockers: enhanced hypotensive effect when clonidine given with ●alpha-blockers
- Anaesthetics, General: enhanced hypotensive effect when clonidine given with ●general anaesthetics
- Analgesics: hypotensive effect of clonidine antagonised by ●NSAIDs
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when clonidine given with ●angiotensin-II receptor antagonists
- Antidepressants: enhanced hypotensive effect when clonidine given with ●MAOIs; hypotensive effect of clonidine possibly antagonised by ●mirtazapine; hypotensive effect of clonidine antagonised by ●tricyclics, also increased risk of hypertension on clonidine withdrawal
- Antipsychotics: enhanced hypotensive effect when clonidine given with ●phenothiazines
- Anxiolytics and Hypnotics: enhanced hypotensive effect when clonidine given with ●anxiolytics and ●hypnotics
- Beta-blockers: increased risk of withdrawal hypertension when clonidine given with ●beta-blockers (withdraw beta-blockers several days before slowly withdrawing clonidine)
- Calcium-channel Blockers: enhanced hypotensive effect when clonidine given with ●calcium-channel blockers
- Corticosteroids: hypotensive effect of clonidine antagonised by ●corticosteroids

**Clonidine** (*continued*)

- Cytotoxics: possible increased risk of bradycardia when clonidine given with **crizotinib**
- Diazoxide: enhanced hypotensive effect when clonidine given with **diazoxide**
- Diuretics: enhanced hypotensive effect when clonidine given with **diuretics**
- Dopaminergics: enhanced hypotensive effect when clonidine given with **levodopa**
- Histamine: avoidance of clonidine advised by manufacturer of **histamine**
- Methylodopa: enhanced hypotensive effect when clonidine given with **methylodopa**
- Moxisylyte: enhanced hypotensive effect when clonidine given with **moxisylyte**
- Moxonidine: enhanced hypotensive effect when clonidine given with **moxonidine**
- Muscle Relaxants: enhanced hypotensive effect when clonidine given with **baclofen** or **tizanidine**
- Nitrates: enhanced hypotensive effect when clonidine given with **nitrates**
- Oestrogens: hypotensive effect of clonidine antagonised by **oestrogens**
- Prostaglandins: enhanced hypotensive effect when clonidine given with **alprostadiol**
- Sympathomimetics: possible risk of hypertension when clonidine given with **adrenaline (epinephrine)** or **noradrenaline (norepinephrine)**; serious adverse events reported with concomitant use of clonidine and **methylphenidate** (causality not established)
- Vasodilator Antihypertensives: enhanced hypotensive effect when clonidine given with **hydralazine**, **minoxidil** or **sodium nitroprusside**

**Clonidine** *see* Diuretics**Clopidogrel**

- Analgesics: increased risk of bleeding when clopidogrel given with **NSAIDs** or **aspirin**
- Antibacterials: antiplatelet effect of clopidogrel possibly reduced by **chloramphenicol**, **ciprofloxacin** and **erythromycin**
- Anticoagulants: manufacturer of clopidogrel advises avoid concomitant use with **warfarin**; antiplatelet action of clopidogrel enhances anticoagulant effect of **coumarins** and **phenindione**; increased risk of bleeding when clopidogrel given with **heparins**
- Antidepressants: antiplatelet effect of clopidogrel possibly reduced by **fluoxetine**, **fluvoxamine** and **moclobemide**
- Antiepileptics: antiplatelet effect of clopidogrel possibly reduced by **carbamazepine** and **oxcarbazepine**
- Antifungals: antiplatelet effect of clopidogrel possibly reduced by **fluconazole**, **itraconazole** and **voriconazole**
- Antivirals: antiplatelet effect of clopidogrel possibly reduced by **etravirine**
- Dipyridamole: increased risk of bleeding when clopidogrel given with **dipyridamole**
- Iloprost: increased risk of bleeding when clopidogrel given with **iloprost**
- Prasugrel: possible increased risk of bleeding when clopidogrel given with **prasugrel**
- Ulcer-healing Drugs: antiplatelet effect of clopidogrel possibly reduced by **cimetidine**, **lansoprazole**, **panoprazole** and **rabeprazole**; antiplatelet effect of clopidogrel reduced by **esomeprazole** and **omeprazole**

**Clozapine** *see* Antipsychotics**Co-amoxiclav** *see* Penicillins**Co-beneldopa** *see* Levodopa**Cobicistat**

- Alpha-blockers: cobicistat possibly increases plasma concentration of **alfuzosin**—manufacturer of cobicistat advises avoid concomitant use

**Cobicistat** (*continued*)

- Anti-arrhythmics: cobicistat possibly increases plasma concentration of **amiodarone**—manufacturer of cobicistat advises avoid concomitant use
- Antibacterials: plasma concentration of cobicistat reduced by **rifabutin** (adjust dose—consult product literature); plasma concentration of cobicistat possibly reduced by **rifampicin**—manufacturer of cobicistat advises avoid concomitant use
- Anticoagulants: cobicistat possibly enhances anticoagulant effect of **rivaroxaban**—avoid concomitant use
- Antidepressants: plasma concentration of cobicistat possibly reduced by **St John's wort**—manufacturer of cobicistat advises avoid concomitant use
- Antiepileptics: plasma concentration of cobicistat possibly reduced by **carbamazepine**, **phenobarbital** and **phenytoin**—manufacturer of cobicistat advises avoid concomitant use
- Antifungals: cobicistat possibly increases plasma concentration of **itraconazole**—manufacturer of cobicistat advises reduce dose of itraconazole
- Antipsychotics: cobicistat possibly increases plasma concentration of **pimozide**—manufacturer of cobicistat advises avoid concomitant use
- Antivirals: manufacturer of cobicistat advises avoid concomitant use with **boceprevir**; cobicistat possibly increases plasma concentration of **maraviroc** (reduce dose of maraviroc); avoidance of cobicistat advised by manufacturer of **nevirapine**
- Anxiolytics and Hypnotics: manufacturer of cobicistat advises avoid concomitant use with **oral midazolam**
- Bosentan: manufacturer of cobicistat advises avoid concomitant use with **bosentan**
- Cardiac Glycosides: cobicistat possibly increases plasma concentration of **digoxin**—reduce initial dose of digoxin
- Domperidone: possible increased risk of ventricular arrhythmias when cobicistat given with **domperidone**—avoid concomitant use
- Ergot Alkaloids: cobicistat possibly increases plasma concentration of **ergot alkaloids**—manufacturer of cobicistat advises avoid concomitant use
- Lipid-regulating Drugs: cobicistat possibly increases plasma concentration of **atorvastatin**—manufacturer of cobicistat advises reduce dose of atorvastatin; manufacturer of cobicistat advises avoid concomitant use with **simvastatin**
- Oestrogens: cobicistat accelerates metabolism of **oestrogens** (reduced contraceptive effect—see p. 536)
- Progestogens: cobicistat increases plasma concentration of **norgestimate**
- Sildenafil: cobicistat possibly increases plasma concentration of **sildenafil**—manufacturer of cobicistat advises avoid concomitant use of sildenafil for pulmonary arterial hypertension or reduce dose of sildenafil for erectile dysfunction—consult cobicistat product literature
- Sympathomimetics, Beta<sub>2</sub>: manufacturer of cobicistat advises avoid concomitant use with **salmeterol**
- Tadalafil: cobicistat possibly increases plasma concentration of **tadalafil**—manufacturer of cobicistat advises reduce dose of tadalafil (consult cobicistat product literature)
- Vardenafil: cobicistat possibly increases plasma concentration of **vardenafil**—manufacturer of cobicistat advises reduce dose of vardenafil (consult cobicistat product literature)

**Co-careldopa** *see* Levodopa**Codeine** *see* Opioid Analgesics**Co-fluampicil** *see* Penicillins**Colchicine**

- Anti-arrhythmics: possible increased risk of colchicine toxicity when given with **amiodarone**

**Colchicine** (continued)

- Antibacterials: possible increased risk of colchicine toxicity when given with ●**azithromycin**, ●**clarithromycin**, ●**erythromycin** and ●**telithromycin**—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Antifungals: possible increased risk of colchicine toxicity when given with ●**itraconazole**—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Antivirals: possible increased risk of colchicine toxicity when given with ●**atazanavir**, ●**indinavir**, ●**ritonavir** and ●**telaprevir**—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Calcium-channel Blockers: possible increased risk of colchicine toxicity when given with ●**diltiazem** and ●**verapamil**—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Cardiac Glycosides: possible increased risk of myopathy when colchicine given with ●**digoxin**
- Cyclosporin: possible increased risk of nephrotoxicity and myotoxicity when colchicine given with ●**cyclosporin**—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Grapefruit Juice: possible increased risk of colchicine toxicity when given with ●**grapefruit juice**
- Lipid-regulating Drugs: possible increased risk of myopathy when colchicine given with ●**fibrates** or ●**statins**

**Colesevelam**

**Note** Other drugs should be taken at least 4 hours before or after colestevlam to reduce possible interference with absorption

Antidiabetics: colestevlam reduces absorption of **glibenclamide** and **glipizide**; colestevlam reduces absorption of **glimepiride**—manufacturer of glimepiride advises give at least 4 hours before colestevlam; manufacturer of canagliflozin advises give bile acid sequestrants at least 1 hour after or 4–6 before **canagliflozin**

Antiepileptics: colestevlam possibly reduces absorption of **phenytoin**

- Cyclosporin: colestevlam reduces absorption of ●**cyclosporin**
- Lipid-regulating Drugs: bile acid sequestrants possibly reduce absorption of **lomitapide** (give at least 4 hours apart)
- Oestrogens: colestevlam reduces absorption of **ethinylestradiol**
- Thyroid Hormones: colestevlam reduces absorption of **levothyroxine**

**Colestilan**

**Note** Other drugs should be taken at least 1 hour before or 3 hours after colestilan to reduce possible interference with absorption

Cyclosporin: manufacturer of colestilan advises give **cyclosporin** at least 1 hour before or 3 hours after colestilan

Mycophenolate: manufacturer of colestilan advises give **mycophenolate** at least 1 hour before or 3 hours after colestilan

Tacrolimus: manufacturer of colestilan advises give **tacrolimus** at least 1 hour before or 3 hours after colestilan

Thyroid Hormones: manufacturer of colestilan advises give **levothyroxine** at least 1 hour before or 3 hours after colestilan

**Colestipol**

**Note** Other drugs should be taken at least 1 hour before or 4–6 hours after colestipol to reduce possible interference with absorption

Antibacterials: colestipol possibly reduces absorption of **tetracycline**

**Colestipol** (continued)

Antidiabetics: manufacturer of canagliflozin advises give bile acid sequestrants at least 1 hour after or 4–6 before **canagliflozin**

Bile Acids: colestipol possibly reduces absorption of **bile acids**

Cardiac Glycosides: colestipol possibly reduces absorption of **cardiac glycosides**

Diuretics: colestipol reduces absorption of **thiazides and related diuretics** (give at least 2 hours apart)

Lipid-regulating Drugs: bile acid sequestrants possibly reduce absorption of **lomitapide** (give at least 4 hours apart)

Thyroid Hormones: colestipol reduces absorption of **thyroid hormones**

**Colestyramine**

**Note** Other drugs should be taken at least 1 hour before or 4–6 hours after colestyramine to reduce possible interference with absorption

Analgesics: colestyramine increases the excretion of **meloxicam**; colestyramine reduces absorption of **paracetamol**

Antibacterials: colestyramine possibly reduces absorption of **tetracycline**; colestyramine antagonises effects of **oral vancomycin**

- Anticoagulants: colestyramine may enhance or reduce anticoagulant effect of ●**coumarins** and ●**phenindione**

Antidiabetics: colestyramine possibly enhances hypoglycaemic effect of **acarbose**; manufacturer of canagliflozin advises give bile acid sequestrants at least 1 hour after or 4–6 before **canagliflozin**

Antiepileptics: colestyramine possibly reduces absorption of **valproate**

Bile Acids: colestyramine possibly reduces absorption of **bile acids**

Cardiac Glycosides: colestyramine possibly reduces absorption of **cardiac glycosides**

Diuretics: colestyramine reduces absorption of **thiazides and related diuretics** (give at least 2 hours apart)

Leflunomide: colestyramine significantly decreases effect of **leflunomide** (enhanced elimination)—avoid unless drug elimination desired

Lipid-regulating Drugs: bile acid sequestrants possibly reduce absorption of **lomitapide** (give at least 4 hours apart)

Mycophenolate: colestyramine reduces absorption of **mycophenolate**

Raloxifene: colestyramine reduces absorption of **raloxifene** (manufacturer of raloxifene advises avoid concomitant administration)

Teriflunomide: colestyramine significantly decreases effect of **teriflunomide** (enhanced elimination)—avoid unless drug elimination desired

Thyroid Hormones: colestyramine reduces absorption of **thyroid hormones**

Vitamins: colestyramine possibly reduces absorption of **calcitriol** (give at least 1 hour before or 4 to 6 hours after colestyramine)

**Colistimethate Sodium** *see* Polymyxins**Contraceptives, oral** *see* Oestrogens and Progestogens**Corticosteroids**

**Note** Interactions do not generally apply to corticosteroids used for topical action (including inhalation) unless specified  
ACE Inhibitors: corticosteroids antagonise hypotensive effect of **ACE inhibitors**

Adrenergic Neurone Blockers: corticosteroids antagonise hypotensive effect of **adrenergic neurone blockers**

- Aldesleukin: avoidance of corticosteroids advised by manufacturer of ●**aldesleukin**

Alpha-blockers: corticosteroids antagonise hypotensive effect of **alpha-blockers**

Analgesics: increased risk of gastro-intestinal bleeding and ulceration when corticosteroids given with

**Corticosteroids**Analgesics (*continued*)

NSAIDs; increased risk of gastro-intestinal bleeding and ulceration when corticosteroids given with **aspirin**, also corticosteroids reduce plasma concentration of salicylate

Angiotensin-II Receptor Antagonists: corticosteroids antagonise hypotensive effect of **angiotensin-II receptor antagonists**

Antacids: absorption of deflazacort reduced by **antacids**

- Antibacterials: plasma concentration of methylprednisolone possibly increased by **clarithromycin**; metabolism of corticosteroids possibly inhibited by **erythromycin**; metabolism of methylprednisolone inhibited by **erythromycin**; corticosteroids possibly reduce plasma concentration of **isoniazid**; metabolism of corticosteroids accelerated by **rifamycins** (reduced effect)
- Anticoagulants: corticosteroids may enhance or reduce anticoagulant effect of **coumarins** (high-dose corticosteroids enhance anticoagulant effect); corticosteroids may enhance or reduce anticoagulant effect of **phenindione**
- Antidiabetics: corticosteroids antagonise hypoglycaemic effect of **antidiabetics**
- Antiepileptics: metabolism of corticosteroids accelerated by **carbamazepine**, **phenobarbital** and **phenytoin** (reduced effect)
- Antifungals: increased risk of hypokalaemia when corticosteroids given with **amphotericin**—avoid concomitant use unless corticosteroids needed to control reactions; metabolism of corticosteroids and methylprednisolone possibly inhibited by **itraconazole**; plasma concentration of *inhaled* and *oral* (and possibly also *intranasal* and *rectal*) budesonide increased by **itraconazole**; plasma concentration of *inhaled* fluticasone increased by **itraconazole**; dexamethasone possibly reduces plasma concentration of **caspofungin**—consider increasing dose of caspofungin
- Antivirals: dexamethasone possibly reduces plasma concentration of **indinavir**, **lopinavir**, **saquinavir** and **telaprevir**; avoidance of dexamethasone (except when given as a single dose) advised by manufacturer of **rilpivirine**; plasma concentration of *inhaled* and *intranasal* fluticasone increased by **ritonavir**—increased risk of adrenal suppression; plasma concentration of budesonide (including *inhaled*, *intranasal*, and *rectal* budesonide) possibly increased by **ritonavir**—increased risk of adrenal suppression; plasma concentration of corticosteroids possibly increased by **ritonavir**—increased risk of adrenal suppression; plasma concentration of *inhaled* and *intranasal* budesonide and fluticasone possibly increased by **telaprevir**
- Appetitant: metabolism of dexamethasone and methylprednisolone inhibited by **aprepitant** (reduce dose of dexamethasone and methylprednisolone)
- Beta-blockers: corticosteroids antagonise hypotensive effect of **beta-blockers**
- Calcium Salts: corticosteroids reduce absorption of **calcium salts**
- Calcium-channel Blockers: corticosteroids antagonise hypotensive effect of **calcium-channel blockers**; plasma concentration of methylprednisolone increased by **diltiazem**
- Cardiac Glycosides: increased risk of hypokalaemia when corticosteroids given with **cardiac glycosides**
- Ciclosporin: high-dose methylprednisolone increases plasma concentration of **ciclosporin** (risk of convulsions); plasma concentration of prednisolone increased by **ciclosporin**
- Clonidine: corticosteroids antagonise hypotensive effect of **clonidine**

**Corticosteroids (continued)**

Cytotoxics: possible increased risk of hepatotoxicity when dexamethasone given with **high-dose methotrexate**; dexamethasone possibly decreases plasma concentration of **axitinib** (increase dose of axitinib—consult axitinib product literature)

Diazoxide: corticosteroids antagonise hypotensive effect of **diazoxide**

Diuretics: corticosteroids antagonise diuretic effect of **diuretics**; increased risk of hypokalaemia when corticosteroids given with **acetazolamide**, **loop diuretics** or **thiazides** and related diuretics

Histamine: avoidance of corticosteroids advised by manufacturer of **histamine**

Methylidopa: corticosteroids antagonise hypotensive effect of **methylidopa**

Mifamurtide: avoidance of corticosteroids advised by manufacturer of **mifamurtide**

Mifepristone: effect of corticosteroids (including *inhaled* corticosteroids) may be reduced for 3–4 days after **mifepristone**

Moxonidine: corticosteroids antagonise hypotensive effect of **moxonidine**

Muscle Relaxants: corticosteroids possibly antagonise effects of **pancuronium** and **vecuronium**

Nitrates: corticosteroids antagonise hypotensive effect of **nitrates**

Oestrogens: plasma concentration of corticosteroids increased by oral contraceptives containing **oestrogens**

Sodium Benzoate: corticosteroids possibly reduce effects of **sodium benzoate**

Sodium Phenylbutyrate: corticosteroids possibly reduce effects of **sodium phenylbutyrate**

Somatropin: corticosteroids may inhibit growth-promoting effect of **somatropin**

Sympathomimetics: metabolism of dexamethasone accelerated by **ephedrine**

Sympathomimetics, Beta<sub>2</sub>: increased risk of hypokalaemia when corticosteroids given with high doses of **beta<sub>2</sub> sympathomimetics**—see Hypokalaemia, p. 186

Theophylline: increased risk of hypokalaemia when corticosteroids given with **theophylline**

Ticagrelor: dexamethasone possibly reduces plasma concentration of **ticagrelor**

- Vaccines: high doses of corticosteroids impair immune response to **vaccines**, avoid concomitant use with live vaccines (see p. 828)

Vasodilator Antihypertensives: corticosteroids antagonise hypotensive effect of **hydralazine**, **minoxidil** and **sodium nitroprusside**

**Co-trimoxazole** see Trimethoprim and Sulfamethoxazole

**Coumarins**

**Note** Change in patient's clinical condition, particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption may also affect anticoagulant control

- Alcohol: anticoagulant control with coumarins may be affected by major changes in consumption of **alcohol**
- Allopurinol: anticoagulant effect of coumarins possibly enhanced by **allopurinol**
- Anabolic Steroids: anticoagulant effect of coumarins enhanced by **anabolic steroids**
- Analgesics: anticoagulant effect of coumarins possibly enhanced by **NSAIDs**; increased risk of haemorrhage when anticoagulants given with **intravenous diclofenac** (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with **ketorolac** (avoid concomitant use, including low-dose heparins); anticoagulant effect of coumarins enhanced by

## Coumarins

- Analgesics (*continued*)
    - **tramadol**; increased risk of bleeding when coumarins given with ● **aspirin** (due to antiplatelet effect); anticoagulant effect of coumarins possibly enhanced by prolonged regular use of **paracetamol**
  - Anti-arrhythmics: metabolism of coumarins inhibited by ● **amiodarone** (enhanced anticoagulant effect); anticoagulant effect of warfarin may be enhanced or reduced by **disopyramide**; anticoagulant effect of coumarins possibly enhanced by ● **dronedarone**; anticoagulant effect of coumarins enhanced by ● **propafenone**
  - Antibacterials: experience in anticoagulant clinics suggests that INR possibly altered when coumarins are given with ● **neomycin** (given for local action on gut); anticoagulant effect of coumarins possibly enhanced by ● **azithromycin**, ● **aztreonam**, ● **cephalosporins**, **ciprofloxacin**, **levofloxacin**, ● **tetracyclines**, **tigecycline** and **trimethoprim**; anticoagulant effect of coumarins enhanced by ● **chloramphenicol**, ● **clarithromycin**, ● **erythromycin**, ● **metronidazole**, ● **nalidixic acid**, ● **norfloxacin**, ● **ofloxacin** and ● **sulfonamides**; an interaction between coumarins and broad-spectrum **penicillins** has not been demonstrated in studies, but common experience in anticoagulant clinics is that INR can be altered; metabolism of coumarins accelerated by ● **rifamycins** (reduced anticoagulant effect)
  - Anticoagulants: increased risk of haemorrhage when other anticoagulants given with ● **apixaban**, ● **dabigatran** and ● **rivaroxaban** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
  - Antidepressants: anticoagulant effect of warfarin possibly enhanced by ● **venlafaxine**; anticoagulant effect of warfarin may be enhanced or reduced by **trazodone**; anticoagulant effect of coumarins possibly enhanced by ● **SSRIs**; anticoagulant effect of coumarins reduced by ● **St John's wort** (avoid concomitant use); anticoagulant effect of warfarin enhanced by **mirtazapine**; anticoagulant effect of coumarins may be enhanced or reduced by ● **tricyclics**
  - Antidiabetics: anticoagulant effect of warfarin possibly enhanced by **exenatide**; coumarins possibly enhance hypoglycaemic effect of ● **sulfonylureas**, also possible changes to anticoagulant effect
  - Antiepileptics: metabolism of coumarins accelerated by ● **carbamazepine** and ● **phenobarbital** (reduced anticoagulant effect); plasma concentration of warfarin reduced by ● **eslicarbazepine**; metabolism of coumarins accelerated by ● **phenytoin** (possibility of reduced anticoagulant effect, but enhancement also reported); anticoagulant effect of coumarins possibly enhanced by **valproate**
  - Antifungals: anticoagulant effect of coumarins enhanced by ● **miconazole** (miconazole oral gel and possibly vaginal and topical formulations absorbed); anticoagulant effect of coumarins enhanced by ● **fluconazole**, ● **itraconazole** and ● **voriconazole**; anticoagulant effect of coumarins reduced by ● **griseofulvin**
- Antimalarials: isolated reports that anticoagulant effect of warfarin may be enhanced by **proguanil**; plasma concentration of both drugs increased when warfarin given with **quinine**
- Antivirals: anticoagulant effect of warfarin may be enhanced or reduced by **atazanavir**, ● **nevirapine** and ● **ritonavir**; plasma concentration of coumarins possibly affected by ● **efavirenz**; anticoagulant effect of coumarins may be enhanced or reduced by **fosamprenavir**; anticoagulant effect of coumarins possibly enhanced by ● **ritonavir**; anticoagulant effect of warfarin possibly enhanced by **saquinavir**;

## Coumarins

- Antivirals (*continued*)
  - plasma concentration of warfarin possibly affected by ● **telaprevir**
- Anxiolytics and Hypnotics: anticoagulant effect of coumarins may transiently be enhanced by **chloral**
- Aprepitant: anticoagulant effect of warfarin possibly reduced by **aprepitant**
- Azathioprine: anticoagulant effect of coumarins possibly reduced by ● **azathioprine**
- Bosentan: monitoring anticoagulant effect of coumarins recommended by manufacturer of **bosentan**
- Clopidogrel: anticoagulant effect of coumarins enhanced due to antiplatelet action of ● **clopidogrel**; avoidance of warfarin advised by manufacturer of ● **clopidogrel**
- Corticosteroids: anticoagulant effect of coumarins may be enhanced or reduced by ● **corticosteroids** (high-dose corticosteroids enhance anticoagulant effect)
- Cranberry Juice: anticoagulant effect of coumarins possibly enhanced by ● **cranberry juice**—avoid concomitant use
- Cytotoxics: anticoagulant effect of coumarins possibly enhanced by ● **etoposide**, ● **ifosfamide** and ● **sorafenib**; anticoagulant effect of coumarins enhanced by ● **fluorouracil**; anticoagulant effect of warfarin possibly enhanced by ● **gefinitib**, **gemcitabine** and ● **vemurafenib**; anticoagulant effect of coumarins possibly reduced by ● **mercaptopurine** and ● **mitotane**; increased risk of bleeding when coumarins given with ● **erlotinib**; replacement of warfarin with a heparin advised by manufacturer of **imatinib** (possibility of enhanced warfarin effect); increased risk of bleeding when warfarin given with ● **regorafenib**
- Dipyridamole: anticoagulant effect of coumarins enhanced due to antiplatelet action of ● **dipyridamole**
- Disulfiram: anticoagulant effect of coumarins enhanced by ● **disulfiram**
- Dopaminergics: anticoagulant effect of warfarin enhanced by ● **entacapone**
- Enteral Foods: anticoagulant effect of coumarins antagonised by vitamin K (present in some ● **enteral feeds**)
- Glucosamine: anticoagulant effect of warfarin enhanced by ● **glucosamine** (avoid concomitant use)
- Hormone Antagonists: anticoagulant effect of coumarins possibly enhanced by **bicalutamide** and ● **torsemide**; metabolism of coumarins inhibited by ● **danzol** (enhanced anticoagulant effect); plasma concentration of coumarins possibly reduced by ● **enzalutamide**; anticoagulant effect of coumarins enhanced by ● **flutamide** and ● **tamoxifen**
- Iloprost: anticoagulant effect of coumarins possibly enhanced by **iloprost**
- Lactulose: anticoagulant effect of coumarins possibly enhanced by **lactulose**
- Leflunomide: anticoagulant effect of warfarin possibly enhanced by **leflunomide**
- Leukotriene Receptor Antagonists: anticoagulant effect of warfarin enhanced by **zafirlukast**
- Levamisole: anticoagulant effect of warfarin possibly enhanced by ● **levamisole**
- Levocarnitine: anticoagulant effect of coumarins possibly enhanced by **levocarnitine**
- Lipid-regulating Drugs: anticoagulant effect of coumarins may be enhanced or reduced by ● **colestyramine**; anticoagulant effect of warfarin may be transiently reduced by **atorvastatin**; anticoagulant effect of coumarins enhanced by ● **fibrates**, ● **fluvastatin** and **simvastatin**; anticoagulant effect of coumarins possibly enhanced by **ezetimibe** and ● **rosuvastatin**; anticoagulant effect of warfarin possibly enhanced by **lomitapide**

**Coumarins** (continued)

- Memantine: anticoagulant effect of warfarin possibly enhanced by **memantine**
- Oestrogens: anticoagulant effect of coumarins may be enhanced or reduced by **oestrogens**
- Orlistat: monitoring anticoagulant effect of coumarins recommended by manufacturer of **orlistat**
- Prasugrel: possible increased risk of bleeding when coumarins given with **prasugrel**
- Progestogens: anticoagulant effect of coumarins may be enhanced or reduced by **progestogens**
- Raloxifene: anticoagulant effect of coumarins antagonised by **raloxifene**
- Retinoids: anticoagulant effect of coumarins possibly reduced by **acitretin**
  - Sulfinpyrazone: anticoagulant effect of coumarins enhanced by **sulfinpyrazone**
  - Sympathomimetics: anticoagulant effect of coumarins possibly enhanced by **methyphenidate**
  - Testolactone: anticoagulant effect of coumarins enhanced by **testolactone**
  - Testosterone: anticoagulant effect of coumarins enhanced by **testosterone**
  - Thyroid Hormones: anticoagulant effect of coumarins enhanced by **thyroid hormones**
- Ubidecarenone: anticoagulant effect of warfarin may be enhanced or reduced by **ubidecarenone**
- Ulcer-healing Drugs: metabolism of coumarins inhibited by **cimetidine** (enhanced anticoagulant effect); anticoagulant effect of coumarins possibly enhanced by **esomeprazole** and **omeprazole**; anticoagulant effect of coumarins might be enhanced by **pantoprazole**; absorption of coumarins possibly reduced by **sucralfate** (reduced anticoagulant effect)
- Vaccines: anticoagulant effect of warfarin possibly enhanced by **influenza vaccine**
- Vitamins: anticoagulant effect of coumarins possibly enhanced by **vitamin E**; anticoagulant effect of coumarins antagonised by **vitamin K**

**Cranberry Juice**

- Anticoagulants: cranberry juice possibly enhances anticoagulant effect of **coumarins**—avoid concomitant use

**Crizotinib**

- Analgesics: manufacturer of crizotinib advises caution with **alfentanil** and **fentanyl**
- Antibacterials: plasma concentration of crizotinib possibly increased by **clarithromycin** and **telithromycin**—manufacturer of crizotinib advises avoid concomitant use; plasma concentration of crizotinib possibly reduced by **rifabutin**—manufacturer of crizotinib advises avoid concomitant use; plasma concentration of crizotinib reduced by **rifampicin**—manufacturer of crizotinib advises avoid concomitant use
- Antidepressants: plasma concentration of crizotinib possibly reduced by **St John's wort**—manufacturer of crizotinib advises avoid concomitant use
- Antiepileptics: plasma concentration of crizotinib possibly reduced by **carbamazepine**, **phenobarbital** and **phenytoin**—manufacturer of crizotinib advises avoid concomitant use
- Antifungals: plasma concentration of crizotinib possibly increased by **itraconazole** and **voriconazole**—manufacturer of crizotinib advises avoid concomitant use
- Antimalarials: possible increased risk of bradycardia when crizotinib given with **mefloquine**
- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis); manufacturer of crizotinib advises caution with **pimozide**
- Antivirals: plasma concentration of crizotinib possibly increased by **atazanavir**, **indinavir**, **ritonavir** and **saquinavir**—manufacturer of crizotinib advises avoid concomitant use

**Crizotinib** (continued)

- Anxiolytics and Hypnotics: crizotinib increases plasma concentration of **midazolam**
  - Beta-blockers: possible increased risk of bradycardia when crizotinib given with **beta-blockers**
  - Calcium-channel Blockers: possible increased risk of bradycardia when crizotinib given with **diltiazem** or **verapamil**
  - Cardiac Glycosides: possible increased risk of bradycardia when crizotinib given with **digoxin**
  - Ciclosporin: manufacturer of crizotinib advises caution with **ciclosporin**
  - Clonidine: possible increased risk of bradycardia when crizotinib given with **clonidine**
  - Ergot Alkaloids: manufacturer of crizotinib advises caution with **ergot alkaloids**
  - Grapefruit Juice: plasma concentration of crizotinib possibly increased by **grapefruit juice**—manufacturer of crizotinib advises avoid concomitant use
  - Oestrogens: manufacturer of crizotinib advises contraceptive effect of **oestrogens** possibly reduced
  - Parasympathomimetics: possible increased risk of bradycardia when crizotinib given with **pilocarpine**
  - Progestogens: manufacturer of crizotinib advises contraceptive effect of **progestogens** possibly reduced
  - Sirolimus: manufacturer of crizotinib advises caution with **sirolimus**
  - Tacrolimus: manufacturer of crizotinib advises caution with **tacrolimus**
- Cyclizine** *see* Antihistamines
- Cyclophosphamide** *see* Diuretics
- Cyclopentolate** *see* Antimuscarinics
- Cyclophosphamide**
- Antifungals: side-effects of cyclophosphamide possibly increased by **fluconazole** and **itraconazole**
- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Cardiac Glycosides: cyclophosphamide possibly reduces absorption of **digoxin tablets**
- Cytotoxics: increased toxicity when high-dose cyclophosphamide given with **pentostatin**—avoid concomitant use
- Muscle Relaxants: cyclophosphamide enhances effects of **suxamethonium**
- Cycloserine**
- Alcohol: increased risk of convulsions when cycloserine given with **alcohol**
- Antibacterials: increased risk of CNS toxicity when cycloserine given with **isoniazid**
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—*see* p. 850
- Cyproheptadine** *see* Antihistamines
- Cytarabine**
- Antifungals: cytarabine possibly reduces plasma concentration of **flucytosine**
- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Cardiac Glycosides: cytarabine possibly reduces absorption of **digoxin tablets**
- Cytotoxics: intracellular concentration of cytarabine increased by **fludarabine**
- Cytotoxics** *see* individual drugs
- Dabigatran**
- Analgesics: possible increased risk of bleeding when dabigatran given with **NSAIDs**; increased risk of haemorrhage when anticoagulants given with **intravenous diclofenac** (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with **ketorolac** (avoid concomitant use, including low-dose heparins)
  - Anti-arrhythmics: plasma concentration of dabigatran increased by **amiodarone** (*see* Dose under Dabigatran, p. 154); plasma concentration of dabigatran increased by **dronedrone**—avoid concomitant use

**Dabigatran** (continued)

- **Antibacterials:** possible increased risk of bleeding when dabigatran given with **clarithromycin**; plasma concentration of dabigatran reduced by **rifampicin**—manufacturer of dabigatran advises avoid concomitant use
- **Anticoagulants:** increased risk of haemorrhage when dabigatran given with other **anticoagulants** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency); increased risk of haemorrhage when other anticoagulants given with **apixaban** and **rivaroxaban** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- **Antidepressants:** possible increased risk of bleeding when dabigatran given with **SSRI-related antidepressants** or **SSRIs**; plasma concentration of dabigatran possibly reduced by **St John's wort**—manufacturer of dabigatran advises avoid concomitant use
- **Antiepileptics:** plasma concentration of dabigatran possibly reduced by **carbamazepine** and **phenytoin**—manufacturer of dabigatran advises avoid concomitant use
- **Antifungals:** manufacturer of dabigatran advises avoid concomitant use with **itraconazole**
- **Antivirals:** plasma concentration of dabigatran possibly increased by **rilpivirine** and **telaprevir**
- **Calcium-channel Blockers:** plasma concentration of dabigatran possibly increased by **verapamil** (see Dose under Dabigatran, p. 154)
- **Ciclosporin:** plasma concentration of dabigatran possibly increased by **ciclosporin**—manufacturer of dabigatran advises avoid concomitant use
- **Sulfinpyrazone:** possible increased risk of bleeding when dabigatran given with **sulfinpyrazone**
- **Tacrolimus:** plasma concentration of dabigatran possibly increased by **tacrolimus**—manufacturer of dabigatran advises avoid concomitant use
- **Ticagrelor:** plasma concentration of dabigatran increased by **ticagrelor**
- **Ulipristal:** manufacturer of ulipristal advises give dabigatran at least 1.5 hours before or after **ulipristal**

**Dabrafenib**

- **Antibacterials:** manufacturer of dabrafenib advises avoid concomitant use with **rifampicin**
- **Antidepressants:** manufacturer of dabrafenib advises avoid concomitant use with **St John's wort**
- **Antiepileptics:** manufacturer of dabrafenib advises avoid concomitant use with **carbamazepine**, **phenobarbital** and **phenytoin**
- **Antipsychotics:** avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- **Oestrogens:** manufacturer of dabrafenib advises contraceptive effect of hormonal contraceptives containing **oestrogens** possibly reduced (alternative contraceptive recommended)
- **Progestogens:** manufacturer of dabrafenib advises contraceptive effect of hormonal contraceptives containing **progestogens** possibly reduced (alternative contraceptive recommended)
- **Ulcer-healing Drugs:** manufacturer of dabrafenib advises avoid concomitant use with **proton pump inhibitors** (plasma concentration of dabrafenib possibly reduced)

**Dacarbazine**

- **Aldesleukin:** avoidance of dacarbazine advised by manufacturer of **aldesleukin**
- **Antipsychotics:** avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)

**Dairy Products**

- **Antibacterials:** dairy products reduce absorption of **ciprofloxacin** and **norfloxacin**; dairy products reduce absorption of **tetracyclines** (except doxycycline and minocycline)

**Dairy Products** (continued)

Cytotoxics: dairy products possibly reduce plasma concentration of **mercaptopurine**—manufacturer of mercaptopurine advises give at least 1 hour before or 2 hours after dairy products

Eltrombopag: dairy products possibly reduce absorption of **eltrombopag** (give at least 4 hours apart)

**Dalteparin** *see* Heparins**Danazol**

- **Anticoagulants:** danazol inhibits metabolism of **coumarins** (enhanced anticoagulant effect)
- **Antiepileptics:** danazol inhibits metabolism of **carbamazepine** (increased risk of toxicity)
- **Ciclosporin:** danazol inhibits metabolism of **ciclosporin** (increased plasma concentration)
- **Lipid-regulating Drugs:** possible increased risk of myopathy when danazol given with **simvastatin**—avoid concomitant use

Tacrolimus: danazol possibly increases plasma concentration of **tacrolimus**

**Dantrolene** *see* Muscle Relaxants**Dapagliflozin** *see* Antidiabetics**Dapoxetine**

- **Alcohol:** increased sedative effect when dapoxetine given with **alcohol**
- **Analgesics:** possible increased risk of serotonergic effects when dapoxetine given with **tramadol** (manufacturer of dapoxetine advises tramadol should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping tramadol)
- **Antibacterials:** manufacturer of dapoxetine advises dose reduction when dapoxetine given with **clarithromycin** and **erythromycin** (see Dose under Dapoxetine, p. 560); manufacturer of dapoxetine advises avoid concomitant use with **telithromycin** (increased risk of toxicity)
- **Antidepressants:** possible increased risk of serotonergic effects when dapoxetine given with **SSRIs**, **St John's wort**, **duloxetine**, **tricyclics** and **venlafaxine** (manufacturer of dapoxetine advises SSRIs, St John's wort, duloxetine, tricyclics and venlafaxine should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping SSRIs, St John's wort, duloxetine, tricyclics and venlafaxine); increased risk of serotonergic effects when dapoxetine given with **MAOIs** (MAOIs should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping MAOIs)
- **Antifungals:** manufacturer of dapoxetine advises dose reduction when dapoxetine given with **fluconazole** (see Dose under Dapoxetine, p. 560); manufacturer of dapoxetine advises avoid concomitant use with **itraconazole** (increased risk of toxicity)
- **Antivirals:** manufacturer of dapoxetine advises avoid concomitant use with **atazanavir**, **ritonavir** and **saquinavir** (increased risk of toxicity); manufacturer of dapoxetine advises dose reduction when dapoxetine given with **fosamprenavir** (see Dose under Dapoxetine, p. 560)
- **Appetitant:** manufacturer of dapoxetine advises dose reduction when dapoxetine given with **aprepitant** (see Dose under Dapoxetine, p. 560)
- **Calcium-channel Blockers:** manufacturer of dapoxetine advises dose reduction when dapoxetine given with **diltiazem** and **verapamil** (see Dose under Dapoxetine, p. 560)
- **5HT<sub>1</sub>-receptor Agonists:** possible increased risk of serotonergic effects when dapoxetine given with **5HT<sub>1</sub> agonists** (manufacturer of dapoxetine advises 5HT<sub>1</sub> agonists should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping 5HT<sub>1</sub> agonists)
- **Lithium:** possible increased risk of serotonergic effects when dapoxetine given with **lithium** (manufacturer

**Dapoxetine**

- Lithium (*continued*)  
of dapoxetine advises lithium should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping lithium)
- Sildenafil: manufacturer of dapoxetine advises avoid concomitant use with **sildenafil**
- Tadalafil: manufacturer of dapoxetine advises avoid concomitant use with **tadalafil**
- Vardenafil: manufacturer of dapoxetine advises avoid concomitant use with **vardenafil**

**Dapsone**

- Antibacterials: plasma concentration of dapsone reduced by **rifamycins**; plasma concentration of both drugs may increase when dapsone given with **trimethoprim**
- Antivirals: increased risk of ventricular arrhythmias when dapsone given with **saquinavir**—avoid concomitant use
- Probenecid: excretion of dapsone reduced by **probenecid** (increased risk of side-effects)
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 850

**Daptomycin**

- Ciclosporin: increased risk of myopathy when daptomycin given with **ciclosporin** (preferably avoid concomitant use)
- Lipid-regulating Drugs: increased risk of myopathy when daptomycin given with **fibrates** or **statins** (preferably avoid concomitant use)
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 850

**Darifenacin** *see* Antimuscarinics**Darunavir**

- Anti-arrhythmics: darunavir possibly increases plasma concentration of **lidocaine**—avoid concomitant use
- Antibacterials: darunavir increases plasma concentration of **rifabutin** (reduce dose of rifabutin); plasma concentration of darunavir significantly reduced by **rifampicin**—avoid concomitant use
- Anticoagulants: avoidance of darunavir advised by manufacturer of **apixaban** and **rivaroxaban**
- Antidepressants: darunavir possibly reduces plasma concentration of **paroxetine** and **sertraline**; plasma concentration of darunavir reduced by **St John's wort**—avoid concomitant use
- Antiepileptics: plasma concentration of darunavir possibly reduced by **carbamazepine**, **phenobarbital** and **phenytoin**
- Antimalarials: darunavir increases plasma concentration of **lumefantrine**; darunavir possibly increases plasma concentration of **quinine** (increased risk of toxicity)
- Antipsychotics: darunavir possibly increases plasma concentration of **aripiprazole** (reduce dose of aripiprazole—consult aripiprazole product literature); darunavir possibly increases plasma concentration of **quetiapine**—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: avoid concomitant use of darunavir with **boceprevir** or **telaprevir**; manufacturer of darunavir advises take **didanosine** 1 hour before or 2 hours after darunavir; plasma concentration of darunavir reduced by **efavirenz** (adjust dose—consult product literature); plasma concentration of both drugs increased when darunavir given with **indinavir**; plasma concentration of darunavir reduced by **lopinavir**, also plasma concentration of lopinavir increased (avoid concomitant use); darunavir increases plasma concentration of **maraviroc** (consider reducing dose of maraviroc); increased risk of rash when darunavir given with **raltegravir**; plasma concentration of darunavir reduced by **saquinavir**
- Cytotoxics: darunavir possibly increases the plasma concentration of **bosutinib**—manufacturer of bosutinib advises avoid or consider reducing dose of

**Darunavir**

- Cytotoxics (*continued*)  
bosutinib; darunavir possibly increases plasma concentration of **everolimus**—manufacturer of everolimus advises avoid concomitant use
- Ergot Alkaloids: increased risk of ergotism when darunavir given with **ergot alkaloids**—manufacturer of darunavir advises avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when darunavir given with **atorvastatin**; darunavir possibly increases plasma concentration of **pravastatin**; darunavir increases plasma concentration of **rosuvastatin**—adjust dose of rosuvastatin (consult product literature); avoidance of darunavir advised by manufacturer of **lomitapide** (plasma concentration of lomitapide possibly increased)
- Orlistat: absorption of darunavir possibly reduced by **orlistat**
- Ranolazine: darunavir possibly increases plasma concentration of **ranolazine**—manufacturer of ranolazine advises avoid concomitant use

**Dasatinib**

- Antibacterials: metabolism of dasatinib accelerated by **rifampicin** (reduced plasma concentration—avoid concomitant use)
- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Antivirals: avoidance of dasatinib advised by manufacturer of **boceprevir**
- Lipid-regulating Drugs: dasatinib possibly increases plasma concentration of **simvastatin**
- Ulcer-healing Drugs: plasma concentration of dasatinib possibly reduced by **famotidine**

**Decitabine**

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)

**Deferasirox**

- Antacids: absorption of deferasirox possibly reduced by **antacids** containing aluminium (manufacturer of deferasirox advises avoid concomitant use)
- Antibacterials: plasma concentration of deferasirox reduced by **rifampicin**
- Antidiabetics: deferasirox increases plasma concentration of **repaglinide**
- Antipsychotics: manufacturer of deferasirox advises avoid concomitant use with **clozapine**
- Anxiolytics and Hypnotics: deferasirox possibly reduces plasma concentration of **midazolam**
- Muscle Relaxants: manufacturer of deferasirox advises avoid concomitant use with **tizanidine**
- Theophylline: deferasirox increases plasma concentration of **theophylline** (consider reducing dose of theophylline)

**Deferiprone**

- Antacids: absorption of deferiprone possibly reduced by **antacids** containing aluminium (manufacturer of deferiprone advises avoid concomitant use)

**Deflazacort** *see* Corticosteroids**Demeclocycline** *see* Tetracyclines**Desferrioxamine**

- Antipsychotics: avoidance of desferrioxamine advised by manufacturer of **levomepromazine**; manufacturer of desferrioxamine advises avoid concomitant use with **prochlorperazine**

**Desflurane** *see* Anaesthetics, General**Desloratadine** *see* Antihistamines**Desmopressin**

- Analgesics: effects of desmopressin enhanced by **indometacin**
- Loperamide: plasma concentration of **oral** desmopressin increased by **loperamide**

**Desogestrel** *see* Progestogens**Dexamethasone** *see* Corticosteroids**Dexamfetamine** *see* Sympathomimetics**Dexibuprofen** *see* NSAIDs

**Dexketoprofen** *see* NSAIDs

**Dextromethorphan** *see* Opioid Analgesics

**Dextropropoxyphene** *see* Opioid Analgesics

**Diamorphine** *see* Opioid Analgesics

**Diazepam** *see* Anxiolytics and Hypnotics

### Diazoxide

ACE Inhibitors: enhanced hypotensive effect when diazoxide given with **ACE inhibitors**

Adrenergic Neurone Blockers: enhanced hypotensive effect when diazoxide given with **adrenergic neurone blockers**

Alcohol: enhanced hypotensive effect when diazoxide given with **alcohol**

Aldesleukin: enhanced hypotensive effect when diazoxide given with **aldesleukin**

Alpha-blockers: enhanced hypotensive effect when diazoxide given with **alpha-blockers**

Anaesthetics, General: enhanced hypotensive effect when diazoxide given with **general anaesthetics**

Analgesics: hypotensive effect of diazoxide antagonised by **NSAIDs**

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when diazoxide given with **angiotensin-II receptor antagonists**

Antidepressants: enhanced hypotensive effect when diazoxide given with **MAOIs** or **tricyclic-related antidepressants**

Antidiabetics: diazoxide antagonises hypoglycaemic effect of **antidiabetics**

Antiepileptics: diazoxide reduces plasma concentration of **phenytoin**, also effect of diazoxide may be reduced

Antipsychotics: enhanced hypotensive effect when diazoxide given with **phenothiazines**

Anxiolytics and Hypnotics: enhanced hypotensive effect when diazoxide given with **anxiolytics and hypnotics**

Beta-blockers: enhanced hypotensive effect when diazoxide given with **beta-blockers**

Calcium-channel Blockers: enhanced hypotensive effect when diazoxide given with **calcium-channel blockers**

Clonidine: enhanced hypotensive effect when diazoxide given with **clonidine**

Corticosteroids: hypotensive effect of diazoxide antagonised by **corticosteroids**

Diuretics: enhanced hypotensive and hyperglycaemic effects when diazoxide given with **diuretics**

Dopaminergics: enhanced hypotensive effect when diazoxide given with **levodopa**

Methyldopa: enhanced hypotensive effect when diazoxide given with **methyldopa**

Moxisylyte: enhanced hypotensive effect when diazoxide given with **moxisylyte**

Moxonidine: enhanced hypotensive effect when diazoxide given with **moxonidine**

Muscle Relaxants: enhanced hypotensive effect when diazoxide given with **baclofen** or **tizanidine**

Nitrates: enhanced hypotensive effect when diazoxide given with **nitrates**

Prostaglandins: enhanced hypotensive effect when diazoxide given with **alprostadil**

Vasodilator Antihypertensives: enhanced hypotensive effect when diazoxide given with **hydralazine**, **minoxidil** or **sodium nitroprusside**

**Diclofenac** *see* NSAIDs

**Dicycloverine** *see* Antimuscarinics

### Didanosine

Note Antacids in tablet formulation might affect absorption of other drugs—give at least 2 hours apart

- Allopurinol: plasma concentration of didanosine increased by **allopurinol** (risk of toxicity)—avoid concomitant use

Analgesics: plasma concentration of didanosine possibly reduced by **methadone**

### Didanosine (continued)

Antibacterials: manufacturer of norfloxacin advises give didanosine at least 2 hours before or after **norfloxacin**

- Antivirals: didanosine *tablets* reduce absorption of **atazanavir** (give at least 2 hours before or 1 hour after didanosine *tablets*); manufacturer of darunavir advises take didanosine 1 hour before or 2 hours after **darunavir**; plasma concentration of didanosine possibly increased by **ganciclovir**; didanosine *tablets* reduce absorption of **indinavir** (give at least 1 hour apart); increased risk of side-effects when didanosine given with **ribavirin**—avoid concomitant use; manufacturer of rilpivirine advises give didanosine 2 hours before or 4 hours after **rilpivirine**; manufacturer of ritonavir advises didanosine and **ritonavir** should be taken 2.5 hours apart; increased risk of side-effects when didanosine given with **stavudine**; plasma concentration of didanosine increased by **tenofovir** (increased risk of toxicity)—avoid concomitant use; plasma concentration of didanosine reduced by **tipranavir**—manufacturer of tipranavir advises tipranavir and didanosine *capsules* should be taken at least 2 hours apart
- Cytotoxics: increased risk of toxicity when didanosine given with **hydroxycarbamide**—avoid concomitant use
- Orlistat: absorption of didanosine possibly reduced by **orlistat**

**Dienogest** *see* Progestogens

**Digoxin** *see* Cardiac Glycosides

**Dihydrocodeine** *see* Opioid Analgesics

**Diltiazem** *see* Calcium-channel Blockers

### Dimethyl sulfoxide

- Analgesics: avoid concomitant use of dimethyl sulfoxide with **sulindac**

**Dinoprostone** *see* Prostaglandins

**Diphenoxylate** *see* Opioid Analgesics

**Dipipanone** *see* Opioid Analgesics

### Dipyridamole

Antacids: absorption of dipyridamole possibly reduced by **antacids**

- Anti-arrhythmics: dipyridamole enhances and extends effect of **adenosine** (important risk of toxicity)—reduce dose of adenosine, see Dose under Adenosine, p. 96
- Anticoagulants: antiplatelet action of dipyridamole enhances anticoagulant effect of **coumarins** and **phenindione**; dipyridamole enhances anticoagulant effect of **heparin**

Clopidogrel: increased risk of bleeding when dipyridamole given with **clopidogrel**

Cytotoxics: dipyridamole possibly reduces effects of **fludarabine**

### Disopyramide

Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with **bupivacaine**, **levobupivacaine**, **prilocaine** or **ropivacaine**

- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other **anti-arrhythmics**; increased risk of ventricular arrhythmias when disopyramide given with **amiodarone** or **dronedronarone**—avoid concomitant use
- Antibacterials: plasma concentration of disopyramide possibly increased by **azithromycin** (increased risk of toxicity); plasma concentration of disopyramide possibly increased by **clarithromycin** (increased risk of ventricular arrhythmias); plasma concentration of disopyramide increased by **erythromycin** (increased risk of toxicity); increased risk of ventricular arrhythmias when disopyramide given with **moxifloxacin**—avoid concomitant use; metabolism of disopyramide accelerated by **rifamycins** (reduced plasma concentration); possible increased

**Disopyramide**

- **Antibacterials** (*continued*)  
risk of ventricular arrhythmias when disopyramide given with •**telithromycin**
- **Anticoagulants**: disopyramide may enhance or reduce anticoagulant effect of **warfarin**
- **Antidepressants**: avoidance of disopyramide advised by manufacturer of •**citalopram** and •**escitalopram** (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when disopyramide given with •**tricyclics**
- **Antidiabetics**: disopyramide possibly enhances hypoglycaemic effect of **gliclazide**, **insulin** and **metformin**
- **Antiepileptics**: metabolism of disopyramide accelerated by **phenobarbital** (reduced plasma concentration); plasma concentration of disopyramide reduced by **phenytoin**
- **Antifungals**: avoidance of disopyramide advised by manufacturer of •**itraconazole**
- **Antihistamines**: increased risk of ventricular arrhythmias when disopyramide given with •**mizolastine**—avoid concomitant use
- **Antimalarials**: avoidance of disopyramide advised by manufacturer of •**piperaquine with arteminol** (possible risk of ventricular arrhythmias); avoidance of disopyramide advised by manufacturer of •**artemether with lumefantrine** (risk of ventricular arrhythmias)
- **Antimuscarinics**: increased risk of antimuscarinic side-effects when disopyramide given with **antimuscarinics**; increased risk of ventricular arrhythmias when disopyramide given with •**tolterodine**
- **Antipsychotics**: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with •**antipsychotics** that prolong the QT interval; increased risk of ventricular arrhythmias when disopyramide given with •**amisulpride**, •**droperidol**, •**pimozide** or •**zuclopentixol**—avoid concomitant use; possible increased risk of ventricular arrhythmias when disopyramide given with •**haloperidol**—avoid concomitant use; increased risk of ventricular arrhythmias when disopyramide given with •**phenothiazines** or •**sulpiride**
- **Antivirals**: plasma concentration of disopyramide possibly increased by •**ritonavir** (increased risk of toxicity); increased risk of ventricular arrhythmias when disopyramide given with •**saguinavir**—avoid concomitant use; avoidance of disopyramide advised by manufacturer of •**telaprevir** (risk of ventricular arrhythmias)
- **Atomoxetine**: increased risk of ventricular arrhythmias when disopyramide given with •**atomoxetine**
- **Beta-blockers**: increased myocardial depression when anti-arrhythmics given with •**beta-blockers**; increased risk of ventricular arrhythmias when disopyramide given with •**sotalol**—avoid concomitant use
- **Calcium-channel Blockers**: increased risk of myocardial depression and asystole when disopyramide given with •**verapamil**
- **Cytotoxics**: possible increased risk of ventricular arrhythmias when disopyramide given with •**bosutinib**; possible increased risk of ventricular arrhythmias when disopyramide given with •**vandetanib**—avoid concomitant use; increased risk of ventricular arrhythmias when disopyramide given with •**arsenic trioxide**
- **Diuretics**: increased cardiac toxicity with disopyramide if hypokalaemia occurs with •**acetazolamide**, •**loop diuretics** or •**thiazides and related diuretics**
- **Fingolimod**: possible increased risk of bradycardia when disopyramide given with **fingolimod**
- **Ivabradine**: increased risk of ventricular arrhythmias when disopyramide given with •**ivabradine**

**Disopyramide** (*continued*)

- **Nitrates**: disopyramide reduces effects of sublingual tablets of **nitrates** (failure to dissolve under tongue owing to dry mouth)
- **Pentamidine Isetionate**: possible increased risk of ventricular arrhythmias when disopyramide given with •**pentamidine isetionate**
- **Ranolazine**: avoidance of disopyramide advised by manufacturer of **ranolazine**
- **Sildenafil**: manufacturer of disopyramide advises avoid concomitant use with **sildenafil** (risk of ventricular arrhythmias)
- **Tadalafil**: manufacturer of disopyramide advises avoid concomitant use with **tadalafil** (risk of ventricular arrhythmias)
- **Vardenafil**: manufacturer of disopyramide advises avoid concomitant use with **vardenafil** (risk of ventricular arrhythmias)

**Disulfiram**

- **Alcohol**: disulfiram reaction when disulfiram given with **alcohol** (see p. 334)
- **Antibacterials**: psychotic reaction reported when disulfiram given with **metronidazole**; CNS effects of disulfiram possibly increased by **isoniazid**
- **Anticoagulants**: disulfiram enhances anticoagulant effect of •**coumarins**
- **Antidepressants**: increased disulfiram reaction with alcohol reported with concomitant **amitriptyline**; disulfiram inhibits metabolism of **tricyclics** (increased plasma concentration)
- **Antiepileptics**: disulfiram inhibits metabolism of •**phenytoin** (increased risk of toxicity)
- **Anxiolytics and Hypnotics**: disulfiram increases risk of **temazepam** toxicity; disulfiram inhibits metabolism of **benzodiazepines** (increased sedative effects)
- **Paraldehyde**: risk of toxicity when disulfiram given with •**paraldehyde**
- **Theophylline**: disulfiram inhibits metabolism of **theophylline** (increased risk of toxicity)

**Diuretics**

- **Note** Since systemic absorption may follow topical application of brinzolamide to the eye, the possibility of interactions should be borne in mind
- **Note** Since systemic absorption may follow topical application of dorzolamide to the eye, the possibility of interactions should be borne in mind
- **ACE Inhibitors**: enhanced hypotensive effect when diuretics given with •**ACE inhibitors**; increased risk of severe hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with •**ACE inhibitors**
- **Adrenergic Neurone Blockers**: enhanced hypotensive effect when diuretics given with **adrenergic neurone blockers**
- **Alcohol**: enhanced hypotensive effect when diuretics given with **alcohol**
- **Aldesleukin**: enhanced hypotensive effect when diuretics given with **aldesleukin**
- **Aliskiren**: plasma concentration of furosemide reduced by **aliskiren**; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with **aliskiren**
- **Allopurinol**: increased risk of hypersensitivity when thiazides and related diuretics given with **allopurinol** especially in renal impairment
- **Alpha-blockers**: enhanced hypotensive effect when diuretics given with •**alpha-blockers**, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
- **Anaesthetics, General**: enhanced hypotensive effect when diuretics given with **general anaesthetics**
- **Analgesics**: possible increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with **NSAIDs**; diuretics increase risk of nephrotoxicity of **NSAIDs**, also antagonism of diuretic effect; Diuretic effect of potassium can-

**Diuretics**

- Analgesics (*continued*)
    - renotate possibly antagonised by NSAIDs; furosemide possibly increases the excretion of **acemetacin**; effects of diuretics antagonised by **indometacin** and **ketorolac**; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with **indometacin**; occasional reports of reduced renal function when triamterene given with ●**indometacin**—avoid concomitant use; diuretic effect of spironolactone antagonised by **aspirin**; possible increased risk of toxicity when loop diuretics given with high-dose **aspirin** (also possible reduced effect of loop diuretics); increased risk of toxicity when acetazolamide given with high-dose ●**aspirin**
  - Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when diuretics given with ●**angiotensin-II receptor antagonists**; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with ●**angiotensin-II receptor antagonists**
  - Anti-arrhythmic: plasma concentration of eplerenone increased by **amiodarone** (reduce dose of eplerenone); hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with **amiodarone**; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with ●**disopyramide**; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with ●**flecainide**; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics antagonises action of ●**lidocaine**
  - Antibacterials: plasma concentration of eplerenone increased by ●**clarithromycin** and ●**telithromycin**—avoid concomitant use; plasma concentration of eplerenone increased by **erythromycin** (reduce dose of eplerenone); plasma concentration of eplerenone reduced by ●**rifampicin**—avoid concomitant use; avoidance of diuretics advised by manufacturer of **lymecycline**; increased risk of ototoxicity when loop diuretics given with ●**aminoglycosides**, ●**polymyxins** or ●**vancomycin**; acetazolamide antagonises effects of ●**methanamine**; possible increased risk of hyperkalaemia when spironolactone given with **trimethoprim**; increased risk of hyperkalaemia when eplerenone given with **trimethoprim**
  - Antidepressants: possible increased risk of hypokalaemia when loop diuretics or thiazides and related diuretics given with **reboxetine**; enhanced hypotensive effect when diuretics given with MAOIs; plasma concentration of eplerenone reduced by ●**St John's wort**—avoid concomitant use; increased risk of postural hypotension when diuretics given with **tricyclics**
- Antidiabetics: loop diuretics and thiazides and related diuretics antagonise hypoglycaemic effect of **anti-diabetics**; diuretic effect of diuretics possibly enhanced by **canagliflozin**; avoidance of loop diuretics advised by manufacturer of **canagliflozin**; diuretic effect of loop diuretics and thiazides and related diuretics possibly enhanced by **dapagliflozin**
- Antiepileptics: plasma concentration of eplerenone reduced by ●**carbamazepine**, ●**phenobarbital** and ●**phenytoin**—avoid concomitant use; increased risk of hyponatraemia when diuretics given with **carbamazepine**; acetazolamide increases plasma concentration of ●**carbamazepine**; increased risk of osteomalacia when carbonic anhydrase inhibitors given with **phenobarbital** or **phenytoin**; effects of furosemide antagonised by **phenytoin**; acetazolamide possibly increases plasma concentration of ●**phenytoin**; hydrochlorothiazide possibly increases plasma concentration of **topiramate**; avoidance of carbonic

**Diuretics**

- Antiepileptics (*continued*)
    - anhydrase inhibitors in children advised by manufacturer of **zonisamide**
  - Antifungals: increased risk of hypokalaemia when loop diuretics or thiazides and related diuretics given with **amphotericin**; hydrochlorothiazide increases plasma concentration of **fluconazole**; plasma concentration of eplerenone increased by **fluconazole** (reduce dose of eplerenone); plasma concentration of eplerenone increased by ●**itraconazole**—avoid concomitant use
  - Antipsychotics: hypokalaemia caused by diuretics increases risk of ventricular arrhythmias with ●**amisulpride**; enhanced hypotensive effect when diuretics given with **phenothiazines**; hypokalaemia caused by diuretics increases risk of ventricular arrhythmias with ●**pimozide** (avoid concomitant use)
  - Antivirals: plasma concentration of eplerenone increased by ●**ritonavir**—avoid concomitant use; plasma concentration of eplerenone increased by **saquinavir** (reduce dose of eplerenone)
- Anxiolytics and Hypnotics: enhanced hypotensive effect when diuretics given with **anxiolytics and hypnotics**; administration of **parenteral** furosemide with **chloral** may displace thyroid hormone from binding sites
- Atomoxetine: hypokalaemia caused by diuretics increases risk of ventricular arrhythmias with ●**atomoxetine**
  - Beta-blockers: enhanced hypotensive effect when diuretics given with **beta-blockers**; hypokalaemia caused by loop diuretics or thiazides and related diuretics increases risk of ventricular arrhythmias with ●**sotalol**
- Calcium Salts: increased risk of hypercalcaemia when thiazides and related diuretics given with **calcium salts**
- Calcium-channel Blockers: enhanced hypotensive effect when diuretics given with **calcium-channel blockers**; plasma concentration of eplerenone increased by **diltiazem** and **verapamil** (reduce dose of eplerenone)
- Cardiac Glycosides: hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with ●**cardiac glycosides**; potassium canrenoate possibly increases plasma concentration of **digoxin**; spironolactone increases plasma concentration of ●**digoxin**
  - Ciclosporin: increased risk of nephrotoxicity and possibly hypermagnesaemia when thiazides and related diuretics given with **ciclosporin**; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with ●**ciclosporin**; acetazolamide possibly increases plasma concentration of ●**ciclosporin**
  - Clonidine: enhanced hypotensive effect when diuretics given with **clonidine**
  - Corticosteroids: diuretic effect of diuretics antagonised by **corticosteroids**; increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with **corticosteroids**
  - Cytotoxics: alkaline urine due to acetazolamide increases excretion of **methotrexate**; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases risk of ventricular arrhythmias with ●**arsenic trioxide**; avoidance of spironolactone advised by manufacturer of **mitotane** (antagonism of effect); increased risk of nephrotoxicity and ototoxicity when diuretics given with **platinum compounds**
- Diazoxide: enhanced hypotensive and hyperglycaemic effects when diuretics given with **diazoxide**
- Diuretics: increased risk of hypokalaemia when loop diuretics or thiazides and related diuretics given

**Diuretics****Diuretics (continued)**

with **acetazolamide**; profound diuresis possible when metolazone given with **furosemide**; increased risk of hypokalaemia when thiazides and related diuretics given with **loop diuretics**

Dopaminergics: enhanced hypotensive effect when diuretics given with **levodopa**

Hormone Antagonists: increased risk of hypercalcaemia when thiazides and related diuretics given with **toremifene**

Lipid-regulating Drugs: absorption of thiazides and related diuretics reduced by **colestipol** and **colestyramine** (give at least 2 hours apart)

- **Lithium**: loop diuretics and thiazides and related diuretics reduce excretion of ● **lithium** (increased plasma concentration and risk of toxicity)—loop diuretics safer than thiazides; potassium-sparing diuretics and aldosterone antagonists reduce excretion of ● **lithium** (increased plasma concentration and risk of toxicity); acetazolamide increases the excretion of ● **lithium**

Methyldopa: enhanced hypotensive effect when diuretics given with **methyldopa**

Moxisylyte: enhanced hypotensive effect when diuretics given with **moxisylyte**

Moxonidine: enhanced hypotensive effect when diuretics given with **moxonidine**

Muscle Relaxants: enhanced hypotensive effect when diuretics given with **baclofen** or **tizanidine**

Nitrates: enhanced hypotensive effect when diuretics given with **nitrates**

Oestrogens: diuretic effect of diuretics antagonised by **oestrogens**

- **Potassium Salts**: increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with ● **potassium salts**
- **Progestogens**: risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with **drospirenone** (monitor serum potassium during first cycle)
- **Prostaglandins**: enhanced hypotensive effect when diuretics given with **alprostadil**
- **Sympathomimetics, Beta<sub>2</sub>**: increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with high doses of **beta<sub>2</sub> sympathomimetics**—see Hypokalaemia, p. 186
- **Tacrolimus**: increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with ● **tacrolimus**
- **Theophylline**: increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with **theophylline**
- **Vasodilator Antihypertensives**: enhanced hypotensive effect when diuretics given with **hydralazine**, **minoxidil** or **sodium nitroprusside**
- **Vitamins**: increased risk of hypercalcaemia when thiazides and related diuretics given with **vitamin D**

**Diuretics, Loop** see Diuretics

**Diuretics, Potassium-sparing and Aldosterone Antagonists** see Diuretics

**Diuretics, Thiazide and related** see Diuretics

**Dobutamine** see Sympathomimetics

**Docetaxel**

Antibacterials: *in vitro* studies suggest a possible interaction between docetaxel and **erythromycin** (consult docetaxel product literature)

- **Antipsychotics**: avoid concomitant use of cytotoxics with ● **clozapine** (increased risk of agranulocytosis)
- **Antivirals**: plasma concentration of docetaxel possibly increased by ● **ritonavir** (increased risk of toxicity)

Ciclosporin: *in vitro* studies suggest a possible interaction between docetaxel and **ciclosporin** (consult docetaxel product literature)

**Docetaxel (continued)**

Cytotoxics: possible increased risk of neutropenia when docetaxel given with **lapatinib**; plasma concentration of docetaxel increased by **sofosbuvir**

**Dolutegravir**

Antacids: absorption of dolutegravir possibly reduced by **aluminium hydroxide** and **oral magnesium salts**—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after aluminium hydroxide and oral magnesium salts

- **Antibacterials**: plasma concentration of dolutegravir reduced by ● **rifampicin** (see Dose under Dolutegravir, p. 421)
- **Antidepressants**: manufacturer of dolutegravir advises avoid concomitant use with **St John's wort**
- **Antiepileptics**: manufacturer of dolutegravir advises avoid concomitant use with **carbamazepine**, **oxcarbazepine**, **phenobarbital** and **phenytoin**
- **Antivirals**: plasma concentration of dolutegravir reduced by ● **efavirenz** and ● **tipranavir** (see Dose under Dolutegravir, p. 421); plasma concentration of dolutegravir reduced by ● **etravirine** (see Cautions under Dolutegravir, p. 421); plasma concentration of dolutegravir reduced by ● **fosamprenavir**; plasma concentration of dolutegravir possibly reduced by ● **nevirapine** (see Dose under Dolutegravir, p. 421)
- **Calcium Salts**: absorption of dolutegravir possibly reduced by **calcium salts**—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after calcium salts

**Domperidone**

Analgesics: effects of domperidone on gastro-intestinal activity antagonised by **opioid analgesics**

- **Antibacterials**: possible increased risk of ventricular arrhythmias when domperidone given with ● **clarithromycin** or ● **telithromycin**—avoid concomitant use; plasma concentration of domperidone increased by ● **erythromycin** (increased risk of ventricular arrhythmias—avoid concomitant use)
- **Antifungals**: possible increased risk of ventricular arrhythmias when domperidone given with ● **itraconazole** or ● **voriconazole**—avoid concomitant use
- **Antimalarials**: avoidance of domperidone advised by manufacturer of ● **piperaquine with arteminol** (possible risk of ventricular arrhythmias)
- **Antimuscarinics**: effects of domperidone on gastro-intestinal activity antagonised by **antimuscarinics**
- **Antivirals**: possible increased risk of ventricular arrhythmias when domperidone given with ● **boceprevir**, ● **ritonavir**, ● **saquinavir** or ● **telaprevir**—avoid concomitant use
- **Cobicistat**: possible increased risk of ventricular arrhythmias when domperidone given with ● **cobicistat**—avoid concomitant use
- **Cytotoxics**: avoidance of domperidone advised by manufacturer of ● **bosutinib** (risk of ventricular arrhythmias)
- **Dopaminergics**: domperidone possibly antagonises hypoprolactinaemic effects of **bromocriptine** and **cabergoline**

**Donepezil** see Parasympathomimetics

**Dopamine** see Sympathomimetics

**Dopaminergics** see Amantadine, Apomorphine, Bromocriptine, Cabergoline, Entacapone, Levodopa, Pergolide, Pramipexole, Quinagolide, Rasagiline, Ropinirole, Rotigotine, Selegiline, and Tolcapone

**Dopexamine** see Sympathomimetics

**Dorzolamide** see Diuretics

**Dosulepin** see Antidepressants, Tricyclic

**Doxapram**

- **Anaesthetics, General**: increased risk of arrhythmias when doxapram given with ● **volatile liquid general anaesthetics** (avoid doxapram for at least 10 minutes after volatile liquid general anaesthetics)

**Doxapram** (*continued*)

Antidepressants: effects of doxapram enhanced by MAOIs

Sympathomimetics: increased risk of hypertension when doxapram given with **sympathomimetics**

Theophylline: increased CNS stimulation when doxapram given with **theophylline**

**Doxazosin** *see* Alpha-blockers**Doxepin** *see* Antidepressants, Tricyclic**Doxorubicin**

• Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)

Antivirals: doxorubicin possibly inhibits effects of **stavudine**

Calcium-channel Blockers: plasma concentration of doxorubicin possibly increased by **verapamil**

Cardiac Glycosides: doxorubicin possibly reduces absorption of **digoxin tablets**

• Cyclosporin: increased risk of neurotoxicity when doxorubicin given with **cyclosporin**

Cytotoxics: plasma concentration of doxorubicin possibly increased by **sorafenib**

**Doxycycline** *see* Tetracyclines**Dronedarone**

Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with **bupivacaine**, **levobupivacaine**, **prilocaine** or **ropivacaine**

• Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other **anti-arrhythmics**; increased risk of ventricular arrhythmias when dronedarone given with **amiodarone** or **disopyramide**—avoid concomitant use

• Antibacterials: manufacturer of dronedarone advises avoid concomitant use with **clarithromycin** (risk of ventricular arrhythmias); plasma concentration of dronedarone increased by **erythromycin** (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of dronedarone reduced by **rifampicin**—avoid concomitant use; increased risk of ventricular arrhythmias when dronedarone given with **telithromycin**—avoid concomitant use

• Anticoagulants: dronedarone possibly enhances anticoagulant effect of **coumarins** and **phenindione**; dronedarone increases plasma concentration of **dabigatran**—avoid concomitant use; avoidance of dronedarone advised by manufacturer of **rivaroxaban**

• Antidepressants: avoidance of dronedarone advised by manufacturer of **citalopram** and **escitalopram** (risk of ventricular arrhythmias); plasma concentration of dronedarone possibly reduced by **St John's wort**—avoid concomitant use; manufacturer of dronedarone advises avoid concomitant use with **tricyclics** (risk of ventricular arrhythmias)

• Antiepileptics: plasma concentration of dronedarone possibly reduced by **carbamazepine**, **phenobarbital** and **phenytoin**—avoid concomitant use

• Antifungals: manufacturer of dronedarone advises avoid concomitant use with **itraconazole**, **posaconazole** and **voriconazole**

• Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with **antipsychotics** that prolong the QT interval; manufacturer of dronedarone advises avoid concomitant use with **phenothiazines** (risk of ventricular arrhythmias)

• Antivirals: manufacturer of dronedarone advises avoid concomitant use with **ritonavir**; increased risk of ventricular arrhythmias when dronedarone given with **saquinavir**—avoid concomitant use

• Beta-blockers: increased myocardial depression when anti-arrhythmics given with **beta-blockers**; dronedarone possibly increases plasma concentration of **metoprolol** and **propranolol**; increased risk of ventricular arrhythmias when dronedarone given with **sotalol**—avoid concomitant use

**Dronedarone** (*continued*)

• Calcium-channel Blockers: plasma concentration of dronedarone increased by **nifedipine**; increased risk of bradycardia and myocardial depression when dronedarone given with **diltiazem** and **verapamil**

• Cardiac Glycosides: dronedarone increases plasma concentration of **digoxin** (halve dose of digoxin)

• Cytotoxics: dronedarone possibly increases the plasma concentration of **bosutinib**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib

Fidaxomicin: avoidance of dronedarone advised by manufacturer of **fidaxomicin**

• Fingolimod: possible increased risk of bradycardia when dronedarone given with **fingolimod**

• Grapefruit Juice: plasma concentration of dronedarone increased by **grapefruit juice**—avoid concomitant use

• Lipid-regulating Drugs: dronedarone possibly increases plasma concentration of **atorvastatin**; dronedarone increases plasma concentration of **rosuvastatin**—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when dronedarone given with **simvastatin**; avoidance of dronedarone advised by manufacturer of **lomitapide** (plasma concentration of lomitapide possibly increased)

Sirolimus: manufacturer of dronedarone advises caution with **sirolimus**

Tacrolimus: manufacturer of dronedarone advises caution with **tacrolimus**

**Droperidol** *see* Antipsychotics**Drospirenone** *see* Progestogens**Duloxetine**

Analgesics: possible increased serotonergic effects when SSRI-related antidepressants given with **fentanyl**; possible increased serotonergic effects when duloxetine given with **petidine** or **tramadol**

• Antibacterials: metabolism of duloxetine inhibited by **ciprofloxacin**—avoid concomitant use

• Anticoagulants: possible increased risk of bleeding when SSRI-related antidepressants given with **dabigatran**

• Antidepressants: metabolism of duloxetine inhibited by **fluvoxamine**—avoid concomitant use; possible increased serotonergic effects when duloxetine given with SSRIs, **St John's wort**, **amitriptyline**, **clomipramine**, **moclobemide** or **venlafaxine**; duloxetine should not be started until 2 weeks after stopping **MAOIs**, also MAOIs should not be started until at least 5 days after stopping duloxetine; after stopping SSRI-related antidepressants do not start **moclobemide** for at least 1 week

• Antimalarials: avoidance of antidepressants advised by manufacturer of **artemether with lumefantrine** and **piperazine with arteminol**

Atomoxetine: possible increased risk of convulsions when antidepressants given with **atomoxetine**

• Dapoxetine: possible increased risk of serotonergic effects when duloxetine given with **dapoxetine** (manufacturer of dapoxetine advises duloxetine should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping duloxetine)

5HT<sub>1</sub>-receptor Agonists: possible increased serotonergic effects when duloxetine given with 5HT<sub>1</sub> agonists

• Methylthionium: risk of CNS toxicity when SSRI-related antidepressants given with **methylthionium**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthionium and observe patient for up to 4 hours after administration)

**Dutasteride**

Calcium-channel Blockers: plasma concentration of dutasteride increased by **diltiazem** and **verapamil**

**Dydrogesterone** *see* Progestogens**Edrophonium** *see* Parasympathomimetics**Efavirenz**

**Analgesics:** efavirenz reduces plasma concentration of **methadone**

**Antibacterials:** efavirenz reduces plasma concentration of **clarithromycin**, also plasma concentration of active metabolite of clarithromycin increased; efavirenz reduces plasma concentration of **rifabutin**—increase dose of rifabutin; plasma concentration of efavirenz reduced by **rifampicin**—increase dose of efavirenz

• **Anticoagulants:** efavirenz possibly affects plasma concentration of **coumarins**

• **Antidepressants:** plasma concentration of efavirenz reduced by **St John's wort**—avoid concomitant use

**Antiepileptics:** plasma concentration of both drugs reduced when efavirenz given with **carbamazepine**

• **Antifungals:** efavirenz reduces plasma concentration of **itraconazole** and **posaconazole**; efavirenz reduces plasma concentration of **voriconazole**, also plasma concentration of efavirenz increased (increase voriconazole dose and reduce efavirenz dose); efavirenz possibly reduces plasma concentration of **caspofungin**—consider increasing dose of caspofungin

• **Antimalarials:** efavirenz reduces plasma concentration of **artemether with lumefantrine**; efavirenz possibly affects plasma concentration of **proguanil**

• **Antipsychotics:** efavirenz possibly reduces plasma concentration of **aripiprazole** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); efavirenz possibly increases plasma concentration of **pimozide** (increased risk of ventricular arrhythmias—avoid concomitant use)

• **Antivirals:** avoidance of efavirenz advised by manufacturer of **atazanavir** (plasma concentration of atazanavir reduced); efavirenz reduces plasma concentration of **darunavir** (adjust dose—consult product literature); efavirenz reduces the plasma concentration of **dolutegravir** (*see* Dose under Dolutegravir, p. 421); avoidance of efavirenz advised by manufacturer of **elvitegravir**; efavirenz possibly reduces plasma concentration of **etravirine**—avoid concomitant use; efavirenz reduces plasma concentration of **indinavir**; efavirenz reduces plasma concentration of **lopinavir**—consider increasing dose of lopinavir; efavirenz possibly reduces plasma concentration of **maraviroc**—consider increasing dose of maraviroc; plasma concentration of efavirenz reduced by **nevirapine**—avoid concomitant use; toxicity of efavirenz increased by **ritonavir**, monitor liver function tests—manufacturer of **Atripla**® advises avoid concomitant use with *high-dose* ritonavir; efavirenz significantly reduces plasma concentration of **saquinavir**; efavirenz reduces plasma concentration of **telaprevir**—increase dose of telaprevir

• **Anxiolytics and Hypnotics:** increased risk of prolonged sedation when efavirenz given with **midazolam**—avoid concomitant use

• **Atovaquone:** efavirenz reduces plasma concentration of **atovaquone**—avoid concomitant use

**Avanafil:** efavirenz possibly reduces plasma concentration of **avanafil**—manufacturer of avanafil advises avoid concomitant use

**Bupropion:** efavirenz accelerates metabolism of **bupropion** (reduced plasma concentration)

**Calcium-channel Blockers:** efavirenz reduces plasma concentration of **diltiazem**

• **Ciclosporin:** efavirenz possibly reduces plasma concentration of **ciclosporin**

**Efavirenz** (*continued*)

• **Cytotoxics:** efavirenz possibly reduces plasma concentration of **bosutinib**—manufacturer of bosutinib advises avoid concomitant use

• **Ergot Alkaloids:** increased risk of ergotism when efavirenz given with **ergot alkaloids**—avoid concomitant use

**Grapefruit Juice:** plasma concentration of efavirenz possibly increased by **grapefruit juice**

**Lipid-regulating Drugs:** efavirenz reduces plasma concentration of **atorvastatin**, **pravastatin** and **simvastatin**

• **Orlistat:** absorption of efavirenz possibly reduced by **orlistat**

• **Progestogens:** efavirenz possibly reduces contraceptive effect of **progestogens**

• **Tacrolimus:** efavirenz possibly affects plasma concentration of **tacrolimus**

**Eletriptan** *see* 5HT<sub>1</sub>-receptor Agonists (under HT)**Eltrombopag**

**Antacids:** absorption of eltrombopag reduced by **antacids** (give at least 4 hours apart)

**Antivirals:** plasma concentration of eltrombopag possibly reduced by **lopinavir**

**Calcium Salts:** absorption of eltrombopag possibly reduced by **calcium salts** (give at least 4 hours apart)

**Dairy Products:** absorption of eltrombopag possibly reduced by **dairy products** (give at least 4 hours apart)

**Iron:** absorption of eltrombopag possibly reduced by **oral iron** (give at least 4 hours apart)

• **Lipid-regulating Drugs:** eltrombopag increases plasma concentration of **rosuvastatin**—adjust dose of rosuvastatin (consult product literature)

**Selenium:** absorption of eltrombopag possibly reduced by **selenium** (give at least 4 hours apart)

**Zinc:** absorption of eltrombopag possibly reduced by **zinc** (give at least 4 hours apart)

**Elvitegravir**

**Antacids:** absorption of elvitegravir reduced by **antacids** (give at least 4 hours apart)

• **Antibacterials:** plasma concentration of elvitegravir reduced by **rifabutin** also plasma concentration of active metabolite of rifabutin increased—reduce dose of rifabutin; manufacturer of elvitegravir advises avoid concomitant use with **rifampicin**

• **Antidepressants:** manufacturer of elvitegravir advises avoid concomitant use with **St John's wort**

• **Antiepileptics:** manufacturer of elvitegravir advises avoid concomitant use with **carbamazepine**, **phenobarbital** and **phenytoin**

• **Antivirals:** plasma concentration of elvitegravir increased by **atazanavir** and **lopinavir** boosted with ritonavir (reduce dose of elvitegravir); manufacturer of elvitegravir advises avoid concomitant use with **efavirenz** and **nevirapine**

**Bosentan:** manufacturer of elvitegravir advises avoid concomitant use with **bosentan**

• **Orlistat:** absorption of elvitegravir possibly reduced by **orlistat**

**Progestogens:** elvitegravir increases plasma concentration of **norgestimate**

**Emtricitabine**

**Antivirals:** manufacturer of emtricitabine advises avoid concomitant use with **lamivudine**

• **Orlistat:** absorption of emtricitabine possibly reduced by **orlistat**

**Enalapril** *see* ACE Inhibitors**Enfuvirtide**

• **Orlistat:** absorption of enfuvirtide possibly reduced by **orlistat**

**Enoxaparin** *see* Heparins**Enoximone** *see* Phosphodiesterase Inhibitors

**Entacapone**

- Anticoagulants: entacapone enhances anticoagulant effect of **warfarin**
- Antidepressants: manufacturer of entacapone advises caution with **moclobemide**, **tricyclics** and **venlafaxine**; avoid concomitant use of entacapone with non-selective **MAOIs**

Dopaminergics: entacapone possibly enhances effects of **apomorphine**; entacapone possibly reduces plasma concentration of **rasagiline**; manufacturer of entacapone advises max. dose of 10mg **selegiline** if used concomitantly

Iron: absorption of entacapone reduced by **oral iron**

Memantine: effects of dopaminergics possibly enhanced by **memantine**

Methyldopa: entacapone possibly enhances effects of **methyldopa**; antiparkinsonian effect of dopaminergics antagonised by **methyldopa**

Sympathomimetics: entacapone possibly enhances effects of **adrenaline (epinephrine)**, **dobutamine**, **dopamine** and **noradrenaline (norepinephrine)**

**Enteral Foods**

- Anticoagulants: the presence of vitamin K in some enteral feeds can antagonise the anticoagulant effect of **coumarins** and **phenindione**

Antiepileptics: enteral feeds possibly reduce absorption of **phenytoin**

**Enzalutamide**

Antibacterials: manufacturer of enzalutamide advises avoid concomitant use with **rifampicin**

- Anticoagulants: enzalutamide possibly reduces plasma concentration of **coumarins**
- Lipid-regulating Drugs: plasma concentration of enzalutamide increased by **gemfibrozil**—manufacturer of enzalutamide advises avoid concomitant use or halve dose of enzalutamide

**Ephedrine** *see* Sympathomimetics

**Epinephrine (adrenaline)** *see* Sympathomimetics

**Epirubicin**

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Ciclosporin: plasma concentration of epirubicin increased by **ciclosporin**
- Ulcer-healing Drugs: plasma concentration of epirubicin increased by **cimetidine**

**Eplerenone** *see* Diuretics

**Eprosartan** *see* Angiotensin-II Receptor Antagonists

**Eptifibatid**

Ilprost: increased risk of bleeding when eptifibatid given with **ilprost**

**Ergometrine** *see* Ergot Alkaloids

**Ergot Alkaloids**

- Antibacterials: increased risk of ergotism when ergotamine given with **macrolides** or **telithromycin**—avoid concomitant use; increased risk of ergotism when ergotamine given with **tetracyclines**

Antidepressants: possible risk of hypertension when ergotamine given with **reboxetine**

- Antifungals: avoidance of ergometrine advised by manufacturer of **itraconazole** (increased risk of ergotism); increased risk of ergotism when ergotamine given with **imidazoles** or **triazoles**—avoid concomitant use

- Antivirals: plasma concentration of ergot alkaloids possibly increased by **atazanavir**—avoid concomitant use; avoidance of ergot alkaloids advised by manufacturer of **boceprevir** and **telaprevir**; increased risk of ergotism when ergot alkaloids given with **darunavir**—manufacturer of darunavir advises avoid concomitant use; increased risk of ergotism when ergot alkaloids given with **efavirenz**—avoid concomitant use; increased risk of ergotism when ergotamine given with **fosamprenavir**, **indinavir**, **ritonavir** or **saquinavir**—avoid concomitant use

**Ergot Alkaloids (continued)**

Beta-blockers: increased peripheral vasoconstriction when ergotamine given with **beta-blockers**

- Cobicistat: plasma concentration of ergot alkaloids possibly increased by **cobicistat**—manufacturer of cobicistat advises avoid concomitant use
- Cytotoxics: caution with ergot alkaloids advised by manufacturer of **crizotinib**
- 5HT<sub>1</sub>-receptor Agonists: increased risk of vasospasm when ergotamine given with **almotriptan**, **rizatriptan**, **sumatriptan** or **zolmitriptan** (avoid ergotamine for 6 hours after almotriptan, rizatriptan, sumatriptan or zolmitriptan, avoid almotriptan, rizatriptan, sumatriptan or zolmitriptan for 24 hours after ergotamine); increased risk of vasospasm when ergotamine given with **eletriptan**, **frovatriptan** or **naratriptan** (avoid eletriptan, frovatriptan or naratriptan for 24 hours after eletriptan, frovatriptan or naratriptan for 24 hours after ergotamine)

Sympathomimetics: increased risk of ergotism when ergotamine given with **sympathomimetics**

- Ticagrelor: plasma concentration of ergot alkaloids possibly increased by **ticagrelor**
- Ulcer-healing Drugs: increased risk of ergotism when ergotamine given with **cimetidine**—avoid concomitant use

**Ergotamine** *see* Ergot Alkaloids

**Eribulin**

Antibacterials: plasma concentration of eribulin possibly reduced by **rifampicin**

Antidepressants: plasma concentration of eribulin possibly reduced by **St John's wort**

Antiepileptics: plasma concentration of eribulin possibly reduced by **carbamazepine** and **phenytoin**

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)

**Erlotinib**

- Analgesics: increased risk of bleeding when erlotinib given with **NSAIDs**

- Antacids: plasma concentration of erlotinib possibly reduced by **antacids**—give antacids at least 4 hours before or 2 hours after erlotinib

Antibacterials: plasma concentration of erlotinib increased by **ciprofloxacin**; metabolism of erlotinib accelerated by **rifampicin** (reduced plasma concentration)

- Anticoagulants: increased risk of bleeding when erlotinib given with **coumarins**

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)

- Antivirals: avoidance of erlotinib advised by manufacturer of **boceprevir**

Cytotoxics: plasma concentration of erlotinib possibly increased by **capecitabine**

- Ulcer-healing Drugs: manufacturer of erlotinib advises avoid concomitant use with **cimetidine**, **esomeprazole**, **famotidine**, **lansoprazole**, **nizatidine**, **pantoprazole** and **rabeprazole**; plasma concentration of erlotinib reduced by **ranitidine**—manufacturer of erlotinib advises give at least 2 hours before or 10 hours after ranitidine; plasma concentration of erlotinib reduced by **omeprazole**—manufacturer of erlotinib advises avoid concomitant use

**Ertapenem**

- Antiepileptics: carbapenems reduce plasma concentration of **valproate**—avoid concomitant use

Vaccines: antibacterials inactivate **oral typhoid vaccine**—*see* p. 850

**Erythromycin** *see* Macrolides

**Escitalopram** *see* Antidepressants, SSRI

**Eslicarbazepine**

Anticoagulants: eslicarbazepine reduces plasma concentration of **warfarin**

**Eslicarbazepine** (continued)

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **SSRIs** and **tricyclics** (convulsive threshold lowered)
- Antiepileptics: plasma concentration of eslicarbazepine possibly reduced by **carbamazepine** but risk of side-effects increased; manufacturer of eslicarbazepine advises avoid concomitant use with **oxcarbazepine**; plasma concentration of eslicarbazepine reduced by **phenytoin**, also plasma concentration of phenytoin increased
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by **mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by **antipsychotics** (convulsive threshold lowered)
- Lipid-regulating Drugs: eslicarbazepine reduces plasma concentration of **rosuvastatin**; eslicarbazepine reduces plasma concentration of **simvastatin**—consider increasing dose of simvastatin
- Oestrogens: eslicarbazepine accelerates metabolism of **oestrogens** (reduced contraceptive effect—see p. 536)
- Orlistat: possible increased risk of convulsions when antiepileptics given with **orlistat**
- Progestogens: eslicarbazepine accelerates metabolism of **progestogens** (reduced contraceptive effect—see p. 536)

**Esmolol** *see* Beta-blockers

**Esomeprazole** *see* Proton Pump Inhibitors

**Estradiol** *see* Oestrogens

**Estramustine**

- Antacids: absorption of estramustine possibly reduced by **aluminium hydroxide** and **oral magnesium salts**—manufacturer of estramustine advises avoid concomitant administration
- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Bisphosphonates: plasma concentration of estramustine increased by **sodium clodronate**
- Calcium Salts: absorption of estramustine reduced by **calcium salts** (manufacturer of estramustine advises avoid concomitant administration)

**Estriol** *see* Oestrogens

**Estrone** *see* Oestrogens

**Etanercept**

- Abatacept: avoid concomitant use of etanercept with **abatacept**
- Anakinra: avoid concomitant use of etanercept with **anakinra**
- Vaccines: avoid concomitant use of etanercept with live **vaccines** (see p. 828)

**Ethinylestradiol** *see* Oestrogens

**Ethosuximide**

- Antibacterials: metabolism of ethosuximide inhibited by **isoniazid** (increased plasma concentration and risk of toxicity)
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **SSRIs** and **tricyclics** (convulsive threshold lowered)
- Antiepileptics: plasma concentration of ethosuximide possibly reduced by **carbamazepine** and **phenobarbital**; plasma concentration of ethosuximide possibly reduced by **phenytoin**, also plasma concentration of phenytoin possibly increased; plasma concentration of ethosuximide possibly increased by **valproate**
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by **mefloquine**

**Ethosuximide** (continued)

- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by **antipsychotics** (convulsive threshold lowered)
  - Orlistat: possible increased risk of convulsions when antiepileptics given with **orlistat**
- Etidronate Disodium** *see* Bisphosphonates
- Etodolac** *see* NSAIDs
- Etomidate** *see* Anaesthetics, General
- Etonogestrel** *see* Progestogens

**Etoposide**

- Anticoagulants: etoposide possibly enhances anticoagulant effect of **coumarins**
- Antiepileptics: plasma concentration of etoposide possibly reduced by **phenobarbital** and **phenytoin**
- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Atovaquone: plasma concentration of etoposide possibly increased by **atovaquone**
- Ciclosporin: plasma concentration of etoposide possibly increased by **ciclosporin** (increased risk of toxicity)

**Etoricoxib** *see* NSAIDs

**Etravirine**

- Antibacterials: etravirine reduces plasma concentration of **clarithromycin** (but concentration of an active metabolite increased); also plasma concentration of etravirine increased; plasma concentration of both drugs reduced when etravirine given with **rifabutin**; manufacturer of etravirine advises avoid concomitant use with **rifampicin**
  - Antidepressants: manufacturer of etravirine advises avoid concomitant use with **St John's wort**
  - Antiepileptics: manufacturer of etravirine advises avoid concomitant use with **carbamazepine**, **phenobarbital** and **phenytoin**
  - Antimalarials: etravirine reduces plasma concentration of **artemether with lumefantrine**
  - Antivirals: effects of both drugs possibly reduced when etravirine given with **boceprevir**; etravirine reduces the plasma concentration of **dolutegravir** (see Cautions under Dolutegravir, p. 421); plasma concentration of etravirine possibly reduced by **efavirenz** and **nevirapine**—avoid concomitant use; etravirine increases plasma concentration of **fosamprenavir** (consider reducing dose of fosamprenavir); etravirine possibly reduces plasma concentration of **indinavir**—avoid concomitant use; etravirine possibly reduces plasma concentration of **maraviroc**; plasma concentration of etravirine reduced by **tipranavir**, also plasma concentration of tipranavir increased (avoid concomitant use)
  - Cardiac Glycosides: etravirine increases plasma concentration of **digoxin**
  - Clopidogrel: etravirine possibly reduces antiplatelet effect of **clopidogrel**
  - Cytotoxics: etravirine possibly reduces plasma concentration of **bosutinib**—manufacturer of bosutinib advises avoid concomitant use
  - Lipid-regulating Drugs: etravirine possibly reduces plasma concentration of **atorvastatin**
  - Orlistat: absorption of etravirine possibly reduced by **orlistat**
  - Sildenafil: etravirine reduces plasma concentration of **sildenafil**
- Everolimus**
- Antibacterials: plasma concentration of everolimus possibly increased by **clarithromycin** and **telithromycin**—manufacturer of everolimus advises avoid concomitant use; plasma concentration of everolimus increased by **erythromycin** (consider reducing the dose of everolimus—consult everolimus product literature); plasma concentration of everolimus reduced by **rifampicin** (avoid concomitant use or consider increasing the dose of everolimus—consult everolimus product literature)

**Everolimus** (*continued*)

Antidepressants: plasma concentration of everolimus possibly reduced by **St John's wort**—manufacturer of everolimus advises avoid concomitant use

- Antifungals: plasma concentration of everolimus possibly increased by **itraconazole**, **posaconazole** and **voriconazole**—manufacturer of everolimus advises avoid concomitant use
- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Antivirals: plasma concentration of everolimus possibly increased by **atazanavir**, **darunavir**, **indinavir**, **ritonavir** and **saquinavir**—manufacturer of everolimus advises avoid concomitant use
- Calcium-channel Blockers: plasma concentration of both drugs may increase when everolimus given with **verapamil** (consider reducing the dose of everolimus—consult everolimus product literature)
- Ciclosporin: plasma concentration of everolimus increased by **ciclosporin** (consider reducing the dose of everolimus—consult everolimus product literature)
- Cytotoxics: plasma concentration of everolimus increased by **imatinib** (consider reducing the dose of everolimus—consult everolimus product literature)

Grapefruit Juice: manufacturer of everolimus advises avoid concomitant use with **grapefruit juice**

**Exemestane**

Antibacterials: plasma concentration of exemestane possibly reduced by **rifampicin**

**Exenatide** *see* Antidiabetics**Ezetimibe**

Anticoagulants: ezetimibe possibly enhances anticoagulant effect of **coumarins**

- Ciclosporin: plasma concentration of both drugs may increase when ezetimibe given with **ciclosporin**
- Lipid-regulating Drugs: ezetimibe increases plasma concentration of **rosuvastatin**—adjust dose of rosuvastatin (consult product literature); increased risk of cholelithiasis and gallbladder disease when ezetimibe given with **fibrates**—discontinue if suspected

**Famciclovir**

Probenecid: excretion of famciclovir possibly reduced by **probenecid** (increased plasma concentration)

**Famotidine** *see* Histamine H<sub>2</sub>-antagonists**Fampridine**

- Ulcer-healing Drugs: manufacturer of fampridine advises avoid concomitant use with **cimetidine**

**Febuxostat**

- Azathioprine: manufacturer of febuxostat advises avoid concomitant use with **azathioprine**
- Cytotoxics: manufacturer of febuxostat advises avoid concomitant use with **mercaptopurine**

**Felodipine** *see* Calcium-channel Blockers**Fenofibrate** *see* Fibrates**Fenpropfen** *see* NSAIDs**Fentanyl** *see* Opioid Analgesics**Ferrous Salts** *see* Iron**Fesoterodine** *see* Antimuscarinics**Fexofenadine** *see* Antihistamines**Fibrates**

- Antibacterials: increased risk of myopathy when fibrates given with **daptomycin** (preferably avoid concomitant use)
- Anticoagulants: fibrates enhance anticoagulant effect of **coumarins** and **phenindione**
- Antidiabetics: fibrates may improve glucose tolerance and have an additive effect with **insulin** or **sulfonylureas**; gemfibrozil possibly enhances hypoglycaemic effect of **nateline**; increased risk of severe hypoglycaemia when gemfibrozil given with **repaglinide**—avoid concomitant use

**Fibrates** (*continued*)

Ciclosporin: increased risk of renal impairment when bezafibrate or fenofibrate given with **ciclosporin**

- Colchicine: possible increased risk of myopathy when fibrates given with **colchicine**
  - Cytotoxics: gemfibrozil increases plasma concentration of **bexarotene**—avoid concomitant use
  - Hormone Antagonists: gemfibrozil increases plasma concentration of **enzalutamide**—manufacturer of enzalutamide advises avoid concomitant use or halve dose of enzalutamide
- Leukotriene Receptor Antagonists: gemfibrozil increases plasma concentration of **montelukast**
- Lipid-regulating Drugs: increased risk of myopathy when gemfibrozil given with **atorvastatin**, **fluvastatin** or **pravastatin** (preferably avoid concomitant use); increased risk of myopathy when fibrates given with **rosuvastatin** (see Dose under Rosuvastatin, p. 173); possible increased risk of myopathy when bezafibrate and ciprofibrate given with **simvastatin** (see Dose under Simvastatin, p. 173); increased risk of myopathy when gemfibrozil given with **simvastatin** (avoid concomitant use); increased risk of cholelithiasis and gallbladder disease when fibrates given with **ezetimibe**—discontinue if suspected; reduce maximum dose of fenofibrate when given with **statins**—see Dose under Fenofibrate, p. 176; increased risk of myopathy when fibrates given with **statins**

**Fidaxomicin**

Anti-arrhythmics: manufacturer of fidaxomicin advises avoid concomitant use with **amiodarone** and **dronedarone**

Antibacterials: manufacturer of fidaxomicin advises avoid concomitant use with **clarithromycin** and **erythromycin**

Calcium-channel Blockers: manufacturer of fidaxomicin advises avoid concomitant use with **verapamil**

Ciclosporin: manufacturer of fidaxomicin advises avoid concomitant use with **ciclosporin**

**Filgrastim**

Note Pegfilgrastim interactions as for filgrastim

Cytotoxics: neutropenia possibly exacerbated when filgrastim given with **fluorouracil**

**Fingolimod**

- Anti-arrhythmics: possible increased risk of bradycardia when fingolimod given with **amiodarone**, **disopyramide** or **dronedarone**
- Antidepressants: plasma concentration of fingolimod possibly reduced by **St John's wort**—manufacturer of fingolimod advises avoid concomitant use
- Antiepileptics: plasma concentration of fingolimod reduced by **carbamazepine**
- Beta-blockers: possible increased risk of bradycardia when fingolimod given with **beta-blockers**
- Calcium-channel Blockers: possible increased risk of bradycardia when fingolimod given with **diltiazem** or **verapamil**

**Flavoxate** *see* Antimuscarinics**Flecainide**

Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with **bupivacaine**, **levobupivacaine**, **prilocaine** or **ropivacaine**

- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other **anti-arrhythmics**; plasma concentration of flecainide increased by **amiodarone** (halve dose of flecainide)
- Antidepressants: plasma concentration of flecainide increased by **fluoxetine**; increased risk of ventricular arrhythmias when flecainide given with **tricyclics**
- Antihistamines: increased risk of ventricular arrhythmias when flecainide given with **mizolastine**—avoid concomitant use
- Antimalarials: avoidance of flecainide advised by manufacturer of **artemether with lumefantrine** (risk

**Flecainide**

- Antimalarials (*continued*): plasma concentration of flecainide increased by ●**quinine**
  - Antimuscarinics: increased risk of ventricular arrhythmias when flecainide given with ●**tolterodine**
  - Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with ●**antipsychotics** that prolong the QT interval; increased risk of arrhythmias when flecainide given with ●**clozapine**
  - Antivirals: plasma concentration of flecainide possibly increased by ●**fosamprenavir**, ●**indinavir**, ●**lopinavir** and ●**ritonavir** (increased risk of ventricular arrhythmias—avoid concomitant use); increased risk of ventricular arrhythmias when flecainide given with ●**saquinavir**—avoid concomitant use; caution with flecainide advised by manufacturer of ●**telaprevir** (risk of ventricular arrhythmias)
  - Beta-blockers: increased risk of myocardial depression and bradycardia when flecainide given with ●**beta-blockers**; increased myocardial depression when anti-arrhythmics given with ●**beta-blockers**
  - Calcium-channel Blockers: increased risk of myocardial depression and asystole when flecainide given with ●**verapamil**
  - Diuretics: increased cardiac toxicity with flecainide if hypokalaemia occurs with ●**acetazolamide**, ●**loop diuretics** or ●**thiazides and related diuretics**
- Ulcer-healing Drugs: metabolism of flecainide inhibited by ●**cimetidine** (increased plasma concentration)

**Fluclxacillin** *see* Penicillins

**Fluconazole** *see* Antifungals, Triazole

**Flucytosine**

Antifungals: renal excretion of flucytosine decreased and cellular uptake increased by ●**amphotericin** (toxicity possibly increased)

Cytotoxics: plasma concentration of flucytosine possibly reduced by ●**cytarabine**

**Fludarabine**

- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
  - Cytotoxics: fludarabine increases intracellular concentration of ●**cytarabine**; increases pulmonary toxicity when fludarabine given with ●**pentostatin** (unacceptably high incidence of fatalities)
- Dipyridamole: effects of fludarabine possibly reduced by ●**dipyridamole**

**Fludrocortisone** *see* Corticosteroids

**Fluorides**

Calcium Salts: absorption of fluorides reduced by ●**calcium salts**

**Fluorouracil**

**Note** Capecitabine is a prodrug of fluorouracil

**Note** Tegafur is a prodrug of fluorouracil

- Allopurinol: manufacturer of capecitabine advises avoid concomitant use with ●**allopurinol**
  - Antibacterials: metabolism of fluorouracil inhibited by ●**metronidazole** (increased toxicity)
  - Anticoagulants: fluorouracil enhances anticoagulant effect of ●**coumarins**
  - Antiepileptics: fluorouracil possibly inhibits metabolism of ●**phenytoin** (increased risk of toxicity)
  - Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
  - Cytotoxics: capecitabine possibly increases plasma concentration of ●**erlotinib**
  - Filgrastim: neutropenia possibly exacerbated when fluorouracil given with ●**filgrastim**
  - Temopofin: increased skin photosensitivity when ●**topical fluorouracil** used with ●**temopofin**
- Ulcer-healing Drugs: metabolism of fluorouracil inhibited by ●**cimetidine** (increased plasma concentration)

**Fluoxetine** *see* Antidepressants, SSRI

**Flupentixol** *see* Antipsychotics

**Fluphenazine** *see* Antipsychotics

**Flurazepam** *see* Anxiolytics and Hypnotics

**Flurbiprofen** *see* NSAIDs

**Flutamide**

- Anticoagulants: flutamide enhances anticoagulant effect of ●**coumarins**

**Fluticasone** *see* Corticosteroids

**Fluvastatin** *see* Statins

**Fluvoxamine** *see* Antidepressants, SSRI

**Folates**

Aminosalicylates: absorption of folic acid possibly reduced by ●**sulfasalazine**

Antiepileptics: folates possibly reduce plasma concentration of ●**phenobarbital** and ●**phenytoin**

- Cytotoxics: avoidance of folates advised by manufacturer of ●**ralitrexed**

**Folic Acid** *see* Folates

**Folinic Acid** *see* Folates

**Formoterol** *see* Sympathomimetics, Beta<sub>2</sub>

**Fosamprenavir**

**Note** Fosamprenavir is a prodrug of amprenavir

Analgesics: fosamprenavir reduces plasma concentration of ●**methadone**

- Anti-arrhythmics: fosamprenavir possibly increases plasma concentration of ●**amiodarone**, ●**flecainide** and ●**propafenone** (increased risk of ventricular arrhythmias—avoid concomitant use); fosamprenavir possibly increases plasma concentration of ●**lidocaine**—avoid concomitant use
- Antibacterials: fosamprenavir increases plasma concentration of ●**rifabutin** (reduce dose of rifabutin); plasma concentration of fosamprenavir significantly reduced by ●**rifampicin**—avoid concomitant use; avoidance of concomitant fosamprenavir in severe renal and hepatic impairment advised by manufacturer of ●**telithromycin**
- Anticoagulants: avoidance of fosamprenavir advised by manufacturer of ●**apixaban** and ●**rivaroxaban**; fosamprenavir may enhance or reduce anticoagulant effect of ●**coumarins**
- Antidepressants: plasma concentration of fosamprenavir reduced by ●**St John's wort**—avoid concomitant use
- Antiepileptics: plasma concentration of fosamprenavir possibly reduced by ●**carbamazepine** and ●**phenobarbital**
- Antifungals: plasma concentration of both drugs may increase when fosamprenavir given with ●**itraconazole**; fosamprenavir possibly reduces plasma concentration of ●**posaconazole**
- Antimalarials: caution with fosamprenavir advised by manufacturer of ●**artemether with lumefantrine**; fosamprenavir possibly increases plasma concentration of ●**quinine** (increased risk of toxicity)
- Antimuscarinics: avoidance of fosamprenavir advised by manufacturer of ●**darifenacin** and ●**tolterodine**
- Antipsychotics: fosamprenavir possibly increases plasma concentration of ●**aripiprazole** (reduce dose of aripiprazole—consult aripiprazole product literature); fosamprenavir increases plasma concentration of ●**pimozide** (increased risk of ventricular arrhythmias—avoid concomitant use); fosamprenavir possibly increases plasma concentration of ●**quetiapine**—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: manufacturer of fosamprenavir advises avoid concomitant use with ●**boceprevir** and ●**raltegravir**; fosamprenavir reduces plasma concentration of ●**dolutegravir**; plasma concentration of fosamprenavir increased by ●**etravirine** (consider reducing dose of fosamprenavir); plasma concentration of fosamprenavir reduced by ●**lopinavir**, effect on lopinavir plasma concentration not predictable—avoid concomitant use; plasma concentration of fosamprenavir reduced by ●**maraviroc**—avoid concomitant use

**Fosamprenavir**

- Antivirals (*continued*)
  - tant use; plasma concentration of fosamprenavir possibly reduced by **nevirapine**—avoid unboosted fosamprenavir; manufacturers advise avoid concomitant use of fosamprenavir with ●**telaprevir**; plasma concentration of fosamprenavir reduced by ●**tipranavir**
- Anxiolytics and Hypnotics: fosamprenavir possibly increases plasma concentration of ●**midazolam** (risk of prolonged sedation—avoid concomitant use of oral midazolam)
- Avanafl: fosamprenavir possibly increases plasma concentration of ●**avanafl**—see Dose under Avanafl, p. 559
- Cyclosporin: fosamprenavir increases plasma concentration of ●**cyclosporin**
- Cytotoxics: fosamprenavir possibly increases the plasma concentration of ●**bosutinib**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Dapoxetine: manufacturer of dapoxetine advises dose reduction when fosamprenavir given with **dapoxetine** (see Dose under Dapoxetine, p. 560)
- Ergot Alkaloids: increased risk of ergotism when fosamprenavir given with ●**ergotamine**—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when fosamprenavir given with **atorvastatin**; possible increased risk of myopathy when fosamprenavir given with ●**rosuvastatin**—manufacturer of rosuvastatin advises avoid concomitant use; possible increased risk of myopathy when fosamprenavir given with ●**simvastatin**—avoid concomitant use; avoidance of fosamprenavir advised by manufacturer of ●**lomitapide** (plasma concentration of lomitapide possibly increased)
- Orlistat: absorption of fosamprenavir possibly reduced by ●**orlistat**
- Ranolazine: fosamprenavir possibly increases plasma concentration of ●**ranolazine**—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: fosamprenavir possibly increases plasma concentration of **sildenafil**
- Tacrolimus: fosamprenavir increases plasma concentration of ●**tacrolimus**
- Tadalafil: fosamprenavir possibly increases plasma concentration of **tadalafil**
- Vardenafil: fosamprenavir possibly increases plasma concentration of **vardenafil**

**Fosaprepitant** see Aprepitant

**Foscarnet**

- Pentamidine Isetionate: increased risk of hypocalcaemia when foscarnet given with *parenteral* ●**pentamidine isetionate**

**Fosinopril** see ACE Inhibitors

**Fosphenytoin** see Phenytoin

**Frovatriptan** see 5HT<sub>1</sub>-receptor Agonists (under HT)

**Furosemide** see Diuretics

**Fusidic Acid**

- Antivirals: plasma concentration of both drugs increased when fusidic acid given with ●**ritonavir**—avoid concomitant use; plasma concentration of both drugs may increase when fusidic acid given with **saquinavir**
- Lipid-regulating Drugs: risk of myopathy and rhabdomyolysis when fusidic acid given with ●**statins**—avoid concomitant use and for 7 days after last fusidic acid dose
- Sugammadex: fusidic acid possibly reduces response to **sugammadex**
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 850

**Gabapentin**

- Analgesics: bioavailability of gabapentin increased by **morphine**
- Antacids: absorption of gabapentin reduced by **antacids**
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and ●**tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●**SSRIs** and ●**tricyclics** (convulsive threshold lowered)
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by ●**mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ●**antipsychotics** (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ●**orlistat**

**Galantamine** see Parasympathomimetics

**Ganciclovir**

- Note** Increased risk of myelosuppression with other myelosuppressive drugs—consult product literature
- Note** Valganciclovir interactions as for ganciclovir
- Antibacterials: increased risk of convulsions when ganciclovir given with ●**imipenem with cilastatin**
- Antivirals: ganciclovir possibly increases plasma concentration of **didanosine**; profound myelosuppression when ganciclovir given with ●**zidovudine** (if possible avoid concomitant administration, particularly during initial ganciclovir therapy)
- Mycophenolate: plasma concentration of ganciclovir possibly increased by **mycophenolate**, also plasma concentration of inactive metabolite of mycophenolate possibly increased
- Probenecid: excretion of ganciclovir reduced by **probenecid** (increased plasma concentration and risk of toxicity)
- Tacrolimus: possible increased risk of nephrotoxicity when ganciclovir given with **tacrolimus**

**Gefitinib**

- Antibacterials: plasma concentration of gefitinib reduced by ●**rifampicin**—avoid concomitant use
- Anticoagulants: gefitinib possibly enhances anti-coagulant effect of ●**warfarin**
- Antidepressants: manufacturer of gefitinib advises avoid concomitant use with **St John's wort**
- Antiepileptics: manufacturer of gefitinib advises avoid concomitant use with **carbamazepine**, **phenobarbital** and **phenytoin**
- Antifungals: plasma concentration of gefitinib increased by **itraconazole**
- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Antivirals: avoidance of gefitinib advised by manufacturer of ●**boceprevir**
- Ulcer-healing Drugs: plasma concentration of gefitinib reduced by ●**ranitidine**

**Gemcitabine**

- Anticoagulants: gemcitabine possibly enhances anti-coagulant effect of **warfarin**
- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)

**Gemeprost** see Prostaglandins

**Gemfibrozil** see Fibrates

**Gentamicin** see Aminoglycosides

**Gestodene** see Progestogens

**Glibenclamide** see Antidiabetics

**Gliclazide** see Antidiabetics

**Glimepiride** see Antidiabetics

**Glipizide** see Antidiabetics

**Glucosamine**

- Anticoagulants: glucosamine enhances anticoagulant effect of ●**warfarin** (avoid concomitant use)

**Glyceryl Trinitrate** see Nitrates

**Glycopyrronium** see Antimuscarinics

**Gold** see Sodium Aurothiomalate

### Golimumab

- Abatacept: avoid concomitant use of golimumab with
  - **abatacept**
- Anakinra: avoid concomitant use of golimumab with
  - **anakinra**
- Vaccines: avoid concomitant use of golimumab with live
  - **vaccines** (see p. 828)

### Grapefruit Juice

- Aliskiren: grapefruit juice reduces plasma concentration of
  - **aliskiren**—avoid concomitant use
- Anti-arrhythmics: grapefruit juice increases plasma concentration of
  - **amiodarone**; grapefruit juice increases plasma concentration of
    - **dronedaron**—avoid concomitant use
- Antidepressants: grapefruit juice possibly increases plasma concentration of
  - **sertraline**
- Antihistamines: grapefruit juice reduces plasma concentration of
  - **bilastine**; grapefruit juice increases plasma concentration of
    - **rupatadine**—avoid concomitant use
- Antimalarials: avoidance of grapefruit juice advised by manufacturer of
  - **piperaquine with arteminimol**; grapefruit juice possibly increases plasma concentration of
    - **artemether with lumefantrine**
- Antipsychotics: grapefruit juice possibly increases plasma concentration of
  - **quetiapine**—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: grapefruit juice possibly increases plasma concentration of
  - **efavirenz**
- Anxiolytics and Hypnotics: grapefruit juice possibly increases plasma concentration of
  - **oral midazolam**; grapefruit juice increases plasma concentration of
    - **buspiron**
- Avanafil: grapefruit juice possibly increases plasma concentration of
  - **avanafil**—manufacturer of avanafil advises avoid grapefruit juice for 24 hours before avanafil
- Calcium-channel Blockers: grapefruit juice possibly increases plasma concentration of
  - **amlodipine**; grapefruit juice increases plasma concentration of
    - **felodipine**, **lacidipine**, **lercanidipine**, **nicardipine**, **nifedipine**, **nimodipine** and **verapamil**
- Ciclosporin: grapefruit juice increases plasma concentration of
  - **ciclosporin** (increased risk of toxicity)
- Colchicine: grapefruit juice possibly increases risk of
  - **colchicine** toxicity
- Cytotoxics: grapefruit juice possibly increases plasma concentration of
  - **axitinib**; grapefruit juice possibly increases the plasma concentration of
    - **bosutinib**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; grapefruit juice possibly increases plasma concentration of
      - **crizotinib** and **vinflunine**—manufacturer of crizotinib and vinflunine advises avoid concomitant use; avoidance of grapefruit juice advised by manufacturer of
        - **everolimus**, **lapatinib**, **nilotinib** and **pazopanib**
  - Ivabradine: grapefruit juice increases plasma concentration of
    - **ivabradine**
  - Ivacaftor: grapefruit juice possibly increases plasma concentration of
    - **ivacaftor**—manufacturer of ivacaftor advises avoid concomitant use
  - Lipid-regulating Drugs: grapefruit juice possibly increases plasma concentration of
    - **atorvastatin**; grapefruit juice increases plasma concentration of
      - **simvastatin**—avoid concomitant use; avoidance of grapefruit juice advised by manufacturer of
        - **lomitapide**
  - Pirfenidone: avoidance of grapefruit juice advised by manufacturer of
    - **pirfenidone**
  - Ranolazine: grapefruit juice possibly increases plasma concentration of
    - **ranolazine**—manufacturer of ranolazine advises avoid concomitant use
  - Sildenafil: grapefruit juice possibly increases plasma concentration of
    - **sildenafil**

### Grapefruit Juice (continued)

- Sirolimus: grapefruit juice increases plasma concentration of
  - **sirolimus**—avoid concomitant use
- Tacrolimus: grapefruit juice increases plasma concentration of
  - **tacrolimus**
- Tadalafil: grapefruit juice possibly increases plasma concentration of
  - **tadalafil**
- Tolvaptan: grapefruit juice increases plasma concentration of
  - **tolvaptan**—avoid concomitant use
- Ulipristal: avoidance of grapefruit juice advised by manufacturer of
  - **ulipristal**
- Vardenafil: grapefruit juice possibly increases plasma concentration of
  - **vardenafil**—avoid concomitant use

### Griseofulvin

- Alcohol: griseofulvin possibly enhances effects of
  - **alcohol**
- Anticoagulants: griseofulvin reduces anticoagulant effect of
  - **coumarins**
- Antiepileptics: absorption of griseofulvin reduced by
  - **phenobarbital** (reduced effect)
- Ciclosporin: griseofulvin possibly reduces plasma concentration of
  - **ciclosporin**
- Oestrogens: anecdotal reports of contraceptive failure and menstrual irregularities when griseofulvin given with
  - **oestrogens**
- Progestogens: anecdotal reports of contraceptive failure and menstrual irregularities when griseofulvin given with
  - **progestogens**

**Guanethidine** see Adrenergic Neurone Blockers

**Haloperidol** see Antipsychotics

**Heparin** see Heparins

### Heparins

- ACE Inhibitors: increased risk of hyperkalaemia when heparins given with
  - **ACE inhibitors**
- Aliskiren: increased risk of hyperkalaemia when heparins given with
  - **aliskiren**
- Analgesics: possible increased risk of bleeding when heparins given with
  - **NSAIDs**; increased risk of haemorrhage when anticoagulants given with
    - **intravenous diclofenac** (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with
      - **ketorolac** (avoid concomitant use, including low-dose heparins); anticoagulant effect of heparins enhanced by
        - **aspirin**
- Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when heparins given with
  - **angiotensin-II receptor antagonists**
- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with
  - **apixaban**,  **dabigatran** and  **rivaroxaban** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- Clopidogrel: increased risk of bleeding when heparins given with
  - **clopidogrel**
- Dipyridamole: anticoagulant effect of heparins enhanced by
  - **dipyridamole**
- Iloprost: anticoagulant effect of heparins possibly enhanced by
  - **iloprost**
- Nitrates: anticoagulant effect of heparins reduced by
  - **infusion of glyceryl trinitrate**

### Histamine

- Antidepressants: manufacturer of histamine advises avoid concomitant use with
  - **MAOIs**; effects of histamine theoretically antagonised by
    - **tricyclics**—manufacturer of histamine advises avoid concomitant use
- Antihistamines: effects of histamine theoretically antagonised by
  - **antihistamines**—manufacturer of histamine advises avoid concomitant use
- Antimalarials: manufacturer of histamine advises avoid concomitant use with
  - **antimalarials**
- Antipsychotics: effects of histamine theoretically antagonised by
  - **antipsychotics**—manufacturer of histamine advises avoid concomitant use

**Histamine** (*continued*)

Atovaquone: manufacturer of histamine advises avoid concomitant use with **atovaquone**

Clonidine: manufacturer of histamine advises avoid concomitant use with **clonidine**

Corticosteroids: manufacturer of histamine advises avoid concomitant use with **corticosteroids**

Ulcer-healing Drugs: effects of histamine theoretically antagonised by **histamine H<sub>2</sub>-antagonists**—manufacturer of histamine advises avoid concomitant use

**Histamine H<sub>2</sub>-antagonists**

- Alpha-blockers: histamine and ranitidine antagonise effects of **tolazoline**
- Analgesics: cimetidine inhibits metabolism of **opioid analgesics** (increased plasma concentration)
- Anti-arrhythmics: cimetidine increases plasma concentration of **amiodarone** and **propafenone**; cimetidine inhibits metabolism of **flecainide** (increased plasma concentration); cimetidine increases plasma concentration of **lidocaine** (increased risk of toxicity)
- Antibacterials: cimetidine increases plasma concentration of **erythromycin** (increased risk of toxicity, including deafness); cimetidine inhibits metabolism of **metronidazole** (increased plasma concentration); metabolism of cimetidine accelerated by **rifampicin** (reduced plasma concentration)
- Anticoagulants: cimetidine inhibits metabolism of **coumarins** (enhanced anticoagulant effect)
- Antidepressants: cimetidine increases plasma concentration of **citalopram**, **escitalopram**, **mirtazapine** and **sertraline**; cimetidine inhibits metabolism of **amitriptyline**, **doxepin**, **imipramine** and **nortriptyline** (increased plasma concentration); cimetidine increases plasma concentration of **moclobemide** (halve dose of moclobemide); cimetidine possibly increases plasma concentration of **tricyclics**
- Antidiabetics: cimetidine reduces excretion of **metformin** (increased plasma concentration); cimetidine enhances hypoglycaemic effect of **sulfonylureas**
- Antiepileptics: cimetidine inhibits metabolism of **carbamazepine**, **phenytoin** and **valproate** (increased plasma concentration)
- Antifungals: histamine H<sub>2</sub>-antagonists reduce absorption of **itraconazole**; cimetidine reduces plasma concentration of **posaconazole**—manufacturer of posaconazole *suspension* advises avoid concomitant use; famotidine, nizatidine and ranitidine possibly reduce plasma concentration of **posaconazole**—manufacturer of posaconazole *suspension* advises avoid concomitant use; cimetidine increases plasma concentration of **terbinafine**
- Antihistamines: manufacturer of loratadine advises cimetidine possibly increases plasma concentration of **loratadine**; cimetidine increases plasma concentration of **hydroxyzine**
- Antimalarials: avoidance of cimetidine advised by manufacturer of **artemether with lumefantrine**; cimetidine inhibits metabolism of **chloroquine** and **hydroxychloroquine** and **quinine** (increased plasma concentration)
- Antipsychotics: cimetidine possibly enhances effects of **antipsychotics**, **chlorpromazine** and **clozapine**
- Antivirals: famotidine and ranitidine reduce the plasma concentration of **atazanavir** (adjust doses of both drugs—consult atazanavir product literature); manufacturer of atazanavir advises adjust doses of both drugs when cimetidine and nizatidine given with **atazanavir**—consult atazanavir product literature; famotidine increases plasma concentration of **raltegravir**; avoidance of histamine H<sub>2</sub>-antagonists for 12 hours before or 4 hours after **rilpivirine** advised by manufacturer of rilpivirine—consult product literature; cimetidine possibly increases plasma concentration of **saquinavir**
- Anxiolytics and Hypnotics: cimetidine inhibits metabolism of **benzodiazepines**, **clomethiazole** and

**Histamine H<sub>2</sub>-antagonists**

Anxiolytics and Hypnotics (*continued*)

**zaleplon** (increased plasma concentration); cimetidine increases plasma concentration of **melatonin**

Beta-blockers: cimetidine increases plasma concentration of **labetalol**, **metoprolol** and **propranolol**

Caffeine citrate: cimetidine increases plasma concentration of **caffeine citrate**

Calcium-channel Blockers: cimetidine possibly inhibits metabolism of **calcium-channel blockers** (increased plasma concentration)

- Ciclosporin: cimetidine possibly increases plasma concentration of **ciclosporin**
- Clopidogrel: cimetidine possibly reduces antiplatelet effect of **clopidogrel**
- Cytotoxics: cimetidine possibly enhances myelosuppressive effects of **carmustine** and **lomustine**; cimetidine increases plasma concentration of **epirubicin**; cimetidine inhibits metabolism of **flourouracil** (increased plasma concentration); famotidine possibly reduces plasma concentration of **dasatinib**; avoidance of cimetidine, famotidine and nizatidine advised by manufacturer of **erlotinib**; ranitidine reduces plasma concentration of **erlotinib**—manufacturer of erlotinib advises give at least 2 hours before or 10 hours after ranitidine; ranitidine reduces plasma concentration of **gefitinib**; histamine H<sub>2</sub>-antagonists possibly reduce absorption of **pazopanib**—manufacturer of pazopanib advises give at least 2 hours before or 10 hours after histamine H<sub>2</sub>-antagonists
- Dopaminergics: cimetidine reduces excretion of **pramipexole** (increased plasma concentration)
- Ergot Alkaloids: increased risk of ergotism when cimetidine given with **ergotamine**—avoid concomitant use
- Fampridine: avoidance of cimetidine advised by manufacturer of **fampridine**
- Histamine: histamine H<sub>2</sub>-antagonists theoretically antagonise effects of **histamine**—manufacturer of histamine advises avoid concomitant use
- Hormone Antagonists: absorption of cimetidine possibly delayed by **octreotide**
- 5HT<sub>1</sub>-receptor Agonists: cimetidine inhibits metabolism of **zolmitriptan** (reduce dose of zolmitriptan)
- Lipid-regulating Drugs: manufacturer of lomitapide advises dose reduction when cimetidine given with **lomitapide** (see Dose under Lomitapide, p. 177)
- Mebendazole: cimetidine possibly inhibits metabolism of **mebendazole** (increased plasma concentration)
- Roflumilast: cimetidine inhibits the metabolism of **roflumilast**
- Sildenafil: cimetidine increases plasma concentration of **sildenafil** (consider reducing dose of sildenafil)
- Sympathomimetics: cimetidine possibly inhibits metabolism of **dobutamine**
- Theophylline: cimetidine inhibits metabolism of **theophylline** (increased plasma concentration)
- Thyroid Hormones: cimetidine reduces absorption of **levothyroxine**
- Ulipristal: avoidance of histamine H<sub>2</sub>-antagonists advised by manufacturer of *high-dose* **ulipristal** (contraceptive effect of ulipristal possibly reduced)

**Homatropine** *see* Antimuscarinics

**Hormone Antagonists** *see* Abiraterone, Bicalutamide, Danazol, Dutasteride, Enzalutamide, Exemestane, Flutamide, Lanreotide, Octreotide, Pasireotide, Tamoxifen, and Toremifene

**5HT<sub>1</sub>-receptor Agonists**

- Antibacterials: plasma concentration of eletriptan increased by **clarithromycin** and **erythromycin** (risk of toxicity)—avoid concomitant use; metabolism of zolmitriptan possibly inhibited by **quinolones** (reduce dose of zolmitriptan)

**5HT<sub>1</sub>-receptor Agonists** (continued)

- Antidepressants: increased risk of CNS toxicity when 5HT<sub>1</sub> agonists given with ●**citalopram** (manufacturer of citalopram advises avoid concomitant use); increased risk of CNS toxicity when sumatriptan given with ●**citalopram**, ●**escitalopram**, ●**fluoxetine**, ●**fluvoxamine** or ●**paroxetine**; metabolism of frovatriptan inhibited by **fluvoxamine**; metabolism of zolmitriptan possibly inhibited by **fluvoxamine** (reduce dose of zolmitriptan); CNS toxicity reported when sumatriptan given with **sertraline**; possible increased serotonergic effects when 5HT<sub>1</sub> agonists given with **duloxetine** or **venlafaxine**; risk of CNS toxicity when zolmitriptan given with ●**MAOIs** or ●**moclobemide** (reduce dose of zolmitriptan); risk of CNS toxicity when rizatriptan or sumatriptan given with ●**MAOIs** (avoid rizatriptan or sumatriptan for 2 weeks after MAOIs); risk of CNS toxicity when rizatriptan or sumatriptan given with ●**moclobemide** (avoid rizatriptan or sumatriptan for 2 weeks after moclobemide); possible increased serotonergic effects when naratriptan given with **SSRIs**; increased serotonergic effects when 5HT<sub>1</sub> agonists given with ●**St John's wort**—avoid concomitant use
- Antifungals: plasma concentration of eletriptan increased by ●**itraconazole** (risk of toxicity)—avoid concomitant use
- Antivirals: plasma concentration of eletriptan increased by ●**indinavir** and ●**ritonavir** (risk of toxicity)—avoid concomitant use
- Beta-blockers: plasma concentration of rizatriptan increased by **propranolol** (manufacturer of rizatriptan advises halve dose and avoid within 2 hours of propranolol)
- Dapoxetine: possible increased risk of serotonergic effects when 5HT<sub>1</sub> agonists given with ●**dapoxetine** (manufacturer of dapoxetine advises 5HT<sub>1</sub> agonists should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping 5HT<sub>1</sub> agonists)
- Dopaminergics: avoidance of 5HT<sub>1</sub> agonists advised by manufacturer of **selegiline**
- Ergot Alkaloids: increased risk of vasospasm when almotriptan, rizatriptan, sumatriptan or zolmitriptan given with ●**ergotamine** (avoid ergotamine for 6 hours after almotriptan, rizatriptan, sumatriptan or zolmitriptan, avoid almotriptan, rizatriptan, sumatriptan or zolmitriptan for 24 hours after ergotamine); increased risk of vasospasm when eletriptan, frovatriptan or naratriptan given with ●**ergotamine** (avoid ergotamine for 24 hours after eletriptan, frovatriptan or naratriptan, avoid eletriptan, frovatriptan or naratriptan for 24 hours after ergotamine)
- Lithium: possible risk of toxicity when sumatriptan given with **lithium**
- Ulcer-healing Drugs: metabolism of zolmitriptan inhibited by **cimetidine** (reduce dose of zolmitriptan)

**5HT<sub>2</sub>-receptor Antagonists**

- Analgesics: ondansetron possibly antagonises effects of **tramadol**
- Antibacterials: metabolism of ondansetron accelerated by **rifampicin** (reduced effect)
- Antiepileptics: metabolism of ondansetron accelerated by **carbamazepine** and **phenytoin** (reduced effect)
- Cytotoxics: increased risk of ventricular arrhythmias when ondansetron given with ●**vandetanib**—avoid concomitant use
- Dopaminergics: possible increased hypotensive effect when ondansetron given with ●**apomorphine**—avoid concomitant use

**Hydralazine** see Vasodilator Antihypertensives**Hydrochlorothiazide** see Diuretics**Hydrocortisone** see Corticosteroids**Hydroflumethiazide** see Diuretics**Hydromorphone** see Opioid Analgesics**Hydrotalcite** see Antacids**Hydroxocobalamin**Antibacterials: response to hydroxocobalamin reduced by **chloramphenicol****Hydroxycarbamide**

- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Antivirals: increased risk of toxicity when hydroxycarbamide given with ●**didanosine** and ●**stavudine**—avoid concomitant use

**Hydroxychloroquine** see Chloroquine and Hydroxychloroquine**Hydroxyzine** see Antihistamines**Hyoscine** see Antimuscarinics**Ibandronic Acid** see Bisphosphonates**Ibuprofen** see NSAIDs**Idarubicin**

- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Ciclosporin: plasma concentration of idarubicin increased by ●**ciclosporin**

**Ifosfamide**

- Anticoagulants: ifosfamide possibly enhances anticoagulant effect of ●**coumarins**
- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Cytotoxics: increased risk of toxicity when ifosfamide given with **cisplatin**

**Iloprost**Analgesics: increased risk of bleeding when iloprost given with **NSAIDs** or **aspirin**Anticoagulants: iloprost possibly enhances anticoagulant effect of **coumarins** and **heparins**; increased risk of bleeding when iloprost given with **phenindione**Clopidogrel: increased risk of bleeding when iloprost given with **clopidogrel**Eptifibatid: increased risk of bleeding when iloprost given with **eptifibatid**Tirofiban: increased risk of bleeding when iloprost given with **tirofiban****Imatinib**Analgesics: manufacturer of imatinib advises caution with **paracetamol**Antibacterials: plasma concentration of imatinib reduced by ●**rifampicin**—avoid concomitant useAnticoagulants: manufacturer of imatinib advises replacement of **warfarin** with a heparin (possibility of enhanced warfarin effect)Antidepressants: plasma concentration of imatinib reduced by ●**St John's wort**—avoid concomitant useAntiepileptics: plasma concentration of imatinib reduced by ●**carbamazepine**, ●**oxcarbazepine** and ●**phenytoin**—avoid concomitant useAntipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)Antivirals: avoidance of imatinib advised by manufacturer of ●**boceprevir**Ciclosporin: imatinib possibly increases plasma concentration of **ciclosporin**Cytotoxics: imatinib possibly increases the plasma concentration of ●**bosutinib**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; imatinib increases plasma concentration of ●**everolimus** (consider reducing the dose of everolimus—consult everolimus product literature)Lipid-regulating Drugs: imatinib increases plasma concentration of **simvastatin**Tacrolimus: imatinib increases plasma concentration of **tacrolimus**Thyroid Hormones: imatinib possibly reduces plasma concentration of **levothyroxine****Imidapril** see ACE Inhibitors

**Imipenem with Cilastatin**

- Antiepileptics: carbapenems reduce plasma concentration of ●**valproate**—avoid concomitant use
  - Antivirals: increased risk of convulsions when imipenem with cilastatin given with ●**ganciclovir**
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 850

**Imipramine** *see* Antidepressants, Tricyclic **Immunoglobulins**

**Note** For advice on immunoglobulins and live virus vaccines, see under Normal Immunoglobulin, p. 852

**Indacaterol** *see* Sympathomimetics, Beta<sub>2</sub>**Indapamide** *see* Diuretics**Indinavir**

- Aldesleukin: plasma concentration of indinavir possibly increased by **aldesleukin**
- Anti-arrhythmics: indinavir possibly increases plasma concentration of ●**amiodarone**—avoid concomitant use; indinavir possibly increases plasma concentration of ●**flecainide** (increased risk of ventricular arrhythmias—avoid concomitant use)
  - Antibacterials: indinavir increases plasma concentration of ●**rifabutin** (also plasma concentration of indinavir reduced)—reduce rifabutin dose; metabolism of indinavir accelerated by ●**rifampicin** (reduced plasma concentration—avoid concomitant use); avoidance of concomitant indinavir in severe renal and hepatic impairment advised by manufacturer of ●**telithromycin**
- Anticoagulants: avoidance of indinavir advised by manufacturer of **apixaban** and **rivaroxaban**
- Antidepressants: plasma concentration of indinavir reduced by ●**St John's wort**—avoid concomitant use
  - Antiepileptics: plasma concentration of indinavir possibly reduced by ●**carbamazepine** and ●**phenytoin**, also plasma concentration of carbamazepine and phenytoin possibly increased; plasma concentration of indinavir possibly reduced by ●**phenobarbital**
  - Antifungals: plasma concentration of indinavir increased by ●**itraconazole** (consider reducing dose of indinavir)
  - Antimalarials: caution with indinavir advised by manufacturer of **artemether with lumefantrine**; indinavir possibly increases plasma concentration of ●**quinine** (increased risk of toxicity)
- Antimuscarinics: avoidance of indinavir advised by manufacturer of **darifenacin** and **tolterodine**; manufacturer of fesoterodine advises dose reduction when indinavir given with **fesoterodine**—consult fesoterodine product literature
- Antipsychotics: indinavir possibly increases plasma concentration of ●**aripiprazole** (reduce dose of aripiprazole—consult aripiprazole product literature); indinavir possibly increases plasma concentration of ●**pimozide** (increased risk of ventricular arrhythmias—avoid concomitant use); indinavir possibly increases plasma concentration of ●**quetiapine**—manufacturer of quetiapine advises avoid concomitant use
  - Antivirals: avoid concomitant use of indinavir with ●**atazanavir**; plasma concentration of both drugs increased when indinavir given with **darunavir**; absorption of indinavir reduced by **didanosine tablets** (give at least 1 hour apart); plasma concentration of indinavir reduced by **efavirenz** and **nevirapine**; plasma concentration of indinavir possibly reduced by ●**etravirine**—avoid concomitant use; indinavir increases plasma concentration of ●**maraviroc** (consider reducing dose of maraviroc); plasma concentration of indinavir increased by **ritonavir**; indinavir increases plasma concentration of **saquinavir**
  - Anxiolytics and Hypnotics: increased risk of prolonged sedation when indinavir given with ●**alprazolam**—avoid concomitant use; indinavir possibly increases

**Indinavir**

- Anxiolytics and Hypnotics (*continued*)
    - plasma concentration of ●**midazolam** (risk of prolonged sedation—avoid concomitant use of *oral* midazolam)
- Atovaquone: plasma concentration of indinavir possibly reduced by **atovaquone**
- Avanafil: indinavir possibly increases plasma concentration of ●**avanafil**—manufacturer of avanafil advises avoid concomitant use
- Bosentan: plasma concentration of indinavir possibly reduced by **bosentan**
- Ciclosporin: indinavir increases plasma concentration of ●**ciclosporin**
  - Colchicine: indinavir possibly increases risk of ●**colchicine** toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids: plasma concentration of indinavir possibly reduced by **dexamethasone**
- Cytotoxics: indinavir possibly increases plasma concentration of **axitinib** (reduce dose of axitinib—consult axitinib product literature); indinavir possibly increases the plasma concentration of ●**bosutinib** and ●**cabazitaxel**—manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; indinavir possibly increases plasma concentration of ●**crizotinib** and ●**everolimus**—manufacturer of crizotinib and everolimus advises avoid concomitant use; indinavir possibly increases plasma concentration of ●**pazopanib** (reduce dose of pazopanib); manufacturer of ruxolitinib advises dose reduction when indinavir given with ●**ruxolitinib**—consult ruxolitinib product literature
  - Ergot Alkaloids: increased risk of ergotism when indinavir given with ●**ergotamine**—avoid concomitant use
  - 5HT<sub>1</sub>-receptor Agonists: indinavir increases plasma concentration of ●**eletriptan** (risk of toxicity)—avoid concomitant use
  - Lipid-regulating Drugs: possible increased risk of myopathy when indinavir given with **atorvastatin**; possible increased risk of myopathy when indinavir given with ●**rosuvastatin**—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when indinavir given with ●**simvastatin** (avoid concomitant use); avoidance of indinavir advised by manufacturer of ●**lomitapide** (plasma concentration of lomitapide possibly increased)
  - Orlista: absorption of indinavir possibly reduced by ●**orlistat**
  - Ranolazine: indinavir possibly increases plasma concentration of ●**ranolazine**—manufacturer of ranolazine advises avoid concomitant use
  - Sildenafil: indinavir increases plasma concentration of ●**sildenafil**—reduce initial dose of sildenafil
- Tadalafil: indinavir possibly increases plasma concentration of **tadalafil**
- Vardenafil: indinavir increases plasma concentration of ●**vardenafil**—avoid concomitant use
- Indometacin** *see* NSAIDs
- Indoramin** *see* Alpha-blockers
- Infliximab**
- Abatacept: avoid concomitant use of infliximab with ●**abatacept**
  - Anakinra: avoid concomitant use of infliximab with ●**anakinra**
  - Vaccines: avoid concomitant use of infliximab with live ●**vaccines** (see p. 828)
- Influenza Vaccine** *see* Vaccines
- Insulin** *see* Antidiabetics
- Interferon Alfa** *see* Interferons
- Interferon Gamma** *see* Interferons

**Interferons**

**Note** Peginterferon alfa interactions as for interferon alfa

- Antivirals: caution with peginterferon alfa advised by manufacturer of **adefovir**; increased risk of peripheral neuropathy when interferon alfa given with **●telbivudine**
  - Theophylline: interferon alfa inhibits metabolism of **●theophylline** (consider reducing dose of theophylline)
- Vaccines: manufacturer of interferon gamma advises avoid concomitant use with **vaccines**

**Ipilimumab**

- Antipsychotics: avoid concomitant use of cytotoxics with **●clozapine** (increased risk of agranulocytosis)
- Cytotoxics: manufacturer of ipilimumab advises avoid concomitant use with **vemurafenib**

**Ipratropium** *see* Antimuscarinics**Irbesartan** *see* Angiotensin-II Receptor Antagonists**Irinotecan**

- Antidepressants: metabolism of irinotecan accelerated by **●St John's wort** (reduced plasma concentration—avoid concomitant use)
- Antiepileptics: plasma concentration of irinotecan and its active metabolite reduced by **●carbamazepine**, **●phenobarbital** and **●phenytoin**
- Antifungals: increased risk of toxicity when irinotecan given with **●itraconazole**—avoid concomitant use
  - Antipsychotics: avoid concomitant use of cytotoxics with **●clozapine** (increased risk of agranulocytosis)
  - Antivirals: metabolism of irinotecan possibly inhibited by **●atazanavir** (increased risk of toxicity)
  - Cytotoxics: plasma concentration of active metabolite of irinotecan increased by **●lapatinib**—consider reducing dose of irinotecan; plasma concentration of irinotecan increased by **●regorafenib**; plasma concentration of irinotecan possibly increased by **●sorafenib**

**Iron**

Antacids: absorption of *oral* iron reduced by **oral magnesium salts** (as magnesium trisilicate)

Antibacterials: *oral* iron reduces absorption of **ciprofloxacin**, **levofloxacin**, **moxifloxacin** and **ofloxacin**; *oral* iron reduces absorption of **norfloxacin** (give at least 2 hours apart); *oral* iron reduces absorption of **tetracyclines**, also absorption of *oral* iron reduced by tetracyclines

Bisphosphonates: *oral* iron reduces absorption of **bisphosphonates**

Calcium Salts: absorption of *oral* iron reduced by **calcium salts**

Dopaminergics: *oral* iron reduces absorption of **entacapone**; *oral* iron possibly reduces absorption of **levodopa**

Eltrombopag: *oral* iron possibly reduces absorption of **eltrombopag** (give at least 4 hours apart)

Methyldopa: *oral* iron antagonises hypotensive effect of **methyldopa**

Mycophenolate: *oral* iron reduces absorption of **mycophenolate**

Penicillamine: *oral* iron reduces absorption of **penicillamine**

Thyroid Hormones: *oral* iron reduces absorption of **levothyroxine** (give at least 2 hours apart)

Trientine: absorption of *oral* iron reduced by **trientine**

Zinc: *oral* iron reduces absorption of **zinc**, also absorption of *oral* iron reduced by zinc

**Iso-carboxazid** *see* MAOIs**Isoflurane** *see* Anaesthetics, General**Iso-methheptene** *see* Sympathomimetics**Isoniazid**

Anaesthetics, General: increased risk of hepatotoxicity when isoniazid given with **iso-flurane**

Analgesics: avoidance of isoniazid advised by manufacturer of **●pethidine**

Antacids: absorption of isoniazid reduced by **antacids**

**Isoniazid** (*continued*)

- Antibacterials: increased risk of hepatotoxicity when isoniazid given with **●rifampicin**; increased risk of CNS toxicity when isoniazid given with **●cycloserine**
  - Antiepileptics: isoniazid increases plasma concentration of **●carbamazepine** (also possibly increased isoniazid hepatotoxicity); isoniazid inhibits metabolism of **●ethosuximide** (increased plasma concentration and risk of toxicity); isoniazid possibly inhibits metabolism of **●phenytoin** (increased risk of toxicity)
- Anxiolytics and Hypnotics: isoniazid inhibits the metabolism of **●diazepam**
- Corticosteroids: plasma concentration of isoniazid possibly reduced by **corticosteroids**
- Disulfiram: isoniazid possibly increases CNS effects of **disulfiram**
- Dopaminergics: isoniazid possibly reduces effects of **levodopa**
- Theophylline: isoniazid possibly increases plasma concentration of **theophylline**
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 850

**Iso-sorbide Dinitrate** *see* Nitrates**Iso-sorbide Mononitrate** *see* Nitrates**Isotretinoin** *see* Retinoids**Itraconazole** *see* Antifungals, Triazole**Ivabradine**

- Anti-arrhythmic: increased risk of ventricular arrhythmias when ivabradine given with **●amiodarone** or **●disopyramide**
- Antibacterials: plasma concentration of ivabradine possibly increased by **●clarithromycin** and **●telithromycin**—avoid concomitant use; increased risk of ventricular arrhythmias when ivabradine given with **●erythromycin**—avoid concomitant use
- Antidepressants: plasma concentration of ivabradine reduced by **St John's wort**—avoid concomitant use
- Antifungals: plasma concentration of ivabradine increased by **fluconazole**—reduce initial dose of ivabradine; plasma concentration of ivabradine possibly increased by **●itraconazole**—avoid concomitant use
- Antimalarials: increased risk of ventricular arrhythmias when ivabradine given with **●mefloquine**
- Antipsychotics: increased risk of ventricular arrhythmias when ivabradine given with **●pimozide**
- Antivirals: plasma concentration of ivabradine possibly increased by **●ritonavir**—avoid concomitant use
- Beta-blockers: increased risk of ventricular arrhythmias when ivabradine given with **●sotalol**
- Calcium-channel Blockers: plasma concentration of ivabradine increased by **●diltiazem** and **●verapamil**—avoid concomitant use
- Grapefruit Juice: plasma concentration of ivabradine increased by **grapefruit juice**
- Pentamidine Isetionate: increased risk of ventricular arrhythmias when ivabradine given with **●pentamidine isetionate**

**Ivacaftor**

- Antibacterials: plasma concentration of ivacaftor possibly increased by **●clarithromycin**, **●erythromycin** and **●telithromycin** (see Dose under Ivacaftor, p. 216); plasma concentration of ivacaftor possibly reduced by **●rifabutin**—manufacturer of ivacaftor advises avoid concomitant use; plasma concentration of ivacaftor reduced by **●rifampicin**—manufacturer of ivacaftor advises avoid concomitant use
- Antidepressants: plasma concentration of ivacaftor possibly reduced by **●St John's wort**—manufacturer of ivacaftor advises avoid concomitant use
- Antiepileptics: plasma concentration of ivacaftor possibly reduced by **●carbamazepine**, **●phenobarbital** and **●phenytoin**—manufacturer of ivacaftor advises avoid concomitant use
- Antifungals: plasma concentration of ivacaftor increased by **●fluconazole** (see Dose under Ivacaftor)

**Ivacaftor**

- Antifungals (*continued*)
  - tor, p. 216); plasma concentration of ivacaftor possibly increased by ●itraconazole, ●posaconazole and ●voriconazole (see Dose under Ivacaftor, p. 216)
- Anxiolytics and Hypnotics: ivacaftor increases plasma concentration of midazolam
- Grapefruit Juice: plasma concentration of ivacaftor possibly increased by grapefruit juice—manufacturer of ivacaftor advises avoid concomitant use

**Kaolin**

- Analgesics: kaolin possibly reduces absorption of aspirin
- Antibacterials: kaolin possibly reduces absorption of tetracyclines
- Antimalarials: kaolin reduces absorption of chloroquine and hydroxychloroquine
- Antipsychotics: kaolin possibly reduces absorption of phenothiazines

**Ketamine** see Anaesthetics, General

**Ketoprofen** see NSAIDs

**Ketorolac** see NSAIDs

**Ketotifen** see Antihistamines

**Labetalol** see Beta-blockers

**Lacidipine** see Calcium-channel Blockers

**Lacosamide**

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and ●tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●SSRIs and ●tricyclics (convulsive threshold lowered)
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by ●mefloquine
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ●antipsychotics (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ●orlistat

**Lactulose**

Anticoagulants: lactulose possibly enhances anticoagulant effect of coumarins

**Lamivudine**

- Antibacterials: plasma concentration of lamivudine increased by trimethoprim (as co-trimoxazole)—avoid concomitant use of high-dose co-trimoxazole
- Antivirals: avoidance of lamivudine advised by manufacturer of emtricitabine
- Cytotoxics: manufacturer of lamivudine advises avoid concomitant use with ●cladribine
- Orlistat: absorption of lamivudine possibly reduced by ●orlistat

**Lamotrigine**

- Antibacterials: plasma concentration of lamotrigine reduced by ●rifampicin
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and ●tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●SSRIs and ●tricyclics (convulsive threshold lowered)
- Antiepileptics: plasma concentration of lamotrigine often reduced by carbamazepine, also plasma concentration of an active metabolite of carbamazepine sometimes raised (but evidence is conflicting); plasma concentration of lamotrigine reduced by phenobarbital and phenytoin; plasma concentration of lamotrigine increased by ●valproate (increased risk of toxicity—reduce lamotrigine dose)
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by ●mefloquine
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ●antipsychotics (convulsive threshold lowered)

**Lamotrigine** (*continued*)

- Antivirals: plasma concentration of lamotrigine possibly reduced by ritonavir
- Estrogens: plasma concentration of lamotrigine reduced by ●estrogens—consider increasing dose of lamotrigine
- Orlistat: possible increased risk of convulsions when antiepileptics given with ●orlistat
- Progestogens: plasma concentration of lamotrigine possibly increased by desogestrel

 **Lanreotide**

- Antidiabetics: lanreotide possibly reduces requirements for antidiabetics
- Ciclosporin: lanreotide reduces plasma concentration of ciclosporin

**Lansoprazole** see Proton Pump Inhibitors

**Lanthanum**

- Antibacterials: lanthanum possibly reduces absorption of quinolones (give at least 2 hours before or 4 hours after lanthanum)
- Antimalarials: lanthanum possibly reduces absorption of chloroquine and hydroxychloroquine (give at least 2 hours apart)
- Thyroid Hormones: lanthanum reduces absorption of levothyroxine (give at least 2 hours apart)

**Lapatinib**

- Antibacterials: manufacturer of lapatinib advises avoid concomitant use with ●rifabutin, ●rifampicin and ●telithromycin
- Antidepressants: manufacturer of lapatinib advises avoid concomitant use with ●St John's wort
- Antidiabetics: manufacturer of lapatinib advises avoid concomitant use with ●repaglinide
- Antiepileptics: plasma concentration of lapatinib reduced by ●carbamazepine—avoid concomitant use; manufacturer of lapatinib advises avoid concomitant use with ●phenytoin
- Antifungals: manufacturer of lapatinib advises avoid concomitant use with ●itraconazole, ●posaconazole and ●voriconazole
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis); manufacturer of lapatinib advises avoid concomitant use with ●pimozide
- Antivirals: avoidance of lapatinib advised by manufacturer of ●boceprevir; manufacturer of lapatinib advises avoid concomitant use with ●ritonavir and ●saquinavir
- Cytotoxics: lapatinib increases plasma concentration of pazopanib; possible increased risk of neutropenia when lapatinib given with docetaxel; increased risk of neutropenia when lapatinib given with ●paclitaxel; lapatinib increases plasma concentration of active metabolite of ●irinotecan—consider reducing dose of irinotecan
- Grapefruit Juice: manufacturer of lapatinib advises avoid concomitant use with ●grapefruit juice
- Ulcer-healing Drugs: absorption of lapatinib possibly reduced by histamine H<sub>2</sub>-antagonists and proton pump inhibitors

**Laronidase**

Antimalarials: effects of laronidase possibly inhibited by chloroquine and hydroxychloroquine (manufacturer of laronidase advises avoid concomitant use)

**Leflunomide**

- Note** Increased risk of toxicity with other haematotoxic and hepatotoxic drugs
- Antibacterials: plasma concentration of active metabolite of leflunomide possibly increased by rifampicin
- Anticoagulants: leflunomide possibly enhances anticoagulant effect of warfarin
- Antidiabetics: leflunomide possibly enhances hypoglycaemic effect of tolbutamide
- Antiepileptics: leflunomide possibly increases plasma concentration of phenytoin

**Leflunomide** (*continued*)

- Cytotoxics: risk of toxicity when leflunomide given with **methotrexate**
- Lipid-regulating Drugs: the effect of leflunomide is significantly decreased by **colestyramine** (enhanced elimination)—avoid unless drug elimination desired
- Vaccines: avoid concomitant use of leflunomide with live **vaccines** (see p. 828)

**Lenalidomide**

- Antibacterials: plasma concentration of lenalidomide possibly increased by **clarithromycin** (increased risk of toxicity)
- Antifungals: plasma concentration of lenalidomide possibly increased by **itraconazole** (increased risk of toxicity)
- Calcium-channel Blockers: plasma concentration of lenalidomide possibly increased by **verapamil** (increased risk of toxicity)
- Cardiac Glycosides: lenalidomide possibly increases plasma concentration of **digoxin**
- Ciclosporin: plasma concentration of lenalidomide possibly increased by **ciclosporin** (increased risk of toxicity)

**Lercanidipine** *see* Calcium-channel Blockers

**Leukotriene Receptor Antagonists**

- Analgesics: plasma concentration of zafirlukast increased by **aspirin**
- Antibacterials: plasma concentration of zafirlukast reduced by **erythromycin**
- Anticoagulants: zafirlukast enhances anticoagulant effect of **warfarin**
- Antiepileptics: plasma concentration of montelukast reduced by **phenobarbital**
- Antifungals: plasma concentration of zafirlukast increased by **fluconazole**
- Lipid-regulating Drugs: plasma concentration of montelukast increased by **gemfibrozil**
- Theophylline: zafirlukast possibly increases plasma concentration of **theophylline**, also plasma concentration of zafirlukast reduced

**Levamisole**

- Alcohol: possibility of disulfiram-like reaction when levamisole given with **alcohol**
- Anticoagulants: levamisole possibly enhances anticoagulant effect of **warfarin**
- Antiepileptics: levamisole possibly increases plasma concentration of **phenytoin**

**Levetiracetam**

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **SSRIs** and **tricyclics** (convulsive threshold lowered)
- Antiepileptics: levetiracetam possibly increases risk of **carbamazepine** toxicity
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by **mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by **antipsychotics** (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with **orlistat**

**Levobunolol** *see* Beta-blockers

**Levobupivacaine**

- Anti-arrhythmics: increased myocardial depression when levobupivacaine given with **anti-arrhythmics**

**Levocarnitine**

- Anticoagulants: levocarnitine possibly enhances anticoagulant effect of **coumarins**

**Levocetirizine** *see* Antihistamines

**Levodopa**

- ACE Inhibitors: enhanced hypotensive effect when levodopa given with **ACE inhibitors**

**Levodopa** (*continued*)

Adrenergic Neuron Blockers: enhanced hypotensive effect when levodopa given with **adrenergic neuron blockers**

Alpha-blockers: enhanced hypotensive effect when levodopa given with **alpha-blockers**

- Anaesthetics, General: increased risk of arrhythmias when levodopa given with **volatile liquid general anaesthetics**
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when levodopa given with **angiotensin-II receptor antagonists**
- Antibacterials: effects of levodopa possibly reduced by **isoniazid**
- Antidepressants: risk of hypertensive crisis when levodopa given with **MAOIs**, avoid levodopa for at least 2 weeks after stopping MAOIs; increased risk of side-effects when levodopa given with **moclobemide**
- Antiepileptics: effects of levodopa possibly reduced by **phenytoin**
- Antimuscarinics: absorption of levodopa possibly reduced by **antimuscarinics**
- Antipsychotics: effects of levodopa antagonised by **antipsychotics**; avoidance of levodopa advised by manufacturer of **amisulpride** (antagonism of effect)
- Anxiolytics and Hypnotics: effects of levodopa possibly antagonised by **benzodiazepines**
- Beta-blockers: enhanced hypotensive effect when levodopa given with **beta-blockers**
- Bupropion: increased risk of side-effects when levodopa given with **bupropion**
- Calcium-channel Blockers: enhanced hypotensive effect when levodopa given with **calcium-channel blockers**
- Clonidine: enhanced hypotensive effect when levodopa given with **clonidine**
- Diazoxide: enhanced hypotensive effect when levodopa given with **diazoxide**
- Diuretics: enhanced hypotensive effect when levodopa given with **diuretics**
- Dopaminergics: enhanced effects and increased toxicity of levodopa when given with **selegiline** (reduce dose of levodopa)
- Iron: absorption of levodopa possibly reduced by **oral iron**
- Memantine: effects of dopaminergics possibly enhanced by **memantine**
- Methylodopa: enhanced hypotensive effect when levodopa given with **methylodopa**; antiparkinsonian effect of dopaminergics antagonised by **methylodopa**
- Moxonidine: enhanced hypotensive effect when levodopa given with **moxonidine**
- Muscle Relaxants: possible agitation, confusion and hallucinations when levodopa given with **baclofen**
- Nitrates: enhanced hypotensive effect when levodopa given with **nitrates**
- Vasodilator Antihypertensives: enhanced hypotensive effect when levodopa given with **hydralazine**, **minoxidil** or **sodium nitroprusside**
- Vitamins: effects of levodopa reduced by **pyridoxine** when given without dopa-decarboxylase inhibitor

**Levofloxacin** *see* Quinolones

**Levofolinic Acid** *see* Folates

**Levomepromazine** *see* Antipsychotics

**Levonorgestrel** *see* Progestogens

**Levothyroxine** *see* Thyroid Hormones

**Lidocaine**

Note Interactions less likely when lidocaine used topically

Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with **bupivacaine**, **levobupivacaine**, **prilocaine** or **ropivacaine**

- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other **anti-arrhythmics**

**Lidocaine** (*continued*)

- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with ●antipsychotics that prolong the QT interval
- Antivirals: plasma concentration of lidocaine possibly increased by ●atazanavir and ●lopinavir; plasma concentration of lidocaine possibly increased by ●darunavir and ●fosamprenavir—avoid concomitant use; increased risk of ventricular arrhythmias when lidocaine given with ●saquinavir—avoid concomitant use; caution with *intravenous* lidocaine advised by manufacturer of ●telaprevir
- Beta-blockers: increased myocardial depression when anti-arrhythmics given with ●beta-blockers; possible increased risk of lidocaine toxicity when given with ●nadolol; increased risk of lidocaine toxicity when given with ●propranolol
- Diuretics: action of lidocaine antagonised by hypokalaemia caused by ●acetazolamide, ●loop diuretics or ●thiazides and related diuretics
- Muscle Relaxants: neuromuscular blockade enhanced and prolonged when lidocaine given with ●suxamethonium
- Ulcer-healing Drugs: plasma concentration of lidocaine increased by ●cimetidine (increased risk of toxicity)

**Linagliptin** *see* Antidiabetics

**Linezolid**

**Note** Linezolid is a reversible, non-selective MAO inhibitor—see interactions of MAOIs

Antibacterials: plasma concentration of linezolid reduced by ●rifampicin (possible therapeutic failure of linezolid)

Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850

**Liothyronine** *see* Thyroid Hormones

**Lipid-regulating Drugs** *see* Colesevelam, Colestipol, Colestyramine, Ezetimibe, Fibrates, Lomitapide, Nicotinic Acid, and Statins

**Liraglutide** *see* Antidiabetics

**Lisdexamfetamine** *see* Sympathomimetics

**Lisinopril** *see* ACE Inhibitors

**Lithium**

- ACE Inhibitors: excretion of lithium reduced by ●ACE inhibitors (increased plasma concentration)
- Analgesics: excretion of lithium reduced by ●NSAIDs (increased risk of toxicity); excretion of lithium reduced by ●ketorolac (increased risk of toxicity)—avoid concomitant use
- Angiotensin-II Receptor Antagonists: excretion of lithium reduced by ●angiotensin-II receptor antagonists (increased plasma concentration)
- Antacids: excretion of lithium increased by ●sodium bicarbonate (reduced plasma concentration)
- Anti-arrhythmics: avoidance of lithium advised by manufacturer of ●amiodarone (risk of ventricular arrhythmias)
- Antibacterials: increased risk of lithium toxicity when given with ●metronidazole
- Antidepressants: possible increased serotonergic effects when lithium given with ●venlafaxine; increased risk of CNS effects when lithium given with ●SSRIs (lithium toxicity reported); risk of toxicity when lithium given with ●tricyclics
- Antiepileptics: neurotoxicity may occur when lithium given with ●carbamazepine or ●phenytoin without increased plasma concentration of lithium; plasma concentration of lithium possibly affected by ●topiramate
- Antipsychotics: increased risk of extrapyramidal side-effects and possibly neurotoxicity when lithium given with ●clozapine, ●flupentixol, ●haloperidol, ●phenothiazines, ●risperidone or ●zuclopentixol; possible risk of toxicity when lithium given with

**Lithium**

● Antipsychotics (*continued*)

●olanzapine; increased risk of extrapyramidal side-effects when lithium given with ●sulpiride

Anxiolytics and Hypnotics: increased risk of neurotoxicity when lithium given with ●clonazepam

Calcium-channel Blockers: neurotoxicity may occur when lithium given with ●diltiazem or ●verapamil without increased plasma concentration of lithium

● Cytotoxics: increased risk of ventricular arrhythmias when lithium given with ●arsenic trioxide

● Dapoxetine: possible increased risk of serotonergic effects when lithium given with ●dapoxetine (manufacturer of dapoxetine advises lithium should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping lithium)

● Diuretics: excretion of lithium increased by ●acetazolamide; excretion of lithium reduced by ●loop diuretics and ●thiazides and related diuretics (increased plasma concentration and risk of toxicity)—loop diuretics safer than thiazides; excretion of lithium reduced by ●potassium-sparing diuretics and ●aldosterone antagonists (increased plasma concentration and risk of toxicity)

5HT<sub>1</sub>-receptor Agonists: possible risk of toxicity when lithium given with ●sumatriptan

● Methyl dopa: neurotoxicity may occur when lithium given with ●methyl dopa without increased plasma concentration of lithium

Muscle Relaxants: lithium enhances effects of ●muscle relaxants; hyperkinesia caused by lithium possibly aggravated by ●baclofen

Parasympathomimetics: lithium antagonises effects of ●neostigmine

Theophylline: excretion of lithium increased by ●theophylline (reduced plasma concentration)

**Lixisenatide** *see* Antidiabetics

**Lofepamine** *see* Antidepressants, Tricyclic

**Lofexidine**

Alcohol: increased sedative effect when lofexidine given with ●alcohol

Anxiolytics and Hypnotics: increased sedative effect when lofexidine given with ●anxiolytics and ●hypnotics

**Lomitapide**

Alcohol: manufacturer of lomitapide advises avoid concomitant use with ●alcohol

● Anti-arrhythmics: manufacturer of lomitapide advises avoid concomitant use with ●dronedarone (plasma concentration of lomitapide possibly increased)

● Antibacterials: manufacturer of lomitapide advises avoid concomitant use with ●clarithromycin, ●erythromycin and ●telithromycin (plasma concentration of lomitapide possibly increased)

Anticoagulants: lomitapide possibly enhances anticoagulant effect of ●warfarin

● Antifungals: manufacturer of lomitapide advises avoid concomitant use with ●triazoles (plasma concentration of lomitapide possibly increased)

● Antivirals: manufacturer of lomitapide advises avoid concomitant use with ●darunavir, ●fosamprenavir, ●indinavir, ●lopinavir, ●ritonavir, ●saquinavir, ●telaprevir and ●tipranavir (plasma concentration of lomitapide possibly increased)

Appetite: manufacturer of lomitapide advises dose reduction when lomitapide given with ●fosaprepitant (see Dose under Lomitapide, p. 177)

● Calcium-channel Blockers: manufacturer of lomitapide advises avoid concomitant use with ●diltiazem and ●verapamil (plasma concentration of lomitapide possibly increased)

Grapefruit Juice: manufacturer of lomitapide advises avoid concomitant use with ●grapefruit juice

● Lipid-regulating Drugs: lomitapide increases plasma concentration of ●atorvastatin; lomitapide increases plasma concentration of ●simvastatin (see Dose

**Lomitapide**

- Lipid-regulating Drugs (*continued*) under Simvastatin, p. 173); absorption of lomitapide possibly reduced by **bile acid sequestrants** (give at least 4 hours apart)
- Ranolazine: manufacturer of lomitapide advises dose reduction when lomitapide given with **ranolazine** (see Dose under Lomitapide, p. 177)
- Ulcer-healing Drugs: manufacturer of lomitapide advises dose reduction when lomitapide given with **cimetidine** (see Dose under Lomitapide, p. 177)

**Lomustine**

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Ulcer-healing Drugs: myelosuppressive effects of lomustine possibly enhanced by **cimetidine**

**Loperamide**

Desmopressin: loperamide increases plasma concentration of **oral desmopressin**

**Lopinavir**

**Note** In combination with ritonavir as **Kaletra**® (ritonavir is present to inhibit lopinavir metabolism and increase plasma-lopinavir concentration)—see also Ritonavir

- Anti-arrhythmics: lopinavir possibly increases plasma concentration of **flecainide** (increased risk of ventricular arrhythmias—avoid concomitant use); lopinavir possibly increases plasma concentration of **lidocaine**
- Antibacterials: plasma concentration of lopinavir reduced by **rifampicin**—avoid concomitant use; avoidance of concomitant lopinavir in severe renal and hepatic impairment advised by manufacturer of **telithromycin**
- Anticoagulants: avoidance of lopinavir advised by manufacturer of **apixaban**; manufacturers advise avoid concomitant use of lopinavir with **rivaroxaban**
- Antidepressants: plasma concentration of lopinavir reduced by **St John's wort**—avoid concomitant use
- Antiepileptics: plasma concentration of lopinavir possibly reduced by **carbamazepine**, **phenobarbital** and **phenytoin**
- Antihistamines: lopinavir possibly increases plasma concentration of **chlorphenamine**
- Antimalarials: caution with lopinavir advised by manufacturer of **artemether with lumefantrine**
- Antimuscarinics: avoidance of lopinavir advised by manufacturer of **darifenacin** and **tolterodine**
- Antipsychotics: lopinavir possibly increases plasma concentration of **aripiprazole** (reduce dose of aripiprazole—consult aripiprazole product literature); lopinavir possibly increases plasma concentration of **quetiapine**—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: manufacturers advise avoid concomitant use of lopinavir with **boceprevir** and **telaprevir**; lopinavir reduces plasma concentration of **darunavir**, also plasma concentration of lopinavir increased (avoid concomitant use); plasma concentration of lopinavir reduced by **efavirenz**—consider increasing dose of lopinavir; lopinavir boosted with ritonavir increases plasma concentration of **elvitegravir** (reduce dose of elvitegravir); lopinavir reduces plasma concentration of **fosamprenavir**, effect on lopinavir plasma concentration not predictable—avoid concomitant use; lopinavir increases plasma concentration of **maraviroc** (consider reducing dose of maraviroc); plasma concentration of lopinavir possibly reduced by **nevirapine**—consider increasing dose of lopinavir; increased risk of ventricular arrhythmias when lopinavir given with **saquinavir**—avoid concomitant use; lopinavir increases plasma concentration of **tenofovir**; plasma concentration of lopinavir reduced by **tipranavir**

**Lopinavir** (*continued*)

- Bosentan: lopinavir increases plasma concentration of **bosentan** (consider reducing dose of bosentan)
  - Corticosteroids: plasma concentration of lopinavir possibly reduced by **dexamethasone**
  - Cytotoxics: manufacturer of ruxolitinib advises dose reduction when lopinavir given with **ruxolitinib**—consult ruxolitinib product literature
  - Eltrombopag: lopinavir possibly reduces plasma concentration of **eltrombopag**
  - Lipid-regulating Drugs: possible increased risk of myopathy when lopinavir given with **atorvastatin**; lopinavir increases plasma concentration of **rosuvastatin**—adjust dose of rosuvastatin (consult product literature); possible increased risk of myopathy when lopinavir given with **simvastatin**—avoid concomitant use; avoidance of lopinavir advised by manufacturer of **lomitapide** (plasma concentration of lomitapide possibly increased)
  - Orlistat: absorption of lopinavir possibly reduced by **orlistat**
  - Ranolazine: lopinavir possibly increases plasma concentration of **ranolazine**—manufacturer of ranolazine advises avoid concomitant use
  - Sirolimus: lopinavir possibly increases plasma concentration of **sirolimus**
  - Sympathomimetics, Beta<sub>2</sub>: manufacturer of lopinavir advises avoid concomitant use with **salmeterol**
- Loprazolam** see Anxiolytics and Hypnotics
- Loratadine** see Antihistamines
- Lorazepam** see Anxiolytics and Hypnotics
- Lormetazepam** see Anxiolytics and Hypnotics
- Losartan** see Angiotensin-II Receptor Antagonists
- Lumefantrine** see Artemether with Lumefantrine
- Lymecycline** see Tetracyclines
- Macitentan**
- Antibacterials: plasma concentration of macitentan reduced by **rifampicin**—avoid concomitant use
  - Antidepressants: manufacturer of macitentan advises avoid concomitant use with **St John's wort**
  - Antiepileptics: manufacturer of macitentan advises avoid concomitant use with **carbamazepine** and **phenytoin**
- Macrogols**
- Note** Some manufacturers suggest taking other oral medication 1 hour before or 1 hour after macrogols to reduce possible interference with absorption
- Macrolides**
- Note** See also Telithromycin
- Note** Interactions do not apply to small amounts of erythromycin used topically
- Analgesics: erythromycin increases plasma concentration of **alfentanil**; clarithromycin possibly increases plasma concentration of **fentanyl**
  - Antacids: absorption of azithromycin reduced by **antacids**
  - Anti-arrhythmics: increased risk of ventricular arrhythmias when *parenteral* erythromycin given with **amiodarone**—avoid concomitant use; erythromycin increases plasma concentration of **disopyramide** (increased risk of toxicity); clarithromycin possibly increases plasma concentration of **disopyramide** (increased risk of ventricular arrhythmias); azithromycin possibly increases plasma concentration of **disopyramide** (increased risk of toxicity); avoidance of clarithromycin advised by manufacturer of **dronedronone** (risk of ventricular arrhythmias); erythromycin increases plasma concentration of **dronedronone** (increased risk of ventricular arrhythmias—avoid concomitant use)
  - Antibacterials: increased risk of ventricular arrhythmias when *parenteral* erythromycin given with **moxifloxacin**—avoid concomitant use; increased risk of side-effects including neutropenia when azithromycin given with **rifabutin**; clarithromycin increases plasma concentration of

## Macrolides

- Antibericals (*continued*)
  - **rifabutin** (increased risk of toxicity—reduce rifabutin dose); erythromycin possibly increases plasma concentration of **rifabutin** (increased risk of toxicity—reduce rifabutin dose); plasma concentration of clarithromycin reduced by **rifamycins**
- Anticoagulants: azithromycin possibly enhances anticoagulant effect of **coumarins**; clarithromycin and erythromycin enhance anticoagulant effect of **coumarins**; possible increased risk of bleeding when clarithromycin given with **dabigatran**
- Antidepressants: avoidance of macrolides advised by manufacturer of **reboxetine**; avoidance of *intravenous* erythromycin advised by manufacturer of **citalopram** and **escitalopram** (risk of ventricular arrhythmias); clarithromycin possibly increases plasma concentration of **trazodone**
- Antidiabetics: clarithromycin enhances effects of **repaglinide**
- Antiepileptics: erythromycin increases plasma concentration of **carbamazepine**; clarithromycin increases plasma concentration of **carbamazepine** (consider reducing dose of carbamazepine); clarithromycin inhibits metabolism of **phenytoin** (increased plasma concentration); erythromycin possibly inhibits metabolism of **valproate** (increased plasma concentration)
- Antifungals: avoidance of erythromycin advised by manufacturer of **fluconazole**; clarithromycin increases plasma concentration of **itraconazole**
- Antihistamines: manufacturer of loratadine advises erythromycin possibly increases plasma concentration of **loratadine**; macrolides possibly inhibit metabolism of **mizolastine** (avoid concomitant use); erythromycin inhibits metabolism of **mizolastine**—avoid concomitant use; erythromycin increases plasma concentration of **rupatadine**
- Antimalarials: avoidance of macrolides advised by manufacturer of **piperaque with arteminimol** (possible risk of ventricular arrhythmias); avoidance of macrolides advised by manufacturer of **artemether with lumefantrine**
- Antimuscarinics: erythromycin possibly increases plasma concentration of **darifenacin**; manufacturer of fesoterodine advises dose reduction when clarithromycin given with **fesoterodine**—consult fesoterodine product literature; avoidance of clarithromycin and erythromycin advised by manufacturer of **tolterodine**
- Antipsychotics: avoidance of macrolides advised by manufacturer of **droperidol** (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when *parenteral* erythromycin given with **zuclopenthixol**—avoid concomitant use; increased risk of ventricular arrhythmias when erythromycin given with **amisulpride**—avoid concomitant use; erythromycin possibly increases plasma concentration of **clozapine** (possible increased risk of convulsions); increased risk of ventricular arrhythmias when clarithromycin given with **pimozide**—avoid concomitant use; possible increased risk of ventricular arrhythmias when erythromycin given with **pimozide**—avoid concomitant use; clarithromycin possibly increases plasma concentration of **quetiapine**—manufacturer of quetiapine advises avoid concomitant use; erythromycin increases plasma concentration of **quetiapine**—manufacturer of quetiapine advises avoid concomitant use; increased risk of ventricular arrhythmias when *parenteral* erythromycin given with **sulpiride**
- Antivirals: plasma concentration of both drugs increased when clarithromycin given with **atazanavir**; plasma concentration of clarithromycin reduced by **efavirenz**, also plasma concentration of active metabolite of clarithromycin increased; plasma con-

## Macrolides

- Antivirals (*continued*)
  - concentration of clarithromycin reduced by **etravirine** and **nevirapine** (but concentration of an active metabolite increased), also plasma concentration of etravirine and nevirapine increased; clarithromycin possibly increases plasma concentration of **maraviroc** (consider reducing dose of maraviroc); avoidance of clarithromycin and erythromycin advised by manufacturer of **rilpivirine** (plasma concentration of rilpivirine possibly increased); plasma concentration of azithromycin and erythromycin possibly increased by **ritonavir**; plasma concentration of clarithromycin increased by **ritonavir** (reduce dose of clarithromycin in renal impairment); increased risk of ventricular arrhythmias when erythromycin given with **saquinavir**—avoid concomitant use; plasma concentration of both drugs possibly increased when clarithromycin given with **saquinavir** and **telaprevir** (increased risk of ventricular arrhythmias); plasma concentration of both drugs possibly increased when erythromycin given with **telaprevir** (increased risk of ventricular arrhythmias); plasma concentration of clarithromycin increased by **tipranavir** (reduce dose of clarithromycin in renal impairment), also clarithromycin increases plasma concentration of tipranavir; clarithromycin tablets reduce absorption of **zidovudine** (give at least 2 hours apart)
- Anxiolytics and Hypnotics: clarithromycin and erythromycin inhibit metabolism of **midazolam** (increased plasma concentration with increased sedation); erythromycin increases plasma concentration of **bupropion** (reduce dose of bupropion); erythromycin inhibits the metabolism of **zopiclone**
- Aprepitant: clarithromycin possibly increases plasma concentration of **aprepitant**
- Atomoxetine: increased risk of ventricular arrhythmias when *parenteral* erythromycin given with **atomoxetine**
- Avanafil: clarithromycin possibly increases plasma concentration of **avanafil**—manufacturer of avanafil advises avoid concomitant use; erythromycin increases plasma concentration of **avanafil**—see Dose under Avanafil, p. 559
- Calcium-channel Blockers: clarithromycin and erythromycin possibly inhibit metabolism of **calcium-channel blockers** (increased risk of side-effects); avoidance of erythromycin advised by manufacturer of **lercanidipine**
- Cardiac Glycosides: macrolides increase plasma concentration of **digoxin** (increased risk of toxicity)
- Ciclosporin: macrolides possibly inhibit metabolism of **ciclosporin** (increased plasma concentration); clarithromycin and erythromycin inhibit metabolism of **ciclosporin** (increased plasma concentration)
- Cilostazol: clarithromycin possibly increases plasma concentration of **cilostazol** (see Dose under Cilostazol, p. 140); erythromycin increases plasma concentrations of **cilostazol** (see Dose under Cilostazol, p. 140)
- Clopidogrel: erythromycin possibly reduces antiplatelet effect of **clopidogrel**
- Colchicine: azithromycin, clarithromycin and erythromycin possibly increase risk of **colchicine** toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids: erythromycin possibly inhibits metabolism of **corticosteroids**; erythromycin inhibits the metabolism of **methylprednisolone**; clarithromycin possibly increases plasma concentration of **methylprednisolone**
- Cytotoxics: erythromycin possibly increases the plasma concentration of **afatinib**—manufacturer of afatinib advises separating administration of erythromycin by 6 to 12 hours; clarithromycin and

**Macrolides**● Cytotoxics (*continued*)

erythromycin possibly increase plasma concentration of **axitinib** (reduce dose of axitinib—consult axitinib product literature); clarithromycin and erythromycin possibly increase the plasma concentration of **bosutinib**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; clarithromycin possibly increases plasma concentration of **crizotinib** and **everolimus**—manufacturer of crizotinib and everolimus advises avoid concomitant use; erythromycin increases plasma concentration of **everolimus** (consider reducing the dose of everolimus—consult everolimus product literature); avoidance of clarithromycin advised by manufacturer of **nilotinib**; clarithromycin possibly increases plasma concentration of **pazopanib** (reduce dose of pazopanib); manufacturer of ruxolitinib advises dose reduction when clarithromycin given with **ruxolitinib**—consult ruxolitinib product literature; possible increased risk of ventricular arrhythmias when *parenteral* erythromycin given with **vandetanib**—avoid concomitant use; clarithromycin possibly increases the plasma concentration of **cabazitaxel**—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel; *in vitro* studies suggest a possible interaction between erythromycin and **docetaxel** (consult docetaxel product literature); increased risk of ventricular arrhythmias when erythromycin given with **arsenic trioxide**; erythromycin increases toxicity of **vinblastine**—avoid concomitant use; possible increased risk of neutropenia when clarithromycin given with **vinorelbine**

Dapoxetine: manufacturer of dapoxetine advises dose reduction when clarithromycin and erythromycin given with **dapoxetine** (see Dose under Dapoxetine, p. 560)

- Diuretics: clarithromycin increases plasma concentration of **eplerenone**—avoid concomitant use; erythromycin increases plasma concentration of **eplerenone** (reduce dose of eplerenone)
- Domperidone: possible increased risk of ventricular arrhythmias when clarithromycin given with **domperidone**—avoid concomitant use; erythromycin increases plasma concentration of **domperidone** (increased risk of ventricular arrhythmias—avoid concomitant use)

Dopaminergics: macrolides possibly increase plasma concentration of **bromocriptine** and **cabergoline** (increased risk of toxicity); erythromycin increases plasma concentration of **bromocriptine** and **cabergoline** (increased risk of toxicity)

- Ergot Alkaloids: increased risk of ergotism when macrolides given with **ergotamine**—avoid concomitant use
- Fidaxomicin: avoidance of clarithromycin and erythromycin advised by manufacturer of **fidaxomicin**
- 5HT<sub>1</sub>-receptor Agonists: clarithromycin and erythromycin increase plasma concentration of **eletriptan** (risk of toxicity)—avoid concomitant use
- Ivabradine: clarithromycin possibly increases plasma concentration of **ivabradine**—avoid concomitant use; increased risk of ventricular arrhythmias when erythromycin given with **ivabradine**—avoid concomitant use
- Ivacaftor: clarithromycin and erythromycin possibly increase plasma concentration of **ivacaftor** (see Dose under Ivacaftor, p. 216)
- Lenalidomide: clarithromycin possibly increases plasma concentration of **lenalidomide** (increased risk of toxicity)
- Leukotriene Receptor Antagonists: erythromycin reduces plasma concentration of **zafirlukast**
- Lipid-regulating Drugs: clarithromycin increases plasma concentration of **atorvastatin** and **prava-**

**Macrolides**● Lipid-regulating Drugs (*continued*)

**statin**; possible increased risk of myopathy when erythromycin given with **atorvastatin**; erythromycin increases plasma concentration of **pravastatin**; erythromycin reduces plasma concentration of **rosuvastatin**; increased risk of myopathy when clarithromycin or erythromycin given with **simvastatin** (avoid concomitant use); avoidance of clarithromycin and erythromycin advised by manufacturer of **lomitapide** (plasma concentration of lomitapide possibly increased)

Mirabegron: when given with clarithromycin avoid or reduce dose of **mirabegron** in hepatic or renal impairment—see Mirabegron, p. 552

Oestrogens: erythromycin increases plasma concentration of **estradiol**

Parasympathomimetics: erythromycin increases plasma concentration of **galantamine**

- Pentamidine Isetionate: increased risk of ventricular arrhythmias when *parenteral* erythromycin given with **pentamidine isetionate**
- Progestogens: erythromycin increases plasma concentration of **dienogest**
- Ranolazine: clarithromycin possibly increases plasma concentration of **ranolazine**—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: clarithromycin increases plasma concentration of **sildenafil** (consider reducing dose of sildenafil); erythromycin increases plasma concentration of **sildenafil**—reduce initial dose of sildenafil
- Sildenafil: clarithromycin increases plasma concentration of **sirolimus**—avoid concomitant use; plasma concentration of both drugs increased when erythromycin given with **sirolimus**
- Tacrolimus: clarithromycin and erythromycin increase plasma concentration of **tacrolimus**
- Tadalafil: clarithromycin and erythromycin possibly increase plasma concentration of **tadalafil**
- Theophylline: clarithromycin possibly increases plasma concentration of **theophylline**; erythromycin increases plasma concentration of **theophylline** (also theophylline may reduce absorption of *oral* erythromycin)
- Ticagrelor: clarithromycin possibly increases plasma concentration of **ticagrelor**—manufacturer of ticagrelor advises avoid concomitant use; erythromycin possibly increases plasma concentration of **ticagrelor**
- Ulcer-healing Drugs: plasma concentration of erythromycin increased by **cimetidine** (increased risk of toxicity, including deafness); plasma concentration of both drugs increased when clarithromycin given with **omeprazole**
- Ulipristal: avoidance of clarithromycin advised by manufacturer of **ulipristal**; erythromycin increases plasma concentration of **ulipristal**—manufacturer of ulipristal advises avoid concomitant use
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 850
- Vardenafil: clarithromycin possibly increases plasma concentration of **varденафил** (consider reducing initial dose of vardenafil); erythromycin increases plasma concentration of **varденафил** (reduce dose of vardenafil)

**Magnesium (parenteral)**

- Calcium-channel Blockers: profound hypotension reported with concomitant use of parenteral magnesium and **nifedipine** in pre-eclampsia
- Muscle Relaxants: parenteral magnesium enhances effects of **non-depolarising muscle relaxants** and **suxamethonium**

**Magnesium Salts (oral)** see Antacids**Mannitol**

Antibacterials: avoidance of mannitol advised by manufacturer of **tobramycin**

**Mannitol** (*continued*)

Ciclosporin: possible increased risk of nephrotoxicity when mannitol given with **ciclosporin**

**MAOIs**

**Note** For interactions of reversible MAO-A inhibitors (RIMAs) see Moclobemide, and for interactions of MAO-B inhibitors see Rasagiline and Selegiline; the antibacterial Linezolid is a reversible, non-selective MAO inhibitor

**ACE Inhibitors:** MAOIs possibly enhance hypotensive effect of **ACE inhibitors**

**Adrenergic Neurone Blockers:** enhanced hypotensive effect when MAOIs given with **adrenergic neurone blockers**

- **Alcohol:** MAOIs interact with tyramine found in some beverages containing **alcohol** and some decaffeinated beverages (hypertensive crisis)—if no tyramine, enhanced hypotensive effect

**Alpha<sub>2</sub>-adrenoceptor Stimulants:** avoidance of MAOIs advised by manufacturer of **apraclonidine** and **bri-monidine**

- **Alpha-blockers:** avoidance of MAOIs advised by manufacturer of **indoramin**; enhanced hypotensive effect when MAOIs given with **alpha-blockers**
  - **Analgesics:** possible increased serotonergic effects when MAOIs given with **fentanyl**; CNS excitation or depression (hypertension or hypotension) when MAOIs given with **opethidine**—avoid concomitant use and for 2 weeks after stopping MAOIs; possible increased serotonergic effects and increased risk of convulsions when MAOIs given with **tramadol**—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs; avoidance of MAOIs advised by manufacturer of **nefopam**; possible CNS excitation or depression (hypertension or hypotension) when MAOIs given with **opioid analgesics**—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs
- Angiotensin-II Receptor Antagonists:** MAOIs possibly enhance hypotensive effect of **angiotensin-II receptor antagonists**

- **Antidepressants:** increased risk of hypertension and CNS excitation when MAOIs given with **reboxetine** (MAOIs should not be started until 1 week after stopping reboxetine, avoid reboxetine for 2 weeks after stopping MAOIs); after stopping MAOIs do not start **citalopram**, **escitalopram**, **fluvoxamine**, **paroxetine** or **sertraline** for 2 weeks, also MAOIs should not be started until at least 1 week after stopping citalopram, escitalopram, fluvoxamine, paroxetine or sertraline; after stopping MAOIs do not start **fluoxetine** for 2 weeks, also MAOIs should not be started until at least 5 weeks after stopping fluoxetine; after stopping MAOIs do not start **duloxetine** for 2 weeks, also MAOIs should not be started until at least 5 days after stopping duloxetine; enhanced CNS effects and toxicity when MAOIs given with **venlafaxine** (venlafaxine should not be started until 2 weeks after stopping MAOIs, avoid MAOIs for 1 week after stopping venlafaxine); increased risk of hypertension and CNS excitation when MAOIs given with other **MAOIs** (avoid for at least 2 weeks after stopping previous MAOIs and then start at a reduced dose); after stopping MAOIs do not start **moclobemide** for at least 1 week; MAOIs increase CNS effects of **SSRIs** (risk of serious toxicity); after stopping MAOIs do not start **mirtazapine** for 2 weeks, also MAOIs should not be started until at least 2 weeks after stopping mirtazapine; after stopping MAOIs do not start **tricyclic-related antidepressants** for 2 weeks, also MAOIs should not be started until at least 1–2 weeks after stopping tricyclic-related antidepressants; increased risk of hypertension and CNS excitation when MAOIs given with **tricyclics**, tricyclics should not be started until 2 weeks after stopping MAOIs (3

**MAOIs**

- **Antidepressants** (*continued*)

weeks if starting clomipramine or imipramine), also MAOIs should not be started for at least 1–2 weeks after stopping tricyclics (3 weeks in the case of clomipramine or imipramine)

**Antidiabetics:** MAOIs possibly enhance hypoglycaemic effect of **antidiabetics**; MAOIs enhance hypoglycaemic effect of **insulin**, **metformin** and **sulfonylureas**

- **Antiepileptics:** MAOIs possibly antagonise anticonvulsant effect of **antiepileptics** (convulsive threshold lowered); avoidance for 2 weeks after stopping MAOIs advised by manufacturer of **carbamazepine**, also antagonism of anticonvulsant effect

**Antihistamines:** avoidance of MAOIs advised by manufacturer of **hydroxyzine**; avoidance of promethazine for 2 weeks after stopping MAOIs advised by manufacturer of **promethazine**; increased antimuscarinic and sedative effects when MAOIs given with **antihistamines**

- **Antimalarials:** avoidance of antidepressants advised by manufacturer of **artemether with lumefantrine** and **piperazine with arteminol**

**Antimuscarinics:** increased risk of antimuscarinic side-effects when MAOIs given with **antimuscarinics**

- **Antipsychotics:** CNS effects of MAOIs possibly increased by **clozapine**

- **Anxiolytics and Hypnotics:** avoidance of MAOIs advised by manufacturer of **bupropion**; manufacturer of tranlycypromine advises avoid **bupropion** for 14 days after stopping tranlycypromine

- **Atomoxetine:** after stopping MAOIs do not start **atomoxetine** for 2 weeks, also MAOIs should not be started until at least 2 weeks after stopping atomoxetine; possible increased risk of convulsions when antidepressants given with **atomoxetine**

**Beta-blockers:** enhanced hypotensive effect when MAOIs given with **beta-blockers**

- **Bupropion:** avoidance of bupropion for 2 weeks after stopping MAOIs advised by manufacturer of **bupropion**

**Calcium-channel Blockers:** enhanced hypotensive effect when MAOIs given with **calcium-channel blockers**

**Clonidine:** enhanced hypotensive effect when MAOIs given with **clonidine**

- **Dapoxetine:** increased risk of serotonergic effects when MAOIs given with **dapoxetine** (MAOIs should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping MAOIs)

**Diazoxide:** enhanced hypotensive effect when MAOIs given with **diazoxide**

**Diuretics:** enhanced hypotensive effect when MAOIs given with **diuretics**

- **Dopaminergics:** avoid concomitant use of non-selective MAOIs with **entacapone**; risk of hypertensive crisis when MAOIs given with **levodopa**, avoid levodopa for at least 2 weeks after stopping MAOIs; risk of hypertensive crisis when MAOIs given with **rasagiline**, avoid MAOIs for at least 2 weeks after stopping rasagiline; enhanced hypotensive effect when MAOIs given with **selegiline**—manufacturer of selegiline advises avoid concomitant use; avoid concomitant use of MAOIs with **tolcapone**

**Doxapram:** MAOIs enhance effects of **doxapram**

**Histamine:** avoidance of MAOIs advised by manufacturer of **histamine**

- **5HT<sub>1</sub>-receptor Agonists:** risk of CNS toxicity when MAOIs given with **rizatriptan** or **sumatriptan** (avoid rizatriptan or sumatriptan for 2 weeks after MAOIs); risk of CNS toxicity when MAOIs given with **zolmitriptan** (reduce dose of zolmitriptan)

**MAOIs** (continued)

- Methyl dopa: avoidance of MAOIs advised by manufacturer of ●**methyl dopa**
- Moxonidine: enhanced hypotensive effect when MAOIs given with **moxonidine**
- Muscle Relaxants: phenelzine enhances effects of **suxamethonium**
- Nicorandil: enhanced hypotensive effect when MAOIs given with **nicorandil**
- Nitrates: enhanced hypotensive effect when MAOIs given with **nitrates**
- Pholcodine: avoidance of pholcodine for 2 weeks after stopping MAOIs advised by manufacturer of **pholcodine**
- Sympathomimetics: risk of hypertensive crisis when MAOIs given with ●**adrenaline (epinephrine)**, ●**dobutamine**, ●**dopamine**, ●**methoxamine**, ●**noradrenaline (norepinephrine)** or ●**oxylometazoline**; risk of hypertensive crisis when MAOIs given with ●**dexamfetamine**, ●**ephedrine**, ●**isometheptene**, ●**lisdexamfetamine**, ●**metaraminol**, ●**methylphenidate**, ●**phenylephrine** or ●**pseudoephedrine**, avoid dexamfetamine, ephedrine, isometheptene, lisdexamfetamine, metaraminol, methylphenidate, phenylephrine or pseudoephedrine for at least 2 weeks after stopping MAOIs; risk of hypertensive crisis when MAOIs given with ●**oxymetazoline**, some manufacturers advise avoid oxymetazoline for at least 2 weeks after stopping MAOIs
- Tetrabenazine: risk of CNS toxicity when MAOIs given with ●**tetrabenazine** (avoid tetrabenazine for 2 weeks after MAOIs)
- Vasodilator Antihypertensives: enhanced hypotensive effect when MAOIs given with **hydralazine**, **minoxidil** or **sodium nitroprusside**

**MAOIs, reversible** *see* Moclobemide**Maraviroc**

- Antibacterials: plasma concentration of maraviroc possibly increased by ●**clarithromycin** and ●**telithromycin** (consider reducing dose of maraviroc); plasma concentration of maraviroc reduced by ●**rifampicin**—consider increasing dose of maraviroc
- Antidepressants: plasma concentration of maraviroc possibly reduced by ●**St John's wort**—avoid concomitant use
- Antivirals: plasma concentration of maraviroc increased by ●**atazanavir**, ●**boceprevir**, ●**darunavir**, ●**indinavir**, ●**lopinavir**, ●**saquinavir** and ●**telaprevir** (consider reducing dose of maraviroc); plasma concentration of maraviroc possibly reduced by ●**efavirenz**—consider increasing dose of maraviroc; plasma concentration of maraviroc possibly reduced by **etravirine**; maraviroc reduces plasma concentration of ●**fosamprenavir**—avoid concomitant use; plasma concentration of maraviroc increased by **ritonavir**
- Cobicistat: plasma concentration of maraviroc possibly increased by ●**cobicistat** (reduce dose of maraviroc)
- Orlistat: absorption of maraviroc possibly reduced by ●**orlistat**

**Mebendazole**

Ulcer-healing Drugs: metabolism of mebendazole possibly inhibited by **cimetidine** (increased plasma concentration)

**Medroxyprogesterone** *see* Progestogens**Mefenamic Acid** *see* NSAIDs**Mefloquine**

- Anti-arrhythmics: increased risk of ventricular arrhythmias when mefloquine given with ●**amiodarone**—avoid concomitant use
- Antibacterials: increased risk of ventricular arrhythmias when mefloquine given with ●**moxifloxacin**—avoid concomitant use; plasma concentration of mefloquine reduced by ●**rifampicin**—avoid concomitant use

**Mefloquine** (continued)

- Antidepressants: avoidance of antimalarials advised by manufacturer of ●**citalopram** and ●**escitalopram** (risk of ventricular arrhythmias)
- Antiepileptics: mefloquine antagonises anticonvulsant effect of ●**antiepileptics**
- Antimalarials: avoidance of antimalarials advised by manufacturer of ●**artemether with lumefantrine**; increased risk of convulsions when mefloquine given with ●**chloroquine and hydroxychloroquine**; increased risk of convulsions when mefloquine given with ●**quinine** (but should not prevent the use of *intravenous* quinine in severe cases)
- Antipsychotics: possible increased risk of ventricular arrhythmias when mefloquine given with ●**haloperidol**—avoid concomitant use; avoidance of mefloquine advised by manufacturer of **amisulpride**; increased risk of ventricular arrhythmias when mefloquine given with ●**pimozide**—avoid concomitant use; manufacturer of risperidone advises possible risk of ventricular arrhythmias when mefloquine given with ●**risperidone**
- Antivirals: mefloquine possibly reduces plasma concentration of **ritonavir**
- Atomoxetine: increased risk of ventricular arrhythmias when mefloquine given with ●**atomoxetine**
- Beta-blockers: increased risk of bradycardia when mefloquine given with **beta-blockers**
- Calcium-channel Blockers: possible increased risk of bradycardia when mefloquine given with **calcium-channel blockers**
- Cardiac Glycosides: possible increased risk of bradycardia when mefloquine given with **digoxin**
- Cytotoxics: possible increased risk of bradycardia when mefloquine given with **crizotinib**
- Histamine: avoidance of antimalarials advised by manufacturer of **histamine**
- Ivabradine: increased risk of ventricular arrhythmias when mefloquine given with ●**ivabradine**
- Vaccines: antimalarials inactivate **oral typhoid vaccine**—*see* p. 850

**Megestrol** *see* Progestogens**Melatonin** *see* Anxiolytics and Hypnotics**Meloxicam** *see* NSAIDs**Melphalan**

- Antibacterials: increased risk of melphalan toxicity when given with **nalidixic acid**
- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Cardiac Glycosides: melphalan possibly reduces absorption of **digoxin tablets**
- Ciclosporin: increased risk of nephrotoxicity when melphalan given with ●**ciclosporin**

**Memantine**

- Anaesthetics, General: increased risk of CNS toxicity when memantine given with ●**ketamine** (manufacturer of memantine advises avoid concomitant use)
- Analgesics: increased risk of CNS toxicity when memantine given with ●**dextromethorphan** (manufacturer of memantine advises avoid concomitant use)
- Anticoagulants: memantine possibly enhances anticoagulant effect of **warfarin**
- Antimuscarinics: memantine possibly enhances effects of **antimuscarinics**
- Antipsychotics: memantine possibly reduces effects of **antipsychotics**
- Dopaminergics: memantine possibly enhances effects of **dopaminergics** and **selegiline**; increased risk of CNS toxicity when memantine given with ●**amantadine** (manufacturer of memantine advises avoid concomitant use)
- Muscle Relaxants: memantine possibly modifies effects of **baclofen** and **dantrolene**
- Mepacrine**
- Antimalarials: mepacrine increases plasma concentration of **primaquine** (increased risk of toxicity)

**Meprobamate** *see* Anxiolytics and Hypnotics

**Meptazinol** *see* Opioid Analgesics

### Mercaptopurine

- Allopurinol: enhanced effects and increased toxicity of mercaptopurine when given with ●**allopurinol** (reduce dose of mercaptopurine to one quarter of usual dose)

Aminosalicylates: possible increased risk of leucopenia when mercaptopurine given with **aminosalicylates**

- Antibacterials: increased risk of haematological toxicity when mercaptopurine given with ●**sulfamethoxazole** (as co-trimoxazole); increased risk of haematological toxicity when mercaptopurine given with ●**trimethoprim** (also with co-trimoxazole)
- Anticoagulants: mercaptopurine possibly reduces anticoagulant effect of ●**coumarins**
- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Dairy Products: plasma concentration of mercaptopurine possibly reduced by **dairy products**—manufacturer of mercaptopurine advises give at least 1 hour before or 2 hours after dairy products
- Febuxostat: avoidance of mercaptopurine advised by manufacturer of ●**febuxostat**

### Meropenem

- Antiepileptics: carbapenems reduce plasma concentration of ●**valproate**—avoid concomitant use
- Probenecid: excretion of meropenem reduced by **probenecid**
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—*see* p. 850

**Mesalazine** *see* Aminosalicylates

**Mestranol** *see* Oestrogens

**Metaraminol** *see* Sympathomimetics

**Metformin** *see* Antidiabetics

**Methadone** *see* Opioid Analgesics

### Methenamine

Antacids: avoid concomitant use of methenamine with **antacids**

- Antibacterials: increased risk of crystalluria when methenamine given with ●**sulfonamides**
- Diuretics: effects of methenamine antagonised by ●**acetazolamide**

Potassium Salts: avoid concomitant use of methenamine with **potassium citrate**

Sodium Citrate: avoid concomitant use of methenamine with **sodium citrate**

Vaccines: antibacterials inactivate **oral typhoid vaccine**—*see* p. 850

**Methocarbamol** *see* Muscle Relaxants

### Methotrexate

- Anaesthetics, General: antifolate effect of methotrexate increased by ●**nitrous oxide**—avoid concomitant use
- Analgesics: excretion of methotrexate probably reduced by ●**NSAIDs** (increased risk of toxicity)—but for concomitant use in rheumatic disease *see* p. 718; excretion of methotrexate reduced by ●**aspirin**, ●**diclofenac**, ●**ibuprofen**, ●**indometacin**, ●**ketoprofen**, ●**meloxicam** and ●**naproxen** (increased risk of toxicity)—but for concomitant use in rheumatic disease *see* p. 718
- Antibacterials: absorption of methotrexate possibly reduced by **neomycin**; excretion of methotrexate possibly reduced by **ciprofloxacin** (increased risk of toxicity); increased risk of haematological toxicity when methotrexate given with ●**sulfamethoxazole** (as co-trimoxazole); increased risk of methotrexate toxicity when given with **doxycycline**, **sulfonamides** or **tetracycline**; excretion of methotrexate reduced by **penicillins** (increased risk of toxicity); increased risk of haematological toxicity when methotrexate given with ●**trimethoprim** (also with co-trimoxazole)

### Methotrexate (continued)

Antiepileptics: antifolate effect of methotrexate increased by **phenytoin**

● Antimalarials: antifolate effect of methotrexate increased by ●**pyrimethamine**

- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Cardiac Glycosides: methotrexate possibly reduces absorption of **digoxin tablets**

- Ciclosporin: risk of toxicity when methotrexate given with ●**ciclosporin**

Corticosteroids: possible increased risk of hepatotoxicity when **high-dose** methotrexate given with **dexamethasone**

- Cytotoxics: increased pulmonary toxicity when methotrexate given with ●**cisplatin**

Diuretics: excretion of methotrexate increased by alkaline urine due to **acetazolamide**

- Leflunomide: risk of toxicity when methotrexate given with ●**leflunomide**

- Probenecid: excretion of methotrexate reduced by ●**probenecid** (increased risk of toxicity)

- Retinoids: plasma concentration of methotrexate increased by ●**acitretin** (also increased risk of hepatotoxicity)—avoid concomitant use

Theophylline: methotrexate possibly increases plasma concentration of **theophylline**

Ulcer-healing Drugs: excretion of methotrexate possibly reduced by **proton pump inhibitors** (increased risk of toxicity)

**Methoxamine** *see* Sympathomimetics

### Methyldopa

ACE Inhibitors: enhanced hypotensive effect when methyldopa given with **ACE inhibitors**

Adrenergic Neurone Blockers: enhanced hypotensive effect when methyldopa given with **adrenergic neurone blockers**

Alcohol: enhanced hypotensive effect when methyldopa given with **alcohol**

Aldesleukin: enhanced hypotensive effect when methyldopa given with **aldesleukin**

Alpha-blockers: enhanced hypotensive effect when methyldopa given with **alpha-blockers**

Anaesthetics, General: enhanced hypotensive effect when methyldopa given with **general anaesthetics**

Analgesics: hypotensive effect of methyldopa antagonised by **NSAIDs**

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when methyldopa given with **angiotensin-II receptor antagonists**

- Antidepressants: manufacturer of methyldopa advises avoid concomitant use with ●**MAOIs**

Antipsychotics: enhanced hypotensive effect when methyldopa given with **antipsychotics** (also increased risk of extrapyramidal effects)

Anxiolytics and Hypnotics: enhanced hypotensive effect when methyldopa given with **anxiolytics and hypnotics**

Beta-blockers: enhanced hypotensive effect when methyldopa given with **beta-blockers**

Calcium-channel Blockers: enhanced hypotensive effect when methyldopa given with **calcium-channel blockers**

Clonidine: enhanced hypotensive effect when methyldopa given with **clonidine**

Corticosteroids: hypotensive effect of methyldopa antagonised by **corticosteroids**

Diazoxide: enhanced hypotensive effect when methyldopa given with **diazoxide**

Diuretics: enhanced hypotensive effect when methyldopa given with **diuretics**

Dopaminergics: methyldopa antagonises anti-parkinsonian effect of **dopaminergics**; increased risk of extrapyramidal side-effects when methyldopa given with **amantadine**; effects of methyldopa possi-

**Methyldopa**Dopaminergics (*continued*)

bly enhanced by **entacapone**; enhanced hypotensive effect when methyldopa given with **levodopa**

Iron: hypotensive effect of methyldopa antagonised by **oral iron**

- Lithium: neurotoxicity may occur when methyldopa given with **lithium** without increased plasma concentration of lithium
- Moxisylyte: enhanced hypotensive effect when methyldopa given with **moxisylyte**
- Moxonidine: enhanced hypotensive effect when methyldopa given with **moxonidine**
- Muscle Relaxants: enhanced hypotensive effect when methyldopa given with **baclofen** or **tizanidine**
- Nitrates: enhanced hypotensive effect when methyldopa given with **nitrates**
- Oestrogens: hypotensive effect of methyldopa antagonised by **oestrogens**
- Prostaglandins: enhanced hypotensive effect when methyldopa given with **alprostadil**
- Sympathomimetics, Beta<sub>2</sub>: acute hypotension reported when methyldopa given with **infusion of salbutamol**
- Vasodilator Antihypertensives: enhanced hypotensive effect when methyldopa given with **hydralazine**, **minoxidil** or **sodium nitroprusside**

**Methylphenidate** *see* Sympathomimetics**Methylprednisolone** *see* Corticosteroids**Methylthionium**

- Antidepressants: risk of CNS toxicity when methylthionium given with **SSRI-related antidepressants**, **SSRIs** and **clomipramine**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthionium and observe patient for up to 4 hours after administration); possible risk of CNS toxicity when methylthionium given with **mirtazapine**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthionium and observe patient for up to 4 hours after administration)
- Anxiolytics and Hypnotics: possible risk of CNS toxicity when methylthionium given with **buspirone**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthionium and observe patient for up to 4 hours after administration)
- Bupropion: possible risk of CNS toxicity when methylthionium given with **bupropion**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthionium and observe patient for up to 4 hours after administration)

**Metoclopramide**

Alcohol: metoclopramide possibly increases absorption of **alcohol**

Anaesthetics, General: metoclopramide enhances effects of **thiopental**

Analgesics: metoclopramide increases rate of absorption of **aspirin** (enhanced effect); effects of metoclopramide on gastro-intestinal activity antagonised by **opioid analgesics**; metoclopramide increases rate of absorption of **paracetamol**

Antidepressants: CNS toxicity reported when metoclopramide given with **SSRIs**

Antimuscarinics: effects of metoclopramide on gastro-intestinal activity antagonised by **antimuscarinics**

Antipsychotics: increased risk of extrapyramidal side-effects when metoclopramide given with **antipsychotics**

Atovaquone: metoclopramide reduces plasma concentration of **atovaquone**—avoid concomitant use

- Ciclosporin: metoclopramide increases plasma concentration of **ciclosporin**
- Dopaminergics: metoclopramide antagonises hypodopaminergic effects of **bromocriptine** and **cabergoline**; metoclopramide antagonises antiparkinsonian

**Metoclopramide**Dopaminergics (*continued*)

effect of **pergolide**; avoidance of metoclopramide advised by manufacturer of **ropinirole** and **rotigotine** (antagonism of effect)

Muscle Relaxants: metoclopramide enhances effects of **suxamethonium**

Tetrabenazine: increased risk of extrapyramidal side-effects when metoclopramide given with **tetrabenazine**

**Metolazone** *see* Diuretics**Metoprolol** *see* Beta-blockers**Metronidazole**

Note Interactions do not apply to topical metronidazole preparations

Alcohol: disulfiram-like reaction when metronidazole given with **alcohol**

- Anticoagulants: metronidazole enhances anticoagulant effect of **coumarins**
- Antiepileptics: metabolism of metronidazole accelerated by **phenobarbital** (reduced effect); metronidazole possibly inhibits metabolism of **phenytoin** (increased plasma concentration)
- Cytotoxics: metronidazole increases plasma concentration of **busulfan** (increased risk of toxicity); metronidazole inhibits metabolism of **fluorouracil** (increased toxicity)

Disulfiram: psychotic reaction reported when metronidazole given with **disulfiram**

Lithium: metronidazole increases risk of **lithium** toxicity

Mycophenolate: metronidazole possibly reduces bioavailability of **mycophenolate**

Ulcer-healing Drugs: metabolism of metronidazole inhibited by **cimetidine** (increased plasma concentration)

Vaccines: antibacterials inactivate **oral typhoid vaccine**—*see* p. 850

**Mianserin** *see* Antidepressants, Tricyclic (related)**Micafungin**

Antifungals: micafungin possibly increases plasma concentration of **amphotericin**; micafungin

increases plasma concentration of **itraconazole** (consider reducing dose of itraconazole)

Calcium-channel Blockers: micafungin increases plasma concentration of **nifedipine**

Ciclosporin: micafungin possibly increases plasma concentration of **ciclosporin**

Sirolimus: micafungin increases plasma concentration of **sirolimus**

**Miconazole** *see* Antifungals, Imidazole**Midazolam** *see* Anxiolytics and Hypnotics**Mifamurtide**

Analgesics: manufacturer of mifamurtide advises avoid concomitant use with high doses of **NSAIDs**

Ciclosporin: manufacturer of mifamurtide advises avoid concomitant use with **ciclosporin**

Corticosteroids: manufacturer of mifamurtide advises avoid concomitant use with **corticosteroids**

Tacrolimus: manufacturer of mifamurtide advises avoid concomitant use with **tacrolimus**

**Mifepristone**

Corticosteroids: mifepristone may reduce effect of **corticosteroids** (including *inhaled* corticosteroids) for 3–4 days

**Milrinone** *see* Phosphodiesterase Inhibitors**Minocycline** *see* Tetracyclines**Minoxidil** *see* Vasodilator Antihypertensives**Mirabegron**

Antibacterials: avoid or reduce dose of mirabegron in hepatic or renal impairment when given with **clarithromycin**—*see* Mirabegron, p. 552

Antifungals: avoid or reduce dose of mirabegron in hepatic or renal impairment when given with **itraconazole**—*see* Mirabegron, p. 552

**Mirabegron** (*continued*)

Antivirals: avoid or reduce dose of mirabegron in hepatic or renal impairment when given with **ritonavir**—see Mirabegron, p. 552

Beta-blockers: mirabegron increases plasma concentration of **metoprolol**

Cardiac Glycosides: mirabegron increases plasma concentration of **digoxin**—reduce initial dose of digoxin

**Mirtazapine**

● Alcohol: increased sedative effect when mirtazapine given with ●**alcohol**

Analgesics: possible increased serotonergic effects when mirtazapine given with **tramadol**

Anticoagulants: mirtazapine enhances anticoagulant effect of **warfarin**

● Antidepressants: possible increased serotonergic effects when mirtazapine given with **fluoxetine**, **fluvoxamine** or **venlafaxine**; mirtazapine should not be started until 2 weeks after stopping ●**MAOIs**, also **MAOIs** should not be started until at least 2 weeks after stopping mirtazapine; after stopping mirtazapine do not start ●**moclobemide** for at least 1 week

Antiepileptics: plasma concentration of mirtazapine reduced by **carbamazepine** and **phenytoin**

● Antimalarials: avoidance of antidepressants advised by manufacturer of ●**artemether with lumefantrine** and ●**piperaqueine with arteminol**

Anxiolytics and Hypnotics: increased sedative effect when mirtazapine given with **anxiolytics** and **hypnotics**

Atomoxetine: possible increased risk of convulsions when antidepressants given with **atomoxetine**

Clonidine: mirtazapine possibly antagonises hypotensive effect of **clonidine**

● Methylthioninium: possible risk of CNS toxicity when mirtazapine given with ●**methylthioninium**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)

Ulcer-healing Drugs: plasma concentration of mirtazapine increased by **cimetidine**

**Mitomycin**

● Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)

**Mitotane**

● Anticoagulants: mitotane possibly reduces anticoagulant effect of ●**coumarins**

● Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)

Diuretics: manufacturer of mitotane advises avoid concomitant use of **spironolactone** (antagonism of effect)

**Mitoxantrone**

● Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)

Cyclosporin: excretion of mitoxantrone reduced by **cyclosporin** (increased plasma concentration)

**Mivacurium** *see* Muscle Relaxants**Mizolastine** *see* Antihistamines**Moclobemide**

● Analgesics: possible CNS excitation or depression (hypertension or hypotension) when moclobemide given with ●**dextromethorphan** or ●**petidine**—avoid concomitant use; possible CNS excitation or depression (hypertension or hypotension) when moclobemide given with ●**opioid analgesics**—manufacturer of moclobemide advises consider reducing dose of opioid analgesics

● Antidepressants: moclobemide should not be started for at least 1 week after stopping ●**MAOIs**, ●**SSRI-related antidepressants**, ●**citalopram**, ●**fluvoxamine**, ●**mirtazapine**, ●**paroxetine**, ●**sertraline**, ●**tricyclic-related antidepressants** or ●**tricyclics**; increased risk of CNS toxicity when moclobemide given with ●**escitalopram**, preferably avoid concomitant use; moclobemide should not be started until 5 weeks

**Moclobemide**

● Antidepressants (*continued*)

after stopping ●**fluoxetine**; possible increased serotonergic effects when moclobemide given with ●**duloxetine**

● Antimalarials: avoidance of antidepressants advised by manufacturer of ●**artemether with lumefantrine** and ●**piperaqueine with arteminol**

Atomoxetine: possible increased risk of convulsions when antidepressants given with **atomoxetine**

● Bupropion: avoidance of moclobemide advised by manufacturer of ●**bupropion**

● Clopidogrel: moclobemide possibly reduces antiplatelet effect of ●**clopidogrel**

● Dopaminergics: caution with moclobemide advised by manufacturer of **entacapone**; increased risk of side-effects when moclobemide given with **levodopa**; avoid concomitant use of moclobemide with ●**selegiline**

● 5HT<sub>1</sub>-receptor Agonists: risk of CNS toxicity when moclobemide given with ●**rizatriptan** or ●**sumatriptan** (avoid rizatriptan or sumatriptan for 2 weeks after moclobemide); risk of CNS toxicity when moclobemide given with ●**zolmitriptan** (reduce dose of zolmitriptan)

● Sympathomimetics: risk of hypertensive crisis when moclobemide given with ●**sympathomimetics**

Ulcer-healing Drugs: plasma concentration of moclobemide increased by **cimetidine** (halve dose of moclobemide)

**Modafinil**

Antiepileptics: modafinil possibly increases plasma concentration of **phenytoin**

● Cyclosporin: modafinil reduces plasma concentration of ●**cyclosporin**

● Cytotoxics: modafinil possibly reduces plasma concentration of ●**bosutinib**—manufacturer of bosutinib advises avoid concomitant use

● Oestrogens: modafinil accelerates metabolism of ●**oestrogens** (reduced contraceptive effect—see p. 536)

**Moexipril** *see* ACE Inhibitors**Mometasone** *see* Corticosteroids**Monobactams** *see* Aztreonam**Montelukast** *see* Leukotriene Receptor Antagonists**Morphine** *see* Opioid Analgesics**Moxifloxacin** *see* Quinolones**Moxislylyte**

ACE Inhibitors: enhanced hypotensive effect when moxislylyte given with **ACE inhibitors**

Adrenergic Neurone Blockers: enhanced hypotensive effect when moxislylyte given with **adrenergic neurone blockers**

● Alpha-blockers: possible severe postural hypotension when moxislylyte given with ●**alpha-blockers**

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when moxislylyte given with **angiotensin-II receptor antagonists**

● Beta-blockers: possible severe postural hypotension when moxislylyte given with ●**beta-blockers**

Calcium-channel Blockers: enhanced hypotensive effect when moxislylyte given with **calcium-channel blockers**

Clonidine: enhanced hypotensive effect when moxislylyte given with **clonidine**

Diazoxide: enhanced hypotensive effect when moxislylyte given with **diazoxide**

Diuretics: enhanced hypotensive effect when moxislylyte given with **diuretics**

Methyl dopa: enhanced hypotensive effect when moxislylyte given with **methyl dopa**

Moxonidine: enhanced hypotensive effect when moxislylyte given with **moxonidine**

Nitrates: enhanced hypotensive effect when moxislylyte given with **nitrates**

**Moxisylyte** (*continued*)

Vasodilator Antihypertensives: enhanced hypotensive effect when moxisylyte given with **hydralazine**, **minoxidil** or **sodium nitroprusside**

**Moxonidine**

ACE Inhibitors: enhanced hypotensive effect when moxonidine given with **ACE inhibitors**

Adrenergic Neurone Blockers: enhanced hypotensive effect when moxonidine given with **adrenergic neurone blockers**

Alcohol: enhanced hypotensive effect when moxonidine given with **alcohol**

Aldesleukin: enhanced hypotensive effect when moxonidine given with **aldesleukin**

Alpha-blockers: enhanced hypotensive effect when moxonidine given with **alpha-blockers**

Anaesthetics, General: enhanced hypotensive effect when moxonidine given with **general anaesthetics**

Analgesics: hypotensive effect of moxonidine antagonised by **NSAIDs**

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when moxonidine given with **angiotensin-II receptor antagonists**

Antidepressants: enhanced hypotensive effect when moxonidine given with **MAOIs**; hypotensive effect of moxonidine possibly antagonised by **tricyclics** (manufacturer of moxonidine advises avoid concomitant use)

Antipsychotics: enhanced hypotensive effect when moxonidine given with **phenothiazines**

Anxiolytics and Hypnotics: enhanced hypotensive effect when moxonidine given with **anxiolytics and hypnotics**; sedative effects possibly increased when moxonidine given with **benzodiazepines**

Beta-blockers: enhanced hypotensive effect when moxonidine given with **beta-blockers**

Calcium-channel Blockers: enhanced hypotensive effect when moxonidine given with **calcium-channel blockers**

Clonidine: enhanced hypotensive effect when moxonidine given with **clonidine**

Corticosteroids: hypotensive effect of moxonidine antagonised by **corticosteroids**

Diazoxide: enhanced hypotensive effect when moxonidine given with **diazoxide**

Diuretics: enhanced hypotensive effect when moxonidine given with **diuretics**

Dopaminergics: enhanced hypotensive effect when moxonidine given with **levodopa**

Methyldopa: enhanced hypotensive effect when moxonidine given with **methyldopa**

Moxisylyte: enhanced hypotensive effect when moxonidine given with **moxisylyte**

Muscle Relaxants: enhanced hypotensive effect when moxonidine given with **baclofen** or **tizanidine**

Nitrates: enhanced hypotensive effect when moxonidine given with **nitrates**

Oestrogens: hypotensive effect of moxonidine antagonised by **oestrogens**

Prostaglandins: enhanced hypotensive effect when moxonidine given with **alprostadil**

Vasodilator Antihypertensives: enhanced hypotensive effect when moxonidine given with **hydralazine**, **minoxidil** or **sodium nitroprusside**

**Muscle Relaxants**

ACE Inhibitors: enhanced hypotensive effect when baclofen or tizanidine given with **ACE inhibitors**

Adrenergic Neurone Blockers: enhanced hypotensive effect when baclofen or tizanidine given with **adrenergic neurone blockers**

Alcohol: increased sedative effect when baclofen, methocarbamol or tizanidine given with **alcohol**

Alpha-blockers: enhanced hypotensive effect when baclofen or tizanidine given with **alpha-blockers**

- Anaesthetics, General: effects of atracurium enhanced by **ketamine**; increased risk of myocardial depres-

**Muscle Relaxants**• Anaesthetics, General (*continued*)

sion and bradycardia when suxamethonium given with **propofol**; effects of non-depolarising muscle relaxants and suxamethonium enhanced by **volatile liquid general anaesthetics**

Analgesics: excretion of baclofen possibly reduced by **NSAIDs** (increased risk of toxicity); excretion of baclofen reduced by **ibuprofen** (increased risk of toxicity); increased sedative effect when baclofen given with **fentanyl** or **morphine**

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when baclofen or tizanidine given with **angiotensin-II receptor antagonists**

Anti-arrhythmics: neuromuscular blockade enhanced and prolonged when suxamethonium given with **lidocaine**

- Antibacterials: effects of non-depolarising muscle relaxants and suxamethonium enhanced by **pipera-cillin**; plasma concentration of tizanidine increased by **ciprofloxacin** (increased risk of toxicity)—avoid concomitant use; plasma concentration of tizanidine possibly increased by **norfloxacin** (increased risk of toxicity); plasma concentration of tizanidine possibly reduced by **rifampicin**; effects of non-depolarising muscle relaxants and suxamethonium enhanced by **aminoglycosides**; effects of non-depolarising muscle relaxants and suxamethonium enhanced by **clindamycin**; effects of non-depolarising muscle relaxants and suxamethonium enhanced by **polymyxins**; effects of suxamethonium enhanced by **vancomycin**
- Antidepressants: plasma concentration of tizanidine increased by **fluvoxamine** (increased risk of toxicity)—avoid concomitant use; effects of suxamethonium enhanced by **phenelzine**; muscle relaxant effect of baclofen enhanced by **tricyclics**
- Antiepileptics: muscle relaxant effect of non-depolarising muscle relaxants antagonised by **carbamazepine** (accelerated recovery from neuromuscular blockade); effects of non-depolarising muscle relaxants reduced by *long-term use* of **phenytoin** (but effects of non-depolarising muscle relaxants might be increased by *acute use* of phenytoin)

Antimalarials: effects of suxamethonium possibly enhanced by **quinine**

Antipsychotics: effects of suxamethonium possibly enhanced by **promazine**

Anxiolytics and Hypnotics: increased sedative effect when baclofen or tizanidine given with **anxiolytics and hypnotics**

Beta-blockers: enhanced hypotensive effect when baclofen given with **beta-blockers**; possible enhanced hypotensive effect and bradycardia when tizanidine given with **beta-blockers**; effects of muscle relaxants enhanced by **propranolol**

Calcium-channel Blockers: enhanced hypotensive effect when baclofen or tizanidine given with **calcium-channel blockers**; effects of non-depolarising muscle relaxants possibly enhanced by **calcium-channel blockers**; possible increased risk of ventricular arrhythmias when *intravenous* dantrolene given with **diltiazem**—manufacturer of diltiazem advises avoid concomitant use; effects of non-depolarising muscle relaxants and suxamethonium enhanced by **verapamil**; avoidance of *intravenous* dantrolene advised by manufacturer of **verapamil**

Cardiac Glycosides: possible increased risk of bradycardia when tizanidine given with **cardiac glycosides**; risk of ventricular arrhythmias when suxamethonium given with **cardiac glycosides**

Clonidine: enhanced hypotensive effect when baclofen or tizanidine given with **clonidine**

Corticosteroids: effects of pancuronium and vecuronium possibly antagonised by **corticosteroids**

**Muscle Relaxants** (*continued*)

Cytotoxics: effects of suxamethonium enhanced by **cyclophosphamide** and **thiotepa**

Deferasirox: avoidance of tizanidine advised by manufacturer of **deferiasirox**

Diazoxide: enhanced hypotensive effect when baclofen or tizanidine given with **diazoxide**

Diuretics: enhanced hypotensive effect when baclofen or tizanidine given with **diuretics**

Dopaminergics: possible agitation, confusion and hallucinations when baclofen given with **levodopa**

Lithium: effects of muscle relaxants enhanced by **lithium**; baclofen possibly aggravates hyperkinesia caused by **lithium**

Magnesium (parenteral): effects of non-depolarising muscle relaxants and suxamethonium enhanced by **parenteral magnesium**

Memantine: effects of baclofen and dantrolene possibly modified by **memantine**

Methyldopa: enhanced hypotensive effect when baclofen or tizanidine given with **methyldopa**

Metoclopramide: effects of suxamethonium enhanced by **metoclopramide**

Moxonidine: enhanced hypotensive effect when baclofen or tizanidine given with **moxonidine**

Nitrates: enhanced hypotensive effect when baclofen or tizanidine given with **nitrates**

Oestrogens: plasma concentration of tizanidine possibly increased by **oestrogens** (increased risk of toxicity)

Parasympathomimetics: effects of non-depolarising muscle relaxants possibly antagonised by **donepezil**; effects of suxamethonium possibly enhanced by **donepezil**; effects of non-depolarising muscle relaxants antagonised by **edrophonium**, **neostigmine**, **pyridostigmine** and **rivastigmine**; effects of suxamethonium enhanced by **edrophonium**, **galantamine**, **neostigmine**, **pyridostigmine** and **rivastigmine**

Progestogens: plasma concentration of tizanidine possibly increased by **progestogens** (increased risk of toxicity)

Sympathomimetics, Beta<sub>2</sub>: effects of suxamethonium enhanced by **bambuterol**

Vasodilator Antihypertensives: enhanced hypotensive effect when baclofen or tizanidine given with **hydralazine**; enhanced hypotensive effect when baclofen or tizanidine given with **minoxidil**; enhanced hypotensive effect when baclofen or tizanidine given with **sodium nitroprusside**

**Muscle Relaxants, depolarising** *see* Muscle Relaxants**Muscle Relaxants, non-depolarising** *see* Muscle Relaxants**Mycophenolate**

Antacids: absorption of mycophenolate reduced by **antacids**

- Antibacterials: plasma concentration of mycophenolate possibly reduced by **co-amoxiclav**; bioavailability of mycophenolate possibly reduced by **metronidazole** and **norfloxacin**; plasma concentration of active metabolite of mycophenolate reduced by **rifampicin**

Antivirals: mycophenolate increases plasma concentration of **aciclovir**, also plasma concentration of inactive metabolite of mycophenolate increased; mycophenolate possibly increases plasma concentration of **ganciclovir**, also plasma concentration of inactive metabolite of mycophenolate possibly increased

Colestilan: manufacturer of colestilan advises give mycophenolate at least 1 hour before or 3 hours after **colestilan**

Iron: absorption of mycophenolate reduced by **oral iron**

Lipid-regulating Drugs: absorption of mycophenolate reduced by **colestyramine**

**Mycophenolate** (*continued*)

Sevelamer: plasma concentration of mycophenolate possibly reduced by **sevelamer**

**Mycophenolate Mofetil** *see* Mycophenolate

**Mycophenolate Sodium** *see* Mycophenolate

**Mycophenolic Acid** *see* Mycophenolate

**Nabumetone** *see* NSAIDs

**Nadolol** *see* Beta-blockers

**Nalidixic Acid** *see* Quinolones

**Nalmefene**

- Analgesics: manufacturer of nalmefene advises avoid concomitant use with **opioid analgesics**

**Nandrolone** *see* Anabolic Steroids

**Naproxen** *see* NSAIDs

**Naratriptan** *see* 5HT<sub>1</sub>-receptor Agonists (under HT)

**Nateglinide** *see* Antidiabetics

**Nebivolol** *see* Beta-blockers

**Nefopam**

- Antidepressants: manufacturer of nefopam advises avoid concomitant use with **MAOIs**; side-effects possibly increased when nefopam given with **tricyclics**

Antimuscarinics: increased risk of antimuscarinic side-effects when nefopam given with **antimuscarinics**

**Neomycin** *see* Aminoglycosides

**Neostigmine** *see* Parasympathomimetics

**Nevirapine**

Analgesics: nevirapine possibly reduces plasma concentration of **methadone**

- Antibacterials: nevirapine reduces plasma concentration of **clarithromycin** (but concentration of an active metabolite increased), also plasma concentration of nevirapine increased; nevirapine possibly increases plasma concentration of **rifabutin**; plasma concentration of nevirapine reduced by **rifampicin**—avoid concomitant use

- Anticoagulants: nevirapine may enhance or reduce anticoagulant effect of **warfarin**

- Antidepressants: plasma concentration of nevirapine reduced by **St John's wort**—avoid concomitant use

Antiepileptics: plasma concentration of nevirapine reduced by **carbamazepine**

- Antifungals: plasma concentration of nevirapine increased by **fluconazole**; nevirapine possibly reduces plasma concentration of **caspofungin** and **itraconazole**—consider increasing dose of caspofungin and itraconazole

- Antipsychotics: nevirapine possibly reduces plasma concentration of **aripiprazole** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature)

- Antivirals: nevirapine possibly reduces plasma concentration of **atazanavir** and **etravirine**—avoid concomitant use; manufacturer of nevirapine advises avoid concomitant use with **boceprevir** and **rilpivirine**; nevirapine possibly reduces the plasma concentration of **dolutegravir** (see Dose under Dolutegravir, p. 421); nevirapine reduces plasma concentration of **efavirenz**—avoid concomitant use; avoidance of nevirapine advised by manufacturer of **elvitegravir**; nevirapine possibly reduces plasma concentration of **fosamprenavir**—avoid unboosted fosamprenavir; nevirapine reduces plasma concentration of **indinavir**; nevirapine possibly reduces plasma concentration of **lopinavir** and **telaprevir**—consider increasing dose of lopinavir and telaprevir; increased risk of granulocytopenia when nevirapine given with **zidovudine**

Cobicistat: manufacturer of nevirapine advises avoid concomitant use with **cobicistat**

- Oestrogens: nevirapine accelerates metabolism of **oestrogens** (reduced contraceptive effect—see p. 536)

**Nevirapine** (continued)

- Orlistat: absorption of nevirapine possibly reduced by ●orlistat
- Progestogens: nevirapine accelerates metabolism of ●progestogens (reduced contraceptive effect—see p. 536)

**Nicardipine** see Calcium-channel Blockers

**Nicorandil**

Alcohol: hypotensive effect of nicorandil possibly enhanced by ●alcohol

Antidepressants: enhanced hypotensive effect when nicorandil given with ●MAOIs; hypotensive effect of nicorandil possibly enhanced by ●tricyclics

- Avanafl: hypotensive effect of nicorandil significantly enhanced by ●avanafl (avoid concomitant use)
  - Sildenafil: hypotensive effect of nicorandil significantly enhanced by ●sildenafil (avoid concomitant use)
  - Tadalafil: hypotensive effect of nicorandil significantly enhanced by ●tadalafil (avoid concomitant use)
  - Vardenafil: possible increased hypotensive effect when nicorandil given with ●vardenafil—avoid concomitant use
- Vasodilator Antihypertensives: possible enhanced hypotensive effect when nicorandil given with ●hydralazine, ●minoxidil or ●sodium nitroprusside

**Nicotine**

Anti-arrhythmics: nicotine possibly enhances effects of ●adenosine

**Nicotinic Acid**

Note Interactions apply to lipid-regulating doses of nicotinic acid

- Lipid-regulating Drugs: increased risk of myopathy when nicotinic acid given with ●statins (applies to lipid regulating doses of nicotinic acid)

**Nifedipine** see Calcium-channel Blockers

**Nilotinib**

- Antibacterials: manufacturer of nilotinib advises avoid concomitant use with ●clarithromycin and ●telithromycin; plasma concentration of nilotinib reduced by ●rifampicin—avoid concomitant use

- Antifungals: manufacturer of nilotinib advises avoid concomitant use with ●voriconazole

- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)

- Antivirals: avoidance of nilotinib advised by manufacturer of ●boceprevir; plasma concentration of nilotinib possibly increased by ●ritonavir—manufacturer of nilotinib advises avoid concomitant use

Anxiolytics and Hypnotics: nilotinib increases plasma concentration of ●midazolam

- Grapefruit Juice: manufacturer of nilotinib advises avoid concomitant use with ●grapefruit juice

**Nimodipine** see Calcium-channel Blockers

**Nitrates**

ACE Inhibitors: enhanced hypotensive effect when nitrates given with ●ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when nitrates given with ●adrenergic neurone blockers

Alcohol: enhanced hypotensive effect when nitrates given with ●alcohol

Aldesleukin: enhanced hypotensive effect when nitrates given with ●aldesleukin

Alpha-blockers: enhanced hypotensive effect when nitrates given with ●alpha-blockers

Anaesthetics, General: enhanced hypotensive effect when nitrates given with ●general anaesthetics

Analgesics: hypotensive effect of nitrates antagonised by ●NSAIDs

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when nitrates given with ●angiotensin-II receptor antagonists

Anti-arrhythmics: effects of sublingual tablets of nitrates reduced by ●disopyramide (failure to dissolve under tongue owing to dry mouth)

**Nitrates** (continued)

- Anticoagulants: infusion of glyceryl trinitrate reduces anticoagulant effect of ●heparins

Antidepressants: enhanced hypotensive effect when nitrates given with ●MAOIs; effects of sublingual tablets of nitrates possibly reduced by ●tricyclic-related antidepressants (failure to dissolve under tongue owing to dry mouth); effects of sublingual tablets of nitrates reduced by ●tricyclics (failure to dissolve under tongue owing to dry mouth)

Antimuscarinics: effects of sublingual tablets of nitrates possibly reduced by ●antimuscarinics (failure to dissolve under tongue owing to dry mouth)

Antipsychotics: enhanced hypotensive effect when nitrates given with ●phenothiazines

Anxiolytics and Hypnotics: enhanced hypotensive effect when nitrates given with ●anxiolytics and ●hypnotics

- Avanafl: hypotensive effect of nitrates significantly enhanced by ●avanafl (avoid concomitant use)

Beta-blockers: enhanced hypotensive effect when nitrates given with ●beta-blockers

Calcium-channel Blockers: enhanced hypotensive effect when nitrates given with ●calcium-channel blockers

Clonidine: enhanced hypotensive effect when nitrates given with ●clonidine

Corticosteroids: hypotensive effect of nitrates antagonised by ●corticosteroids

Diazoxide: enhanced hypotensive effect when nitrates given with ●diazoxide

Diuretics: enhanced hypotensive effect when nitrates given with ●diuretics

Dopaminergics: enhanced hypotensive effect when nitrates given with ●levodopa

Methyldopa: enhanced hypotensive effect when nitrates given with ●methyldopa

Moxisylyte: enhanced hypotensive effect when nitrates given with ●moxisylyte

Moxonidine: enhanced hypotensive effect when nitrates given with ●moxonidine

Muscle Relaxants: enhanced hypotensive effect when nitrates given with ●baclofen or ●tizanidine

Oestrogens: hypotensive effect of nitrates antagonised by ●oestrogens

Prostaglandins: enhanced hypotensive effect when nitrates given with ●alprostadil

- Riociguat: possible enhanced hypotensive effect when nitrates given with ●riociguat—avoid concomitant use

- Sildenafil: hypotensive effect of nitrates significantly enhanced by ●sildenafil (avoid concomitant use)

- Tadalafil: hypotensive effect of nitrates significantly enhanced by ●tadalafil (avoid concomitant use)

- Vardenafil: possible increased hypotensive effect when nitrates given with ●vardenafil—avoid concomitant use

Vasodilator Antihypertensives: enhanced hypotensive effect when nitrates given with ●hydralazine, ●minoxidil or ●sodium nitroprusside

**Nitrazepam** see Anxiolytics and Hypnotics

**Nitrofurantoin**

Antacids: absorption of nitrofurantoin reduced by ●oral magnesium salts (as magnesium trisilicate)

Antibacterials: nitrofurantoin possibly antagonises effects of ●nalidixic acid

Probenecid: excretion of nitrofurantoin reduced by ●probenecid (increased risk of side-effects)

Sulfapyrazone: excretion of nitrofurantoin reduced by ●sulfapyrazone (increased risk of toxicity)

Vaccines: antibacterials inactivate ●oral typhoid vaccine—see p. 850

**Nitroimidazoles** see Metronidazole and Tinidazole

**Nitrous Oxide** see Anaesthetics, General

**Nizatidine** see Histamine H<sub>2</sub>-antagonists

**Nomegestrol** see Progestogens

**Noradrenaline (norepinephrine)** *see* Sympathomimetics

**Norelgestromin** *see* Progestogens

**Norepinephrine (noradrenaline)** *see* Sympathomimetics

**Norethisterone** *see* Progestogens

**Norfloxacin** *see* Quinolones

**Norgestimate** *see* Progestogens

**Norgestrel** *see* Progestogens

**Nortriptyline** *see* Antidepressants, Tricyclic

## NSAIDs

*Note* *See also* Aspirin. Interactions do not generally apply to topical NSAIDs

ACE Inhibitors: increased risk of renal impairment when NSAIDs given with **ACE inhibitors**, also hypotensive effect antagonised

Adrenergic Neurone Blockers: NSAIDs antagonise hypotensive effect of **adrenergic neurone blockers**

Aliskiren: NSAIDs possibly antagonise hypotensive effect of **aliskiren**

Alpha-blockers: NSAIDs antagonise hypotensive effect of **alpha-blockers**

- Analgesics: avoid concomitant use of NSAIDs with **NSAIDs** or **aspirin** (increased side-effects); avoid concomitant use of NSAIDs with **ketorolac** (increased side-effects and haemorrhage); ibuprofen possibly reduces antiplatelet effect of **aspirin**

Angiotensin-II Receptor Antagonists: increased risk of renal impairment when NSAIDs given with **angiotensin-II receptor antagonists**, also hypotensive effect antagonised

Antacids: absorption of acetaminophen possibly reduced by **antacids**

- Antibacterials: indometacin possibly increases plasma concentration of **amikacin** and **gentamicin** in neonates; plasma concentration of celecoxib, diclofenac and etoricoxib reduced by **rifampicin**; possible increased risk of convulsions when NSAIDs given with **quinolones**

- Anticoagulants: increased risk of haemorrhage when *intravenous* diclofenac given with **anticoagulants** (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when ketorolac given with **anticoagulants** (avoid concomitant use, including low-dose heparins); NSAIDs possibly enhance anticoagulant effect of **coumarins** and **phenindione**; possible increased risk of bleeding when NSAIDs given with **dabigatran** or **heparins**

- Antidepressants: increased risk of bleeding when NSAIDs given with **SSRIs** or **venlafaxine**

- Antidiabetics: NSAIDs possibly enhance effects of **sulfonylureas**

Antiepileptics: acetaminophen possibly reduces excretion of **phenytoin** (increased risk of toxicity)

Antifungals: plasma concentration of parecoxib increased by **fluconazole** (reduce dose of parecoxib); plasma concentration of celecoxib increased by **fluconazole** (halve dose of celecoxib); plasma concentration of flurbiprofen and ibuprofen increased by **fluconazole**; plasma concentration of diclofenac and ibuprofen increased by **voriconazole**

Antipsychotics: possible severe drowsiness when acetaminophen or indometacin given with **haloperidol**

- Antivirals: plasma concentration of NSAIDs possibly increased by **ritonavir**; plasma concentration of piroxicam increased by **ritonavir** (risk of toxicity)—avoid concomitant use; increased risk of haematological toxicity when NSAIDs given with **zidovudine**

Beta-blockers: NSAIDs antagonise hypotensive effect of **beta-blockers**

Calcium-channel Blockers: NSAIDs antagonise hypotensive effect of **calcium-channel blockers**

Cardiac Glycosides: NSAIDs possibly increase plasma concentration of **cardiac glycosides**, also possible

## NSAIDs

Cardiac Glycosides (*continued*)

exacerbation of heart failure and reduction of renal function

- Ciclosporin: increased risk of nephrotoxicity when NSAIDs given with **ciclosporin**; plasma concentration of diclofenac increased by **ciclosporin** (halve dose of diclofenac)

Clonidine: NSAIDs antagonise hypotensive effect of **clonidine**

Clopidogrel: increased risk of bleeding when NSAIDs given with **clopidogrel**

Corticosteroids: increased risk of gastro-intestinal bleeding and ulceration when NSAIDs given with **corticosteroids**

- Cytotoxics: NSAIDs probably reduce excretion of **methotrexate** (increased risk of toxicity)—but for concomitant use in rheumatic disease *see* p. 718; diclofenac, ibuprofen, indometacin, ketoprofen, meloxicam and naproxen reduce excretion of **methotrexate** (increased risk of toxicity)—but for concomitant use in rheumatic disease *see* p. 718; NSAIDs possibly reduce renal excretion of **pemetrexed**—consult product literature; increased risk of bleeding when NSAIDs given with **erlotinib**; avoidance of mefenamic acid advised by manufacturer of **regorafenib**

Desmopressin: indometacin enhances effects of **desmopressin**

Diazoxide: NSAIDs antagonise hypotensive effect of **diazoxide**

- Dimethyl sulfoxide: avoid concomitant use of sulindac with **dimethyl sulfoxide**

- Diuretics: risk of nephrotoxicity of NSAIDs increased by **diuretics**, also antagonism of diuretic effect; indometacin and ketorolac antagonise effects of **diuretics**; excretion of acetaminophen possibly increased by **furosemide**; NSAIDs possibly antagonise diuretic effect of **potassium canrenoate**; occasional reports of reduced renal function when indometacin given with **triamterene**—avoid concomitant use; increased risk of hyperkalaemia when indometacin given with **potassium-sparing diuretics** and **aldosterone antagonists**; possible increased risk of hyperkalaemia when NSAIDs given with **potassium-sparing diuretics** and **aldosterone antagonists**

Iloprost: increased risk of bleeding when NSAIDs given with **iloprost**

Lipid-regulating Drugs: excretion of meloxicam increased by **colestyramine**

- Lithium: NSAIDs reduce excretion of **lithium** (increased risk of toxicity); ketorolac reduces excretion of **lithium** (increased risk of toxicity)—avoid concomitant use

Methyldopa: NSAIDs antagonise hypotensive effect of **methyldopa**

Mifamurtide: avoidance of high doses of NSAIDs advised by manufacturer of **mifamurtide**

Moxonidine: NSAIDs antagonise hypotensive effect of **moxonidine**

Muscle Relaxants: ibuprofen reduces excretion of **baclofen** (increased risk of toxicity); NSAIDs possibly reduce excretion of **baclofen** (increased risk of toxicity)

Nitrates: NSAIDs antagonise hypotensive effect of **nitrates**

Oestrogens: etoricoxib increases plasma concentration of **ethinylestradiol**

Penicillamine: possible increased risk of nephrotoxicity when NSAIDs given with **penicillamine**

- Pentoxifylline: possible increased risk of bleeding when NSAIDs given with **pentoxifylline**; increased risk of bleeding when ketorolac given with **pentoxifylline** (avoid concomitant use)

**NSAIDs (continued)**

Prasugrel: possible increased risk of bleeding when NSAIDs given with **prasugrel**

- **Probenecid**: excretion of acetaminophen, indometacin, ketoprofen and naproxen reduced by ●**probenecid** (increased plasma concentration); excretion of ketorolac reduced by ●**probenecid** (increased plasma concentration)—avoid concomitant use
  - **Tacrolimus**: possible increased risk of nephrotoxicity when NSAIDs given with **tacrolimus**; increased risk of nephrotoxicity when ibuprofen given with ●**tacrolimus**
- Vasodilator Antihypertensives: NSAIDs antagonise hypotensive effect of **hydralazine**, **minoxidil** and **sodium nitroprusside**

**Octreotide**

Antidiabetics: octreotide possibly reduces requirements for **antidiabetics**

- **Ciclosporin**: octreotide reduces plasma concentration of ●**ciclosporin**
- Dopaminergics: octreotide increases plasma concentration of **bromocriptine**
- Ulcer-healing Drugs: octreotide possibly delays absorption of **cimetidine**

**Oestrogens**

**Note** Interactions of combined oral contraceptives may also apply to combined contraceptive patches and vaginal rings, see p. 536

ACE Inhibitors: oestrogens antagonise hypotensive effect of **ACE inhibitors**

Adrenergic Neurone Blockers: oestrogens antagonise hypotensive effect of **adrenergic neurone blockers**

Alpha-blockers: oestrogens antagonise hypotensive effect of **alpha-blockers**

Analgesics: plasma concentration of ethinylestradiol increased by **etoricoxib**

Angiotensin-II Receptor Antagonists: oestrogens antagonise hypotensive effect of **angiotensin-II receptor antagonists**

- **Antibacterials**: plasma concentration of estradiol increased by **erythromycin**; metabolism of oestrogens accelerated by ●**rifamycins** (reduced contraceptive effect—see p. 536)
  - **Anticoagulants**: oestrogens may enhance or reduce anticoagulant effect of **coumarins**; oestrogens antagonise anticoagulant effect of ●**phenindione**
  - **Antidepressants**: contraceptive effect of oestrogens reduced by ●**St John's wort** (avoid concomitant use); oestrogens antagonise antidepressant effect of **tricyclics** (but side-effects of tricyclics possibly increased due to increased plasma concentration)
- Antidiabetics: oestrogens antagonise hypoglycaemic effect of **antidiabetics**
- **Antiepileptics**: metabolism of oestrogens accelerated by ●**carbamazepine**, ●**eslicarbazepine**, ●**oxcarbazepine**, ●**phenobarbital**, ●**phenytoin**, ●**rufinamide** and ●**topiramate** (reduced contraceptive effect—see p. 536); oestrogens reduce plasma concentration of ●**lamotrigine**—consider increasing dose of lamotrigine; ethinylestradiol possibly reduces plasma concentration of **valproate**
- Antifungals: oestrogens increase plasma concentration of **voriconazole**; anecdotal reports of contraceptive failure and menstrual irregularities when oestrogens given with **griseofulvin**; anecdotal reports of contraceptive failure when oestrogens given with **imidazoles**; occasional reports of breakthrough bleeding when oestrogens (used for contraception) given with **terbinafine**
- **Antivirals**: plasma concentration of ethinylestradiol increased by **atazanavir**; metabolism of oestrogens accelerated by ●**nevirapine** and ●**ritonavir** (reduced contraceptive effect—see p. 536); plasma concentration of ethinylestradiol possibly reduced by

**Oestrogens**● **Antivirals (continued)**

●**telaprevir**—manufacturer of telaprevir advises additional contraceptive precautions

Anxiolytics and Hypnotics: oestrogens possibly increase plasma concentration of **chlordiazepoxide**, **diazepam** and **nitrazepam**; oestrogens possibly reduce plasma concentration of **lorazepam**, **oxazepam** and **temazepam**; oestrogens increase plasma concentration of **melatonin**

- **Aprepitant**: possible contraceptive failure of hormonal contraceptives containing oestrogens when given with ●**aprepitant** (alternative contraception recommended)

Beta-blockers: oestrogens antagonise hypotensive effect of **beta-blockers**

- **Bosentan**: possible contraceptive failure of hormonal contraceptives containing oestrogens when given with ●**bosentan** (alternative contraception recommended)

Calcium-channel Blockers: oestrogens antagonise hypotensive effect of **calcium-channel blockers**

Ciclosporin: oestrogens possibly increase plasma concentration of **ciclosporin**

Clonidine: oestrogens antagonise hypotensive effect of **clonidine**

- **Cobicistat**: metabolism of oestrogens accelerated by ●**cobicistat** (reduced contraceptive effect—see p. 536)

Corticosteroids: oral contraceptives containing oestrogens increase plasma concentration of **corticosteroids**

- **Cytotoxics**: possible reduction in contraceptive effect of oestrogens advised by manufacturer of ●**crizotinib** and ●**vemurafenib**; possible reduced contraceptive effect of hormonal contraceptives containing oestrogens advised by manufacturer of ●**dabrafenib** (alternative contraception recommended)

Diuretics: oestrogens antagonise diuretic effect of **diuretics**

- **Dopaminergics**: oestrogens increase plasma concentration of **ropinirole**; oestrogens increase plasma concentration of ●**selegiline**—manufacturer of selegiline advises avoid concomitant use

Lipid-regulating Drugs: absorption of ethinylestradiol reduced by **colestevam**; plasma concentration of ethinylestradiol increased by **atorvastatin** and **rosuvastatin**

Methyldopa: oestrogens antagonise hypotensive effect of **methyldopa**

- **Modafinil**: metabolism of oestrogens accelerated by ●**modafinil** (reduced contraceptive effect—see p. 536)

Moxonidine: oestrogens antagonise hypotensive effect of **moxonidine**

Muscle Relaxants: oestrogens possibly increase plasma concentration of **tizanidine** (increased risk of toxicity)

Nitrates: oestrogens antagonise hypotensive effect of **nitrates**

Somatropin: oestrogens (when used as oral replacement therapy) may increase dose requirements of **somatropin**

Tacrolimus: ethinylestradiol possibly increases plasma concentration of **tacrolimus**

Teriflunomide: plasma concentration of ethinylestradiol increased by **teriflunomide**

Theophylline: oestrogens increase plasma concentration of **theophylline** (consider reducing dose of theophylline)

Thyroid Hormones: oestrogens may increase requirements for **thyroid hormones** in hypothyroidism

Vasodilator Antihypertensives: oestrogens antagonise hypotensive effect of **hydralazine**, **minoxidil** and **sodium nitroprusside**

**Oestrogens, conjugated** see Oestrogens

**Ofloxacin** *see* Quinolones

**Olanzapine** *see* Antipsychotics

**Olmesartan** *see* Angiotensin-II Receptor Antagonists

**Olodaterol** *see* Sympathomimetics, Beta<sub>2</sub>

**Olsalazine** *see* Aminosalicylates

**Omeprazole** *see* Proton Pump Inhibitors

**Ondansetron** *see* 5HT<sub>3</sub>-receptor Antagonists (under HT)

### Opioid Analgesics

Alcohol: enhanced hypotensive and sedative effects when opioid analgesics given with **alcohol**

Anaesthetics, General: fentanyl inhibits metabolism of **etomidate** (consider reducing dose of etomidate); opioid analgesics possibly enhance effects of **intra-venous general anaesthetics** and **volatile liquid general anaesthetics**

- Antibacterials: plasma concentration of fentanyl possibly increased by **clarithromycin**; plasma concentration of alfentanil increased by **erythromycin**; metabolism of alfentanil, codeine, fentanyl, methadone and morphine accelerated by **rifampicin** (reduced effect); metabolism of oxycodone possibly accelerated by **rifampicin**; manufacturer of pethidine advises avoid concomitant use with **isoniazid**; possible increased risk of ventricular arrhythmias when methadone given with **telithromycin**; metabolism of oxycodone inhibited by **telithromycin**
- Anticoagulants: tramadol enhances anticoagulant effect of **coumarins**
- Antidepressants: plasma concentration of methadone possibly increased by **fluoxetine**, **fluvoxamine**, **paroxetine** and **sertraline**; possible increased serotonergic effects when pethidine or tramadol given with **duloxetine**; possible increased serotonergic effects when tramadol given with **mirtazapine** or **venlafaxine**; possible increased serotonergic effects and increased risk of convulsions when tramadol given with **MAOIs**—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs; CNS excitation or depression (hypertension or hypotension) when pethidine given with **MAOIs**—avoid concomitant use and for 2 weeks after stopping MAOIs; possible increased serotonergic effects when fentanyl given with **MAOIs**, **SSRI-related antidepressants** or **SSRIs**; possible CNS excitation or depression (hypertension or hypotension) when opioid analgesics given with **MAOIs**—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs; possible CNS excitation or depression (hypertension or hypotension) when opioid analgesics given with **moclobemide**—manufacturer of moclobemide advises consider reducing dose of opioid analgesics; possible CNS excitation or depression (hypertension or hypotension) when dextromethorphan or pethidine given with **moclobemide**—avoid concomitant use; increased risk of CNS toxicity when tramadol given with **SSRIs** or **tricyclics**; plasma concentration of methadone possibly reduced by **St John's wort**; sedative effects possibly increased when opioid analgesics given with **tricyclics**
- Antiepileptics: metabolism of fentanyl possibly accelerated by **carbamazepine** and **phenytoin** (reduced effect); dextropropoxyphene enhances effects of **carbamazepine**; effects of tramadol reduced by **carbamazepine**; plasma concentration of methadone reduced by **carbamazepine** and **phenobarbital**; morphine increases bioavailability of **gabapentin**; metabolism of methadone accelerated by **phenytoin** (reduced effect and risk of withdrawal effects); possible increased risk of pethidine toxicity when given with **phenytoin**
- Antifungals: metabolism of alfentanil inhibited by **fluconazole** (risk of prolonged or delayed respiratory depression); plasma concentration of methadone increased by **fluconazole**; metabolism of alfentanil

### Opioid Analgesics

- Antifungals (*continued*)
  - possibly inhibited by **itraconazole**; plasma concentration of methadone possibly increased by **itraconazole** (increased risk of ventricular arrhythmias); plasma concentration of oxycodone increased by **itraconazole** and **voriconazole**; plasma concentration of alfentanil and methadone increased by **voriconazole** (consider reducing dose of alfentanil and methadone); plasma concentration of fentanyl possibly increased by **triazoles**
- Antihistamines: sedative effects possibly increased when opioid analgesics given with **sedating antihistamines**
- Antimalarials: avoidance of methadone advised by manufacturer of **piperazine with arteminimol** (possible risk of ventricular arrhythmias)
- Antimuscarinics: possible increased risk of antimuscarinic side-effects when codeine given with **antimuscarinics**
- Antipsychotics: enhanced hypotensive and sedative effects when opioid analgesics given with **antipsychotics**; increased risk of ventricular arrhythmias when methadone given with **antipsychotics** that prolong the QT interval; increased risk of convulsions when tramadol given with **antipsychotics**; increased risk of ventricular arrhythmias when methadone given with **amisulpride**—avoid concomitant use
- Antivirals: plasma concentration of methadone possibly reduced by **abacavir**, **nevirapine** and **rilpivirine**; plasma concentration of methadone possibly affected by **boceprevir**; possible increased risk of prolonged sedation and respiratory depression when buprenorphine given with **boceprevir**; methadone possibly reduces plasma concentration of **didanosine**; plasma concentration of methadone reduced by **efavirenz**, **fosamprenavir** and **ritonavir**; plasma concentration of morphine possibly reduced by **ritonavir**; plasma concentration of alfentanil and fentanyl increased by **ritonavir**; plasma concentration of dextropropoxyphene increased by **ritonavir** (risk of toxicity)—avoid concomitant use; plasma concentration of buprenorphine possibly increased by **ritonavir**; plasma concentration of pethidine reduced by **ritonavir**, but plasma concentration of toxic pethidine metabolite increased (avoid concomitant use); increased risk of ventricular arrhythmias when alfentanil, fentanyl or methadone given with **saquinavir**—avoid concomitant use; caution with methadone advised by manufacturer of **telaprevir** (risk of ventricular arrhythmias); buprenorphine possibly reduces plasma concentration of **tipranavir**; methadone possibly increases plasma concentration of **zidovudine**
- Anxiolytics and Hypnotics: increased sedative effect when opioid analgesics given with **anxiolytics and hypnotics**; fentanyl possibly inhibits metabolism of **midazolam**
- Atomoxetine: increased risk of ventricular arrhythmias when methadone given with **atomoxetine**; possible increased risk of convulsions when tramadol given with **atomoxetine**
- Beta-blockers: morphine possibly increases plasma concentration of **esmolol**
- Calcium-channel Blockers: metabolism of alfentanil inhibited by **diltiazem** (risk of prolonged or delayed respiratory depression)
- Cytotoxics: possible increased risk of ventricular arrhythmias when methadone given with **bosutinib**; caution with alfentanil and fentanyl advised by manufacturer of **crizotinib**; possible increased risk of ventricular arrhythmias when methadone given with **vandetanib**—avoid concomitant use
- Dapoxetine: possible increased risk of serotonergic effects when tramadol given with

**Opioid Analgesics**

- **Dapoxetine** (*continued*)
  - **dapoxetine** (manufacturer of dapoxetine advises tramadol should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping tramadol)
- Domperidone: opioid analgesics antagonise effects of **domperidone** on gastro-intestinal activity
- **Dopaminergics**: risk of CNS toxicity when pethidine given with ●**rasagiline** (avoid pethidine for 2 weeks after rasagiline); avoid concomitant use of dextromethorphan with ●**rasagiline**; hyperpyrexia and CNS toxicity reported when pethidine given with ●**selegiline** (avoid concomitant use); avoidance of opioid analgesics advised by manufacturer of **selegiline**
- 5HT<sub>2</sub>-receptor Antagonists: effects of tramadol possibly antagonised by **ondansetron**
- **Memantine**: increased risk of CNS toxicity when dextromethorphan given with ●**memantine** (manufacturer of memantine advises avoid concomitant use)
- Metoclopramide: opioid analgesics antagonise effects of **metoclopramide** on gastro-intestinal activity
- Muscle Relaxants: increased sedative effect when fentanyl or morphine given with **baclofen**
- **Nalmefene**: avoidance of opioid analgesics advised by manufacturer of **nalmefene**
- **Sodium Oxybate**: opioid analgesics enhance effects of ●**sodium oxybate** (avoid concomitant use)
- Ulcer-healing Drugs: metabolism of opioid analgesics inhibited by **cimetidine** (increased plasma concentration)

**Orlistat**

- Anti-arrhythmics: orlistat possibly reduces plasma concentration of **amiodarone**
- Anticoagulants: manufacturer of orlistat recommends monitoring anticoagulant effect of **coumarins**
- Antidiabetics: manufacturer of orlistat advises avoid concomitant use with **acarbose**
- **Antiepileptics**: possible increased risk of convulsions when orlistat given with ●**antiepileptics**
- **Antivirals**: orlistat possibly reduces absorption of
  - abacavir**, ●**atazanavir**, ●**darunavir**, ●**didanosine**,
  - efavirenz**, ●**elvitegravir**, ●**femtricitabine**,
  - enfuvirtide**, ●**etravirine**, ●**fosamprenavir**,
  - indinavir**, ●**lamivudine**, ●**lopinavir**, ●**maraviroc**,
  - nevirapine**, ●**raltegravir**, ●**rilpivirine**, ●**ritonavir**,
  - saquinavir**, ●**stavudine**, ●**tenofovir**, ●**tipranavir** and
  - zidovudine**
- **Ciclosporin**: orlistat possibly reduces absorption of ●**ciclosporin**
- Thyroid Hormones: possible increased risk of hypothyroidism when orlistat given with **levothyroxine**

**Orphenadrine** *see* Antimuscarinics

**Oxaliplatin** *see* Platinum Compounds

**Oxandrolone** *see* Anabolic Steroids

**Oxazepam** *see* Anxiolytics and Hypnotics

**Oxcarbazepine**

- **Antidepressants**: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and ●**tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●**SSRIs** and ●**tricyclics** (convulsive threshold lowered)
- **Antiepileptics**: oxcarbazepine sometimes reduces plasma concentration of **carbamazepine** (but concentration of an active metabolite of carbamazepine may be increased), also plasma concentration of an active metabolite of oxcarbazepine often reduced; avoidance of oxcarbazepine advised by manufacturer of **eslicarbazepine**; oxcarbazepine reduces plasma concentration of ●**perampanel** (see Dose under Perampanel, p. 307); oxcarbazepine increases plasma concentration of **phenobarbital** and **phenytoin**, also plasma concentration of an active meta-

**Oxcarbazepine**

- **Antiepileptics** (*continued*)

- bolite of oxcarbazepine reduced; plasma concentration of an active metabolite of oxcarbazepine sometimes reduced by **valproate**
- **Antimalarials**: anticonvulsant effect of antiepileptics antagonised by ●**mefloquine**
- **Antipsychotics**: anticonvulsant effect of antiepileptics antagonised by ●**antipsychotics** (convulsive threshold lowered)
- **Antivirals**: avoidance of oxcarbazepine advised by manufacturer of **dolutegravir** and **sofosbuvir**; avoidance of oxcarbazepine advised by manufacturer of ●**rilpivirine** (plasma concentration of rilpivirine possibly reduced)
- Ciclosporin: oxcarbazepine possibly reduces plasma concentration of **ciclosporin**
- **Clopidogrel**: oxcarbazepine possibly reduces antiplatelet effect of ●**clopidogrel**
- **Cytotoxics**: oxcarbazepine reduces plasma concentration of ●**imatinib**—avoid concomitant use
- **Oestrogens**: oxcarbazepine accelerates metabolism of ●**oestrogens** (reduced contraceptive effect—see p. 536)
- **Orlistat**: possible increased risk of convulsions when antiepileptics given with ●**orlistat**
- **Progestogens**: oxcarbazepine accelerates metabolism of ●**progestogens** (reduced contraceptive effect—see p. 536)

**Oxprenolol** *see* Beta-blockers

**Oxybutynin** *see* Antimuscarinics

**Oxycodone** *see* Opioid Analgesics

**Oxymetazoline** *see* Sympathomimetics

**Oxytetracycline** *see* Tetracyclines

**Oxytocin**

Anaesthetics, General: oxytocic effect possibly reduced, also enhanced hypotensive effect and risk of arrhythmias when oxytocin given with **volatile liquid general anaesthetics**

Prostaglandins: uteronic effect of oxytocin potentiated by **prostaglandins**

Sympathomimetics: risk of hypertension when oxytocin given with vasoconstrictor **sympathomimetics** (due to enhanced vasopressor effect)

**Paclitaxel**

- **Antipsychotics**: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- **Antivirals**: plasma concentration of paclitaxel increased by **ritonavir**
- **Cytotoxics**: increased risk of neutropenia when paclitaxel given with ●**lapatinib**

**Paliperidone** *see* Antipsychotics

**Pamidronate Disodium** *see* Bisphosphonates

**Pancreatin**

Antidiabetics: pancreatin antagonises hypoglycaemic effect of **acarbose**

**Pancuronium** *see* Muscle Relaxants

**Pantoprazole** *see* Proton Pump Inhibitors

**Papaveretum** *see* Opioid Analgesics

**Paracetamol**

Anticoagulants: prolonged regular use of paracetamol possibly enhances anticoagulant effect of **coumarins**

Antidiabetics: absorption of paracetamol possibly reduced when given 1 to 4 hours after **lixisenatide**

Antiepileptics: metabolism of paracetamol possibly accelerated by **carbamazepine**, **phenobarbital** and **phenytoin** (also isolated reports of hepatotoxicity)

Cytotoxics: paracetamol possibly inhibits metabolism of **intravenous busulfan** (manufacturer of **intravenous busulfan** advises caution within 72 hours of paracetamol); caution with paracetamol advised by manufacturer of **imatinib**

Lipid-regulating Drugs: absorption of paracetamol reduced by **colestyramine**

**Paracetamol** (*continued*)

Metoclopramide: rate of absorption of paracetamol increased by **metoclopramide**

**Paraldehyde**

- Alcohol: increased sedative effect when paraldehyde given with ● **alcohol**
- Disulfiram: risk of toxicity when paraldehyde given with ● **disulfiram**

**Parasympathomimetics**

Anti-arrhythmics: effects of neostigmine and pyridostigmine possibly antagonised by **propafenone**

- Antibacterials: plasma concentration of galantamine increased by **erythromycin**; effects of neostigmine and pyridostigmine antagonised by ● **aminoglycosides**; effects of neostigmine and pyridostigmine antagonised by **clindamycin**; effects of neostigmine and pyridostigmine antagonised by ● **polymyxins**
- Antidepressants: plasma concentration of galantamine increased by **paroxetine**
- Antimalarials: effects of neostigmine and pyridostigmine may be diminished because of potential for **chloroquine** and **hydroxychloroquine** to increase symptoms of myasthenia gravis
- Antimuscarinics: effects of parasympathomimetics antagonised by **antimuscarinics**
- Beta-blockers: increased risk of arrhythmias when pilocarpine given with **beta-blockers**; effects of neostigmine and pyridostigmine antagonised by **propranolol**
- Cytotoxics: possible increased risk of bradycardia when pilocarpine given with **crizotinib**
- Lithium: effects of neostigmine antagonised by **lithium**
- Muscle Relaxants: donepezil possibly enhances effects of **suxamethonium**; edrophonium, galantamine, neostigmine, pyridostigmine and rivastigmine enhance effects of **suxamethonium**; edrophonium, neostigmine, pyridostigmine and rivastigmine antagonise effects of **non-depolarising muscle relaxants**; donepezil possibly antagonises effects of **non-depolarising muscle relaxants**

**Parecoxib** *see* NSAIDs**Paricalcitol** *see* Vitamins**Paroxetine** *see* Antidepressants, SSRI**Pasireotide**

- Antidiabetics: pasireotide possibly reduces requirements for **antidiabetics**
- Antimuscarinics: possible increased risk of bradycardia when pasireotide given with **ipratropium** or **oxybutynin**
- Beta-blockers: possible increased risk of bradycardia when pasireotide given with **carterolol**, **metoprolol**, **propranolol** or **sotalol**
- Calcium-channel Blockers: possible increased risk of bradycardia when pasireotide given with **diltiazem** or **verapamil**
- Ciclosporin: pasireotide possibly reduces plasma concentration of ● **ciclosporin**

**Pazopanib**

- Antibacterials: plasma concentration of pazopanib possibly increased by ● **clarithromycin** and ● **telithromycin** (reduce dose of pazopanib); plasma concentration of pazopanib possibly reduced by ● **rifampicin**
- Antifungals: plasma concentration of pazopanib possibly increased by ● **itraconazole** and ● **voriconazole** (reduce dose of pazopanib)
- Antipsychotics: avoid concomitant use of cytotoxics with ● **clozapine** (increased risk of agranulocytosis)
- Antivirals: plasma concentration of pazopanib possibly increased by ● **atazanavir**, ● **indinavir** and ● **ritonavir** (reduce dose of pazopanib); avoidance of pazopanib advised by manufacturer of ● **boceprevir**; increased risk of ventricular arrhythmias when pazopanib given with ● **saquinavir**—avoid concomitant use
- Cytotoxics: plasma concentration of pazopanib increased by **lapatinib**

**Pazopanib** (*continued*)

- Grapefruit juice: manufacturer of pazopanib advises avoid concomitant use with ● **grapefruit juice**
- Ulcer-healing Drugs: absorption of pazopanib possibly reduced by **histamine H<sub>2</sub>-antagonists**—manufacturer of pazopanib advises give at least 2 hours before or 10 hours after histamine H<sub>2</sub>-antagonists; absorption of pazopanib possibly reduced by **proton pump inhibitors**—manufacturer of pazopanib advises give at the same time as proton pump inhibitors

**Pegfilgrastim** *see* Filgrastim**Peginterferon Alfa** *see* Interferons**Pemetrexed**

- Analgesics: renal excretion of pemetrexed possibly reduced by **NSAIDs** and **aspirin**—consult product literature
- Antimalarials: antifolate effect of pemetrexed increased by ● **pyrimethamine**
- Antipsychotics: avoid concomitant use of cytotoxics with ● **clozapine** (increased risk of agranulocytosis)
- Penicillamine**
- Analgesics: possible increased risk of nephrotoxicity when penicillamine given with **NSAIDs**
- Antacids: absorption of penicillamine reduced by **antacids**
- Antipsychotics: avoid concomitant use of penicillamine with ● **clozapine** (increased risk of agranulocytosis)
- Cardiac Glycosides: penicillamine possibly reduces plasma concentration of **digoxin**
- Gold: manufacturer of penicillamine advises avoid concomitant use with **sodium aurothiomalate** (increased risk of toxicity)
- Iron: absorption of penicillamine reduced by **oral iron**
- Zinc: penicillamine reduces absorption of **zinc**, also absorption of penicillamine reduced by zinc

**Penicillins**

- Allopurinol: increased risk of rash when amoxicillin or ampicillin given with **allopurinol**
- Antibacterials: absorption of phenoxymethylpenicillin reduced by **neomycin**; effects of penicillins possibly antagonised by **tetracyclines**
- Anticoagulants: an interaction between broad-spectrum penicillins and **coumarins** and **phenindione** has not been demonstrated in studies, but common experience in anticoagulant clinics is that INR can be altered
- Antiepileptics: manufacturer of pivmecillinam advises avoid concomitant use with ● **valproate**
- Cytotoxics: penicillins reduce excretion of **methotrexate** (increased risk of toxicity)
- Muscle Relaxants: piperacillin enhances effects of **non-depolarising muscle relaxants** and **suxamethonium**
- Mycophenolate: co-amoxiclav possibly reduces plasma concentration of **mycophenolate**
- Probenecid: excretion of penicillins reduced by **probenecid** (increased plasma concentration)
- Sulfapyrazone: excretion of penicillins reduced by **sulfapyrazone**
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—*see* p. 850

**Pentamidine Isetionate**

- Anti-arrhythmics: increased risk of ventricular arrhythmias when pentamidine isetionate given with ● **amiodarone**—avoid concomitant use; possible increased risk of ventricular arrhythmias when pentamidine isetionate given with ● **disopyramide**
- Antibacterials: increased risk of ventricular arrhythmias when pentamidine isetionate given with **parenteral erythromycin**; increased risk of ventricular arrhythmias when pentamidine isetionate given with ● **moxifloxacin**—avoid concomitant use; possible increased risk of ventricular arrhythmias when

**Pentamidine Isetonate**

- Antibericals (*continued*)  
parenteral pentamidine isetionate given with •**teli-thromycin**
- Antidepressants: avoidance of pentamidine isetionate advised by manufacturer of •**citalopram** and •**escitalopram** (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when pentamidine isetionate given with •**tricyclics**
- Antifungals: possible increased risk of nephrotoxicity when pentamidine isetionate given with •**amphotericin**
- Antimalarials: avoidance of pentamidine isetionate advised by manufacturer of •**piperaquine with arteminimol** (possible risk of ventricular arrhythmias)
- Antipsychotics: increased risk of ventricular arrhythmias when pentamidine isetionate given with •**amisulpride** or •**droperidol**—avoid concomitant use; increased risk of ventricular arrhythmias when pentamidine isetionate given with •**phenothiazines**
- Antivirals: increased risk of hypocalcaemia when parenteral pentamidine isetionate given with •**foscarnet**; increased risk of ventricular arrhythmias when pentamidine isetionate given with •**saquinavir**—avoid concomitant use
- Cytotoxics: possible increased risk of ventricular arrhythmias when pentamidine isetionate given with •**vandetanib**—avoid concomitant use
- Ivabradine: increased risk of ventricular arrhythmias when pentamidine isetionate given with •**ivabradine**

**Pentazocine** *see* Opioid Analgesics**Pentostatin**

- Antipsychotics: avoid concomitant use of cytotoxics with •**clozapine** (increased risk of agranulocytosis)
- Cytotoxics: increased toxicity when pentostatin given with high-dose •**cyclophosphamide**—avoid concomitant use; increased pulmonary toxicity when pentostatin given with •**fludarabine** (unacceptably high incidence of fatalities)

**Pentoxifylline**

- Analgesics: possible increased risk of bleeding when pentoxifylline given with •**NSAIDs**; increased risk of bleeding when pentoxifylline given with •**ketorolac** (avoid concomitant use)

Theophylline: pentoxifylline increases plasma concentration of theophylline

**Perampanel**

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and •**tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by •**SSRIs** and •**tricyclics** (convulsive threshold lowered)
- Antiepileptics: plasma concentration of perampanel reduced by •**carbamazepine**, •**oxcarbazepine** and •**phenytoin** (see Dose under Perampanel, p. 307); plasma concentration of perampanel reduced by •**topiramate**
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by •**mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by •**antipsychotics** (convulsive threshold lowered)
- Anxiolytics and Hypnotics: perampanel reduces plasma concentration of •**midazolam**
- Orlistat: possible increased risk of convulsions when antiepileptics given with •**orlistat**
- Progestogens: perampanel accelerates metabolism of •**progestogens** (reduced contraceptive effect—see p. 536)

**Pergolide**

Antipsychotics: effects of pergolide antagonised by antipsychotics

Memantine: effects of dopaminergics possibly enhanced by memantine

**Pergolide** (*continued*)

Methyl dopa: antiparkinsonian effect of dopaminergics antagonised by methyl dopa

Metoclopramide: antiparkinsonian effect of pergolide antagonised by metoclopramide

**Pericyazine** *see* Antipsychotics**Perindopril** *see* ACE Inhibitors**Perphenazine** *see* Antipsychotics**Pethidine** *see* Opioid Analgesics**Phenelzine** *see* MAOIs**Phenindione**

**Note** Change in patient's clinical condition particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption may also affect anticoagulant control

- Alcohol: anticoagulant control with phenindione may be affected by major changes in consumption of alcohol
- Anabolic Steroids: anticoagulant effect of phenindione enhanced by anabolic steroids
- Analgesics: anticoagulant effect of phenindione possibly enhanced by •**NSAIDs**; increased risk of haemorrhage when anticoagulants given with intravenous •**diclofenac** (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with •**ketorolac** (avoid concomitant use, including low-dose heparins); increased risk of bleeding when phenindione given with •**aspirin** (due to antiplatelet effect)
- Anti-arrhythmics: metabolism of phenindione inhibited by •**amiodarone** (enhanced anticoagulant effect); anticoagulant effect of phenindione possibly enhanced by •**dronedarone**
- Antibacterials: experience in anticoagulant clinics suggests that INR possibly altered when phenindione is given with •**neomycin** (given for local action on gut); anticoagulant effect of phenindione possibly enhanced by •**levofloxacin** and •**tetracyclines**; an interaction between phenindione and broad-spectrum penicillins has not been demonstrated in studies, but common experience in anticoagulant clinics is that INR can be altered; metabolism of phenindione possibly inhibited by •**sulfonamides**
- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with •**apixaban**, •**dabigatran** and •**rivaroxaban** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- Antivirals: anticoagulant effect of phenindione possibly enhanced by •**ritonavir**
- Clopidogrel: anticoagulant effect of phenindione enhanced due to antiplatelet action of •**clopidogrel**
- Corticosteroids: anticoagulant effect of phenindione may be enhanced or reduced by •**corticosteroids**
- Dipyridamole: anticoagulant effect of phenindione enhanced due to antiplatelet action of •**dipyridamole**
- Enteral Foods: anticoagulant effect of phenindione antagonised by vitamin K (present in some enteral feeds)
- Iloprost: increased risk of bleeding when phenindione given with •**iloprost**
- Lipid-regulating Drugs: anticoagulant effect of phenindione may be enhanced or reduced by •**colestyramine**; anticoagulant effect of phenindione possibly enhanced by •**rosuvastatin**; anticoagulant effect of phenindione enhanced by •**fibrates**
- Oestrogens: anticoagulant effect of phenindione antagonised by •**oestrogens**
- Prasugrel: possible increased risk of bleeding when phenindione given with •**prasugrel**
- Progestogens: anticoagulant effect of phenindione antagonised by •**progestogens**

**Phenindione** (*continued*)

- Testolactone: anticoagulant effect of phenindione enhanced by ●**testolactone**
- Testosterone: anticoagulant effect of phenindione enhanced by ●**testosterone**
- Thyroid Hormones: anticoagulant effect of phenindione enhanced by ●**thyroid hormones**
- Vitamins: anticoagulant effect of phenindione antagonised by ●**vitamin K**

**Phenobarbital**

Note Primidone interactions as for phenobarbital

Alcohol: increased sedative effect when phenobarbital given with **alcohol**

Analgesics: phenobarbital reduces plasma concentration of **methadone**; phenobarbital possibly accelerates metabolism of **paracetamol** (also isolated reports of hepatotoxicity)

- Anti-arrhythmics: phenobarbital accelerates metabolism of **disopyramide** (reduced plasma concentration); phenobarbital possibly reduces plasma concentration of ●**dronedaron**—avoid concomitant use; phenobarbital possibly accelerates metabolism of **propafenone**
- Antibacterials: phenobarbital accelerates metabolism of **metronidazole** (reduced effect); phenobarbital possibly reduces plasma concentration of **rifampicin**; phenobarbital accelerates metabolism of **doxycycline** (reduced plasma concentration); phenobarbital possibly accelerates metabolism of ●**chloramphenicol** (reduced plasma concentration); phenobarbital reduces plasma concentration of ●**telithromycin** (avoid during and for 2 weeks after phenobarbital)
- Anticoagulants: phenobarbital possibly reduces plasma concentration of ●**apixaban**; phenobarbital accelerates metabolism of ●**coumarins** (reduced anticoagulant effect); phenobarbital possibly reduces plasma concentration of ●**rivaroxaban**—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Antidepressants: phenobarbital possibly reduces plasma concentration of **reboxetine**; phenobarbital reduces plasma concentration of **paroxetine**; phenobarbital accelerates metabolism of ●**mianserin** (reduced plasma concentration); anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and ●**tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●**SSRIs** and ●**tricyclics** (convulsive threshold lowered); plasma concentration of phenobarbital possibly reduced by ●**St John's wort**—avoid concomitant use; phenobarbital possibly accelerates metabolism of ●**tricyclics** (reduced plasma concentration)
- Antiepileptics: plasma concentration of phenobarbital possibly increased by **carbamazepine**; phenobarbital possibly reduces plasma concentration of **ethosuximide**, **rufinamide** and **topiramate**; phenobarbital reduces plasma concentration of **lamotrigine**, **tiagabine** and **zonisamide**; plasma concentration of phenobarbital increased by **oxcarbazepine**, also plasma concentration of an active metabolite of oxcarbazepine reduced; plasma concentration of phenobarbital often increased by **phenytoin**, plasma concentration of phenytoin often reduced but may be increased; plasma concentration of phenobarbital increased by ●**stiripentol**; plasma concentration of phenobarbital increased by **valproate** (also plasma concentration of valproate reduced)
- Antifungals: phenobarbital possibly reduces plasma concentration of **itraconazole** and ●**posaconazole**; phenobarbital possibly reduces plasma concentration of ●**voriconazole**—avoid concomitant use; phenobarbital reduces absorption of **griseofulvin** (reduced effect)

**Phenobarbital** (*continued*)

- Antimalarials: avoidance of phenobarbital advised by manufacturer of **piperaquine with arteminol**; anticonvulsant effect of antiepileptics antagonised by ●**mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ●**antipsychotics** (convulsive threshold lowered); phenobarbital accelerates metabolism of **haloperidol** (reduced plasma concentration); plasma concentration of both drugs reduced when phenobarbital given with **chlorpromazine**; phenobarbital possibly reduces plasma concentration of ●**aripiprazole** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); phenobarbital possibly reduces plasma concentration of **clozapine**
- Antivirals: phenobarbital possibly reduces plasma concentration of **abacavir**, **darunavir**, **fosamprenavir**, ●**indinavir**, ●**lopinavir** and ●**saquinavir**; avoidance of phenobarbital advised by manufacturer of ●**boceprevir** and ●**rilpivirine** (plasma concentration of boceprevir and rilpivirine possibly reduced); avoidance of phenobarbital advised by manufacturer of **dolutegravir**, ●**elvitegravir**, **etravirine**, **sofosbuvir** and ●**telaprevir**
- Anxiolytics and Hypnotics: increased sedative effect when phenobarbital given with **anxiolytics** and **hypnotics**; phenobarbital often reduces plasma concentration of **clonazepam**
- Aprepitant: phenobarbital possibly reduces plasma concentration of **aprepitant**
- Avanafil: phenobarbital possibly reduces plasma concentration of **avanafil**—manufacturer of avanafil advises avoid concomitant use
- Beta-blockers: phenobarbital possibly reduces plasma concentration of **propranolol**
- Caffeine citrate: effects of phenobarbital possibly antagonised by **caffeine citrate**
- Calcium-channel Blockers: phenobarbital probably reduces effects of ●**calcium-channel blockers**; avoidance of phenobarbital advised by manufacturer of ●**nimodipine** (plasma concentration of nimodipine reduced)
- Ciclosporin: phenobarbital accelerates metabolism of ●**ciclosporin** (reduced plasma concentration)
- Cobicistat: phenobarbital possibly reduces plasma concentration of ●**cobicistat**—manufacturer of cobicistat advises avoid concomitant use
- Corticosteroids: phenobarbital accelerates metabolism of ●**corticosteroids** (reduced effect)
- Cytotoxics: phenobarbital possibly decreases plasma concentration of **axitinib** (increase dose of axitinib—consult axitinib product literature); phenobarbital possibly reduces plasma concentration of ●**bosutinib** and **crizotinib**—manufacturer of bosutinib and crizotinib advises avoid concomitant use; avoidance of phenobarbital advised by manufacturer of ●**cabazitaxel**, **dabrafenib** and **gefitinib**; avoidance of phenobarbital advised by manufacturer of **vandetanib** (plasma concentration of vandetanib possibly reduced); phenobarbital possibly reduces plasma concentration of **etoposide**; phenobarbital reduces plasma concentration of **irinotecan** and its active metabolite; manufacturer of procarbazine advises possible increased risk of hypersensitivity reactions when phenobarbital given with **procarbazine**
- Diuretics: phenobarbital reduces plasma concentration of ●**eplerenone**—avoid concomitant use; increased risk of osteomalacia when phenobarbital given with **carbonic anhydrase inhibitors**
- Folate: plasma concentration of phenobarbital possibly reduced by **folates**
- Hormone Antagonists: phenobarbital possibly reduces plasma concentration of ●**abiraterone**—manufacturer of abiraterone advises avoid concomitant use;

**Phenobarbital**

- **Hormone Antagonists** (*continued*)  
phenobarbital accelerates metabolism of **toremifene** (reduced plasma concentration)
- **Ivacaftor**: phenobarbital possibly reduces plasma concentration of **ivacaftor**—manufacturer of ivacaftor advises avoid concomitant use
- Leukotriene Receptor Antagonists**: phenobarbital reduces plasma concentration of **montelukast**
- **Oestrogens**: phenobarbital accelerates metabolism of **oestrogens** (reduced contraceptive effect—see p. 536)
- **Orlistat**: possible increased risk of convulsions when antiepileptics given with **orlistat**
- **Progestogens**: phenobarbital accelerates metabolism of **progestogens** (reduced contraceptive effect—see p. 536)
- Roflumilast**: phenobarbital possibly inhibits effects of **roflumilast** (manufacturer of roflumilast advises avoid concomitant use)
- Sodium Oxybate**: avoidance of phenobarbital advised by manufacturer of **sodium oxybate**
- Sympathomimetics**: plasma concentration of phenobarbital possibly increased by **methylphenidate**
- **Tacrolimus**: phenobarbital reduces plasma concentration of **tacrolimus**
- **Theophylline**: phenobarbital accelerates metabolism of **theophylline** (reduced effect)
- Thyroid Hormones**: phenobarbital accelerates metabolism of **thyroid hormones** (may increase requirements for thyroid hormones in hypothyroidism)
- Ticagrelor**: phenobarbital possibly reduces plasma concentration of **ticagrelor**
- **Ulipristal**: avoidance of phenobarbital advised by manufacturer of **ulipristal** (contraceptive effect of ulipristal possibly reduced)
- Vitamins**: phenobarbital possibly increases requirements for **vitamin D**

**Phenothiazines** *see* Antipsychotics

**Phenoxybenzamine** *see* Alpha-blockers

**Phenoxymethylpenicillin** *see* Penicillins

**Phentolamine** *see* Alpha-blockers

**Phenylephrine** *see* Sympathomimetics

**Phenytoin**

**Note** Fosphenytoin interactions as for phenytoin

**Alcohol**: plasma concentration of phenytoin possibly reduced by chronic heavy consumption of **alcohol**

- **Analgesics**: excretion of phenytoin possibly reduced by **acetaminophen** (increased risk of toxicity); phenytoin possibly accelerates metabolism of **fentanyl** (reduced effect); phenytoin accelerates metabolism of **methadone** (reduced effect and risk of withdrawal effects); phenytoin possibly increases risk of **opiate** toxicity; effects of phenytoin enhanced by **aspirin**; phenytoin possibly accelerates metabolism of **paracetamol** (also isolated reports of hepatotoxicity)
- Antacids**: absorption of phenytoin reduced by **antacids**
- **Anti-arrhythmics**: metabolism of phenytoin inhibited by **amiodarone** (increased plasma concentration); phenytoin reduces plasma concentration of **disopyramide**; phenytoin possibly reduces plasma concentration of **dronedarone**—avoid concomitant use
- **Antibacterials**: metabolism of phenytoin inhibited by **clarithromycin** (increased plasma concentration); metabolism of phenytoin possibly inhibited by **metronidazole** (increased plasma concentration); plasma concentration of phenytoin increased or decreased by **ciprofloxacin**; phenytoin accelerates metabolism of **doxycycline** (reduced plasma concentration); plasma concentration of phenytoin increased by **chloramphenicol** (increased risk of toxicity); metabolism of phenytoin possibly inhibited by **isoniazid** (increased risk of toxicity); metabolism of phenytoin accelerated by **rifamycins** (reduced

**Phenytoin**

- **Antibacterials** (*continued*)

plasma concentration); plasma concentration of phenytoin possibly increased by **sulfonamides**; phenytoin reduces plasma concentration of **tetracycline** (avoid during and for 2 weeks after phenytoin); plasma concentration of phenytoin increased by **trimethoprim** (also increased antifolate effect)

- **Anticoagulants**: phenytoin possibly reduces plasma concentration of **apixaban**; phenytoin accelerates metabolism of **coumarins** (possibility of reduced anticoagulant effect, but enhancement also reported); phenytoin possibly reduces plasma concentration of **dabigatran**—manufacturer of dabigatran advises avoid concomitant use; phenytoin possibly reduces plasma concentration of **rivaroxaban**—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- **Antidepressants**: plasma concentration of phenytoin increased by **fluoxetine** and **fluvoxamine**; phenytoin reduces plasma concentration of **mianserin**, **mirtazapine** and **paroxetine**; plasma concentration of phenytoin possibly increased by **sertraline**, also plasma concentration of sertraline possibly reduced; anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **SSRIs** and **tricyclics** (convulsive threshold lowered); plasma concentration of phenytoin possibly reduced by **St John's wort**—avoid concomitant use; phenytoin possibly reduces plasma concentration of **tricyclics**
- Antidiabetics**: plasma concentration of phenytoin transiently increased by **tolbutamide** (possibility of toxicity)
- **Antiepileptics**: plasma concentration of both drugs often reduced when phenytoin given with **carbamazepine**, also plasma concentration of phenytoin may be increased; phenytoin reduces plasma concentration of **eslicarbazepine**, also plasma concentration of phenytoin increased; plasma concentration of phenytoin possibly increased by **ethosuximide**, also plasma concentration of ethosuximide possibly reduced; phenytoin reduces plasma concentration of **lamotrigine**, **tiagabine** and **zonisamide**; plasma concentration of phenytoin increased by **oxcarbazepine**, also plasma concentration of an active metabolite of oxcarbazepine reduced; phenytoin reduces plasma concentration of **perampanel** (see Dose under Perampanel, p. 307); phenytoin often increases plasma concentration of **phenobarbital**, plasma concentration of phenytoin often reduced but may be increased; phenytoin possibly reduces plasma concentration of **retigabine**; phenytoin possibly reduces plasma concentration of **rufinamide**, also plasma concentration of phenytoin possibly increased; plasma concentration of phenytoin increased by **stiripentol**; plasma concentration of phenytoin increased by **topiramate** (also plasma concentration of topiramate reduced); plasma concentration of phenytoin increased or possibly reduced when given with **valproate**, also plasma concentration of valproate reduced; plasma concentration of phenytoin reduced by **vigabatrin**
- **Antifungals**: anticonvulsant effect of phenytoin enhanced by **miconazole** (plasma concentration of phenytoin increased); plasma concentration of phenytoin increased by **fluconazole** (consider reducing dose of phenytoin); phenytoin reduces plasma concentration of **itraconazole**—avoid concomitant use; phenytoin reduces plasma concentration of **posaconazole**; plasma concentration of phenytoin increased by **voriconazole**, also phenytoin reduces

## Phenytoin

- **Antifungals** (*continued*)  
plasma concentration of voriconazole (increase dose of voriconazole and also monitor for phenytoin toxicity); phenytoin possibly reduces plasma concentration of **casprofungin**—consider increasing dose of casprofungin
- **Antimalarials**: avoidance of phenytoin advised by manufacturer of **piperazine with arteminol**; anti-convulsant effect of antiepileptics antagonised by ● **mefloquine**; anticonvulsant effect of phenytoin antagonised by ● **pyrimethamine**, also increased antifolate effect
- **Antipsychotics**: anticonvulsant effect of antiepileptics antagonised by ● **antipsychotics** (convulsive threshold lowered); phenytoin reduces plasma concentration of **haloperidol**; plasma concentration of phenytoin possibly increased or decreased by **chlorpromazine**; phenytoin possibly reduces plasma concentration of ● **aripiprazole** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); phenytoin accelerates metabolism of **clozapine** and **quetiapine** (reduced plasma concentration)
- **Antivirals**: phenytoin possibly reduces plasma concentration of **abacavir**, **darunavir**, **lopinavir** and **saquinavir**; avoidance of phenytoin advised by manufacturer of ● **boceprevir** and **rilpivirine** (plasma concentration of boceprevir and rilpivirine possibly reduced); avoidance of phenytoin advised by manufacturer of **dolutegravir**, ● **elvitegravir**, **etravirine**, **sofosbuvir** and ● **telaprevir**; phenytoin possibly reduces plasma concentration of ● **indinavir**, also plasma concentration of phenytoin possibly increased; phenytoin possibly reduces plasma concentration of **ritonavir**, also plasma concentration of phenytoin possibly affected; plasma concentration of phenytoin increased or decreased by **zidovudine**
- Anxiolytics and Hypnotics**: phenytoin often reduces plasma concentration of **clonazepam**; plasma concentration of phenytoin increased or decreased by **diazepam**; plasma concentration of phenytoin possibly increased or decreased by **benzodiazepines**
- Appetitant**: phenytoin possibly reduces plasma concentration of **aprepitant**
- Bupropion**: phenytoin reduces plasma concentration of **bupropion**
- Caffeine citrate**: phenytoin reduces plasma concentration of **caffeine citrate**
- **Calcium-channel Blockers**: phenytoin reduces effects of **felodipine** and **verapamil**; avoidance of phenytoin advised by manufacturer of **nimodipine** (plasma concentration of nimodipine possibly reduced); plasma concentration of phenytoin increased by ● **diltiazem** but also effect of diltiazem reduced
- Cardiac Glycosides**: phenytoin possibly reduces plasma concentration of **digoxin**
- **Ciclosporin**: phenytoin accelerates metabolism of ● **ciclosporin** (reduced plasma concentration)
- **Cobicistat**: phenytoin possibly reduces plasma concentration of ● **cobicistat**—manufacturer of cobicistat advises avoid concomitant use
- **Corticosteroids**: phenytoin accelerates metabolism of ● **corticosteroids** (reduced effect)
- **Cytotoxics**: phenytoin possibly reduces plasma concentration of **busulfan**, **eribulin** and **etoposide**; metabolism of phenytoin possibly inhibited by **fluorouracil** (increased risk of toxicity); phenytoin increases antifolate effect of **methotrexate**; plasma concentration of phenytoin possibly reduced by **cisplatin**; phenytoin possibly decreases plasma concentration of **axitinib** (increase dose of axitinib—consult axitinib product literature); phenytoin possibly reduces plasma concentration of ● **bosutinib** and **crizotinib**—manufacturer of bosutinib and crizotinib advises avoid concomitant use; avoidance of phenytoin

## Phenytoin

- **Cytotoxics** (*continued*)  
toin advised by manufacturer of ● **cabazitaxel**, **dabrafenib**, **gefitinib**, ● **lapatinib** and **vemurafenib**; phenytoin reduces plasma concentration of ● **imatinib**—avoid concomitant use; phenytoin reduces plasma concentration of **irinotecan** and its active metabolite; manufacturer of procarbazine advises possible increased risk of hypersensitivity reactions when phenytoin given with **procarbazine**; avoidance of phenytoin advised by manufacturer of ● **vismodegib** (plasma concentration of vismodegib possibly reduced)
- Diazoxide**: plasma concentration of phenytoin reduced by **diazoxide**, also effect of diazoxide may be reduced
- **Disulfiram**: metabolism of phenytoin inhibited by ● **disulfiram** (increased risk of toxicity)
- **Diuretics**: plasma concentration of phenytoin possibly increased by ● **acetazolamide**; phenytoin antagonises effects of **furosemide**; phenytoin reduces plasma concentration of ● **eplerenone**—avoid concomitant use; increased risk of osteomalacia when phenytoin given with **carbonic anhydrase inhibitors**
- Dopaminergics**: phenytoin possibly reduces effects of **levodopa**
- Enteral Foods**: absorption of phenytoin possibly reduced by **enteral feeds**
- Folates**: plasma concentration of phenytoin possibly reduced by **folates**
- **Hormone Antagonists**: phenytoin possibly reduces plasma concentration of ● **abiraterone**—manufacturer of abiraterone advises avoid concomitant use; phenytoin possibly accelerates metabolism of **toremifene**
- 5HT<sub>3</sub>-receptor Antagonists**: phenytoin accelerates metabolism of **ondansetron** (reduced effect)
- **Ivacaftor**: phenytoin possibly reduces plasma concentration of ● **ivacaftor**—manufacturer of ivacaftor advises avoid concomitant use
- Leflunomide**: plasma concentration of phenytoin possibly increased by **leflunomide**
- Levamisole**: plasma concentration of phenytoin possibly increased by **levamisole**
- Lipid-regulating Drugs**: absorption of phenytoin possibly reduced by **colesevelam**; combination of phenytoin with **fluvastatin** may increase plasma concentration of either drug (or both)
- Lithium**: neurotoxicity may occur when phenytoin given with **lithium** without increased plasma concentration of lithium
- Macitentan**: avoidance of phenytoin advised by manufacturer of **macitentan**
- Modafinil**: plasma concentration of phenytoin possibly increased by **modafinil**
- **Muscle Relaxants**: *long-term use* of phenytoin reduces effects of ● **non-depolarising muscle relaxants** (but *acute use* of phenytoin might increase effects of non-depolarising muscle relaxants)
- **Oestrogens**: phenytoin accelerates metabolism of ● **oestrogens** (reduced contraceptive effect—see p. 536)
- **Orlistat**: possible increased risk of convulsions when antiepileptics given with ● **orlistat**
- **Progestogens**: phenytoin accelerates metabolism of ● **progestogens** (reduced contraceptive effect—see p. 536)
- Roflumilast**: phenytoin possibly inhibits effects of **roflumilast** (manufacturer of roflumilast advises avoid concomitant use)
- **Sulfapyrazone**: plasma concentration of phenytoin increased by ● **sulfapyrazone**
- Sympathomimetics**: plasma concentration of phenytoin increased by **methylphenidate**

**Phenytoin** (continued)

Tacrolimus: phenytoin reduces plasma concentration of **tacrolimus**, also plasma concentration of phenytoin possibly increased

- Theophylline: plasma concentration of both drugs reduced when phenytoin given with **theophylline**
- Thyroid Hormones: phenytoin accelerates metabolism of **thyroid hormones** (may increase requirements in hypothyroidism), also plasma concentration of phenytoin possibly increased
- Tibolone: phenytoin accelerates metabolism of **tibolone**
- Ticagrelor: phenytoin possibly reduces plasma concentration of **ticagrelor**
- Ulcer-healing Drugs: metabolism of phenytoin inhibited by **cimetidine** (increased plasma concentration); effects of phenytoin enhanced by **esomeprazole**; effects of phenytoin possibly enhanced by **omeprazole**; absorption of phenytoin reduced by **sucralfate**
- Ulipristal: avoidance of phenytoin advised by manufacturer of **ulipristal** (contraceptive effect of ulipristal possibly reduced)
- Vaccines: effects of phenytoin enhanced by **influenza vaccine**
- Vitamins: phenytoin possibly increases requirements for **vitamin D**

**Pholcodine**

Antidepressants: manufacturer of pholcodine advises avoid for 2 weeks after stopping **MAOIs**

**Phosphodiesterase Type-3 Inhibitors**

- Anagrelide: avoidance of enoximone and milrinone advised by manufacturer of **anagrelide**

**Physostigmine** see Parasympathomimetics**Pilocarpine** see Parasympathomimetics**Pimozide** see Antipsychotics**Pindolol** see Beta-blockers**Pioglitazone** see Antidiabetics**Piperacillin** see Penicillins**Piperazine** see Piperazine with Artenimol**Piperazine with Artenimol**

**Note** Piperazine has a long half-life; there is a potential for drug interactions to occur for up to 3 months after treatment has been stopped

- Analgesics: manufacturer of piperazine with artenimol advises avoid concomitant use with **methadone** (possible risk of ventricular arrhythmias)
- Anti-arrhythmics: manufacturer of piperazine with artenimol advises avoid concomitant use with **amiodarone** and **disopyramide** (possible risk of ventricular arrhythmias)
- Antibacterials: manufacturer of piperazine with artenimol advises avoid concomitant use with **macrolides** and **moxifloxacin** (possible risk of ventricular arrhythmias); manufacturer of piperazine with artenimol advises avoid concomitant use with **rifampicin**
- Antidepressants: avoidance of antimalarials advised by manufacturer of **citalopram** and **escitalopram** (risk of ventricular arrhythmias); manufacturer of piperazine with artenimol advises avoid concomitant use with **antidepressants**
- Antiepileptics: manufacturer of piperazine with artenimol advises avoid concomitant use with **carbamazepine**, **phenobarbital** and **phenytoin**
- Antifungals: manufacturer of piperazine with artenimol advises avoid concomitant use with **imidazoles** and **triazoles** (possible risk of ventricular arrhythmias)
- Antihistamines: manufacturer of piperazine with artenimol advises avoid concomitant use with **mizolastine** (possible risk of ventricular arrhythmias)
- Antimalarials: avoidance of antimalarials advised by manufacturer of **artemether with lumefantrine**

**Piperazine with Artenimol** (continued)

- Antipsychotics: manufacturer of piperazine with artenimol advises avoid concomitant use with **droperidol**, **haloperidol**, **phenothiazines** and **pimozide** (possible risk of ventricular arrhythmias)
- Antivirals: manufacturer of piperazine with artenimol advises avoid concomitant use with **sauquinavir** (possible risk of ventricular arrhythmias)
- Beta-blockers: manufacturer of piperazine with artenimol advises avoid concomitant use with **sotalol** (possible risk of ventricular arrhythmias)
- Cytotoxics: manufacturer of piperazine with artenimol advises avoid concomitant use with **arsenic trioxide** (possible risk of ventricular arrhythmias); manufacturer of piperazine with artenimol advises avoid concomitant use with **vinblastine**, **vincristine**, **vinflunine** and **vinorelbine**
- Domperidone: manufacturer of piperazine with artenimol advises avoid concomitant use with **domperidone** (possible risk of ventricular arrhythmias)
- Grapefruit Juice: manufacturer of piperazine with artenimol advises avoid concomitant use with **grapefruit juice**
- Histamine: avoidance of antimalarials advised by manufacturer of **histamine**
- Pentamidine Isetionate: manufacturer of piperazine with artenimol advises avoid concomitant use with **pentamidine isetionate** (possible risk of ventricular arrhythmias)
- Vaccines: antimalarials inactivate **oral typhoid vaccine**—see p. 850

**Pipotiazine** see Antipsychotics**Pirfenidone**

- Antibacterials: plasma concentration of pirfenidone increased by **ciprofloxacin**—see Cautions under Pirfenidone, p. 220
- Antidepressants: plasma concentration of pirfenidone increased by **fluvoxamine**—manufacturer of pirfenidone advises avoid concomitant use
- Grapefruit Juice: manufacturer of pirfenidone advises avoid concomitant use with **grapefruit juice**

**Piroxicam** see NSAIDs**Pivmecillinam** see Penicillins**Pixantroline**

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Vaccines: avoid concomitant use of pixantroline with live **vaccines** (see p. 828)

**Pizotifen**

Adrenergic Neuron Blockers: pizotifen antagonises hypotensive effect of **adrenergic neuron blockers**

**Platinum Compounds**

- Aldesleukin: avoidance of cisplatin advised by manufacturer of **aldesleukin**
- Antibacterials: increased risk of nephrotoxicity and possibly of ototoxicity when platinum compounds given with **aminoglycosides** or **polymyxins**; increased risk of nephrotoxicity and ototoxicity when platinum compounds given with **capreomycin**; increased risk of nephrotoxicity and possibly of ototoxicity when cisplatin given with **vancomycin**
- Antiepileptics: cisplatin possibly reduces plasma concentration of **phenytoin**
- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Cytotoxics: increased risk of toxicity when cisplatin given with **ifosfamide**; increased pulmonary toxicity when cisplatin given with **bleomycin** and **methotrexate**
- Diuretics: increased risk of nephrotoxicity and ototoxicity when platinum compounds given with **diuretics**

**Polymyxin B** see Polymyxins**Polymyxins**

Antibacterials: increased risk of nephrotoxicity when colistimethate sodium or polymyxins given with

**Polymyxins**Antibacterials (*continued*)

- aminoglycosides; increased risk of nephrotoxicity when colistimethate sodium or polymyxins given with **capreomycin**; increased risk of nephrotoxicity when polymyxins given with **vancomycin**; increased risk of nephrotoxicity and ototoxicity when colistimethate sodium given with **vancomycin**
- Antifungals: increased risk of nephrotoxicity when polymyxins given with **amphotericin**
- Cyclosporin: increased risk of nephrotoxicity when polymyxins given with **ciclosporin**
- Cytotoxics: increased risk of nephrotoxicity and possibly of ototoxicity when polymyxins given with **platinum compounds**
- Diuretics: increased risk of ototoxicity when polymyxins given with **loop diuretics**
- Muscle Relaxants: polymyxins enhance effects of **non-depolarising muscle relaxants** and **suxamethonium**
- Parasympathomimetics: polymyxins antagonise effects of **neostigmine** and **pyridostigmine**
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 850

**Polystyrene Sulfonate Resins**

Antacids: risk of intestinal obstruction when polystyrene sulfonate resins given with **aluminium hydroxide**; risk of metabolic alkalosis when polystyrene sulfonate resins given with **oral magnesium salts**

Thyroid Hormones: polystyrene sulfonate resins reduce absorption of **levothyroxine**

**Pomalidomide**

- Antidepressants: plasma concentration of pomalidomide increased by **eflvoxamine**

**Ponatinib**

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)

**Posaconazole** *see* Antifungals, Triazole**Potassium Canrenoate** *see* Diuretics**Potassium Aminobenzoate**Antibacterials: potassium aminobenzoate inhibits effects of **sulfonamides****Potassium Bicarbonate** *see* Potassium Salts**Potassium Chloride** *see* Potassium Salts**Potassium Citrate** *see* Potassium Salts**Potassium Salts***Note* Includes salt substitutes

- ACE Inhibitors: increased risk of severe hyperkalaemia when potassium salts given with **ACE inhibitors**
- Aliskiren: increased risk of hyperkalaemia when potassium salts given with **aliskiren**
- Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when potassium salts given with **angiotensin-II receptor antagonists**
- Antibacterials: avoid concomitant use of potassium citrate with **methenamine**
- Cyclosporin: increased risk of hyperkalaemia when potassium salts given with **ciclosporin**
- Diuretics: increased risk of hyperkalaemia when potassium salts given with **potassium-sparing diuretics** and **aldosterone antagonists**
- Tacrolimus: increased risk of hyperkalaemia when potassium salts given with **tacrolimus**
- Ulcer-healing Drugs: avoidance of potassium citrate advised by manufacturer of **sucralfate**

**Pramipexole**Antipsychotics: manufacturer of pramipexole advises avoid concomitant use of **antipsychotics** (antagonism of effect)Memantine: effects of dopaminergics possibly enhanced by **memantine**Methyldopa: antiparkinsonian effect of dopaminergics antagonised by **methyldopa****Pramipexole** (*continued*)Ulcer-healing Drugs: excretion of pramipexole reduced by **cimetidine** (increased plasma concentration)**Prasugrel**Analgesics: possible increased risk of bleeding when prasugrel given with **NSAIDs**Anticoagulants: possible increased risk of bleeding when prasugrel given with **coumarins** or **phenindione**Clopidogrel: possible increased risk of bleeding when prasugrel given with **clopidogrel****Pravastatin** *see* Statins**Prazosin** *see* Alpha-blockers**Prednisolone** *see* Corticosteroids**Prednisone** *see* Corticosteroids**Pregabalin**

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOs** and **tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **SSRIs** and **tricyclics** (convulsive threshold lowered)
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by **mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by **antipsychotics** (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with **orlistat**

**Prilocaine**Anti-arrhythmics: increased myocardial depression when prilocaine given with **anti-arrhythmics**Antibacterials: increased risk of methaemoglobinemia when prilocaine given with **sulfonamides****Primaquine**

- Antidepressants: avoidance of antimalarials advised by manufacturer of **escitalopram** and **escitalopram** (risk of ventricular arrhythmias)

- Antimalarials: avoidance of antimalarials advised by manufacturer of **artemether with lumefantrine**

Histamine: avoidance of antimalarials advised by manufacturer of **histamine**Mepacrine: plasma concentration of primaquine increased by **mepacrine** (increased risk of toxicity)Vaccines: antimalarials inactivate **oral typhoid vaccine**—see p. 850**Primidone** *see* Phenobarbital**Probenecid**ACE Inhibitors: probenecid reduces excretion of **captopril**Anaesthetics, General: probenecid possibly enhances effects of **thiopental**

- Analgesics: probenecid reduces excretion of **acetaminophen**, **dexketoprofen**, **indometacin**, **ketoprofen** and **naproxen** (increased plasma concentration); probenecid reduces excretion of **ketorolac** (increased plasma concentration)—avoid concomitant use; effects of probenecid antagonised by **aspirin**
- Antibacterials: probenecid reduces excretion of **meropenem**; probenecid reduces excretion of **cephalosporins**, **ciprofloxacin**, **nalidixic acid**, **norfloxacin** and **penicillins** (increased plasma concentration); probenecid reduces excretion of **dapsone** and **nitrofurantoin** (increased risk of side-effects); effects of probenecid antagonised by **pyrazinamide**
- Antivirals: probenecid reduces excretion of **aciclovir** (increased plasma concentration); probenecid possibly reduces excretion of **famciclovir** (increased plasma concentration); probenecid reduces excretion of **ganciclovir** and **zidovudine** (increased plasma concentration and risk of toxicity)
- Anxiolytics and Hypnotics: probenecid reduces excretion of **lorazepam** (increased plasma concentration);

**Probenecid**

Anxiolytics and Hypnotics (*continued*)

probenecid possibly reduces excretion of **nitrazepam** (increased plasma concentration)

- Cytotoxics: probenecid reduces excretion of **methotrexate** (increased risk of toxicity)
- Sodium Benzoate: probenecid possibly reduces excretion of conjugate formed by **sodium benzoate**
- Sodium Phenylbutyrate: probenecid possibly reduces excretion of conjugate formed by **sodium phenylbutyrate**

**Procarbazine**

Alcohol: disulfiram-like reaction when procarbazine given with **alcohol**

Antiepileptics: manufacturer of procarbazine advises possible increased risk of hypersensitivity reactions when given with **carbamazepine**, **phenobarbital** and **phenytoin**

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Cardiac Glycosides: procarbazine possibly reduces absorption of **digoxin tablets**

**Prochlorperazine** *see* Antipsychotics

**Procyclidine** *see* Antimuscarinics

**Progesterone** *see* Progestogens

**Progestogens**

**Note** Interactions of combined oral contraceptives may also apply to combined contraceptive patches and vaginal rings, *see* p. 536. For further information on interactions of oral progestogen-only contraceptives, *see* also p. 539; parenteral progestogen-only contraceptives, *see* also p. 543; the intrauterine progestogen-only device, *see* also p. 544; hormonal emergency contraception, *see* also p. 547

- Antibacterials: plasma concentration of dienogest increased by **erythromycin**; metabolism of progestogens accelerated by **rifamycins** (reduced contraceptive effect—*see* p. 536)
  - Anticoagulants: progestogens may enhance or reduce anticoagulant effect of **coumarins**; progestogens antagonise anticoagulant effect of **phenindione**
  - Antidepressants: contraceptive effect of progestogens reduced by **St John's wort** (avoid concomitant use)
- Antidiabetics: progestogens antagonise hypoglycaemic effect of **antidiabetics**
- Antiepileptics: metabolism of progestogens accelerated by **carbamazepine**, **eslicarbazepine**, **oxcarbazepine**, **perampanel**, **phenobarbital**, **phenytoin**, **rufinamide** and **topiramate** (reduced contraceptive effect—*see* p. 536); desogestrel possibly increases plasma concentration of **lamotrigine**
- Antifungals: progestogens possibly increase plasma concentration of **voriconazole**; anecdotal reports of contraceptive failure and menstrual irregularities when progestogens given with **griseofulvin**; occasional reports of breakthrough bleeding when progestogens (used for contraception) given with **terbinafine**
- Antivirals: plasma concentration of norethisterone increased by **atazanavir**; plasma concentration of drosiprone increased by **boceprevir** (increased risk of toxicity); contraceptive effect of progestogens possibly reduced by **efavirenz**; plasma concentration of norgestimate increased by **elvitegravir**; metabolism of progestogens accelerated by **nevirapine** (reduced contraceptive effect—*see* p. 536)
- Anxiolytics and Hypnotics: progestogens possibly increase plasma concentration of **chlordiazepoxide**, **diazepam** and **nitrazepam**; progestogens possibly reduce plasma concentration of **lorazepam**, **oxazepam** and **temazepam**
- Aprepitant: possible contraceptive failure of hormonal contraceptives containing progestogens when given with **aprepitant** (alternative contraception recommended)

**Progestogens** (*continued*)

- Bosentan: possible contraceptive failure of hormonal contraceptives containing progestogens when given with **bosentan** (alternative contraception recommended)
- Ciclosporin: progestogens possibly increase plasma concentration of **ciclosporin**
- Cobicistat: plasma concentration of norgestimate increased by **cobicistat**
- Cytotoxics: possible reduction in contraceptive effect of progestogens advised by manufacturer of **crizotinib** and **vemurafenib**; possible reduced contraceptive effect of hormonal contraceptives containing progestogens advised by manufacturer of **dabrafenib** (alternative contraception recommended)
- Diuretics: risk of hyperkalaemia when drosiprone given with **potassium-sparing diuretics and aldosterone antagonists** (monitor serum potassium during first cycle)
- Dopaminergics: progestogens increase plasma concentration of **selegiline**—manufacturer of selegiline advises avoid concomitant use
- Lipid-regulating Drugs: plasma concentration of norethisterone increased by **atorvastatin**; plasma concentration of active metabolite of norgestimate increased by **rosuvastatin**; plasma concentration of norgestrel increased by **rosuvastatin**
- Muscle Relaxants: progestogens possibly increase plasma concentration of **tizanidine** (increased risk of toxicity)
- Sugammadex: plasma concentration of progestogens possibly reduced by **sugammadex**—manufacturer of sugammadex advises additional contraceptive precautions
- Teriflunomide: plasma concentration of levonorgestrel increased by **teriflunomide**
- Ulipristal: contraceptive effect of progestogens possibly reduced by **ulipristal**

**Proguanil**

Antacids: absorption of proguanil reduced by **oral magnesium salts** (as magnesium trisilicate)

Anticoagulants: isolated reports that proguanil may enhance anticoagulant effect of **warfarin**

- Antidepressants: avoidance of antimalarials advised by manufacturer of **citalopram** and **escitalopram** (risk of ventricular arrhythmias)
  - Antimalarials: avoidance of antimalarials advised by manufacturer of **artemether with lumefantrine**; increased antifolate effect when proguanil given with **pyrimethamine**
- Antivirals: plasma concentration of proguanil possibly affected by **efavirenz**
- Histamine: avoidance of antimalarials advised by manufacturer of **histamine**
- Vaccines: antimalarials inactivate **oral typhoid vaccine**—*see* p. 850

**Promazine** *see* Antipsychotics

**Promethazine** *see* Antihistamines

**Propafenone**

Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with **bupivacaine**, **levobupivacaine**, **prilocaine** or **ropivacaine**

- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other **anti-arrhythmics**
- Antibacterials: metabolism of propafenone accelerated by **rifampicin** (reduced effect)
- Anticoagulants: propafenone enhances anticoagulant effect of **coumarins**
- Antidepressants: metabolism of propafenone possibly inhibited by **fluoxetine** and **paroxetine**; increased risk of arrhythmias when propafenone given with **tricyclics**
- Antiepileptics: metabolism of propafenone possibly accelerated by **phenobarbital**

**Propafenone** (continued)

Antihistamines: avoidance of propafenone advised by manufacturer of **mizolastine** (possible risk of ventricular arrhythmias)

- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with **antipsychotics** that prolong the QT interval
- Antivirals: plasma concentration of propafenone possibly increased by **fosamprenavir** (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of propafenone increased by **ritonavir** (increased risk of ventricular arrhythmias—avoid concomitant use); increased risk of ventricular arrhythmias when propafenone given with **saquinavir**—avoid concomitant use; caution with propafenone advised by manufacturer of **telaprevir** (risk of ventricular arrhythmias)
- Beta-blockers: increased myocardial depression when anti-arrhythmics given with **beta-blockers**; propafenone increases plasma concentration of **metoprolol** and **propranolol**
- Cardiac Glycosides: propafenone increases plasma concentration of **digoxin** (halve dose of digoxin)
- Ciclosporin: propafenone possibly increases plasma concentration of **ciclosporin**
- Parasympathomimetics: propafenone possibly antagonises effects of **neostigmine** and **pyridostigmine**
- Theophylline: propafenone increases plasma concentration of **theophylline**
- Ulcer-healing Drugs: plasma concentration of propafenone increased by **cimetidine**

**Propantheline** see Antimuscarinics**Propiverine** see Antimuscarinics**Propofol** see Anaesthetics, General**Propranolol** see Beta-blockers**Prostaglandins**

- ACE Inhibitors: enhanced hypotensive effect when alprostadil given with **ACE inhibitors**
- Adrenergic Neurone Blockers: enhanced hypotensive effect when alprostadil given with **adrenergic neurone blockers**
- Alpha-blockers: enhanced hypotensive effect when alprostadil given with **alpha-blockers**
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alprostadil given with **angiotensin-II receptor antagonists**
- Beta-blockers: enhanced hypotensive effect when alprostadil given with **beta-blockers**
- Calcium-channel Blockers: enhanced hypotensive effect when alprostadil given with **calcium-channel blockers**
- Clonidine: enhanced hypotensive effect when alprostadil given with **clonidine**
- Diazoxide: enhanced hypotensive effect when alprostadil given with **diazoxide**
- Diuretics: enhanced hypotensive effect when alprostadil given with **diuretics**
- Methyldopa: enhanced hypotensive effect when alprostadil given with **methyldopa**
- Moxonidine: enhanced hypotensive effect when alprostadil given with **moxonidine**
- Nitrates: enhanced hypotensive effect when alprostadil given with **nitrates**
- Oxytocin: prostaglandins potentiate uterotonic effect of **oxytocin**
- Vasodilator Antihypertensives: enhanced hypotensive effect when alprostadil given with **hydralazine**, **minoxidil** or **sodium nitroprusside**

**Protein Kinase Inhibitors** see individual drugs**Proton Pump Inhibitors**

- Antacids: absorption of lansoprazole possibly reduced by **antacids**
- Antibacterials: plasma concentration of both drugs increased when omeprazole given with **clarithromycin**

**Proton Pump Inhibitors** (continued)

- Anticoagulants: pantoprazole might enhance the anticoagulant effect of **coumarins**; esomeprazole and omeprazole possibly enhance anticoagulant effect of **coumarins**
- Antidepressants: omeprazole increases plasma concentration of **escitalopram**; plasma concentration of lansoprazole possibly increased by **fluvoxamine**; plasma concentration of omeprazole possibly reduced by **St John's wort**
- Antiepileptics: omeprazole possibly enhances effects of **phenytoin**; esomeprazole enhances effects of **phenytoin**
- Antifungals: proton pump inhibitors reduce absorption of **itraconazole**; esomeprazole reduces plasma concentration of **posaconazole**—manufacturer of posaconazole *suspension* advises avoid concomitant use; lansoprazole, omeprazole, pantoprazole and rabeprazole possibly reduce plasma concentration of **posaconazole**—manufacturer of posaconazole *suspension* advises avoid concomitant use; plasma concentration of esomeprazole possibly increased by **voriconazole**; plasma concentration of omeprazole increased by **voriconazole** (consider reducing dose of omeprazole)
- Antipsychotics: omeprazole possibly reduces plasma concentration of **clozapine**
- Antivirals: proton pump inhibitors reduce plasma concentration of **atazanavir**—avoid or adjust dose of both drugs (consult product literature); omeprazole increases plasma concentration of **raltegravir**; omeprazole reduces plasma concentration of **rilpivirine**—avoid concomitant use; avoidance of esomeprazole, lansoprazole, pantoprazole and rabeprazole advised by manufacturer of **rilpivirine** (plasma concentration of rilpivirine possibly reduced); omeprazole increases plasma concentration of **saquinavir**—manufacturer of saquinavir advises avoid concomitant use; esomeprazole, lansoprazole, pantoprazole and rabeprazole possibly increase plasma concentration of **saquinavir**—manufacturer of saquinavir advises avoid concomitant use; plasma concentration of esomeprazole and omeprazole reduced by **tipranavir**
- Anxiolytics and Hypnotics: esomeprazole and omeprazole possibly inhibit metabolism of **diazepam** (increased plasma concentration)
- Cardiac Glycosides: proton pump inhibitors possibly slightly increase plasma concentration of **digoxin**
- Ciclosporin: omeprazole possibly affects plasma concentration of **ciclosporin**
- Cilostazol: omeprazole increases plasma concentrations of **cilostazol** (see Dose under Cilostazol, p. 140)
- Clopidogrel: esomeprazole and omeprazole reduce antiplatelet effect of **clopidogrel**; lansoprazole, pantoprazole and rabeprazole possibly reduce antiplatelet effect of **clopidogrel**
- Cytotoxics: proton pump inhibitors possibly reduce excretion of **methotrexate** (increased risk of toxicity); lansoprazole reduces plasma concentration of **bosutinib**; avoidance of proton pump inhibitors advised by manufacturer of **dabrafenib** (plasma concentration of dabrafenib possibly reduced); avoidance of esomeprazole, lansoprazole, pantoprazole and rabeprazole advised by manufacturer of **erlotinib**; omeprazole reduces plasma concentration of **erlotinib**—manufacturer of erlotinib advises avoid concomitant use; proton pump inhibitors possibly reduce absorption of **lapatinib**; proton pump inhibitors possibly reduce absorption of **pazopanib**—manufacturer of pazopanib advises give at the same time as proton pump inhibitors
- Tacrolimus: omeprazole possibly increases plasma concentration of **tacrolimus**

**Proton Pump Inhibitors** (*continued*)

Ulcer-healing Drugs: absorption of lansoprazole possibly reduced by **sucralfate**

- **Ulipristal**: avoidance of proton pump inhibitors advised by manufacturer of **high-dose ulipristal** (contraceptive effect of ulipristal possibly reduced)

**Pseudoephedrine** *see* Sympathomimetics**Pyrazinamide**

**Probenecid**: pyrazinamide antagonises effects of **probenecid**

**Sulfapyrazone**: pyrazinamide antagonises effects of **sulfapyrazone**

**Vaccines**: antibacterials inactivate **oral typhoid vaccine**—*see* p. 850

**Pyridostigmine** *see* Parasympathomimetics**Pyridoxine** *see* Vitamins**Pyrimethamine**

- **Antibacterials**: increased antifolate effect when pyrimethamine given with ●**sulfonamides** or ●**trimethoprim**
- **Antidepressants**: avoidance of antimalarials advised by manufacturer of ●**citalopram** and ●**escitalopram** (risk of ventricular arrhythmias)
- **Antiepileptics**: pyrimethamine antagonises anti-convulsant effect of ●**phenytoin**, also increased antifolate effect
- **Antimalarials**: avoidance of antimalarials advised by manufacturer of ●**artemether with lumefantrine**; increased antifolate effect when pyrimethamine given with **proguanil**
- **Antivirals**: increased antifolate effect when pyrimethamine given with **zidovudine**
- **Cytotoxics**: pyrimethamine increases antifolate effect of ●**methotrexate** and ●**pemetrexed**
- **Histamine**: avoidance of antimalarials advised by manufacturer of **histamine**
- **Vaccines**: antimalarials inactivate **oral typhoid vaccine**—*see* p. 850

**Quetiapine** *see* Antipsychotics**Quinagolide**

**Memantine**: effects of dopaminergics possibly enhanced by **memantine**

**Methyl dopa**: antiparkinsonian effect of dopaminergics antagonised by **methyl dopa**

**Quinapril** *see* ACE Inhibitors**Quinine**

- **Anti-arrhythmics**: increased risk of ventricular arrhythmias when quinine given with ●**amiodarone**—avoid concomitant use; quinine increases plasma concentration of ●**flecainide**
  - **Antibacterials**: increased risk of ventricular arrhythmias when quinine given with ●**moxifloxacin**—avoid concomitant use; plasma concentration of quinine reduced by ●**rifampicin**
  - **Anticoagulants**: plasma concentration of both drugs increased when quinine given with **warfarin**
  - **Antidepressants**: avoidance of antimalarials advised by manufacturer of ●**citalopram** and ●**escitalopram** (risk of ventricular arrhythmias)
  - **Antimalarials**: avoidance of antimalarials advised by manufacturer of ●**artemether with lumefantrine**; increased risk of ventricular arrhythmias when quinine given with ●**artemether with lumefantrine**; increased risk of convulsions when quinine given with ●**mefloquine** (but should not prevent the use of **intravenous quinine** in severe cases)
  - **Antipsychotics**: increased risk of ventricular arrhythmias when quinine given with ●**droperidol** or ●**pimozide**—avoid concomitant use; possible increased risk of ventricular arrhythmias when quinine given with ●**haloperidol**—avoid concomitant use; possible increased risk of ventricular arrhythmias when quinine given with ●**risperidone**
  - **Antivirals**: plasma concentration of quinine possibly increased by ●**atazanavir**, ●**darunavir**,
- Quinine**
- **Antivirals** (*continued*)
    - **fosamprenavir**, ●**indinavir** and ●**tipranavir** (increased risk of toxicity); plasma concentration of quinine increased by ●**ritonavir** (increased risk of toxicity); increased risk of ventricular arrhythmias when quinine given with ●**saquinavir**—avoid concomitant use
  - **Cardiac Glycosides**: quinine increases plasma concentration of ●**digoxin**
  - **Dopaminergics**: quinine possibly increases plasma concentration of **amantadine**
  - **Histamine**: avoidance of antimalarials advised by manufacturer of **histamine**
  - **Muscle Relaxants**: quinine possibly enhances effects of **suxamethonium**
  - **Ulcer-healing Drugs**: metabolism of quinine inhibited by **cimetidine** (increased plasma concentration)
  - **Vaccines**: antimalarials inactivate **oral typhoid vaccine**—*see* p. 850
- Quinolones**
- **Analgesics**: possible increased risk of convulsions when quinolones given with ●**NSAIDs**
  - **Antacids**: absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin and ofloxacin reduced by **antacids**
  - **Anti-arrhythmics**: increased risk of ventricular arrhythmias when levofloxacin or moxifloxacin given with ●**amiodarone**—avoid concomitant use; increased risk of ventricular arrhythmias when moxifloxacin given with ●**disopyramide**—avoid concomitant use
  - **Antibacterials**: increased risk of ventricular arrhythmias when moxifloxacin given with **parenteral erythromycin**—avoid concomitant use; effects of nalidixic acid possibly antagonised by **nitrofurantoin**; possible increased risk of ventricular arrhythmias when moxifloxacin given with ●**telithromycin**
  - **Anticoagulants**: ciprofloxacin and levofloxacin possibly enhance anticoagulant effect of **coumarins**; nalidixic acid, norfloxacin and ofloxacin enhance anticoagulant effect of ●**coumarins**; levofloxacin possibly enhances anticoagulant effect of **phenindione**
  - **Antidepressants**: avoidance of moxifloxacin advised by manufacturer of ●**citalopram** and ●**escitalopram** (risk of ventricular arrhythmias); ciprofloxacin inhibits metabolism of ●**duloxetine**—avoid concomitant use; avoidance of ciprofloxacin advised by manufacturer of ●**agomelatine**; increased risk of ventricular arrhythmias when moxifloxacin given with ●**tricyclics**—avoid concomitant use
  - **Antidiabetics**: norfloxacin possibly enhances effects of **glibenclamide**
  - **Antiepileptics**: ciprofloxacin increases or decreases plasma concentration of **phenytoin**
  - **Antihistamines**: increased risk of ventricular arrhythmias when moxifloxacin given with ●**mizolastine**—avoid concomitant use
  - **Antimalarials**: avoidance of moxifloxacin advised by manufacturer of ●**piperaquine with artemimol** (possible risk of ventricular arrhythmias); avoidance of quinolones advised by manufacturer of ●**artemether with lumefantrine**; increased risk of ventricular arrhythmias when moxifloxacin given with ●**chloroquine** and ●**hydroxychloroquine**, ●**mefloquine** or ●**quinine**—avoid concomitant use
  - **Antipsychotics**: increased risk of ventricular arrhythmias when moxifloxacin given with ●**benperidol**—manufacturer of benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias when moxifloxacin given with ●**droperidol**, ●**haloperidol**, ●**phenothiazines**, ●**pimozide** or ●**zuclopendithol**—avoid concomitant use; ciprofloxacin increases plasma concentration of **clozapine**;

## Quinolones

- Antipsychotics (*continued*)  
ciprofloxacin possibly increases plasma concentration of **olanzapine**
- Antivirals: manufacturer of norfloxacin advises give **didanosine** at least 2 hours before or after norfloxacin; increased risk of ventricular arrhythmias when moxifloxacin given with ●**saquinavir**—avoid concomitant use
- Atomoxetine: increased risk of ventricular arrhythmias when moxifloxacin given with ●**atomoxetine**
- Beta-blockers: increased risk of ventricular arrhythmias when moxifloxacin given with ●**sotalol**—avoid concomitant use
- Calcium Salts: absorption of ciprofloxacin reduced by **calcium salts**
- Cyclosporin: increased risk of nephrotoxicity when quinolones given with ●**cyclosporin**
- Clopidogrel: ciprofloxacin possibly reduces antiplatelet effect of ●**clopidogrel**
- Cytotoxics: nalidixic acid increases risk of **melphalan** toxicity; ciprofloxacin possibly reduces excretion of **methotrexate** (increased risk of toxicity); possible increased risk of ventricular arrhythmias when moxifloxacin given with ●**bosutinib**; ciprofloxacin possibly increases the plasma concentration of ●**bosutinib**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; ciprofloxacin increases plasma concentration of **erlotinib**; possible increased risk of ventricular arrhythmias when moxifloxacin given with ●**vandetanib**—avoid concomitant use; increased risk of ventricular arrhythmias when levofloxacin or moxifloxacin given with ●**arsenic trioxide**
- Dairy Products: absorption of ciprofloxacin and norfloxacin reduced by **dairy products**
- Dopaminergics: ciprofloxacin increases plasma concentration of **rasagiline**; ciprofloxacin inhibits metabolism of **ropinirel** (increased plasma concentration)
- 5HT<sub>1</sub>-receptor Agonists: quinolones possibly inhibit metabolism of **zolmitriptan** (reduce dose of zolmitriptan)
- Iron: absorption of ciprofloxacin, levofloxacin, moxifloxacin and ofloxacin reduced by **oral iron**; absorption of norfloxacin reduced by **oral iron** (give at least 2 hours apart)
- Lanthanum: absorption of quinolones possibly reduced by **lanthanum** (give at least 2 hours before or 4 hours after lanthanum)
- Muscle Relaxants: ciprofloxacin increases plasma concentration of ●**tizanidine** (increased risk of toxicity)—avoid concomitant use; norfloxacin possibly increases plasma concentration of **tizanidine** (increased risk of toxicity)
- Mycophenolate: norfloxacin possibly reduces bioavailability of **mycophenolate**
- Pentamidine Isetionate: increased risk of ventricular arrhythmias when moxifloxacin given with ●**pentamidine isetionate**—avoid concomitant use
- Pifenedone: ciprofloxacin increases plasma concentration of ●**pifenedone**—see Cautions under Pifenedone, p. 220
- Probenecid: excretion of ciprofloxacin, nalidixic acid and norfloxacin reduced by **probenecid** (increased plasma concentration)
- Sevelamer: bioavailability of ciprofloxacin reduced by **sevelamer**
- Strontium Ranelate: absorption of quinolones reduced by **strontium ranelate** (manufacturer of strontium ranelate advises avoid concomitant use)
- Theophylline: possible increased risk of convulsions when quinolones given with ●**theophylline**; ciprofloxacin and norfloxacin increase plasma concentration of ●**theophylline**

Quinolones (*continued*)

- Ulcer-healing Drugs: absorption of ciprofloxacin, levofloxacin, moxifloxacin and ofloxacin reduced by **sucralfate**; absorption of norfloxacin reduced by **sucralfate** (give at least 2 hours apart)
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 850
- Zinc: absorption of ciprofloxacin, levofloxacin, moxifloxacin and ofloxacin reduced by **zinc**; absorption of norfloxacin reduced by **zinc** (give at least 2 hours apart)
- Rabeprazole** *see* Proton Pump Inhibitors
- Rabies Vaccine** *see* Vaccines
- Raloxifene**  
Anticoagulants: raloxifene antagonises anticoagulant effect of **coumarins**
- Lipid-regulating Drugs: absorption of raloxifene reduced by **colestyramine** (manufacturer of raloxifene advises avoid concomitant administration)
- Raltegravir**  
Antacids: absorption of raltegravir possibly reduced by **antacids** (give at least 2 hours apart)
- Antibacterials: plasma concentration of raltegravir reduced by ●**rifampicin**—consider increasing dose of raltegravir
- Antivirals: increased risk of rash when raltegravir given with **darunavir**; avoidance of raltegravir advised by manufacturer of ●**fosamprenavir**
- Orlistat: absorption of raltegravir possibly reduced by ●**orlistat**
- Ulcer-healing Drugs: plasma concentration of raltegravir increased by **famotidine** and **omeprazole**
- Raltitrexed**  
● Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Folates: manufacturer of raltitrexed advises avoid concomitant use with ●**folates**
- Ramipril** *see* ACE Inhibitors
- Ranitidine** *see* Histamine H<sub>2</sub>-antagonists
- Ranolazine**  
● Anti-arrhythmics: manufacturer of ranolazine advises avoid concomitant use with ●**disopyramide**
- Antibacterials: plasma concentration of ranolazine possibly increased by ●**clarithromycin** and ●**telithromycin**—manufacturer of ranolazine advises avoid concomitant use; plasma concentration of ranolazine reduced by ●**rifampicin**—manufacturer of ranolazine advises avoid concomitant use
- Antidepressants: plasma concentration of ranolazine increased by **paroxetine**
- Antifungals: plasma concentration of ranolazine possibly increased by ●**itraconazole**, ●**posaconazole** and ●**voriconazole**—manufacturer of ranolazine advises avoid concomitant use
- Antivirals: plasma concentration of ranolazine possibly increased by ●**atazanavir**, ●**darunavir**, ●**fosamprenavir**, ●**indinavir**, ●**lopinavir**, ●**ritonavir**, ●**saquinavir** and ●**tipranavir**—manufacturer of ranolazine advises avoid concomitant use
- Beta-blockers: manufacturer of ranolazine advises avoid concomitant use with ●**sotalol**
- Calcium-channel Blockers: plasma concentration of ranolazine increased by **diltiazem** and **verapamil** (consider reducing dose of ranolazine)
- Cardiac Glycosides: ranolazine increases plasma concentration of **digoxin**
- Cyclosporin: plasma concentration of both drugs may increase when ranolazine given with **cyclosporin**
- Grapefruit Juice: plasma concentration of ranolazine possibly increased by ●**grapefruit juice**—manufacturer of ranolazine advises avoid concomitant use
- Lipid-regulating Drugs: ranolazine increases plasma concentration of ●**simvastatin** (see Dose under Simvastatin, p. 173); manufacturer of lomitapide advises dose reduction when ranolazine given with **lomitapide** (see Dose under Lomitapide, p. 177)

**Ranolazine** (*continued*)

- Tacrolimus: ranolazine increases plasma concentration of ●**tacrolimus**

**Rasagiline**

**Note** Rasagiline is a MAO-B inhibitor

- Analgesics: avoid concomitant use of rasagiline with ●**dextromethorphan**; risk of CNS toxicity when rasagiline given with ●**pethidine** (avoid pethidine for 2 weeks after rasagiline)

Antibacterials: plasma concentration of rasagiline increased by ●**ciprofloxacin**

- Antidepressants: after stopping rasagiline do not start ●**fluoxetine** for 2 weeks, also rasagiline should not be started until at least 5 weeks after stopping fluoxetine; after stopping rasagiline do not start ●**fluvoxamine** for 2 weeks; risk of hypertensive crisis when rasagiline given with ●**MAOIs**, avoid MAOIs for at least 2 weeks after stopping rasagiline; increased risk of CNS toxicity when rasagiline given with ●**SSRIs** or ●**tricyclics**

Dopaminergics: plasma concentration of rasagiline possibly reduced by ●**entacapone**

Memantine: effects of dopaminergics possibly enhanced by ●**memantine**

Methylodopa: antiparkinsonian effect of dopaminergics antagonised by ●**methylodopa**

- Sympathomimetics: avoid concomitant use of rasagiline with ●**sympathomimetics**

**Reboxetine**

- Antibacterials: manufacturer of reboxetine advises avoid concomitant use with ●**macrolides**
- Antidepressants: manufacturer of reboxetine advises avoid concomitant use with ●**fluvoxamine**; increased risk of hypertension and CNS excitation when reboxetine given with ●**MAOIs** (MAOIs should not be started until 1 week after stopping reboxetine, avoid reboxetine for 2 weeks after stopping MAOIs)

Antiepileptics: plasma concentration of reboxetine possibly reduced by ●**carbamazepine** and ●**phenobarbital**

- Antifungals: manufacturer of reboxetine advises avoid concomitant use with ●**imidazoles** and ●**triazoles**
- Antimalarials: avoidance of antidepressants advised by manufacturer of ●**artemether with lumefantrine** and ●**piperazine with arteminol**

Atomoxetine: possible increased risk of convulsions when antidepressants given with ●**atomoxetine**

Diuretics: possible increased risk of hypokalaemia when reboxetine given with ●**loop diuretics** or ●**thiazides and related diuretics**

Ergot Alkaloids: possible risk of hypertension when reboxetine given with ●**ergotamine**

**Regorafenib**

Analgesics: manufacturer of regorafenib advises avoid concomitant use with ●**mefenamic acid**

- Antibacterials: plasma concentration of regorafenib reduced by ●**rifampicin**—manufacturer of regorafenib advises avoid concomitant use
  - Anticoagulants: increased risk of bleeding when regorafenib given with ●**warfarin**
  - Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Cytotoxics: regorafenib increases plasma concentration of ●**irinotecan**

**Remifentanyl** *see* Opioid Analgesics

**Repaglinide** *see* Antidiabetics

**Retigabine**

Alcohol: increased risk of blurred vision when retigabine given with ●**alcohol**

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by ●**MAOIs** and ●**tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●**SSRIs** and ●**tricyclics** (convulsive threshold lowered)

**Retigabine** (*continued*)

Antiepileptics: plasma concentration of retigabine possibly reduced by ●**carbamazepine** and ●**phenytoin**

- Antimalarials: anticonvulsant effect of antiepileptics antagonised by ●**mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ●**antipsychotics** (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ●**orlistat**

**Retinoids**

Alcohol: etretinate formed from acitretin in presence of ●**alcohol** (increased risk of teratogenicity in women of child-bearing potential)

Antibacterials: possible increased risk of benign intracranial hypertension when retinoids given with ●**tetracyclines** (avoid concomitant use)

Anticoagulants: acitretin possibly reduces anticoagulant effect of ●**coumarins**

Antiepileptics: isotretinoin possibly reduces plasma concentration of ●**carbamazepine**

Antifungals: possible increased risk of retinoid toxicity when given with ●**fluconazole** and ●**voriconazole**

Cytotoxics: acitretin increases plasma concentration of ●**methotrexate** (also increased risk of hepatotoxicity)—avoid concomitant use

Lipid-regulating Drugs: alitretinoin reduces plasma concentration of ●**simvastatin**

Vitamins: risk of hypervitaminosis A when retinoids given with ●**vitamin A**—avoid concomitant use

**Ribavirin**

Antivirals: effects of ribavirin possibly reduced by ●**abacavir**; increased risk of side-effects when ribavirin given with ●**didanosine**—avoid concomitant use; increased risk of toxicity when ribavirin given with ●**stavudine**; increased risk of anaemia when ribavirin given with ●**zidovudine**—avoid concomitant use

Azathioprine: ribavirin possibly enhances myelosuppressive effects of ●**azathioprine**

**Rifabutin** *see* Rifamycins

**Rifampicin** *see* Rifamycins

**Rifamycins**

**Note** Interactions do not apply to rifaximin

ACE Inhibitors: rifampicin reduces plasma concentration of active metabolite of ●**imidapril** (reduced antihypertensive effect)

Aliskiren: rifampicin reduces plasma concentration of ●**aliskiren**

Ambrisentan: rifampicin possibly increases plasma concentration of ●**ambrisentan**

Analgesics: rifampicin reduces plasma concentration of ●**celecoxib**, ●**diclofenac** and ●**etoricoxib**; rifampicin accelerates metabolism of ●**alfentanil**, ●**codeine**, ●**fentanyl**, ●**methadone** and ●**morphine** (reduced effect); rifampicin possibly accelerates metabolism of ●**oxycodone**

Angiotensin-II Receptor Antagonists: rifampicin reduces plasma concentration of ●**losartan** and its active metabolite

Antacids: absorption of rifampicin reduced by ●**antacids**

- Anti-arrhythmics: rifamycins accelerate metabolism of ●**disopyramide** (reduced plasma concentration); rifampicin reduces plasma concentration of ●**dronedarone**—avoid concomitant use; rifampicin accelerates metabolism of ●**propafenone** (reduced effect)
- Antibacterials: increased risk of side-effects including neutropenia when rifabutin given with ●**azithromycin**; rifamycins reduce plasma concentration of ●**clarithromycin** and ●**dapsone**; plasma concentration of rifabutin increased by ●**clarithromycin** (increased risk of toxicity—reduce rifabutin dose); plasma concentration of rifabutin possibly increased by ●**erythromycin** (increased risk of toxicity—reduce

## Rifamycins

- **Antibacterials** (*continued*)
  - rifabutin dose); rifampicin possibly reduces plasma concentration of **tinidazole** and **trimethoprim**; rifampicin reduces plasma concentration of **doxycycline**—consider increasing dose of doxycycline; rifampicin accelerates metabolism of **chloramphenicol** (reduced plasma concentration); increased risk of hepatotoxicity when rifampicin given with **isoniazid**; rifampicin reduces plasma concentration of **linezolid** (possible therapeutic failure of linezolid); rifampicin reduces plasma concentration of **tellithromycin** (avoid during and for 2 weeks after rifampicin)
- **Anticoagulants**: rifampicin reduces plasma concentration of **apixaban**; rifamycins accelerate metabolism of **coumarins** (reduced anticoagulant effect); rifampicin reduces plasma concentration of **dabigatran**—manufacturer of dabigatran advises avoid concomitant use; rifampicin reduces plasma concentration of **rivaroxaban**—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- **Antidiabetics**: rifamycins accelerate metabolism of **tolbutamide** (reduced effect); rifampicin reduces plasma concentration of **canagliflozin** and **nateglinide**; rifampicin possibly reduces effects of **linagliptin**; rifampicin possibly antagonises hypoglycaemic effect of **repaglinide**; rifamycins possibly accelerate metabolism of **sulfonylureas** (reduced effect)
- **Antiepileptics**: rifabutin reduces plasma concentration of **carbamazepine**; rifampicin reduces plasma concentration of **lamotrigine**; plasma concentration of rifampicin possibly reduced by **phenobarbital**; rifamycins accelerate metabolism of **phenytoin** (reduced plasma concentration)
- **Antifungals**: plasma concentration of rifabutin increased by **fluconazole** (increased risk of uveitis—reduce rifabutin dose); rifampicin accelerates metabolism of **fluconazole** (reduced plasma concentration); rifabutin and rifampicin reduce plasma concentration of **itraconazole**—manufacturer of itraconazole advises avoid concomitant use; plasma concentration of rifabutin increased by **posaconazole** (also plasma concentration of posaconazole reduced); rifampicin reduces plasma concentration of **posaconazole** and **terbinafine**; plasma concentration of rifabutin increased by **voriconazole**, also rifabutin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for rifabutin toxicity); rifampicin reduces plasma concentration of **voriconazole**—avoid concomitant use; rifampicin initially increases and then reduces plasma concentration of **caspofungin** (consider increasing dose of caspofungin); plasma concentration of rifabutin possibly increased by **triazoles** (increased risk of uveitis—reduce rifabutin dose)
- **Antihistamines**: rifampicin possibly reduces effects of **fenofenadine**
- **Antimalarials**: avoidance of rifampicin advised by manufacturer of **piperazine with arteminol**; rifampicin reduces plasma concentration of **mefloquine**—avoid concomitant use; rifampicin reduces plasma concentration of **quinine**
- **Antimuscarinics**: rifampicin reduces plasma concentration of active metabolite of **fesoterodine**
- **Antipsychotics**: rifampicin accelerates metabolism of **haloperidol** (reduced plasma concentration); rifabutin and rifampicin possibly reduce plasma concentration of **aripiprazole** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); rifampicin possibly reduces plasma concentration of **clozapine**
- **Antivirals**: rifampicin possibly reduces plasma concentration of **abacavir**; plasma concentration of rifabutin increased by **atazanavir**, **darunavir**, **fosamprenavir** and **tipranavir** (reduce dose of rifabutin);

## Rifamycins

- **Antivirals** (*continued*)
  - rifampicin reduces plasma concentration of **atazanavir**, **lopinavir**, **nevirapine** and **rilpivirine**—avoid concomitant use; avoidance of rifampicin advised by manufacturer of **boceprevir** (plasma concentration of boceprevir possibly reduced); rifampicin significantly reduces plasma concentration of **darunavir**, **fosamprenavir** and **telaprevir**—avoid concomitant use; rifampicin reduces the plasma concentration of **dolutegravir** (see Dose under Dolutegravir, p. 421); plasma concentration of rifabutin reduced by **efavirenz**—increase dose of rifabutin; rifampicin reduces plasma concentration of **efavirenz**—increase dose of efavirenz; rifabutin reduces plasma concentration of **elvitegravir** also plasma concentration of active metabolite of rifabutin increased—reduce dose of rifabutin; avoidance of rifampicin advised by manufacturer of **elvitegravir**, **etravirine**, **sofosbuvir** and **zidovudine**; plasma concentration of both drugs reduced when rifabutin given with **etravirine**; rifampicin accelerates metabolism of **indinavir** (reduced plasma concentration—avoid concomitant use); plasma concentration of rifabutin increased by **indinavir** and **saquinavir** (also plasma concentration of indinavir and saquinavir reduced)—reduce rifabutin dose; rifampicin reduces plasma concentration of **maraviroc** and **raltegravir**—consider increasing dose of maraviroc and raltegravir; plasma concentration of rifabutin possibly increased by **nevirapine**; rifabutin decreases plasma concentration of **rilpivirine** (increase dose of rilpivirine—consult rilpivirine product literature); rifampicin reduces plasma concentration of **ritonavir**; plasma concentration of rifabutin increased by **ritonavir** (increased risk of toxicity—reduce rifabutin dose); rifampicin significantly reduces plasma concentration of **saquinavir**, also risk of hepatotoxicity—avoid concomitant use; avoidance of rifabutin advised by manufacturer of **sofosbuvir** and **telaprevir**; rifampicin possibly reduces plasma concentration of **tipranavir**—avoid concomitant use
- **Anxiolytics and Hypnotics**: rifampicin accelerates metabolism of **diazepam** and **zaleplon** (reduced plasma concentration); rifampicin possibly accelerates metabolism of **benzodiazepines** (reduced plasma concentration); rifampicin possibly accelerates metabolism of **buprion**; rifampicin accelerates metabolism of **zolpidem** (reduced plasma concentration and reduced effect); rifampicin significantly reduces plasma concentration of **zopiclone**
- **Appetitant**: rifampicin reduces plasma concentration of **aprepitant**
- **Atovaquone**: avoidance of concomitant rifabutin advised by manufacturer of **atovaquone** (plasma concentration of both drugs reduced); rifampicin reduces plasma concentration of **atovaquone** (and concentration of rifampicin increased)—avoid concomitant use
- **Avanafil**: rifampicin possibly reduces plasma concentration of **avanafil**—manufacturer of avanafil advises avoid concomitant use
- **Beta-blockers**: rifampicin accelerates metabolism of **bisoprolol** and **propranolol** (plasma concentration significantly reduced); rifampicin reduces plasma concentration of **carvedilol**, **celiprolol** and **metoprolol**
- **Bosentan**: rifampicin reduces plasma concentration of **bosentan**—avoid concomitant use
- **Calcium-channel Blockers**: rifampicin possibly reduces plasma concentration of **felodipine**; rifampicin possibly accelerates metabolism of **nicardipine** (possibly significantly reduced plasma concentration); rifampicin accelerates metabolism of **diltiazem**,

**Rifamycins**

- Calcium-channel Blockers (*continued*)
  - **nifedipine**, ● **nimodipine** and ● **verapamil** (plasma concentration significantly reduced)
- Cardiac Glycosides: rifampicin possibly reduces plasma concentration of **digoxin**
- Cyclosporin: rifampicin accelerates metabolism of ● **cyclosporin** (reduced plasma concentration)
- Cobistat: rifabutin reduces plasma concentration of ● **cobicistat** (adjust dose—consult product literature); rifampicin possibly reduces plasma concentration of ● **cobicistat**—manufacturer of cobicistat advises avoid concomitant use
- Corticosteroids: rifamycins accelerate metabolism of ● **corticosteroids** (reduced effect)
- Cytotoxics: rifampicin reduces plasma concentration of ● **afatinib**, ● **ruxolitinib** and ● **sorafenib**; rifabutin possibly decreases plasma concentration of ● **axitinib** (increase dose of axitinib—consult axitinib product literature); rifampicin decreases plasma concentration of ● **axitinib** (increase dose of axitinib—consult axitinib product literature); rifabutin possibly reduces plasma concentration of ● **bosutinib** and ● **crizotinib**—manufacturer of bosutinib and crizotinib advises avoid concomitant use; rifampicin reduces plasma concentration of ● **bosutinib**, ● **cabazitaxel**, ● **crizotinib**, ● **regorafenib** and ● **vandetanib**—manufacturer of bosutinib, cabazitaxel, crizotinib, regorafenib and vandetanib advises avoid concomitant use; avoidance of rifampicin advised by manufacturer of ● **dabrafenib**, ● **lapatinib** and ● **vemurafenib**; rifampicin accelerates metabolism of ● **dasatinib** (reduced plasma concentration—avoid concomitant use); rifampicin accelerates metabolism of ● **erlotinib** and ● **sunitinib** (reduced plasma concentration); rifampicin reduces plasma concentration of ● **everolimus** (avoid concomitant use or consider increasing the dose of everolimus—consult everolimus product literature); rifampicin reduces plasma concentration of ● **gefitinib**, ● **imatinib** and ● **nilotinib**—avoid concomitant use; avoidance of rifabutin advised by manufacturer of ● **cabazitaxel**, ● **lapatinib** and ● **vemurafenib**; rifampicin possibly reduces plasma concentration of ● **erbulin** and ● **pazopanib**; rifampicin reduces plasma concentration of active metabolite of ● **temsirolimus**—avoid concomitant use; rifampicin possibly reduces effects of ● **brentuximab vedotin**; rifampicin possibly reduces plasma concentration of ● **vinflunine**—manufacturer of vinflunine advises avoid concomitant use; avoidance of rifampicin advised by manufacturer of ● **vismodegib** (plasma concentration of vismodegib possibly reduced)
- Deferasirox: rifampicin reduces plasma concentration of ● **deferasirox**
- Diuretics: rifampicin reduces plasma concentration of ● **eplerenone**—avoid concomitant use
- Hormone Antagonists: rifampicin reduces plasma concentration of ● **abiraterone**—manufacturer of abiraterone advises avoid concomitant use; rifabutin possibly reduces plasma concentration of ● **abiraterone**—manufacturer of abiraterone advises avoid concomitant use; avoidance of rifampicin advised by manufacturer of ● **enzalutamide**; rifampicin possibly reduces plasma concentration of ● **exemestane**; rifampicin accelerates metabolism of ● **tamoxifen** (reduced plasma concentration)
- 5HT<sub>3</sub>-receptor Antagonists: rifampicin accelerates metabolism of ● **ondansetron** (reduced effect)
- Ivacaftor: rifabutin possibly reduces plasma concentration of ● **ivacaftor**—manufacturer of ivacaftor advises avoid concomitant use; rifampicin reduces plasma concentration of ● **ivacaftor**—manufacturer of ivacaftor advises avoid concomitant use
- Leflunomide: rifampicin possibly increases plasma concentration of active metabolite of ● **leflunomide**

**Rifamycins (continued)**

- Lipid-regulating Drugs: rifampicin possibly reduces plasma concentration of ● **atorvastatin** and ● **simvastatin**; rifampicin accelerates metabolism of ● **fluvastatin** (reduced effect)
- Macitentan: rifampicin reduces plasma concentration of ● **macitentan**—avoid concomitant use
  - Muscle Relaxants: rifampicin possibly reduces plasma concentration of ● **tizanidine**
  - Mycophenolate: rifampicin reduces plasma concentration of active metabolite of ● **mycophenolate**
  - Oestrogens: rifamycins accelerate metabolism of ● **oestrogens** (reduced contraceptive effect—see p. 536)
  - Progestogens: rifamycins accelerate metabolism of ● **progestogens** (reduced contraceptive effect—see p. 536)
  - Ranolazine: rifampicin reduces plasma concentration of ● **ranolazine**—manufacturer of ranolazine advises avoid concomitant use
  - Roflumilast: rifampicin inhibits effects of ● **roflumilast** (manufacturer of roflumilast advises avoid concomitant use)
  - Sirolimus: rifabutin and rifampicin reduce plasma concentration of ● **sirolimus**—avoid concomitant use
  - Tacrolimus: rifabutin possibly reduces plasma concentration of ● **tacrolimus**; rifampicin reduces plasma concentration of ● **tacrolimus**
  - Tadalafil: rifampicin reduces plasma concentration of ● **tadalafil**—manufacturer of tadalafil advises avoid concomitant use
  - Teriflunomide: rifampicin reduces plasma concentration of ● **teriflunomide**
  - Theophylline: rifampicin accelerates metabolism of ● **theophylline** (reduced plasma concentration)
  - Thyroid Hormones: rifampicin accelerates metabolism of ● **levothyroxine** (may increase requirements for levothyroxine in hypothyroidism)
  - Tibolone: rifampicin accelerates metabolism of ● **tibolone** (reduced plasma concentration)
  - Ticagrelor: rifampicin reduces plasma concentration of ● **ticagrelor**
  - Tolvaptan: rifampicin reduces plasma concentration of ● **tolvaptan**
  - Ulcer-healing Drugs: rifampicin accelerates metabolism of ● **cimetidine** (reduced plasma concentration)
  - Ulipristal: avoidance of rifampicin advised by manufacturer of ● **ulipristal** (contraceptive effect of ulipristal possibly reduced)
  - Vaccines: antibacterials inactivate ● **oral typhoid vaccine**—see p. 850
- Rilpivirine**
- Analgesics: rilpivirine possibly reduces plasma concentration of ● **methadone**
  - Antacids: manufacturer of rilpivirine advises give ● **antacids** 2 hours before or 4 hours after rilpivirine
  - Antibacterials: manufacturer of rilpivirine advises avoid concomitant use with ● **clarithromycin** and ● **erythromycin** (plasma concentration of rilpivirine possibly increased); plasma concentration of rilpivirine decreased by ● **rifabutin** (increase dose of rilpivirine—consult rilpivirine product literature); plasma concentration of rilpivirine reduced by ● **rifampicin**—avoid concomitant use
  - Anticoagulants: rilpivirine possibly increases plasma concentration of ● **dabigatran**
  - Antidepressants: manufacturer of rilpivirine advises avoid concomitant use with ● **St John's wort** (plasma concentration of rilpivirine possibly reduced)
  - Antiepileptics: manufacturer of rilpivirine advises avoid concomitant use with ● **carbamazepine**, ● **oxcarbazepine**, ● **phenobarbital** and ● **phenytoin** (plasma concentration of rilpivirine possibly reduced)

**Rilpivirine** (*continued*)

Antivirals: manufacturer of rilpivirine advises give **didanosine** 2 hours before or 4 hours after rilpivirine; avoidance of rilpivirine advised by manufacturer of **nevirapine**

Calcium Salts: manufacturer of rilpivirine gives **calcium salts** 2 hours before or 4 hours after rilpivirine

- Corticosteroids: manufacturer of rilpivirine advises avoid concomitant use with **dexamethasone** (except when given as a single dose)
- Orlistat: absorption of rilpivirine possibly reduced by **orlistat**
- Ulcer-healing Drugs: manufacturer of rilpivirine advises avoid concomitant use with **esomeprazole**, **lansoprazole**, **pantoprazole** and **rabeprazole** (plasma concentration of rilpivirine possibly reduced); plasma concentration of rilpivirine reduced by **omeprazole**—avoid concomitant use; manufacturer of rilpivirine advises avoid **histamine H<sub>2</sub>-antagonists** for 12 hours before or 4 hours after rilpivirine—consult product literature

**Riociguat**

Antacids: absorption of riociguat reduced by **antacids** (give at least 2 hours before or 1 hour after riociguat)

Antifungals: manufacturer of riociguat advises avoid concomitant use with **itraconazole** and **voriconazole**

Antivirals: manufacturer of riociguat advises avoid concomitant use with **ritonavir**

- Avanafl: possible enhanced hypotensive effect when riociguat given with **avanafl**—avoid concomitant use
- Bosentan: plasma concentration of riociguat reduced by **bosentan**
- Nitrates: possible enhanced hypotensive effect when riociguat given with **nitrates**—avoid concomitant use
- Sildenafil: enhanced hypotensive effect when riociguat given with **sildenafil**—avoid concomitant use
- Tadalafil: possible enhanced hypotensive effect when riociguat given with **tadalafil**—avoid concomitant use
- Vardenafil: possible enhanced hypotensive effect when riociguat given with **vardenafil**—avoid concomitant use

**Risedronate Sodium** *see* Bisphosphonates

**Risperidone** *see* Antipsychotics

**Ritonavir**

- Alpha-blockers: ritonavir possibly increases plasma concentration of **alfuzosin**—avoid concomitant use
- Analgesics: ritonavir possibly increases plasma concentration of **NSAIDs** and **buprenorphine**; ritonavir increases plasma concentration of **dextropropoxyphene** and **piroxicam** (risk of toxicity)—avoid concomitant use; ritonavir increases plasma concentration of **alfentanil** and **fentanyl**; ritonavir reduces plasma concentration of **methadone**; ritonavir possibly reduces plasma concentration of **morphine**; ritonavir reduces plasma concentration of **pethidine**, but increases plasma concentration of toxic metabolite of pethidine (avoid concomitant use)
- Anti-arrhythmics: ritonavir increases plasma concentration of **amiodarone** and **propafenone** (increased risk of ventricular arrhythmias—avoid concomitant use); ritonavir possibly increases plasma concentration of **disopyramide** (increased risk of toxicity); avoidance of ritonavir advised by manufacturer of **dronedrone**; ritonavir possibly increases plasma concentration of **flecainide** (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antibacterials: ritonavir possibly increases plasma concentration of **azithromycin** and **erythromycin**; ritonavir increases plasma concentration of **clarithromycin** (reduce dose of clarithromycin in

**Ritonavir**• Antibacterials (*continued*)

renal impairment); ritonavir increases plasma concentration of **rifabutin** (increased risk of toxicity—reduce rifabutin dose); plasma concentration of ritonavir reduced by **rifampicin**; plasma concentration of both drugs increased when ritonavir given with **fusidic acid**—avoid concomitant use; avoidance of concomitant ritonavir in severe renal and hepatic impairment advised by manufacturer of **telithromycin**

• Anticoagulants: ritonavir may enhance or reduce anticoagulant effect of **warfarin**; avoidance of ritonavir advised by manufacturer of **apixaban**; ritonavir possibly enhances anticoagulant effect of **coumarins** and **phenindione**; ritonavir increases plasma concentration of **rivaroxaban**—avoid concomitant use

• Antidepressants: ritonavir possibly reduces plasma concentration of **paroxetine**; ritonavir increases plasma concentration of **trazodone** (increased risk of toxicity); ritonavir possibly increases plasma concentration of **SSRIs** and **tricyclics**; plasma concentration of ritonavir reduced by **St John's wort**—avoid concomitant use

Antidiabetics: ritonavir possibly increases plasma concentration of **tolbutamide**

• Antiepileptics: ritonavir possibly increases plasma concentration of **carbamazepine**; ritonavir possibly reduces plasma concentration of **lamotrigine** and **valproate**; plasma concentration of ritonavir possibly reduced by **phenytoin**, also plasma concentration of phenytoin possibly affected

• Antifungals: plasma concentration of ritonavir increased by **fluconazole**; combination of ritonavir with **itraconazole** may increase plasma concentration of either drug (or both); ritonavir reduces plasma concentration of **voriconazole**—avoid concomitant use

Antihistamines: ritonavir possibly increases plasma concentration of **non-sedating antihistamines**

• Antimalarials: caution with ritonavir advised by manufacturer of **artemether with lumefantrine**; plasma concentration of ritonavir possibly reduced by **mefloquine**; ritonavir increases plasma concentration of **quinine** (increased risk of toxicity)

• Antimuscarinics: avoidance of ritonavir advised by manufacturer of **darifenacin** and **tolterodine**; manufacturer of fesoterodine advises dose reduction when ritonavir given with **fesoterodine**—consult fesoterodine product literature; ritonavir possibly increases plasma concentration of **solifenacin**—see Dose under Solifenacin, p. 553

• Antipsychotics: ritonavir possibly increases plasma concentration of **antipsychotics**; ritonavir possibly increases plasma concentration of **aripiprazole** (reduce dose of aripiprazole—consult aripiprazole product literature); manufacturer of ritonavir advises avoid concomitant use with **clozapine** (increased risk of toxicity); ritonavir reduces plasma concentration of **olanzapine**—consider increasing dose of olanzapine; ritonavir increases plasma concentration of **pimozide** (increased risk of ventricular arrhythmias—avoid concomitant use); ritonavir possibly increases plasma concentration of **quetiapine**—manufacturer of quetiapine advises avoid concomitant use

• Antivirals: plasma concentration of both drugs reduced when ritonavir given with **boceprevir**; manufacturer of ritonavir advises ritonavir and **didanosine** should be taken 2.5 hours apart; ritonavir increases the toxicity of **efavirenz**, monitor liver function tests —manufacturer of **Atripla**<sup>®</sup> advises avoid concomitant use with **high-dose** ritonavir; ritonavir increases plasma concentration of **indinavir**, **maraviroc** and **sاقuinar**; ritonavir possibly reduces plasma concentration of **telaprevir**

**Ritonavir** (*continued*)

- Anxiolytics and Hypnotics: ritonavir possibly increases plasma concentration of **anxiolytics and hypnotics**; ritonavir possibly increases plasma concentration of **alprazolam**, **diazepam**, **flurazepam** and **zolpidem** (risk of extreme sedation and respiratory depression—avoid concomitant use); ritonavir possibly increases plasma concentration of **midazolam** (risk of prolonged sedation—avoid concomitant use of oral midazolam); ritonavir increases plasma concentration of **buprion** (increased risk of toxicity)
- Aprepitant: ritonavir possibly increases plasma concentration of **aprepitant**
- Atovaquone: ritonavir possibly reduces plasma concentration of **atovaquone**—manufacturer of atovaquone advises avoid concomitant use
- Avanafl: ritonavir significantly increases plasma concentration of **avanafl**—avoid concomitant use
- Bosentan: ritonavir increases plasma concentration of **bosentan** (consider reducing dose of bosentan)
- Bupropion: ritonavir reduces plasma concentration of **bupropion**
- Calcium-channel Blockers: ritonavir possibly increases plasma concentration of **calcium-channel blockers**; avoidance of ritonavir advised by manufacturer of **lercanidipine**
- Cardiac Glycosides: ritonavir possibly increases plasma concentration of **digoxin**
- Cyclosporin: ritonavir possibly increases plasma concentration of **cyclosporin**
- Cilostazol: ritonavir possibly increases plasma concentration of **cilostazol** (see Dose under Cilostazol, p. 140)
- Colchicine: ritonavir possibly increases risk of **colchicine** toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids: ritonavir possibly increases plasma concentration of **corticosteroids**—increased risk of adrenal suppression; ritonavir possibly increases plasma concentration of **budesonide** (including *inhaled*, *intranasal*, and *rectal* budesonide)—increased risk of adrenal suppression; ritonavir increases plasma concentration of *inhaled* and *intranasal* **fluticasone**—increased risk of adrenal suppression
- Cytotoxics: ritonavir increases the plasma concentration of **afatinib**—manufacturer of afatinib advises separating administration of ritonavir by 6 to 12 hours; ritonavir possibly increases plasma concentration of **axitinib** (reduce dose of axitinib—consult axitinib product literature); ritonavir possibly increases the plasma concentration of **bosutinib** and **cabazitaxel**—manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; ritonavir possibly increases plasma concentration of **crizotinib**, **everolimus**, **nilotinib** and **vinflunine**—manufacturer of crizotinib, everolimus, nilotinib and vinflunine advises avoid concomitant use; avoidance of ritonavir advised by manufacturer of **lapatinib**; ritonavir possibly increases plasma concentration of **pazopanib** (reduce dose of pazopanib); manufacturer of ruxolitinib advises dose reduction when ritonavir given with **ruxolitinib**—consult ruxolitinib product literature; ritonavir possibly increases plasma concentration of **docetaxel** (increased risk of toxicity); ritonavir increases plasma concentration of **paclitaxel**; ritonavir possibly increases plasma concentration of **vinblastine**
- Dapoxetine: avoidance of ritonavir advised by manufacturer of **dapoxetine** (increased risk of toxicity)
- Diuretics: ritonavir increases plasma concentration of **eplerenone**—avoid concomitant use

**Ritonavir** (*continued*)

- Domperidone: possible increased risk of ventricular arrhythmias when ritonavir given with **domperidone**—avoid concomitant use
  - Ergot Alkaloids: increased risk of ergotism when ritonavir given with **ergotamine**—avoid concomitant use
  - 5HT<sub>2</sub>-receptor Agonists: ritonavir increases plasma concentration of **eletriptan** (risk of toxicity)—avoid concomitant use
  - Ivabradine: ritonavir possibly increases plasma concentration of **ivabradine**—avoid concomitant use
  - Lipid-regulating Drugs: possible increased risk of myopathy when ritonavir given with **atorvastatin**; possible increased risk of myopathy when ritonavir given with **rosuvastatin**—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when ritonavir given with **simvastatin** (avoid concomitant use); avoidance of ritonavir advised by manufacturer of **lomitapide** (plasma concentration of lomitapide possibly increased)
  - Mirabegron: when given with ritonavir avoid or reduce dose of **mirabegron** in hepatic or renal impairment—see Mirabegron, p. 552
  - Oestrogens: ritonavir accelerates metabolism of **oestrogens** (reduced contraceptive effect—see p. 536)
  - Orlistat: absorption of ritonavir possibly reduced by **orlistat**
  - Ranolazine: ritonavir possibly increases plasma concentration of **ranolazine**—manufacturer of ranolazine advises avoid concomitant use
  - Riociguat: avoidance of ritonavir advised by manufacturer of **riociguat**
  - Sildenafil: ritonavir significantly increases plasma concentration of **sildenafil**—avoid concomitant use
  - Sympathomimetics: ritonavir possibly increases plasma concentration of **dexamfetamine**
  - Sympathomimetics, Beta<sub>2</sub>: manufacturer of ritonavir advises avoid concomitant use with **salmeterol**
  - Tacrolimus: ritonavir possibly increases plasma concentration of **tacrolimus**
  - Tadalafil: ritonavir increases plasma concentration of **tadalafil**—manufacturer of tadalafil advises avoid concomitant use
  - Theophylline: ritonavir accelerates metabolism of **theophylline** (reduced plasma concentration)
  - Ticagrelor: ritonavir possibly increases plasma concentration of **ticagrelor**—manufacturer of ticagrelor advises avoid concomitant use
  - Ulipristal: avoidance of ritonavir advised by manufacturer of **ulipristal** (contraceptive effect of ulipristal possibly reduced)
  - Vardenafil: ritonavir increases plasma concentration of **vardenafil**—avoid concomitant use
- Rivaroxaban**
- Analgesics: increased risk of haemorrhage when anticoagulants given with *intravenous* **diclofenac** (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with **ketorolac** (avoid concomitant use, including low-dose heparins)
  - Anti-arrhythmics: manufacturer of rivaroxaban advises avoid concomitant use with **dronedaron**
  - Antibacterials: plasma concentration of rivaroxaban reduced by **rifampicin**—manufacturer of rivaroxaban advises monitor for signs of thrombosis
  - Anticoagulants: increased risk of haemorrhage when rivaroxaban given with other **anticoagulants** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency); increased risk of haemorrhage when other anticoagulants given with **apixaban** and **dabigatran** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)

**Rivaroxaban** (*continued*)

- Antidepressants: plasma concentration of rivaroxaban possibly reduced by ●**St John's wort**—manufacturer of rivaroxaban advises monitor for signs of thrombosis

- Antiepileptics: plasma concentration of rivaroxaban possibly reduced by ●**carbamazepine**, ●**phenobarbital** and ●**phenytoin**—manufacturer of rivaroxaban advises monitor for signs of thrombosis

Antifungals: manufacturer of rivaroxaban advises avoid concomitant use with **itraconazole**, **posaconazole** and **voriconazole**

- Antivirals: manufacturer of rivaroxaban advises avoid concomitant use with **atazanavir**, **darunavir**, **fosamprenavir**, **indinavir**, **saquinavir** and **tipranavir**; manufacturers advise avoid concomitant use of rivaroxaban with **lopinavir**; plasma concentration of rivaroxaban increased by ●**ritonavir**—avoid concomitant use

- Cobicistat: anticoagulant effect of rivaroxaban possibly enhanced by ●**cobicistat**—avoid concomitant use

**Rivastigmine** *see* Parasympathomimetics

**Rizatriptan** *see* 5HT<sub>1</sub>-receptor Agonists (under HT)

**Rocuronium** *see* Muscle Relaxants

**Roflumilast**

- Antibacterials: effects of roflumilast inhibited by ●**rifampicin** (manufacturer of roflumilast advises avoid concomitant use)

Antidepressants: metabolism of roflumilast inhibited by **fluvoxamine**

Antiepileptics: effects of roflumilast possibly inhibited by **carbamazepine**, **phenobarbital** and **phenytoin** (manufacturer of roflumilast advises avoid concomitant use)

Theophylline: manufacturer of roflumilast advises avoid concomitant use with **theophylline**

Ulcer-healing Drugs: metabolism of roflumilast inhibited by **cimetidine**

**Ropinirole**

Antibacterials: metabolism of ropinirole inhibited by **ciprofloxacin** (increased plasma concentration)

Antipsychotics: manufacturer of ropinirole advises avoid concomitant use of **antipsychotics** (antagonism of effect)

Memantine: effects of dopaminergics possibly enhanced by **memantine**

Methyldopa: antiparkinsonian effect of dopaminergics antagonised by **methyldopa**

Metoclopramide: manufacturer of ropinirole advises avoid concomitant use of **metoclopramide** (antagonism of effect)

Oestrogens: plasma concentration of ropinirole increased by **oestrogens**

**Ropivacaine**

Anti-arrhythmics: increased myocardial depression when ropivacaine given with **anti-arrhythmics**

Antidepressants: metabolism of ropivacaine inhibited by **fluvoxamine**—avoid prolonged administration of ropivacaine

**Rosuvastatin** *see* Statins

**Rotigotine**

Antipsychotics: manufacturer of rotigotine advises avoid concomitant use of **antipsychotics** (antagonism of effect)

Memantine: effects of dopaminergics possibly enhanced by **memantine**

Methyldopa: antiparkinsonian effect of dopaminergics antagonised by **methyldopa**

Metoclopramide: manufacturer of rotigotine advises avoid concomitant use of **metoclopramide** (antagonism of effect)

**Rufinamide**

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and ●**tricyclic-**

**Rufinamide**

- Antidepressants (*continued*)

**related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●**SSRIs** and ●**tricyclics** (convulsive threshold lowered)

Antiepileptics: plasma concentration of both drugs possibly reduced when rufinamide given with **carbamazepine**; plasma concentration of rufinamide possibly reduced by **phenobarbital**; plasma concentration of rufinamide possibly reduced by **phenytoin**, also plasma concentration of phenytoin possibly increased; plasma concentration of rufinamide possibly increased by **valproate** (reduce dose of rufinamide)

- Antimalarials: anticonvulsant effect of antiepileptics antagonised by ●**mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ●**antipsychotics** (convulsive threshold lowered)
- Oestrogens: rufinamide accelerates metabolism of ●**oestrogens** (reduced contraceptive effect—see p. 536)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ●**orlistat**
- Progestogens: rufinamide accelerates metabolism of ●**progestogens** (reduced contraceptive effect—see p. 536)

**Rupatadine** *see* Antihistamines

**Ruxolitinib**

- Antibacterials: manufacturer of ruxolitinib advises dose reduction when ruxolitinib given with ●**clarithromycin** and ●**telithromycin**—consult ruxolitinib product literature; plasma concentration of ruxolitinib reduced by **rifampicin**
- Antifungals: manufacturer of ruxolitinib advises dose reduction when ruxolitinib given with ●**fluconazole**, ●**itraconazole**, ●**posaconazole** and ●**voriconazole**—consult ruxolitinib product literature
- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Antivirals: manufacturer of ruxolitinib advises dose reduction when ruxolitinib given with ●**boceprevir**, ●**indinavir**, ●**lopinavir**, ●**ritonavir**, ●**saquinavir** and ●**telaprevir**—consult ruxolitinib product literature

**St John's Wort**

Analgesics: St John's wort possibly reduces plasma concentration of **methadone**

- Anti-arrhythmics: St John's wort possibly reduces plasma concentration of ●**dronedarone**—avoid concomitant use
- Antibacterials: St John's wort reduces plasma concentration of ●**telithromycin** (avoid during and for 2 weeks after St John's wort)
- Anticoagulants: St John's wort possibly reduces plasma concentration of ●**apixaban**; St John's wort reduces anticoagulant effect of ●**coumarins** (avoid concomitant use); St John's wort possibly reduces plasma concentration of **dabigatran**—manufacturer of dabigatran advises avoid concomitant use; St John's wort possibly reduces plasma concentration of ●**rivaroxaban**—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Antidepressants: possible increased serotonergic effects when St John's wort given with **duloxetine** or **venlafaxine**; St John's wort reduces plasma concentration of **amitriptyline**; increased serotonergic effects when St John's wort given with ●**SSRIs**—avoid concomitant use
- Antiepileptics: St John's wort possibly reduces plasma concentration of **carbamazepine**; St John's wort possibly reduces plasma concentration of ●**phenobarbital** and ●**phenytoin**—avoid concomitant use
- Antifungals: St John's wort reduces plasma concentration of ●**voriconazole**—avoid concomitant use

**St John's Wort** (continued)

- Antimalarials: avoidance of antidepressants advised by manufacturer of **artemether with lumefantrine** and **piperazine with arteminol**
- Antipsychotics: St John's wort possibly reduces plasma concentration of **aripiprazole** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature)
- Antivirals: St John's wort reduces plasma concentration of **atazanavir**, **darunavir**, **efavirenz**, **fosamprenavir**, **indinavir**, **lopinavir**, **nevirapine**, **ritonavir** and **saquinavir**—avoid concomitant use; avoidance of St John's wort advised by manufacturer of **dolutegravir**, **elvitegravir**, **etravirine**, **sofosbuvir** and **telaprevir**; St John's wort possibly reduces plasma concentration of **maraviroc** and **tipranavir**—avoid concomitant use; avoidance of St John's wort advised by manufacturer of **rilpivirine** (plasma concentration of rilpivirine possibly reduced)
- Anxiolytics and Hypnotics: St John's wort possibly reduces plasma concentration of **oral midazolam**
- Aprepitant: avoidance of St John's wort advised by manufacturer of **aprepitant**
- Atomoxetine: possible increased risk of convulsions when antidepressants given with **atomoxetine**
- Calcium-channel Blockers: St John's wort possibly reduces plasma concentration of **amlodipine** and **felodipine**; St John's wort reduces plasma concentration of **nifedipine**; St John's wort significantly reduces plasma concentration of **verapamil**
- Cardiac Glycosides: St John's wort reduces plasma concentration of **digoxin**—avoid concomitant use
- Ciclosporin: St John's wort reduces plasma concentration of **ciclosporin**—avoid concomitant use
- Cobicistat: St John's wort possibly reduces plasma concentration of **cobicistat**—manufacturer of cobicistat advises avoid concomitant use
- Cytotoxics: St John's wort possibly reduces plasma concentration of **axitinib**—consider increasing dose of axitinib; St John's wort possibly reduces plasma concentration of **bosutinib**, **crizotinib**, **everolimus** and **vinflunine**—manufacturer of bosutinib, crizotinib, everolimus and vinflunine advises avoid concomitant use; avoidance of St John's wort advised by manufacturer of **cabazitaxel**, **dabrafenib**, **gefitinib**, **lapatinib** and **vemurafenib**; St John's wort reduces plasma concentration of **imatinib**—avoid concomitant use; avoidance of St John's wort advised by manufacturer of **vandetanib** and **vismodegib** (plasma concentration of vandetanib and vismodegib possibly reduced); St John's wort possibly reduces plasma concentration of **eribulin**; St John's wort accelerates metabolism of **irinotecan** (reduced plasma concentration—avoid concomitant use)
- Dapoxetine: possible increased risk of serotonergic effects when St John's wort given with **dapoxetine** (manufacturer of dapoxetine advises St John's wort should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping St John's wort)
- Diuretics: St John's wort reduces plasma concentration of **eplerenone**—avoid concomitant use
- Fingolimod: St John's wort possibly reduces plasma concentration of **fingolimod**—manufacturer of fingolimod advises avoid concomitant use
- Hormone Antagonists: St John's wort possibly reduces plasma concentration of **abiraterone**—manufacturer of abiraterone advises avoid concomitant use
- 5HT<sub>1</sub>-receptor Agonists: increased serotonergic effects when St John's wort given with **5HT<sub>1</sub> agonists**—avoid concomitant use
- Ivabradine: St John's wort reduces plasma concentration of **ivabradine**—avoid concomitant use

**St John's Wort** (continued)

- Ivacaftor: St John's wort possibly reduces plasma concentration of **ivacaftor**—manufacturer of ivacaftor advises avoid concomitant use
  - Lipid-regulating Drugs: St John's wort reduces plasma concentration of **simvastatin**
  - Macitentan: avoidance of St John's wort advised by manufacturer of **macitentan**
  - Oestrogens: St John's wort reduces contraceptive effect of **oestrogens** (avoid concomitant use)
  - Progestogens: St John's wort reduces contraceptive effect of **progestogens** (avoid concomitant use)
  - Tacrolimus: St John's wort reduces plasma concentration of **tacrolimus**—avoid concomitant use
  - Theophylline: St John's wort possibly reduces plasma concentration of **theophylline**
  - Ulcer-healing Drugs: St John's wort possibly reduces plasma concentration of **omeprazole**
  - Ulipristal: avoidance of St John's wort advised by manufacturer of **ulipristal** (contraceptive effect of ulipristal possibly reduced)
- Salbutamol** see Sympathomimetics, Beta<sub>2</sub>
- Salmeterol** see Sympathomimetics, Beta<sub>2</sub>
- Saquinavir**
- Analgesics: increased risk of ventricular arrhythmias when saquinavir given with **alfentanil**, **fentanyl** or **methadone**—avoid concomitant use
  - Anti-arrhythmics: increased risk of ventricular arrhythmias when saquinavir given with **amiodarone**, **disopyramide**, **dronedarone**, **flecainide**, **lidocaine** or **propafenone**—avoid concomitant use
  - Antibacterials: plasma concentration of both drugs possibly increased when saquinavir given with **clarithromycin** (increased risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when saquinavir given with **dapsone**, **erythromycin** or **moxifloxacin**—avoid concomitant use; saquinavir increases plasma concentration of **rifabutin** (also plasma concentration of saquinavir reduced)—reduce rifabutin dose; plasma concentration of saquinavir significantly reduced by **rifampicin**, also risk of hepatotoxicity—avoid concomitant use; plasma concentration of both drugs may increase when saquinavir given with **fusidic acid**; avoidance of saquinavir advised by manufacturer of **telithromycin** (risk of ventricular arrhythmias)
  - Anticoagulants: saquinavir possibly enhances anticoagulant effect of **warfarin**; avoidance of saquinavir advised by manufacturer of **apixaban** and **rivaroxaban**
  - Antidepressants: increased risk of ventricular arrhythmias when saquinavir given with **trazodone** or **tricyclics**—avoid concomitant use; plasma concentration of saquinavir reduced by **St John's wort**—avoid concomitant use
  - Antiepileptics: plasma concentration of saquinavir possibly reduced by **carbamazepine**, **phenobarbital** and **phenytoin**
  - Antifungals: plasma concentration of saquinavir possibly increased by **imidazoles** and **triazoles**
  - Antihistamines: increased risk of ventricular arrhythmias when saquinavir given with **mizolastine**—avoid concomitant use
  - Antimalarials: avoidance of saquinavir advised by manufacturer of **piperazine with arteminol** (possible risk of ventricular arrhythmias); caution with saquinavir advised by manufacturer of **artemether with lumefantrine**; increased risk of ventricular arrhythmias when saquinavir given with **quinine**—avoid concomitant use
  - Antimuscarinics: avoidance of saquinavir advised by manufacturer of **darifenacin** and **tolterodine**; manufacturer of fesoterodine advises dose reduction when saquinavir given with **fesoterodine**—consult fesoterodine product literature

**Saquinavir** (*continued*)

- Antipsychotics: increased risk of ventricular arrhythmias when saquinavir given with ●clozapine, ●haloperidol or ●phenothiazines—avoid concomitant use; saquinavir possibly increases plasma concentration of ●aripiprazole (reduce dose of aripiprazole—consult aripiprazole product literature); saquinavir possibly increases plasma concentration of ●pimozide (increased risk of ventricular arrhythmias—avoid concomitant use); saquinavir possibly increases plasma concentration of ●quetiapine—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: increased risk of ventricular arrhythmias when saquinavir given with ●atazanavir or ●lopinavir—avoid concomitant use; saquinavir reduces plasma concentration of ●darunavir; plasma concentration of saquinavir significantly reduced by ●efavirenz; plasma concentration of saquinavir increased by ●indinavir and ●ritonavir; saquinavir increases plasma concentration of ●maraviroc (consider reducing dose of maraviroc); plasma concentration of saquinavir reduced by ●tipranavir
- Anxiolytics and Hypnotics: saquinavir increases plasma concentration of ●midazolam (risk of prolonged sedation—avoid concomitant use of oral midazolam)
- Avanafil: saquinavir possibly increases plasma concentration of ●avanafil—manufacturer of avanafil advises avoid concomitant use
- Beta-blockers: increased risk of ventricular arrhythmias when saquinavir given with ●sotalol—avoid concomitant use
- Ciclosporin: plasma concentration of both drugs increased when saquinavir given with ●ciclosporin
- Corticosteroids: plasma concentration of saquinavir possibly reduced by ●dexamethasone
- Cytotoxics: saquinavir possibly increases the plasma concentration of ●afatinib—manufacturer of afatinib advises separating administration of saquinavir by 6 to 12 hours; saquinavir possibly increases plasma concentration of ●axitinib (reduce dose of axitinib—consult axitinib product literature); saquinavir possibly increases the plasma concentration of ●bosutinib and ●cabazitaxel—manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; saquinavir possibly increases plasma concentration of ●crizotinib and ●everolimus—manufacturer of crizotinib and everolimus advises avoid concomitant use; avoidance of saquinavir advised by manufacturer of ●lapatinib; increased risk of ventricular arrhythmias when saquinavir given with ●pazopanib—avoid concomitant use; manufacturer of ruxolitinib advises dose reduction when saquinavir given with ●ruxolitinib—consult ruxolitinib product literature
- Dapoxetine: avoidance of saquinavir advised by manufacturer of ●dapoxetine (increased risk of toxicity)
- Diuretics: saquinavir increases plasma concentration of ●eplerenone (reduce dose of eplerenone)
- Domperidone: possible increased risk of ventricular arrhythmias when saquinavir given with ●domperidone—avoid concomitant use
- Ergot Alkaloids: increased risk of ergotism when saquinavir given with ●ergotamine—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when saquinavir given with ●atorvastatin; possible increased risk of myopathy when saquinavir given with ●rosuvastatin—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when saquinavir given with ●simvastatin (avoid concomitant use); avoidance of saquinavir advised by manufacturer of ●lomitapide (plasma concentration of lomitapide possibly increased)

**Saquinavir** (*continued*)

- Orlistat: absorption of saquinavir possibly reduced by ●orlistat
- Pentamidine Isetionate: increased risk of ventricular arrhythmias when saquinavir given with ●pentamidine isetionate—avoid concomitant use
- Ranolazine: saquinavir possibly increases plasma concentration of ●ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: increased risk of ventricular arrhythmias when saquinavir given with ●sildenafil—avoid concomitant use
- Tacrolimus: saquinavir increases plasma concentration of ●tacrolimus (consider reducing dose of tacrolimus)
- Tadalafil: increased risk of ventricular arrhythmias when saquinavir given with ●tadalafil—avoid concomitant use
- Ulcer-healing Drugs: plasma concentration of saquinavir possibly increased by ●cimetidine; plasma concentration of saquinavir possibly increased by ●esomeprazole, ●lansoprazole, ●pantoprazole and ●rabeprazole—manufacturer of saquinavir advises avoid concomitant use; plasma concentration of saquinavir increased by ●omeprazole—manufacturer of saquinavir advises avoid concomitant use
- Vardenafil: increased risk of ventricular arrhythmias when saquinavir given with ●vardenafil—avoid concomitant use

**Saxagliptin** *see* Antidiabetics**Selegiline**

*Note* Selegiline is a MAO-B inhibitor

- Analgesics: hyperpyrexia and CNS toxicity reported when selegiline given with ●pethidine (avoid concomitant use); manufacturer of selegiline advises avoid concomitant use with ●opioid analgesics
- Antidepressants: manufacturer of selegiline advises avoid concomitant use with ●citalopram and ●escitalopram; increased risk of hypertension and CNS excitation when selegiline given with ●fluoxetine (selegiline should not be started until 5 weeks after stopping fluoxetine, avoid fluoxetine for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when selegiline given with ●fluvoxamine, ●sertraline or ●venlafaxine (selegiline should not be started until 1 week after stopping fluvoxamine, sertraline or venlafaxine, avoid fluvoxamine, sertraline or venlafaxine for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when selegiline given with ●paroxetine (selegiline should not be started until 2 weeks after stopping paroxetine, avoid paroxetine for 2 weeks after stopping selegiline); enhanced hypotensive effect when selegiline given with ●MAOIs—manufacturer of selegiline advises avoid concomitant use; avoid concomitant use of selegiline with ●moclobemide; CNS toxicity reported when selegiline given with ●tricyclics
- Dopaminergics: max. dose of 10mg selegiline advised by manufacturer of ●entacapone if used concomitantly; selegiline enhances effects and increases toxicity of ●levodopa (reduce dose of levodopa)
- 5HT<sub>1</sub>-receptor Agonists: manufacturer of selegiline advises avoid concomitant use with ●5HT<sub>1</sub> agonists
- Memantine: effects of dopaminergics and selegiline possibly enhanced by ●memantine
- Methyl dopa: antiparkinsonian effect of dopaminergics antagonised by ●methyl dopa
- Oestrogens: plasma concentration of selegiline increased by ●oestrogens—manufacturer of selegiline advises avoid concomitant use
- Progestogens: plasma concentration of selegiline increased by ●progestogens—manufacturer of selegiline advises avoid concomitant use
- Sympathomimetics: manufacturer of selegiline advises avoid concomitant use with ●sympathomimetics; risk

**Selegiline**

- Sympathomimetics (*continued*)
  - of hypertensive crisis when selegiline given with
    - dopamine

**Selenium**

Eltrombopag: selenium possibly reduces absorption of **eltrombopag** (give at least 4 hours apart)

Vitamins: absorption of selenium possibly reduced by **ascorbic acid** (give at least 4 hours apart)

**Sertraline** *see* Antidepressants, SSRI**Sevelamer**

Antibacterials: sevelamer reduces bioavailability of **ciprofloxacin**

Ciclosporin: sevelamer possibly reduces plasma concentration of **ciclosporin**

Mycophenolate: sevelamer possibly reduces plasma concentration of **mycophenolate**

Tacrolimus: sevelamer possibly reduces plasma concentration of **tacrolimus**

Thyroid Hormones: sevelamer possibly reduces absorption of **levothyroxine**

Vitamins: sevelamer reduces absorption of **calcitriol** (give at least 1 hour before or 3 hours after sevelamer)

**Sufloxurone** *see* Anaesthetics, General**Sildenafil**

- Alpha-blockers: enhanced hypotensive effect when sildenafil given with
  - alpha-blockers (avoid alpha-blockers for 4 hours after sildenafil)—see also p. 558
- Anti-arrhythmics: avoidance of sildenafil advised by manufacturer of **disopyramide** (risk of ventricular arrhythmias)
- Antibacterials: plasma concentration of sildenafil increased by
  - clarithromycin (consider reducing dose of sildenafil); plasma concentration of sildenafil increased by **erythromycin**—reduce initial dose of sildenafil; plasma concentration of sildenafil possibly increased by **telithromycin**—reduce initial dose of sildenafil
- Antifungals: plasma concentration of sildenafil increased by **itraconazole**—reduce initial dose of sildenafil
- Antivirals: side-effects of sildenafil possibly increased by
  - atazanavir; plasma concentration of sildenafil reduced by **etravirine**; plasma concentration of sildenafil possibly increased by **fosamprenavir**; plasma concentration of sildenafil increased by **indinavir**—reduce initial dose of sildenafil; plasma concentration of sildenafil significantly increased by **ritonavir**—avoid concomitant use; increased risk of ventricular arrhythmias when sildenafil given with
    - saquinavir—avoid concomitant use; avoidance of sildenafil advised by manufacturer of **telaprevir**
- Bosentan: plasma concentration of sildenafil reduced by **bosentan**, also plasma concentration of bosentan increased
- Calcium-channel Blockers: enhanced hypotensive effect when sildenafil given with **amlodipine**
- Cobicistat: plasma concentration of sildenafil possibly increased by
  - cobicistat—manufacturer of cobicistat advises avoid concomitant use of sildenafil for pulmonary arterial hypertension or reduce dose of sildenafil for erectile dysfunction—consult cobicistat product literature
- Dapoxetine: avoidance of sildenafil advised by manufacturer of **dapoxetine**
- Grapefruit Juice: plasma concentration of sildenafil possibly increased by **grapefruit juice**
- Nicorandil: sildenafil significantly enhances hypotensive effect of **nicorandil** (avoid concomitant use)
- Nitrates: sildenafil significantly enhances hypotensive effect of **nitrates** (avoid concomitant use)
- Riociguat: enhanced hypotensive effect when sildenafil given with
  - riociguat—avoid concomitant use

**Sildenafil** (*continued*)

Ulcer-healing Drugs: plasma concentration of sildenafil increased by **cimetidine** (consider reducing dose of sildenafil)

**Simvastatin** *see* Statins**Sirolimus**

Anti-arrhythmics: caution with sirolimus advised by manufacturer of **dronedarone**

- Antibacterials: plasma concentration of sirolimus increased by
  - clarithromycin and •telithromycin—avoid concomitant use; plasma concentration of both drugs increased when sirolimus given with
    - erythromycin; plasma concentration of sirolimus reduced by
      - rifabutin and •rifampicin—avoid concomitant use
  - Antifungals: plasma concentration of sirolimus increased by **miconazole** and **voriconazole**; plasma concentration of sirolimus possibly increased by **fluconazole** and **posaconazole**; plasma concentration of sirolimus increased by **itraconazole** and **voriconazole**—avoid concomitant use
  - Antivirals: plasma concentration of sirolimus possibly increased by
    - atazanavir and •lopinavir; plasma concentration of sirolimus increased by
      - boceprevir (increased risk of toxicity—reduce sirolimus dose); plasma concentration of both drugs increased when sirolimus given with
        - telaprevir (reduce dose of sirolimus)
    - Calcium-channel Blockers: plasma concentration of sirolimus increased by
      - diltiazem; plasma concentration of both drugs increased when sirolimus given with
        - verapamil

Ciclosporin: plasma concentration of sirolimus increased by **ciclosporin**

    - Cytotoxics: caution with sirolimus advised by manufacturer of **crizotinib**
    - Grapefruit Juice: plasma concentration of sirolimus increased by
      - grapefruit juice—avoid concomitant use

**Sitagliptin** *see* Antidiabetics**Sodium Aurothiomalate**

- ACE Inhibitors: flushing and hypotension reported when sodium aurothiomalate given with
    - ACE inhibitors
- Penicillamine: avoidance of sodium aurothiomalate advised by manufacturer of **penicillamine** (increased risk of toxicity)

**Sodium Benzoate**

Antiepileptics: effects of sodium benzoate possibly reduced by **valproate**

Antipsychotics: effects of sodium benzoate possibly reduced by **haloperidol**

Corticosteroids: effects of sodium benzoate possibly reduced by **corticosteroids**

Probenecid: excretion of conjugate formed by sodium benzoate possibly reduced by **probenecid**

**Sodium Bicarbonate** *see* Antacids**Sodium Citrate**

Antibacterials: avoid concomitant use of sodium citrate with **methenamine**

Ulcer-healing Drugs: avoidance of sodium citrate advised by manufacturer of **sucralfate**

**Sodium Clodronate** *see* Bisphosphonates**Sodium Nitroprusside** *see* Vasodilator Anti-hypertensives**Sodium Oxybate**

- Analgesics: effects of sodium oxybate enhanced by
  - opioid analgesics (avoid concomitant use)
- Antidepressants: increased risk of side-effects when sodium oxybate given with **tricyclics**
- Antiepileptics: manufacturer of sodium oxybate advises avoid concomitant use with **phenobarbital**
- Antipsychotics: effects of sodium oxybate possibly enhanced by **antipsychotics**

**Sodium Oxybate** (*continued*)

- Anxiolytics and Hypnotics: effects of sodium oxybate enhanced by ●benzodiazepines (avoid concomitant use)

**Sodium Phenylbutyrate**

Antiepileptics: effects of sodium phenylbutyrate possibly reduced by ●valproate

Antipsychotics: effects of sodium phenylbutyrate possibly reduced by ●haloperidol

Corticosteroids: effects of sodium phenylbutyrate possibly reduced by ●corticosteroids

Probenecid: excretion of conjugate formed by sodium phenylbutyrate possibly reduced by ●probenecid

**Sodium Stibogluconate**

- Antifungals: possible increased risk of arrhythmias when sodium stibogluconate given before ●amphotericin—manufacturer of sodium stibogluconate advises giving 14 days apart

**Sodium Valproate** *see* Valproate**Sofosbuvir**

Antibacterials: manufacturer of sofosbuvir advises avoid concomitant use with ●rifabutin and ●rifampicin

Antidepressants: manufacturer of sofosbuvir advises avoid concomitant use with ●St John's wort

Antiepileptics: manufacturer of sofosbuvir advises avoid concomitant use with ●carbamazepine, ●oxcarbazepine, ●phenobarbital and ●phenytoin

**Solifenacin** *see* Antimuscarinics**Somatropin**

Corticosteroids: growth-promoting effect of somatropin may be inhibited by ●corticosteroids

Oestrogens: increased doses of somatropin may be needed when given with ●oestrogens (when used as oral replacement therapy)

**Sorafenib**

Antibacterials: bioavailability of sorafenib reduced by ●neomycin; plasma concentration of sorafenib reduced by ●rifampicin

- Anticoagulants: sorafenib possibly enhances anticoagulant effect of ●coumarins
- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)
- Antivirals: avoidance of sorafenib advised by manufacturer of ●boceprevir

Cytotoxics: sorafenib possibly increases plasma concentration of ●doxorubicin and ●irinotecan; sorafenib increases plasma concentration of ●docetaxel

**Sotalol** *see* Beta-blockers**Spirolactone** *see* Diuretics**Statins**

Antacids: absorption of rosuvastatin reduced by ●antacids

- Anti-arrhythmics: increased risk of myopathy when simvastatin given with ●amiodarone (see Dose under Simvastatin, p. 173); increased risk of myopathy when simvastatin given with ●dronedarone; plasma concentration of atorvastatin possibly increased by ●dronedarone; plasma concentration of rosuvastatin increased by ●dronedarone—adjust dose of rosuvastatin (consult product literature)
- Antibacterials: plasma concentration of atorvastatin and pravastatin increased by ●clarithromycin; increased risk of myopathy when simvastatin given with ●clarithromycin, ●erythromycin or ●telithromycin (avoid concomitant use); plasma concentration of rosuvastatin reduced by ●erythromycin; possible increased risk of myopathy when atorvastatin given with ●erythromycin; plasma concentration of pravastatin increased by ●erythromycin; plasma concentration of atorvastatin and simvastatin possibly reduced by ●rifampicin; metabolism of fluvastatin accelerated by ●rifampicin (reduced effect); increased risk of myopathy when statins given with ●daptomycin (preferably avoid concomitant use); risk of myopathy and rhabdomyolysis when statins given

**Statins****Antibacterials** (*continued*)

with ●fusidic acid—avoid concomitant use and for 7 days after last fusidic acid dose; increased risk of myopathy when atorvastatin given with ●telithromycin (avoid concomitant use); possible increased risk of myopathy when pravastatin given with ●telithromycin

- Anticoagulants: atorvastatin may transiently reduce anticoagulant effect of ●warfarin; fluvastatin and simvastatin enhance anticoagulant effect of ●coumarins; rosuvastatin possibly enhances anticoagulant effect of ●coumarins and ●phenindione

Antidepressants: plasma concentration of simvastatin reduced by ●St John's wort

Antidiabetics: fluvastatin possibly increases plasma concentration of ●glibenclamide

- Antiepileptics: plasma concentration of simvastatin reduced by ●carbamazepine and ●eslicarbazepine—consider increasing dose of simvastatin; plasma concentration of rosuvastatin reduced by ●eslicarbazepine; combination of fluvastatin with ●phenytoin may increase plasma concentration of either drug (or both)
- Antifungals: possible increased risk of myopathy when simvastatin given with ●fluconazole or ●miconazole; possible increased risk of myopathy when atorvastatin given with ●fluconazole or ●imidazoles; plasma concentration of fluvastatin increased by ●fluconazole—possible increased risk of myopathy; plasma concentration of rosuvastatin increased by ●itraconazole—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when atorvastatin given with ●itraconazole, ●posaconazole or ●voriconazole; increased risk of myopathy when simvastatin given with ●itraconazole or ●posaconazole (avoid concomitant use); increased risk of myopathy when simvastatin given with ●voriconazole
- Antivirals: possible increased risk of myopathy when atorvastatin or pravastatin given with ●atazanavir; plasma concentration of rosuvastatin increased by ●atazanavir, ●darunavir, ●lopinavir and ●tipranavir—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when simvastatin given with ●atazanavir, ●indinavir, ●ritonavir or ●saquinavir (avoid concomitant use); manufacturers advise avoid concomitant use of simvastatin with ●boceprevir and ●telaprevir; plasma concentration of pravastatin increased by ●boceprevir; plasma concentration of atorvastatin increased by ●boceprevir (reduce dose of atorvastatin); plasma concentration of pravastatin possibly increased by ●darunavir; possible increased risk of myopathy when atorvastatin given with ●darunavir, ●fosamprenavir, ●indinavir, ●lopinavir, ●ritonavir or ●saquinavir; plasma concentration of atorvastatin, pravastatin and simvastatin reduced by ●efavirenz; plasma concentration of atorvastatin possibly reduced by ●etravirine; possible increased risk of myopathy when rosuvastatin given with ●fosamprenavir, ●indinavir, ●ritonavir and ●saquinavir—manufacturer of rosuvastatin advises avoid concomitant use; possible increased risk of myopathy when simvastatin given with ●fosamprenavir or ●lopinavir—avoid concomitant use; avoidance of atorvastatin advised by manufacturer of ●telaprevir; plasma concentration of simvastatin possibly increased by ●tipranavir—avoid concomitant use; increased risk of myopathy when atorvastatin given with ●tipranavir (see Dose under Atorvastatin, p. 171)
- Anxiolytics and Hypnotics: atorvastatin possibly increases plasma concentration of ●midazolam
- Bosentan: plasma concentration of simvastatin reduced by ●bosentan
- Calcium-channel Blockers: possible increased risk of myopathy when simvastatin given with ●amlodipine

## Statins

- Calcium-channel Blockers (*continued*) and **diltiazem** (see Dose under Simvastatin, p. 173); plasma concentration of atorvastatin increased by **diltiazem**—possible increased risk of myopathy; increased risk of myopathy when simvastatin given with **verapamil** (see Dose under Simvastatin, p. 173)
- Cardiac Glycosides: atorvastatin possibly increases plasma concentration of **digoxin**
- Cyclosporin: increased risk of myopathy when rosuvastatin or simvastatin given with **cyclosporin** (avoid concomitant use); increased risk of myopathy when atorvastatin given with **cyclosporin** (see Dose under Atorvastatin, p. 171); increased risk of myopathy when fluvastatin or pravastatin given with **cyclosporin**
- Cobicistat: plasma concentration of atorvastatin possibly increased by **cobicistat**—manufacturer of cobicistat advises reduce dose of atorvastatin; avoidance of simvastatin advised by manufacturer of **cobicistat**
- Colchicine: possible increased risk of myopathy when statins given with **colchicine**
- Cytotoxics: plasma concentration of simvastatin possibly increased by **dasatinib**; plasma concentration of simvastatin increased by **imatinib**
- Eltrombopag: plasma concentration of rosuvastatin increased by **eltrombopag**—adjust dose of rosuvastatin (consult product literature)
- Grapefruit Juice: plasma concentration of atorvastatin possibly increased by **grapefruit juice**; plasma concentration of simvastatin increased by **grapefruit juice**—avoid concomitant use
- Hormone Antagonists: possible increased risk of myopathy when simvastatin given with **danazol**—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when simvastatin given with **bezafibrate** and **ciprofibrate** (see Dose under Simvastatin, p. 173); when given with statins reduce maximum dose of **fenofibrate**—see Dose under Fenofibrate, p. 176; increased risk of myopathy when atorvastatin, fluvastatin or pravastatin given with **gemfibrozil** (preferably avoid concomitant use); increased risk of myopathy when simvastatin given with **gemfibrozil** (avoid concomitant use); plasma concentration of rosuvastatin increased by **ezetimibe**—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when rosuvastatin given with **fibrates** (see Dose under Rosuvastatin, p. 173); increased risk of myopathy when statins given with **fibrates**; plasma concentration of simvastatin increased by **lomitapide** (see Dose under Simvastatin, p. 173); plasma concentration of atorvastatin increased by **lomitapide**; increased risk of myopathy when statins given with **nicotinic acid** (applies to lipid regulating doses of nicotinic acid)
- Oestrogens: atorvastatin and rosuvastatin increase plasma concentration of **ethinylestradiol**
- Progestogens: atorvastatin increases plasma concentration of **norethisterone**; rosuvastatin increases plasma concentration of active metabolite of **norgestimate**; rosuvastatin increases plasma concentration of **norgestrel**
- Ranolazine: plasma concentration of simvastatin increased by **ranolazine** (see Dose under Simvastatin, p. 173)
- Retinoids: plasma concentration of simvastatin reduced by **alitretinoin**
- Teriflunomide: plasma concentration of rosuvastatin increased by **teriflunomide** (consider reducing dose of rosuvastatin)
- Ticagrelor: plasma concentration of simvastatin increased by **ticagrelor** (increased risk of toxicity)

## Stavudine

- Antivirals: increased risk of side-effects when stavudine given with **didanosine**; increased risk of toxicity when stavudine given with **ribavirin**; effects of stavudine possibly inhibited by **zidovudine** (manufacturers advise avoid concomitant use)
- Cytotoxics: effects of stavudine possibly inhibited by **doxorubicin**; increased risk of toxicity when stavudine given with **hydroxycarbamide**—avoid concomitant use
- Orlistat: absorption of stavudine possibly reduced by **orlistat**
- Stiripentol**
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **SSRIs** and **tricyclics** (convulsive threshold lowered)
- Antiepileptics: stiripentol increases plasma concentration of **carbamazepine**, **phenobarbital** and **phenytoin**
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by **mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by **antipsychotics** (convulsive threshold lowered)
- Anxiolytics and Hypnotics: stiripentol increases plasma concentration of **clonazepam**
- Orlistat: possible increased risk of convulsions when antiepileptics given with **orlistat**

**Streptomycin** see Aminoglycosides

## Strontium Ranelate

Antibacterials: strontium ranelate reduces absorption of **quinolones** and **tetracyclines** (manufacturer of strontium ranelate advises avoid concomitant use)

## Sucralfate

- Antibacterials: sucralfate reduces absorption of **ciprofloxacin**, **levofloxacin**, **moxifloxacin**, **ofloxacin** and **tetracyclines**; sucralfate reduces absorption of **norfloxacin** (give at least 2 hours apart)
- Anticoagulants: sucralfate possibly reduces absorption of **coumarins** (reduced anticoagulant effect)
- Antiepileptics: sucralfate reduces absorption of **phenytoin**
- Antipsychotics: sucralfate reduces absorption of **sulpiride**
- Cardiac Glycosides: sucralfate possibly reduces absorption of **cardiac glycosides**
- Potassium Salts: manufacturer of sucralfate advises avoid concomitant use with **potassium citrate**
- Sodium Citrate: manufacturer of sucralfate advises avoid concomitant use with **sodium citrate**
- Theophylline: sucralfate possibly reduces absorption of **theophylline** (give at least 2 hours apart)
- Thyroid Hormones: sucralfate reduces absorption of **levothyroxine**
- Ulcer-healing Drugs: sucralfate possibly reduces absorption of **lansoprazole**

## Sugammadex

- Antibacterials: response to sugammadex possibly reduced by **fusidic acid**
- Progestogens: sugammadex possibly reduces plasma concentration of **progestogens**—manufacturer of sugammadex advises additional contraceptive precautions

**Sulfadiazine** see Sulfonamides

**Sulfadoxine** see Sulfonamides

**Sulfamethoxazole** see Sulfonamides

**Sulfasalazine** see Aminosalicilylates

## Sulfinpyrazone

- Analgesics: effects of sulfinpyrazone antagonised by **aspirin**
- Antibacterials: sulfinpyrazone reduces excretion of **nitrofurantoin** (increased risk of toxicity); sulfinpyra-

**Sulfinpyrazone**Antibacterials (*continued*)

- zone reduces excretion of **penicillins**; effects of sulfinpyrazone antagonised by **pyrazinamide**
- Anticoagulants: increased risk of bleeding when sulfinpyrazone given with **apixaban**; sulfinpyrazone enhances anticoagulant effect of ●**coumarins**; possible increased risk of bleeding when sulfinpyrazone given with ●**dabigatran**
  - Antidiabetics: sulfinpyrazone enhances effects of ●**sulfonylureas**
  - Antiepileptics: sulfinpyrazone increases plasma concentration of ●**phenytoin**
  - Calcium-channel Blockers: sulfinpyrazone reduces plasma concentration of **verapamil**
  - Cyclosporin: sulfinpyrazone reduces plasma concentration of ●**cyclosporin**
  - Theophylline: sulfinpyrazone reduces plasma concentration of **theophylline**

**Sulfonamides**Anaesthetics, General: sulfonamides enhance effects of **thiopental**

- Anaesthetics, Local: effects of sulfonamides possibly inhibited by ●**chloroprocaine** (manufacturer of chloroprocaine advises avoid concomitant use); increased risk of methaemoglobinaemia when sulfonamides given with **prilocaine**
- Anti-arrhythmics: possible increased risk of ventricular arrhythmias when sulfamethoxazole (as co-trimoxazole) given with **amiodarone**—manufacturer of amiodarone advises avoid concomitant use of co-trimoxazole
- Antibacterials: increased risk of crystalluria when sulfonamides given with ●**methenamine**
- Anticoagulants: sulfonamides enhance anticoagulant effect of ●**coumarins**; sulfonamides possibly inhibit metabolism of **phenindione**
- Antidiabetics: sulfonamides rarely enhance the effects of **sulfonylureas**
- Antiepileptics: sulfonamides possibly increase plasma concentration of **phenytoin**
- Antimalarials: increased antifolate effect when sulfonamides given with ●**pyrimethamine**
- Antipsychotics: avoid concomitant use of sulfonamides with ●**clozapine** (increased risk of agranulocytosis)
- Azathioprine: increased risk of haematological toxicity when sulfamethoxazole (as co-trimoxazole) given with ●**azathioprine**
- Cyclosporin: increased risk of nephrotoxicity when sulfonamides given with ●**cyclosporin**; sulfadiazine possibly reduces plasma concentration of ●**cyclosporin**
- Cytotoxics: increased risk of haematological toxicity when sulfamethoxazole (as co-trimoxazole) given with ●**mercaptopurine** or ●**methotrexate**; sulfonamides increase risk of **methotrexate** toxicity
- Potassium Aminobenzoate: effects of sulfonamides inhibited by **potassium aminobenzoate**
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 850

**Sulfonylureas** see Antidiabetics**Sulindac** see NSAIDs**Sulpiride** see Antipsychotics**Sumatriptan** see 5HT<sub>1</sub>-receptor Agonists (under HT)**Sunitinib**Antibacterials: metabolism of sunitinib accelerated by **rifampicin** (reduced plasma concentration)

- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Antivirals: avoidance of sunitinib advised by manufacturer of ●**boceprevir**

**Suxamethonium** see Muscle Relaxants**Sympathomimetics**

- Adrenergic Neurone Blockers: ephedrine, isometheptene, metaraminol, methylphenidate, noradren-

**Sympathomimetics**● Adrenergic Neurone Blockers (*continued*)

aline (norepinephrine), oxymetazoline, phenylephrine, pseudoephedrine and xylometazoline antagonise hypotensive effect of ●**adrenergic neurone blockers**; dexamfetamine and lisdexamfetamine antagonise hypotensive effect of ●**guanethidine**

Alcohol: effects of methylphenidate possibly enhanced by **alcohol**Alpha<sub>2</sub>-adrenoceptor Stimulants: avoidance of sympathomimetics advised by manufacturer of **apraclonidine**

- Alpha-blockers: avoid concomitant use of adrenaline (epinephrine) or dopamine with ●**tolazoline**
- Anaesthetics, General: avoidance of sympathomimetics advised by manufacturer of ●**isoflurane** (risk of ventricular arrhythmias); increased risk of arrhythmias when adrenaline (epinephrine) or noradrenaline (norepinephrine) given with ●**volatile liquid general anaesthetics**; increased risk of hypertension when methylphenidate given with ●**volatile liquid general anaesthetics**

Antacids: absorption of pseudoephedrine possibly increased by **aluminium hydroxide**

- Anticoagulants: methylphenidate possibly enhances anticoagulant effect of ●**coumarins**
- Antidepressants: risk of hypertensive crisis when dexamfetamine, ephedrine, isometheptene, lisdexamfetamine, metaraminol, methylphenidate, phenylephrine or pseudoephedrine given with ●**MAOIs**, avoid dexamfetamine, ephedrine, isometheptene, lisdexamfetamine, metaraminol, methylphenidate, phenylephrine or pseudoephedrine for at least 2 weeks after stopping MAOIs; risk of hypertensive crisis when adrenaline (epinephrine), dobutamine, dopamine, methoxamine, noradrenaline (norepinephrine) or xylometazoline given with ●**MAOIs**; risk of hypertensive crisis when oxymetazoline given with ●**MAOIs**, some manufacturers advise avoid oxymetazoline for at least 2 weeks after stopping MAOIs; risk of hypertensive crisis when sympathomimetics given with ●**moclobemide**; methylphenidate possibly inhibits metabolism of **SSRIs** and **tricyclics**; increased risk of hypertension and arrhythmias when noradrenaline (norepinephrine) or phenylephrine given with ●**tricyclics**; increased risk of hypertension and arrhythmias when adrenaline (epinephrine) given with ●**tricyclics** (but local anaesthetics with adrenaline appear to be safe)
- Antiepileptics: methylphenidate possibly increases plasma concentration of **phenobarbital**; methylphenidate increases plasma concentration of **phenytoin**
- Antipsychotics: hypertensive effect of sympathomimetics antagonised by **antipsychotics**; effects of lisdexamfetamine possibly reduced by **chlorpromazine**; dexamfetamine possibly antagonises antipsychotic effects of **chlorpromazine**; methylphenidate possibly increases side-effects of **risperidone**
- Antivirals: plasma concentration of dexamfetamine possibly increased by **ritonavir**
- Beta-blockers: increased risk of severe hypertension and bradycardia when adrenaline (epinephrine) given with non-cardioselective ●**beta-blockers**, also response to adrenaline (epinephrine) may be reduced; increased risk of severe hypertension and bradycardia when dobutamine given with non-cardioselective ●**beta-blockers**; possible increased risk of severe hypertension and bradycardia when noradrenaline (norepinephrine) given with non-cardioselective ●**beta-blockers**
- Clonidine: possible risk of hypertension when adrenaline (epinephrine) or noradrenaline (norepinephrine) given with **clonidine**; serious adverse events reported with concomitant use of methylphenidate and ●**clonidine** (causality not established)

**Sympathomimetics** (*continued*)

Corticosteroids: ephedrine accelerates metabolism of **dexamethasone**

- Dopaminergics: risk of toxicity when isometheptene given with •**bromocriptine**; effects of adrenaline (epinephrine), dobutamine, dopamine and noradrenaline (norepinephrine) possibly enhanced by **entacapone**; avoid concomitant use of sympathomimetics with •**rasagiline**; risk of hypertensive crisis when dopamine given with •**selegiline**; avoidance of sympathomimetics advised by manufacturer of **selegiline**

Doxapram: increased risk of hypertension when sympathomimetics given with **doxapram**

Ergot Alkaloids: increased risk of ergotism when sympathomimetics given with **ergotamine**

Oxytocin: risk of hypertension when vasoconstrictor sympathomimetics given with **oxytocin** (due to enhanced vasopressor effect)

- Sympathomimetics: effects of adrenaline (epinephrine) possibly enhanced by •**dopexamine**; dopexamine possibly enhances effects of •**noradrenaline** (norepinephrine)

Theophylline: avoidance of ephedrine in children advised by manufacturer of **theophylline**

Ulcer-healing Drugs: metabolism of dobutamine possibly inhibited by **cimetidine**

**Sympathomimetics, Beta<sub>2</sub>**

- Antivirals: avoidance of salmeterol advised by manufacturer of **lopinavir**, **ritonavir** and **tipranavir**; avoidance of salmeterol advised by manufacturer of •**telaprevir** (risk of ventricular arrhythmias)

Atomoxetine: increased risk of cardiovascular side-effects when *parenteral* salbutamol given with **atomoxetine**

Cardiac Glycosides: salbutamol possibly reduces plasma concentration of **digoxin**

Cobicistat: avoidance of salmeterol advised by manufacturer of **cobicistat**

Corticosteroids: increased risk of hypokalaemia when high doses of beta<sub>2</sub> sympathomimetics given with **corticosteroids**—see Hypokalaemia, p. 186

Diuretics: increased risk of hypokalaemia when high doses of beta<sub>2</sub> sympathomimetics given with **acetazolamide**, **loop diuretics** or **thiazides and related diuretics**—see Hypokalaemia, p. 186

- Methyl dopa: acute hypotension reported when *infusion* of salbutamol given with •**methyl dopa**

Muscle Relaxants: bambuterol enhances effects of **suxamethonium**

Theophylline: increased risk of hypokalaemia when high doses of beta<sub>2</sub> sympathomimetics given with **theophylline**—see Hypokalaemia, p. 186

**Tacrolimus**

**Note** Interactions do not generally apply to tacrolimus used topically; risk of facial flushing and skin irritation with alcohol consumption (p. 803) does not apply to tacrolimus taken systemically

- Analgesics: possible increased risk of nephrotoxicity when tacrolimus given with **NSAIDs**; increased risk of nephrotoxicity when tacrolimus given with •**ibuprofen**
- Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when tacrolimus given with **angiotensin-II receptor antagonists**
- Anti-arrhythmics: caution with tacrolimus advised by manufacturer of **dronedarone**
- Antibacterials: plasma concentration of tacrolimus increased by •**clarithromycin** and •**erythromycin**; plasma concentration of tacrolimus possibly reduced by **rifabutin**; plasma concentration of tacrolimus reduced by •**rifampicin**; increased risk of nephrotoxicity when tacrolimus given with •**aminoglycosides**; plasma concentration of tacrolimus possibly increased by •**chloramphenicol** and •**telithro-**

**Tacrolimus**

- Antibacterials (*continued*)

**mycin**; possible increased risk of nephrotoxicity when tacrolimus given with **vancomycin**

- Anticoagulants: tacrolimus possibly increases plasma concentration of • **dabigatran**—manufacturer of dabigatran advises avoid concomitant use
- Antidepressants: plasma concentration of tacrolimus reduced by •**St John's wort**—avoid concomitant use
- Antiepileptics: plasma concentration of tacrolimus reduced by •**phenobarbital**; plasma concentration of tacrolimus reduced by **phenytoin**, also plasma concentration of phenytoin possibly increased
- Antifungals: plasma concentration of tacrolimus possibly increased by •**miconazole oral gel**; increased risk of nephrotoxicity when tacrolimus given with •**amphotericin**; plasma concentration of tacrolimus increased by •**fluconazole**, •**itraconazole**, •**posaconazole** and •**voriconazole** (consider reducing dose of tacrolimus); plasma concentration of tacrolimus reduced by •**casopfungin**
- Antipsychotics: avoidance of tacrolimus advised by manufacturer of •**droperidol** (risk of ventricular arrhythmias)
- Antivirals: possible increased risk of nephrotoxicity when tacrolimus given with **aciclovir** or **ganciclovir**; plasma concentration of tacrolimus possibly increased by •**atazanavir** and •**ritonavir**; plasma concentration of tacrolimus increased by •**boceprevir** (reduce dose of tacrolimus); plasma concentration of tacrolimus possibly affected by •**efavirenz**; plasma concentration of tacrolimus increased by •**fosamprenavir**; plasma concentration of tacrolimus increased by •**saquinavir** (consider reducing dose of tacrolimus); plasma concentration of both drugs increased when tacrolimus given with •**telaprevir** (reduce dose of tacrolimus)
- Calcium-channel Blockers: plasma concentration of tacrolimus possibly increased by **felodipine**, **nicardipine** and **verapamil**; plasma concentration of tacrolimus increased by •**diltiazem** and •**nifedipine**
- Ciclosporin: tacrolimus increases plasma concentration of •**ciclosporin** (increased risk of nephrotoxicity)—avoid concomitant use  
Colestilan: manufacturer of colestilan advises give tacrolimus at least 1 hour before or 3 hours after **colestilan**
- Cytotoxics: tacrolimus possibly increases the plasma concentration of **afatinib**—manufacturer of afatinib advises separating administration of tacrolimus by 6 to 12 hours; caution with tacrolimus advised by manufacturer of •**crizotinib**; plasma concentration of tacrolimus increased by **imatinib**
- Diuretics: increased risk of hyperkalaemia when tacrolimus given with •**potassium-sparing diuretics and aldosterone antagonists**
- Grapefruit Juice: plasma concentration of tacrolimus increased by •**grapefruit juice**
- Hormone Antagonists: plasma concentration of tacrolimus possibly increased by **danazol**
- Mifamurtide: avoidance of tacrolimus advised by manufacturer of **mifamurtide**
- Oestrogens: plasma concentration of tacrolimus possibly increased by **ethinylestradiol**
- Potassium Salts: increased risk of hyperkalaemia when tacrolimus given with •**potassium salts**
- Ranolazine: plasma concentration of tacrolimus increased by •**ranolazine**
- Sevelamer: plasma concentration of tacrolimus possibly reduced by **sevelamer**
- Ulcer-healing Drugs: plasma concentration of tacrolimus possibly increased by **omeprazole**

**Tadalafil**

- Alpha-blockers: enhanced hypotensive effect when tadalafil given with •**doxazosin**—manufacturer of

**Tadalafil**

- Alpha-blockers (*continued*)  
tadalafil advises avoid concomitant use; enhanced hypotensive effect when tadalafil given with **alpha-blockers**—see also p. 558
- Anti-arrhythmics: avoidance of tadalafil advised by manufacturer of **disopyramide** (risk of ventricular arrhythmias)
- Antibacterials: plasma concentration of tadalafil possibly increased by **clarithromycin** and **erythromycin**; plasma concentration of tadalafil reduced by **rifampicin**—manufacturer of tadalafil advises avoid concomitant use
- Antifungals: plasma concentration of tadalafil possibly increased by **itraconazole**
- Antivirals: plasma concentration of tadalafil possibly increased by **fosamprenavir** and **indinavir**; plasma concentration of tadalafil increased by **ritonavir**—manufacturer of tadalafil advises avoid concomitant use; increased risk of ventricular arrhythmias when tadalafil given with **saquinavir**—avoid concomitant use; avoidance of high doses of tadalafil advised by manufacturer of **telaprevir**—consult product literature
- Bosentan: plasma concentration of tadalafil reduced by **bosentan**
- Cobicistat: plasma concentration of tadalafil possibly increased by **cobicistat**—manufacturer of cobicistat advises reduce dose of tadalafil (consult cobicistat product literature)
- Dapoxetine: avoidance of tadalafil advised by manufacturer of **dapoxetine**
- Grapefruit Juice: plasma concentration of tadalafil possibly increased by **grapefruit juice**
- Nicorandil: tadalafil significantly enhances hypotensive effect of **nicorandil** (avoid concomitant use)
- Nitrates: tadalafil significantly enhances hypotensive effect of **nitrates** (avoid concomitant use)
- Riociguat: possible enhanced hypotensive effect when tadalafil given with **riociguat**—avoid concomitant use

**Tamoxifen**

- Antibacterials: metabolism of tamoxifen accelerated by **rifampicin** (reduced plasma concentration)
- Anticoagulants: tamoxifen enhances anticoagulant effect of **coumarins**
- Antidepressants: metabolism of tamoxifen to active metabolite possibly inhibited by **fluoxetine** and **paroxetine** (avoid concomitant use)
- Antipsychotics: avoidance of tamoxifen advised by manufacturer of **droperidol** (risk of ventricular arrhythmias)
- Bupropion: metabolism of tamoxifen to active metabolite possibly inhibited by **bupropion** (avoid concomitant use)
- Cinacalcet: metabolism of tamoxifen to active metabolite possibly inhibited by **cinacalcet** (avoid concomitant use)

**Tamsulosin** *see* Alpha-blockers

**Tapentadol** *see* Opioid Analgesics

**Taxanes** *see* Cabazitaxel, Docetaxel, and Paclitaxel

**Tegafur** *see* Fluorouracil

**Teicoplanin**

Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 850

**Telaprevir**

- Alpha-blockers: manufacturer of telaprevir advises avoid concomitant use with **alfuzosin**
- Analgesics: manufacturer of telaprevir advises caution with **methadone** (risk of ventricular arrhythmias)
- Anti-arrhythmics: manufacturer of telaprevir advises avoid concomitant use with **amiodarone** and **disopyramide** (risk of ventricular arrhythmias); manufacturer of telaprevir advises caution with **flecainide** and **propafenone** (risk of ventricular arrhythmias)

**Telaprevir**

- Anti-arrhythmics (*continued*)  
thmias); manufacturer of telaprevir advises caution with **intravenous lidocaine**
- Antibacterials: plasma concentration of both drugs possibly increased when telaprevir given with **clarithromycin**, **erythromycin** and **telithromycin** (increased risk of ventricular arrhythmias); manufacturer of telaprevir advises avoid concomitant use with **rifabutin**; plasma concentration of telaprevir significantly reduced by **rifampicin**—avoid concomitant use
- Anticoagulants: telaprevir possibly affects plasma concentration of **warfarin**; telaprevir possibly increases plasma concentration of **dabigatran**
- Antidepressants: telaprevir possibly increases plasma concentration of **trazodone**; manufacturer of telaprevir advises avoid concomitant use with **St John's wort**
- Antiepileptics: manufacturer of telaprevir advises avoid concomitant use with **carbamazepine**, **phenobarbital** and **phenytoin**
- Antifungals: telaprevir possibly increases plasma concentration of **itraconazole**; telaprevir possibly increases plasma concentration of **posaconazole** (increased risk of ventricular arrhythmias); telaprevir possibly affects plasma concentration of **voriconazole** (possible increased risk of ventricular arrhythmias)
- Antipsychotics: manufacturer of telaprevir advises avoid concomitant use with **pimozide**; telaprevir possibly increases plasma concentration of **quetiapine**—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: plasma concentration of telaprevir possibly reduced by **atazanavir**, also plasma concentration of atazanavir possibly increased; avoid concomitant use of telaprevir with **darunavir**; plasma concentration of telaprevir reduced by **efavirenz**—increase dose of telaprevir; manufacturers advise avoid concomitant use of telaprevir with **fosamprenavir** and **lopinavir**; telaprevir increases plasma concentration of **maraviroc** (consider reducing dose of maraviroc); plasma concentration of telaprevir possibly reduced by **nevirapine**—consider increasing dose of telaprevir; plasma concentration of telaprevir possibly reduced by **ritonavir**; telaprevir increases plasma concentration of **tenofovir**
- Anxiolytics and Hypnotics: telaprevir possibly increases plasma concentration of **midazolam** (risk of prolonged sedation—avoid concomitant use of oral midazolam)
- Beta-blockers: manufacturer of telaprevir advises avoid concomitant use with **sotalol** (risk of ventricular arrhythmias)
- Bosentan: plasma concentration of telaprevir possibly reduced by **bosentan**, also plasma concentration of bosentan possibly increased
- Calcium-channel Blockers: telaprevir increases plasma concentration of **amlodipine** (consider reducing dose of amlodipine); manufacturer of telaprevir advises caution with **diltiazem**, **felodipine**, **nicardipine**, **nifedipine** and **verapamil**
- Cardiac Glycosides: telaprevir increases plasma concentration of **digoxin**
- Ciclosporin: plasma concentration of both drugs increased when telaprevir given with **ciclosporin** (reduce dose of ciclosporin)
- Cilostazol: telaprevir possibly increases plasma concentration of **cilostazol** (see Dose under Cilostazol, p. 140)
- Colchicine: telaprevir possibly increases risk of **colchicine** toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)

**Telaprevir** (*continued*)

Corticosteroids: telaprevir possibly increases plasma concentration of *inhaled* and *intranasal* **budesonide** and **fluticasone**; plasma concentration of telaprevir possibly reduced by **dexamethasone**

- Cytotoxics: telaprevir possibly increases the plasma concentration of ●**bosutinib**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; manufacturer of ruxolitinib advises dose reduction when telaprevir given with ●**ruxolitinib**—consult ruxolitinib product literature
- Domperidone: possible increased risk of ventricular arrhythmias when telaprevir given with ●**domperidone**—avoid concomitant use
- Ergot Alkaloids: manufacturer of telaprevir advises avoid concomitant use with ●**ergot alkaloids**
- Lipid-regulating Drugs: manufacturer of telaprevir advises avoid concomitant use with ●**atorvastatin**; manufacturers advise avoid concomitant use of telaprevir with ●**simvastatin**; avoidance of telaprevir advised by manufacturer of ●**lomitapide** (plasma concentration of lomitapide possibly increased)
- Oestrogens: telaprevir possibly reduces plasma concentration of ●**ethinylestradiol**—manufacturer of telaprevir advises additional contraceptive precautions
- Sildenafil: manufacturer of telaprevir advises avoid concomitant use with ●**sildenafil**
- Sirolimus: plasma concentration of both drugs increased when telaprevir given with ●**sirolimus** (reduce dose of sirolimus)
- Sympathomimetics, Beta<sub>2</sub>: manufacturer of telaprevir advises avoid concomitant use with ●**salmeterol** (risk of ventricular arrhythmias)
- Tacrolimus: plasma concentration of both drugs increased when telaprevir given with ●**tacrolimus** (reduce dose of tacrolimus)
- Tadalafil: manufacturer of telaprevir advises avoid concomitant use with high doses of ●**tadalafil**—consult product literature
- Vardenafil: manufacturer of telaprevir advises avoid concomitant use with ●**vardenafil**

**Telbivudine**

- Interferons: increased risk of peripheral neuropathy when telbivudine given with ●**interferon alfa**

**Telithromycin**

- Analgesics: possible increased risk of ventricular arrhythmias when telithromycin given with ●**methadone**; telithromycin inhibits the metabolism of **oxycodone**
- Anti-arrhythmics: possible increased risk of ventricular arrhythmias when telithromycin given with ●**amiodarone** and ●**disopyramide**; increased risk of ventricular arrhythmias when telithromycin given with ●**dronedrone**—avoid concomitant use
- Antibacterials: possible increased risk of ventricular arrhythmias when telithromycin given with ●**moxifloxacin**; plasma concentration of telithromycin reduced by ●**rifampicin** (avoid during and for 2 weeks after rifampicin)
- Antidepressants: possible increased risk of ventricular arrhythmias when telithromycin given with ●**citalopram** and ●**tricyclics**; plasma concentration of telithromycin reduced by ●**St John's wort** (avoid during and for 2 weeks after St John's wort)
- Antiepileptics: plasma concentration of telithromycin reduced by ●**carbamazepine**, ●**phenobarbital** and ●**phenytoin** (avoid during and for 2 weeks after carbamazepine, phenobarbital and phenytoin)
- Antimuscarinics: manufacturer of fesoterodine advises dose reduction when telithromycin given with **fesoterodine**—consult fesoterodine product literature
- Antipsychotics: possible increased risk of ventricular arrhythmias when telithromycin given with ●**chlorpromazine**; increased risk of ventricular arrhythmias when telithromycin given with ●**pimozide**—avoid concomitant use; telithromycin possibly increases plasma concentration of **quetiapine**
- Antivirals: manufacturer of telithromycin advises avoid concomitant use with ●**atazanavir**, ●**fosamprenavir**, ●**indinavir**, ●**lopinavir**, ●**ritonavir** and ●**tipranavir** in severe renal and hepatic impairment; telithromycin possibly increases plasma concentration of ●**maraviroc** (consider reducing dose of maraviroc); manufacturer of telithromycin advises avoid concomitant use with ●**saquinavir** (risk of ventricular arrhythmias); plasma concentration of both drugs possibly increased when telithromycin given with ●**telaprevir** (increased risk of ventricular arrhythmias)
- Anxiolytics and Hypnotics: telithromycin inhibits metabolism of ●**midazolam** (increased plasma concentration with increased sedation)
- Aprepitant: telithromycin possibly increases plasma concentration of **aprepitant**
- Avanafl: telithromycin possibly increases plasma concentration of ●**avanafl**—manufacturer of avanafl advises avoid concomitant use
- Calcium-channel Blockers: telithromycin possibly inhibits metabolism of ●**calcium-channel blockers** (increased risk of side-effects)
- Cardiac Glycosides: telithromycin possibly increases plasma concentration of **digoxin**
- Ciclosporin: telithromycin possibly increases plasma concentration of ●**ciclosporin**
- Colchicine: telithromycin possibly increases risk of ●**colchicine** toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Cytotoxics: telithromycin possibly increases plasma concentration of **axitinib** (reduce dose of axitinib—consult axitinib product literature); telithromycin possibly increases the plasma concentration of ●**bosutinib** and ●**cabazitaxel**—manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; telithromycin possibly increases plasma concentration of ●**crizotinib** and ●**everolimus**—manufacturer of crizotinib and everolimus advises avoid concomitant use; avoidance of telithromycin advised by manufacturer of ●**lapatinib** and ●**nilotinib**; telithromycin possibly increases plasma concentration of ●**pazopanib** (reduce dose of pazopanib); manufacturer of ruxolitinib advises dose reduction when telithromycin given with ●**ruxolitinib**—consult ruxolitinib product literature
- Dapoxetine: avoidance of telithromycin advised by manufacturer of ●**dapoxetine** (increased risk of toxicity)
- Diuretics: telithromycin increases plasma concentration of ●**eplerenone**—avoid concomitant use
- Domperidone: possible increased risk of ventricular arrhythmias when telithromycin given with ●**domperidone**—avoid concomitant use
- Ergot Alkaloids: increased risk of ergotism when telithromycin given with ●**ergotamine**—avoid concomitant use
- Ivabradine: telithromycin possibly increases plasma concentration of ●**ivabradine**—avoid concomitant use
- Ivacaftor: telithromycin possibly increases plasma concentration of ●**ivacaftor** (see Dose under Ivacaftor, p. 216)
- Lipid-regulating Drugs: increased risk of myopathy when telithromycin given with ●**atorvastatin** or ●**simvastatin** (avoid concomitant use); possible increased risk of myopathy when telithromycin given with **pravastatin**; avoidance of telithromycin advised by manufacturer of ●**lomitapide** (plasma concentration of lomitapide possibly increased)

**Telithromycin** (*continued*)

- Pentamidine isetionate: possible increased risk of ventricular arrhythmias when telithromycin given with **parenteral** ●**pentamidine isetionate**
- Ranolazine: telithromycin possibly increases plasma concentration of ●**ranolazine**—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: telithromycin possibly increases plasma concentration of **sildenafil**—reduce initial dose of sildenafil
- Sirolimus: telithromycin increases plasma concentration of ●**sirolimus**—avoid concomitant use
- Tacrolimus: telithromycin possibly increases plasma concentration of ●**tacrolimus**
- Ulipristal: avoidance of telithromycin advised by manufacturer of **ulipristal**
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 850

**Telmisartan** *see* Angiotensin-II Receptor Antagonists

**Temazepam** *see* Anxiolytics and Hypnotics

**Temocillin** *see* Penicillins

**Temporfin**

- Cytotoxics: increased skin photosensitivity when temporfin given with **topical** ●**fluorouracil**

**Temozolomide**

Antiepileptics: plasma concentration of temozolomide increased by **valproate**

- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)

**Temsirolimus**

**Note** The main active metabolite of temsirolimus is sirolimus—*see also* interactions of sirolimus and consult product literature

- Antibacterials: plasma concentration of active metabolite of temsirolimus reduced by ●**rifampicin**—avoid concomitant use
- Antifungals: manufacturer of temsirolimus advises avoid concomitant use with ●**itraconazole** (plasma concentration of temsirolimus possibly increased)
- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)

**Tenofovir**

- Antivirals: manufacturer of tenofovir advises avoid concomitant use with **adefovir**; tenofovir reduces plasma concentration of **atazanavir**, also plasma concentration of tenofovir possibly increased; manufacturers advise avoid concomitant use of tenofovir with ●**cidofovir**; tenofovir increases plasma concentration of ●**didanosine** (increased risk of toxicity)—avoid concomitant use; plasma concentration of tenofovir increased by **lopinavir** and **telaprevir**
- Orlistat: absorption of tenofovir possibly reduced by ●**orlistat**

**Tenoxicam** *see* NSAIDs

**Terazosin** *see* Alpha-blockers

**Terbinafine**

- Antibacterials: plasma concentration of terbinafine reduced by ●**rifampicin**
- Antidepressants: terbinafine possibly increases plasma concentration of **paroxetine** and **tricyclics**
- Antifungals: terbinafine increases plasma concentration of **fluconazole**
- Ciclosporin: terbinafine possibly reduces plasma concentration of **ciclosporin**
- Oestrogens: occasional reports of breakthrough bleeding when terbinafine given with **oestrogens** (when used for contraception)
- Progestogens: occasional reports of breakthrough bleeding when terbinafine given with **progestogens** (when used for contraception)
- Ulcer-healing Drugs: plasma concentration of terbinafine increased by **cimetidine**

**Terbutaline** *see* Sympathomimetics, Beta<sub>2</sub>

**Teriflunomide**

Antibacterials: teriflunomide increases plasma concentration of **cefaclor**; plasma concentration of teriflunomide reduced by **rifampicin**

Antidiabetics: teriflunomide increases plasma concentration of **repaglinide**

- Lipid-regulating Drugs: the effect of teriflunomide is significantly decreased by **colestyramine** (enhanced elimination)—avoid unless drug elimination desired; teriflunomide increases plasma concentration of ●**rosuvastatin** (consider reducing dose of rosuvastatin)
- Oestrogens: teriflunomide increases plasma concentration of **ethinylestradiol**
- Progestogens: teriflunomide increases plasma concentration of **levonorgestrel**
- Vaccines: avoid concomitant use of teriflunomide with live ●**vaccines** (see p. 828)

**Testolactone**

- Anticoagulants: testolactone enhances anticoagulant effect of ●**coumarins** and ●**phenindione**

**Testosterone**

- Anticoagulants: testosterone enhances anticoagulant effect of ●**coumarins** and ●**phenindione**
- Antidiabetics: testosterone possibly enhances hypoglycaemic effect of **antidiabetics**

**Tetrabenazine**

- Antidepressants: risk of CNS toxicity when tetrabenazine given with ●**MAOIs** (avoid tetrabenazine for 2 weeks after MAOIs)

Antipsychotics: increased risk of extrapyramidal side-effects when tetrabenazine given with **antipsychotics**

Dopaminergics: increased risk of extrapyramidal side-effects when tetrabenazine given with **amantadine**

Metoclopramide: increased risk of extrapyramidal side-effects when tetrabenazine given with **metoclopramide**

**Tetracosactide** *see* Corticosteroids

**Tetracycline** *see* Tetracyclines

**Tetracyclines**

ACE Inhibitors: absorption of tetracyclines reduced by **quinapril** tablets (quinapril tablets contain magnesium carbonate)

Adsorbents: absorption of tetracyclines possibly reduced by **kaolin**

Antacids: absorption of tetracyclines reduced by **antacids**

Antibacterials: plasma concentration of doxycycline reduced by **rifampicin**—consider increasing dose of doxycycline; tetracyclines possibly antagonise effects of **penicillins**

- Anticoagulants: tetracyclines possibly enhance anticoagulant effect of ●**coumarins** and ●**phenindione**
- Antidiabetics: tetracyclines possibly enhance hypoglycaemic effect of **sulfonylureas**

Antiepileptics: metabolism of doxycycline accelerated by **carbamazepine** (reduced effect); metabolism of doxycycline accelerated by **phenobarbital** and **phenytoin** (reduced plasma concentration)

Atovaquone: tetracycline reduces plasma concentration of **atovaquone**

Calcium Salts: absorption of tetracycline reduced by **calcium salts**

Cytotoxics: doxycycline or tetracycline increase risk of **methotrexate** toxicity

Dairy Products: absorption of tetracyclines (except doxycycline and minocycline) reduced by **dairy products**

Diuretics: manufacturer of lymecycline advises avoid concomitant use with **diuretics**

Ergot Alkaloids: increased risk of ergotism when tetracyclines given with **ergotamine**

Iron: absorption of tetracyclines reduced by **oral iron**, also absorption of **oral iron** reduced by tetracyclines

**Tetracyclines** (continued)

Lipid-regulating Drugs: absorption of tetracycline possibly reduced by **colestipol** and **colestyramine**

- **Retinoids**: possible increased risk of benign intracranial hypertension when tetracyclines given with ● **retinoids** (avoid concomitant use)
- Strontium Ranelate**: absorption of tetracyclines reduced by **strontium ranelate** (manufacturer of strontium ranelate advises avoid concomitant use)
- Ulcer-healing Drugs**: absorption of tetracyclines reduced by **sucralfate** and **tripotassium dicitrate-bismuthate**
- Vaccines**: antibacterials inactivate **oral typhoid vaccine**—see p. 850
- Zinc**: absorption of tetracyclines reduced by **zinc**, also absorption of zinc reduced by tetracyclines

**Theophylline**

- Allopurinol**: plasma concentration of theophylline possibly increased by **allopurinol**
- Anaesthetics, General**: increased risk of convulsions when theophylline given with **ketamine**
- Anti-arrhythmics**: theophylline antagonises anti-arrhythmic effect of **adenosine**—manufacturer of adenosine advises avoid theophylline for 24 hours before adenosine; plasma concentration of theophylline increased by **propafenone**
- **Antibacterials**: plasma concentration of theophylline possibly increased by **clarithromycin** and **isoniazid**; plasma concentration of theophylline increased by ● **erythromycin** (also theophylline may reduce absorption of *oral erythromycin*); plasma concentration of theophylline increased by ● **ciprofloxacin** and ● **norfloxacin**; metabolism of theophylline accelerated by **rifampicin** (reduced plasma concentration); possible increased risk of convulsions when theophylline given with ● **quinolones**
- **Antidepressants**: plasma concentration of theophylline increased by ● **fluvoxamine** (concomitant use should usually be avoided, but where not possible halve theophylline dose and monitor plasma-theophylline concentration); plasma concentration of theophylline possibly reduced by **St John's wort**
- **Antiepileptics**: metabolism of theophylline accelerated by **carbamazepine** and ● **phenobarbital** (reduced effect); plasma concentration of both drugs reduced when theophylline given with ● **phenytoin**
- **Antifungals**: plasma concentration of theophylline possibly increased by ● **fluconazole**
- **Antivirals**: plasma concentration of theophylline possibly increased by **aciclovir**; metabolism of theophylline accelerated by ● **ritonavir** (reduced plasma concentration)
- Anxiolytics and Hypnotics**: theophylline possibly reduces effects of **benzodiazepines**
- Caffeine citrate**: avoidance of theophylline advised by manufacturer of **caffeine citrate**
- **Calcium-channel Blockers**: plasma concentration of theophylline possibly increased by ● **calcium-channel blockers** (enhanced effect); plasma concentration of theophylline increased by **diltiazem**; plasma concentration of theophylline increased by ● **verapamil** (enhanced effect)
- Corticosteroids**: increased risk of hypokalaemia when theophylline given with **corticosteroids**
- Cytotoxics**: plasma concentration of theophylline possibly increased by **methotrexate**
- **Deferasirox**: plasma concentration of theophylline increased by ● **deferasirox** (consider reducing dose of theophylline)
- Disulfiram**: metabolism of theophylline inhibited by **disulfiram** (increased risk of toxicity)
- Diuretics**: increased risk of hypokalaemia when theophylline given with **acetazolamide**, **loop diuretics** or **thiazides and related diuretics**
- Doxapram**: increased CNS stimulation when theophylline given with **doxapram**

**Theophylline** (continued)

- **Interferons**: metabolism of theophylline inhibited by ● **interferon alfa** (consider reducing dose of theophylline)
  - Leukotriene Receptor Antagonists**: plasma concentration of theophylline possibly increased by **zafirlukast**, also plasma concentration of zafirlukast reduced
  - Lithium**: theophylline increases excretion of **lithium** (reduced plasma concentration)
  - Oestrogens**: plasma concentration of theophylline increased by **oestrogens** (consider reducing dose of theophylline)
  - Pentoxifylline**: plasma concentration of theophylline increased by **pentoxifylline**
  - Roflumilast**: avoidance of theophylline advised by manufacturer of **roflumilast**
  - Sulfinpyrazone**: plasma concentration of theophylline reduced by **sulfinpyrazone**
  - Sympathomimetics**: manufacturer of theophylline advises avoid concomitant use with **ephedrine** in children
  - Sympathomimetics, Beta<sub>2</sub>**: increased risk of hypokalaemia when theophylline given with high doses of **beta<sub>2</sub> sympathomimetics**—see Hypokalaemia, p. 186
  - **Ulcer-healing Drugs**: metabolism of theophylline inhibited by ● **cimetidine** (increased plasma concentration); absorption of theophylline possibly reduced by **sucralfate** (give at least 2 hours apart)
  - Vaccines**: plasma concentration of theophylline possibly increased by **influenza vaccine**
- Thiazolidinediones** see Antidiabetics
- Thiopental** see Anaesthetics, General
- Thiotepa**
- **Antipsychotics**: avoid concomitant use of cytotoxics with ● **clozapine** (increased risk of agranulocytosis)
  - Muscle Relaxants**: thiotepa enhances effects of **suxamethonium**
- Thioxanthenes** see Antipsychotics
- Thyroid Hormones**
- Antacids**: absorption of levothyroxine possibly reduced by **antacids**
  - Anti-arrhythmics**: for concomitant use of thyroid hormones and **amiodarone** see p. 97
  - Antibacterials**: metabolism of levothyroxine accelerated by **rifampicin** (may increase requirements for levothyroxine in hypothyroidism)
  - **Anticoagulants**: thyroid hormones enhance anticoagulant effect of ● **coumarins** and ● **phenindione**
  - Antidepressants**: thyroid hormones enhance effects of **amitriptyline** and **imipramine**; thyroid hormones possibly enhance effects of **tricyclics**
  - Antiepileptics**: metabolism of thyroid hormones accelerated by **carbamazepine** and **phenobarbital** (may increase requirements for thyroid hormones in hypothyroidism); metabolism of thyroid hormones accelerated by **phenytoin** (may increase requirements in hypothyroidism), also plasma concentration of phenytoin possibly increased
  - Beta-blockers**: levothyroxine accelerates metabolism of **propranolol**
  - Calcium Salts**: absorption of levothyroxine reduced by **calcium salts**
  - Colestilan**: manufacturer of colestilan advises give levothyroxine at least 1 hour before or 3 hours after **colestilan**
  - Cytotoxics**: plasma concentration of levothyroxine possibly reduced by **imatinib**
  - Iron**: absorption of levothyroxine reduced by **oral iron** (give at least 2 hours apart)
  - Lanthanum**: absorption of levothyroxine reduced by **lanthanum** (give at least 2 hours apart)
  - Lipid-regulating Drugs**: absorption of levothyroxine reduced by **colesvelam**; absorption of thyroid hormones reduced by **colestipol** and **colestyramine**

**Thyroid Hormones** (continued)

- Oestrogens: requirements for thyroid hormones in hypothyroidism may be increased by **oestrogens**
- Orlistat: possible increased risk of hypothyroidism when levothyroxine given with **orlistat**
- Polystyrene Sulfonate Resins: absorption of levothyroxine reduced by **polystyrene sulfonate resins**
- Sevelamer: absorption of levothyroxine possibly reduced by **sevelamer**
- Ulcer-healing Drugs: absorption of levothyroxine reduced by **cimetidine** and **sucralfate**

**Tiagabine**

- Antidepressants: anticonvulsant effect of antidepressants possibly antagonised by **MAOIs** and **tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antidepressants antagonised by **SSRIs** and **tricyclics** (convulsive threshold lowered)
- Antiepileptics: plasma concentration of tiagabine reduced by **carbamazepine**, **phenobarbital** and **phenytoin**
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by **mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by **antipsychotics** (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with **orlistat**

**Tiaprofenic Acid** *see* NSAIDs**Tibolone**

- Antibacterials: metabolism of tibolone accelerated by **rifampicin** (reduced plasma concentration)
- Antiepileptics: metabolism of tibolone accelerated by **carbamazepine** (reduced plasma concentration); metabolism of tibolone accelerated by **phenytoin**

**Ticagrelor**

- Antibacterials: plasma concentration of ticagrelor possibly increased by **clarithromycin**—manufacturer of ticagrelor advises avoid concomitant use; plasma concentration of ticagrelor possibly increased by **erythromycin**; plasma concentration of ticagrelor reduced by **rifampicin**
- Anticoagulants: ticagrelor increases plasma concentration of **dabigatran**
- Antidepressants: possible increased risk of bleeding when ticagrelor given with **citalopram**, **paroxetine** or **sertraline**
- Antiepileptics: plasma concentration of ticagrelor possibly reduced by **carbamazepine**, **phenobarbital** and **phenytoin**
- Antivirals: plasma concentration of ticagrelor possibly increased by **atazanavir** and **ritonavir**—manufacturer of ticagrelor advises avoid concomitant use
- Calcium-channel Blockers: plasma concentration of ticagrelor increased by **diltiazem**
- Cardiac Glycosides: ticagrelor increases plasma concentration of **digoxin**
- Ciclosporin: plasma concentration of ticagrelor increased by **ciclosporin**
- Corticosteroids: plasma concentration of ticagrelor possibly reduced by **dexamethasone**
- Ergot Alkaloids: ticagrelor possibly increases plasma concentration of **ergot alkaloids**
- Lipid-regulating Drugs: ticagrelor increases plasma concentration of **simvastatin** (increased risk of toxicity)

**Ticarcillin** *see* Penicillins**Tigecycline**

- Anticoagulants: tigecycline possibly enhances anticoagulant effect of **coumarins**
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—*see* p. 850

**Timolol** *see* Beta-blockers**Tinidazole**

- Alcohol: possibility of disulfiram-like reaction when tinidazole given with **alcohol**

**Tinidazole** (continued)

- Antibacterials: plasma concentration of tinidazole possibly reduced by **rifampicin**
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—*see* p. 850

**Tinzaparin** *see* Heparins**Tioguanine**

- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)
- Cytotoxics: increased risk of hepatotoxicity when tioguanine given with **busulfan**

**Tiotropium** *see* Antimuscarinics**Tipranavir**

- Analgesics: plasma concentration of tipranavir possibly reduced by **buprenorphine**
- Antacids: absorption of tipranavir reduced by **antacids**
- Antibacterials: tipranavir increases plasma concentration of **clarithromycin** (reduce dose of clarithromycin in renal impairment), also plasma concentration of tipranavir increased by clarithromycin; tipranavir increases plasma concentration of **rifabutin** (reduce dose of rifabutin); plasma concentration of tipranavir possibly reduced by **rifampicin**—avoid concomitant use; avoidance of concomitant tipranavir in severe renal and hepatic impairment advised by manufacturer of **telithromycin**
  - Anticoagulants: avoidance of tipranavir advised by manufacturer of **apixaban** and **rivaroxaban**
  - Antidepressants: plasma concentration of tipranavir possibly reduced by **St John's wort**—avoid concomitant use
  - Antiepileptics: plasma concentration of tipranavir possibly reduced by **carbamazepine**
  - Antifungals: plasma concentration of tipranavir increased by **fluconazole**
  - Antimalarials: caution with tipranavir advised by manufacturer of **artemether with lumefantrine**; tipranavir possibly increases plasma concentration of **quinine** (increased risk of toxicity)
  - Antimuscarinics: avoidance of tipranavir advised by manufacturer of **darifenacin**
  - Antipsychotics: tipranavir possibly increases plasma concentration of **aripiprazole** (reduce dose of aripiprazole—consult aripiprazole product literature); tipranavir possibly increases plasma concentration of **quetiapine**—manufacturer of quetiapine advises avoid concomitant use
  - Antivirals: tipranavir reduces plasma concentration of **abacavir**, **fosamprenavir**, **lopinavir**, **saquinavir** and **zidovudine**; plasma concentration of tipranavir increased by **atazanavir** (also plasma concentration of atazanavir reduced); tipranavir reduces plasma concentration of **didanosine**—manufacturer of tipranavir advises tipranavir and didanosine *capsules* should be taken at least 2 hours apart; tipranavir reduces the plasma concentration of **dolutegravir** (*see* Dose under Dolutegravir, p. 421); tipranavir reduces plasma concentration of **etravirine**, also plasma concentration of tipranavir increased (avoid concomitant use)
  - Beta-blockers: manufacturer of tipranavir advises avoid concomitant use with **metoprolol** for heart failure
- Bosentan: manufacturer of tipranavir advises avoid concomitant use with **bosentan**
- Lipid-regulating Drugs: increased risk of myopathy when tipranavir given with **atorvastatin** (*see* Dose under Atorvastatin, p. 171); tipranavir increases plasma concentration of **rosuvastatin**—adjust dose of rosuvastatin (consult product literature); tipranavir possibly increases plasma concentration of **simvastatin**—avoid concomitant use; avoidance of tipranavir advised by manufacturer of **lomitapide** (plasma concentration of lomitapide possibly increased)

**Tipranavir** (continued)

- Orlistat: absorption of tipranavir possibly reduced by ●orlistat
- Ranolazine: tipranavir possibly increases plasma concentration of ●ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Sympathomimetics, Beta<sub>2</sub>: manufacturer of tipranavir advises avoid concomitant use with ●salmeterol
- Ulcer-healing Drugs: tipranavir reduces plasma concentration of ●esomeprazole and ●omeprazole
- Vardenafil: manufacturer of tipranavir advises caution with ●vardenafil
- Vitamins: increased risk of bleeding when tipranavir given with high doses of ●vitamin E

**Tirofiban**

Iloprost: increased risk of bleeding when tirofiban given with ●iloprost

**Tizanidine** see Muscle Relaxants**Tobramycin** see Aminoglycosides**Tocilizumab**

- Vaccines: avoid concomitant use of tocilizumab with live ●vaccines (see p. 828)

**Tolazoline** see Alpha-blockers**Tolbutamide** see Antidiabetics**Tolcapone**

Antidepressants: avoid concomitant use of tolcapone with MAOIs

Memantine: effects of dopaminergics possibly enhanced by ●memantine

Methyl dopa: antiparkinsonian effect of dopaminergics antagonised by ●methyl dopa

**Tolfenamic Acid** see NSAIDs**Tolterodine** see Antimuscarinics**Tolvaptan**

Antibacterials: plasma concentration of tolvaptan reduced by ●rifampicin

Cardiac Glycosides: tolvaptan increases plasma concentration of ●digoxin (increased risk of toxicity)

- Grapefruit Juice: plasma concentration of tolvaptan increased by ●grapefruit juice—avoid concomitant use

**Topiramate**

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and ●tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●SSRIs and ●tricyclics (convulsive threshold lowered)
- Antidiabetics: topiramate possibly increases plasma concentration of ●metformin; topiramate possibly reduces plasma concentration of ●glibenclamide
- Antiepileptics: plasma concentration of topiramate often reduced by ●carbamazepine; topiramate reduces plasma concentration of ●perampanel; plasma concentration of topiramate possibly reduced by ●phenobarbital; topiramate increases plasma concentration of ●phenytoin (also plasma concentration of topiramate reduced); hyperammonaemia and CNS toxicity reported when topiramate given with ●valproate
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by ●mefloquine
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ●antipsychotics (convulsive threshold lowered)
- Diuretics: plasma concentration of topiramate possibly increased by ●hydrochlorothiazide
- Lithium: topiramate possibly affects plasma concentration of ●lithium
- Oestrogens: topiramate accelerates metabolism of ●oestrogens (reduced contraceptive effect—see p. 536)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ●orlistat

**Topiramate** (continued)

- Progestogens: topiramate accelerates metabolism of ●progestogens (reduced contraceptive effect—see p. 536)

**Torsemide** see Diuretics**Toremifene**

- Anticoagulants: toremifene possibly enhances anticoagulant effect of ●coumarins
- Antiepileptics: metabolism of toremifene possibly accelerated by ●carbamazepine (reduced plasma concentration); metabolism of toremifene accelerated by ●phenobarbital (reduced plasma concentration); metabolism of toremifene possibly accelerated by ●phenytoin
- Cytotoxics: possible increased risk of ventricular arrhythmias when toremifene given with ●vandetanib—avoid concomitant use
- Diuretics: increased risk of hypercalcaemia when toremifene given with ●thiazides and related diuretics

**Trabectedin**

- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)

**Tramadol** see Opioid Analgesics**Trandolapril** see ACE Inhibitors**Tranylcypromine** see MAOIs**Trastuzumab**

- Antipsychotics: avoid concomitant use of cytotoxics with ●clozapine (increased risk of agranulocytosis)

**Trazodone** see Antidepressants, Tricyclic (related)**Tretinoin** see Retinoids**Triamcinolone** see Corticosteroids**Triamterene** see Diuretics**Trientine**

Iron: trientine reduces absorption of ●oral iron

Zinc: trientine reduces absorption of ●zinc, also absorption of trientine reduced by zinc

**Trifluoperazine** see Antipsychotics**Trihexyphenidyl** see Antimuscarinics**Trimethoprim**

ACE Inhibitors: possible increased risk of hyperkalaemia when trimethoprim given with ●ACE inhibitors

Angiotensin-II Receptor Antagonists: possible increased risk of hyperkalaemia when trimethoprim given with ●angiotensin-II receptor antagonists

Anti-arrhythmics: possible increased risk of ventricular arrhythmias when trimethoprim (as co-trimoxazole) given with ●amiodarone—manufacturer of amiodarone advises avoid concomitant use of co-trimoxazole

Antibacterials: plasma concentration of trimethoprim possibly reduced by ●rifampicin; plasma concentration of both drugs may increase when trimethoprim given with ●dapson

Anticoagulants: trimethoprim possibly enhances anticoagulant effect of ●coumarins

Antidiabetics: trimethoprim possibly enhances hypoglycaemic effect of ●repaglinide—manufacturer advises avoid concomitant use; trimethoprim rarely enhances the effects of ●sulfonylureas

- Antiepileptics: trimethoprim increases plasma concentration of ●phenytoin (also increased antifolate effect)
- Antimalarials: increased antifolate effect when trimethoprim given with ●pyrimethamine
- Antivirals: trimethoprim (as co-trimoxazole) increases plasma concentration of ●lamivudine—avoid concomitant use of high-dose co-trimoxazole
- Azathioprine: increased risk of haematological toxicity when trimethoprim (also with co-trimoxazole) given with ●azathioprine
- Cardiac Glycosides: trimethoprim possibly increases plasma concentration of ●digoxin
- Ciclosporin: increased risk of nephrotoxicity when trimethoprim given with ●ciclosporin, also plasma

**Trimethoprim**

- Cyclosporin (*continued*)  
concentration of cyclosporin reduced by *intravenous* trimethoprim
- Cytotoxics: increased risk of haematological toxicity when trimethoprim (also with co-trimoxazole) given with ●mercaptapurine or ●methotrexate
- Diuretics: increased risk of hyperkalaemia when trimethoprim given with ●eplerenone; possible increased risk of hyperkalaemia when trimethoprim given with ●spironolactone
- Vaccines: antibacterials inactivate **oral typhoid vaccine**—see p. 850

**Trimipramine** *see* Antidepressants, Tricyclic

**Tripotassium Dicitratobismuthate**

Antibacterials: tripotassium dicitratobismuthate reduces absorption of **tetracyclines**

**Tropicamide** *see* Antimuscarinics

**Trospium** *see* Antimuscarinics

**Typhoid Vaccine (oral)** *see* Vaccines

**Typhoid Vaccine (parenteral)** *see* Vaccines

**Ubidecarenone**

Anticoagulants: ubidecarenone may enhance or reduce anticoagulant effect of **warfarin**

**Ulcer-healing Drugs** *see* Histamine H<sub>2</sub>-antagonists, Proton Pump Inhibitors, Sucralfate, and Tripotassium Dicitratobismuthate

**Ulipristal**

- Antacids: manufacturer of *high-dose* ulipristal advises avoid concomitant use with ●antacids (contraceptive effect of ulipristal possibly reduced)
- Antibacterials: manufacturer of ulipristal advises avoid concomitant use with ●clarithromycin and ●telithromycin; plasma concentration of ulipristal increased by ●erythromycin—manufacturer of ulipristal advises avoid concomitant use; manufacturer of ulipristal advises avoid concomitant use with ●rifampicin (contraceptive effect of ulipristal possibly reduced)
- Anticoagulants: manufacturer of ulipristal advises give **dabigatran** at least 1.5 hours before or after ulipristal
- Antidepressants: manufacturer of ulipristal advises avoid concomitant use with ●St John's wort (contraceptive effect of ulipristal possibly reduced)
- Antiepileptics: manufacturer of ulipristal advises avoid concomitant use with ●carbamazepine, ●phenobarbital and ●phenytoin (contraceptive effect of ulipristal possibly reduced)
- Antifungals: manufacturer of ulipristal advises avoid concomitant use with ●itraconazole
- Antihistamines: manufacturer of ulipristal advises give **efoxenadine** at least 1.5 hours before or after ulipristal
- Antivirals: manufacturer of ulipristal advises avoid concomitant use with ●ritonavir (contraceptive effect of ulipristal possibly reduced)
- Calcium-channel Blockers: manufacturer of ulipristal advises avoid concomitant use with ●verapamil
- Cardiac Glycosides: manufacturer of ulipristal advises give **digoxin** at least 1.5 hours before or after ulipristal
- Grapefruit Juice: manufacturer of ulipristal advises avoid concomitant use with ●grapefruit juice
- Progestogens: ulipristal possibly reduces contraceptive effect of ●progestogens
- Ulcer-healing Drugs: manufacturer of *high-dose* ulipristal advises avoid concomitant use with ●histamine H<sub>2</sub>-antagonists and ●proton pump inhibitors (contraceptive effect of ulipristal possibly reduced)

**Ursodeoxycholic Acid** *see* Bile Acids

**Ustekinumab**

- Vaccines: avoid concomitant use of ustekinumab with live ●vaccines (see p. 828)

**Vaccines**

**Note** For a general warning on live vaccines and high doses of corticosteroids or other immunosuppressive drugs, see p. 828; for advice on live vaccines and immunoglobulins, see under Normal Immunoglobulin, p. 852

- Abatacept: avoid concomitant use of live vaccines with ●abatacept (see p. 828)
- Adalimumab: avoid concomitant use of live vaccines with ●adalimumab (see p. 828)
- Alemtuzumab: avoid concomitant use of live vaccines with ●alemtuzumab (see p. 828)
- Anakinra: avoid concomitant use of live vaccines with ●anakinra (see p. 828)
- Antibacterials: oral typhoid vaccine inactivated by ●antibacterials—see p. 850
- Anticoagulants: influenza vaccine possibly enhances anticoagulant effect of **warfarin**
- Antiepileptics: influenza vaccine enhances effects of ●phenytoin
- Antimalarials: oral typhoid vaccine inactivated by ●antimalarials—see p. 850
- Belimumab: avoid concomitant use of live vaccines with ●belimumab (see p. 828)
- Certolizumab pegol: avoid concomitant use of live vaccines with ●certolizumab pegol (see p. 828)
- Corticosteroids: immune response to vaccines impaired by high doses of ●corticosteroids, avoid concomitant use with live vaccines (see p. 828)
- Cytotoxics: avoid concomitant use of live vaccines with ●pixantrone (see p. 828)
- Etanercept: avoid concomitant use of live vaccines with ●etanercept (see p. 828)
- Golimumab: avoid concomitant use of live vaccines with ●golimumab (see p. 828)
- Infliximab: avoid concomitant use of live vaccines with ●infliximab (see p. 828)
- Interferons: avoidance of vaccines advised by manufacturer of **interferon gamma**
- Leflunomide: avoid concomitant use of live vaccines with ●leflunomide (see p. 828)
- Teriflunomide: avoid concomitant use of live vaccines with ●teriflunomide (see p. 828)
- Theophylline: influenza vaccine possibly increases plasma concentration of ●theophylline
- Tocilizumab: avoid concomitant use of live vaccines with ●tocilizumab (see p. 828)
- Ustekinumab: avoid concomitant use of live vaccines with ●ustekinumab (see p. 828)

**Valaciclovir** *see* Aciclovir

**Valganciclovir** *see* Ganciclovir

**Valproate**

- Analgesics: effects of valproate enhanced by ●aspirin
- Antibacterials: metabolism of valproate possibly inhibited by ●erythromycin (increased plasma concentration); avoidance of valproate advised by manufacturer of ●pivmecillinam; plasma concentration of valproate reduced by ●carbapenems—avoid concomitant use
- Anticoagulants: valproate possibly enhances anticoagulant effect of ●coumarins
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by ●MAOIs and ●tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●SSRIs and ●tricyclics (convulsive threshold lowered)
- Antiepileptics: plasma concentration of valproate reduced by ●carbamazepine, also plasma concentration of active metabolite of carbamazepine increased; valproate possibly increases plasma concentration of ●ethosuximide; valproate increases plasma concentration of ●lamotrigine (increased risk of toxicity—reduce lamotrigine dose); valproate sometimes reduces plasma concentration of an active metabolite of ●oxcarbazepine; valproate increases plasma concentration of

**Valproate**

- Antiepileptics (*continued*)
    - phenobarbital (also plasma concentration of valproate reduced); valproate increases or possibly decreases plasma concentration of phenytoin, also plasma concentration of valproate reduced; valproate possibly increases plasma concentration of rifinamide (reduce dose of rifinamide); hyperammonaemia and CNS toxicity reported when valproate given with topiramate
  - Antimalarials: anticonvulsant effect of antiepileptics antagonised by mefloquine
  - Antipsychotics: anticonvulsant effect of antiepileptics antagonised by antipsychotics (convulsive threshold lowered); valproate possibly increases or decreases plasma concentration of clozapine; increased risk of side-effects including neutropenia when valproate given with olanzapine
- Antivirals: plasma concentration of valproate possibly reduced by ritonavir; valproate possibly increases plasma concentration of zidovudine (increased risk of toxicity)
- Anxiolytics and Hypnotics: plasma concentration of valproate possibly increased by clobazam; increased risk of side-effects when valproate given with clonazepam; valproate possibly increases plasma concentration of diazepam and lorazepam
- Bupropion: valproate inhibits the metabolism of bupropion
- Cytotoxics: valproate increases plasma concentration of temozolomide
- Lipid-regulating Drugs: absorption of valproate possibly reduced by colestyramine
- Oestrogens: plasma concentration of valproate possibly reduced by ethinylestradiol
- Orlistat: possible increased risk of convulsions when antiepileptics given with orlistat
- Sodium Benzoate: valproate possibly reduces effects of sodium benzoate
- Sodium Phenylbutyrate: valproate possibly reduces effects of sodium phenylbutyrate
- Ulcer-healing Drugs: metabolism of valproate inhibited by cimetidine (increased plasma concentration)

**Valsartan** *see* Angiotensin-II Receptor Antagonists**Vancomycin**

- Anaesthetics, General: hypersensitivity-like reactions can occur when intravenous vancomycin given with general anaesthetics
- Antibacterials: increased risk of nephrotoxicity and ototoxicity when vancomycin given with aminoglycosides, capreomycin or colistimethate sodium; increased risk of nephrotoxicity when vancomycin given with polymyxins
- Antifungals: possible increased risk of nephrotoxicity when vancomycin given with amphotericin
- Ciclosporin: increased risk of nephrotoxicity when vancomycin given with ciclosporin
- Cytotoxics: increased risk of nephrotoxicity and possibly of ototoxicity when vancomycin given with cisplatin
- Diuretics: increased risk of ototoxicity when vancomycin given with loop diuretics
- Lipid-regulating Drugs: effects of oral vancomycin antagonised by colestyramine
- Muscle Relaxants: vancomycin enhances effects of suxamethonium
- Tacrolimus: possible increased risk of nephrotoxicity when vancomycin given with tacrolimus
- Vaccines: antibacterials inactivate oral typhoid vaccine—*see* p. 850

**Vandetanib**

- Analgesics: possible increased risk of ventricular arrhythmias when vandetanib given with methadone—avoid concomitant use

**Vandetanib** (*continued*)

- Anti-arrhythmics: possible increased risk of ventricular arrhythmias when vandetanib given with amiodarone or disopyramide—avoid concomitant use
  - Antibacterials: possible increased risk of ventricular arrhythmias when vandetanib given with parenteral erythromycin—avoid concomitant use; possible increased risk of ventricular arrhythmias when vandetanib given with moxifloxacin—avoid concomitant use; plasma concentration of vandetanib reduced by rifampicin—manufacturer of vandetanib advises avoid concomitant use
- Antidepressants: manufacturer of vandetanib advises avoid concomitant use with St John's wort (plasma concentration of vandetanib possibly reduced)
- Antidiabetics: vandetanib possibly increases plasma concentration of metformin (consider reducing dose of metformin)
- Antiepileptics: manufacturer of vandetanib advises avoid concomitant use with carbamazepine and phenobarbital (plasma concentration of vandetanib possibly reduced)
- Antihistamines: possible increased risk of ventricular arrhythmias when vandetanib given with mizolastine—avoid concomitant use
  - Antimalarials: possible increased risk of ventricular arrhythmias when vandetanib given with artemether with lumefantrine—avoid concomitant use
  - Antipsychotics: possible increased risk of ventricular arrhythmias when vandetanib given with amisulpride, chlorpromazine, haloperidol, pimozide, sulpiride or zuclopenthixol—avoid concomitant use; avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)
  - Beta-blockers: possible increased risk of ventricular arrhythmias when vandetanib given with sotalol—avoid concomitant use
- Cardiac Glycosides: vandetanib increases plasma concentration of digoxin—possible increased risk of bradycardia
- Cytotoxics: possible increased risk of ventricular arrhythmias when vandetanib given with arsenic trioxide—avoid concomitant use
  - Hormone Antagonists: possible increased risk of ventricular arrhythmias when vandetanib given with toremifene—avoid concomitant use
  - 5HT<sub>2</sub>-receptor Antagonists: increased risk of ventricular arrhythmias when vandetanib given with ondansetron—avoid concomitant use
  - Pentamidine Isetionate: possible increased risk of ventricular arrhythmias when vandetanib given with pentamidine isetionate—avoid concomitant use
- Vardenafil**
- Alpha-blockers: enhanced hypotensive effect when vardenafil given with alpha-blockers—separate doses by 6 hours (except with tamsulosin)—*see* also p. 558
- Anti-arrhythmics: avoidance of vardenafil advised by manufacturer of disopyramide (risk of ventricular arrhythmias)
- Antibacterials: plasma concentration of vardenafil possibly increased by clarithromycin (consider reducing initial dose of vardenafil); plasma concentration of vardenafil increased by erythromycin (reduce dose of vardenafil)
- Antifungals: plasma concentration of vardenafil possibly increased by itraconazole—avoid concomitant use
- Antivirals: plasma concentration of vardenafil possibly increased by fosamprenavir; plasma concentration of vardenafil increased by indinavir and ritonavir—avoid concomitant use; increased risk of ventricular arrhythmias when vardenafil given with saquinavir—avoid concomitant use; avoidance of vardenafil advised by manufacturer of telaprevir;

**Vardenafil**

- Antivirals (*continued*)  
caution with vardenafil advised by manufacturer of **tipranavir**  
Calcium-channel Blockers: enhanced hypotensive effect when vardenafil given with **nifedipine**
- Cobicistat: plasma concentration of vardenafil possibly increased by ●**cobicistat**—manufacturer of cobicistat advises reduce dose of vardenafil (consult cobicistat product literature)
- Dapoxetine: avoidance of vardenafil advised by manufacturer of **dapoxetine**
- Grapefruit Juice: plasma concentration of vardenafil possibly increased by ●**grapefruit juice**—avoid concomitant use
- Nicorandil: possible increased hypotensive effect when vardenafil given with ●**nicorandil**—avoid concomitant use
- Nitrates: possible increased hypotensive effect when vardenafil given with ●**nitrates**—avoid concomitant use
- Riociguat: possible enhanced hypotensive effect when vardenafil given with ●**riociguat**—avoid concomitant use

**Varicella-zoster Vaccine** *see* Vaccines

**Vasodilator Antihypertensives**

- ACE Inhibitors: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **ACE inhibitors**
- Adrenergic Neurone Blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **adrenergic neurone blockers**
- Alcohol: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **alcohol**
- Aldesleukin: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **aldesleukin**
- Alpha-blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **alpha-blockers**
- Anaesthetics, General: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **general anaesthetics**
- Analgesics: hypotensive effect of hydralazine, minoxidil and sodium nitroprusside antagonised by **NSAIDs**
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **angiotensin-II receptor antagonists**
- Antidepressants: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **MAOIs**; enhanced hypotensive effect when hydralazine or sodium nitroprusside given with **tricyclic-related antidepressants**
- Antipsychotics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **phenothiazines**
- Anxiolytics and Hypnotics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **anxiolytics and hypnotics**
- Beta-blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **beta-blockers**
- Calcium-channel Blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **calcium-channel blockers**
- Clonidine: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **clonidine**
- Corticosteroids: hypotensive effect of hydralazine, minoxidil and sodium nitroprusside antagonised by **corticosteroids**

**Vasodilator Antihypertensives** (*continued*)

- Diazoxide: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **diazoxide**
- Diuretics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **diuretics**
- Dopaminergics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **levodopa**
- Methyldopa: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **methyldopa**
- Moxisylyte: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **moxisylyte**
- Moxonidine: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **moxonidine**
- Muscle Relaxants: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **baclofen**; enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **tizanidine**
- Nicorandil: possible enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **nicorandil**
- Nitrates: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **nitrates**
- Oestrogens: hypotensive effect of hydralazine, minoxidil and sodium nitroprusside antagonised by **oestrogens**
- Prostaglandins: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with **alprostadil**
- Vasodilator Antihypertensives: enhanced hypotensive effect when hydralazine given with **minoxidil** or **sodium nitroprusside**; enhanced hypotensive effect when minoxidil given with **sodium nitroprusside**
- Vecuronium** *see* Muscle Relaxants
- Vemurafenib**
- Antibacterials: manufacturer of vemurafenib advises avoid concomitant use with **rifabutin** and **rifampicin**
- Anticoagulants: vemurafenib possibly enhances anticoagulant effect of ●**warfarin**
- Antidepressants: manufacturer of vemurafenib advises avoid concomitant use with **St John's wort**
- Antiepileptics: manufacturer of vemurafenib advises avoid concomitant use with **carbamazepine** and **phenytoin**
- Antipsychotics: avoid concomitant use of cytotoxics with ●**clozapine** (increased risk of agranulocytosis)
- Cytotoxics: avoidance of vemurafenib advised by manufacturer of **ipilimumab**- Oestrogens: manufacturer of vemurafenib advises contraceptive effect of ●**oestrogens** possibly reduced
- Progestogens: manufacturer of vemurafenib advises contraceptive effect of ●**progestogens** possibly reduced

**Venlafaxine**

- Analgesics: increased risk of bleeding when venlafaxine given with ●**NSAIDs** or ●**aspirin**; possible increased serotonergic effects when SSRI-related antidepressants given with **fentanyl**; possible increased serotonergic effects when venlafaxine given with **tramadol**
- Anticoagulants: venlafaxine possibly enhances anticoagulant effect of ●**warfarin**; possible increased risk of bleeding when SSRI-related antidepressants given with ●**dabigatran**
- Antidepressants: possible increased serotonergic effects when venlafaxine given with **St John's wort**, **duloxetine** or **mirtazapine**; enhanced CNS effects and toxicity when venlafaxine given with

### Venlafaxine

- Antidepressants (*continued*)
    - MAOIs (venlafaxine should not be started until 2 weeks after stopping MAOIs, avoid MAOIs for 1 week after stopping venlafaxine); after stopping SSRI-related antidepressants do not start •moclomide for at least 1 week
  - Antimalarials: avoidance of antidepressants advised by manufacturer of •artemether with lumefantrine and •piperazine with arteminol
- Antipsychotics: venlafaxine increases plasma concentration of haloperidol
- Atomoxetine: possible increased risk of convulsions when antidepressants given with atomoxetine
- Dapoxetine: possible increased risk of serotonergic effects when venlafaxine given with •dapoxetine (manufacturer of dapoxetine advises venlafaxine should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping venlafaxine)
  - Dopaminergics: caution with venlafaxine advised by manufacturer of entacapone; increased risk of hypertension and CNS excitation when venlafaxine given with •selegiline (selegiline should not be started until 1 week after stopping venlafaxine, avoid venlafaxine for 2 weeks after stopping selegiline)
- 5HT<sub>1</sub>-receptor Agonists: possible increased serotonergic effects when venlafaxine given with 5HT<sub>1</sub> agonists
- Lithium: possible increased serotonergic effects when venlafaxine given with lithium
- Methylthionium: risk of CNS toxicity when SSRI-related antidepressants given with •methylthionium—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthionium and observe patient for up to 4 hours after administration)

Verapamil *see* Calcium-channel Blockers

### Vigabatrin

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and •tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by •SSRIs and •tricyclics (convulsive threshold lowered)
- Antiepileptics: vigabatrin reduces plasma concentration of phenytoin
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by •mefloquine
  - Antipsychotics: anticonvulsant effect of antiepileptics antagonised by •antipsychotics (convulsive threshold lowered)
  - Orlistat: possible increased risk of convulsions when antiepileptics given with •orlistat

Vilanterol *see* Sympathomimetics, Beta<sub>2</sub>

Vildagliptin *see* Antidiabetics

### Vinblastine

- Aldesleukin: avoidance of vinblastine advised by manufacturer of •aldesleukin
  - Antibacterials: toxicity of vinblastine increased by •erythromycin—avoid concomitant use
  - Antifungals: possible increased risk of vinblastine toxicity when given with •itraconazole; metabolism of vinblastine possibly inhibited by •posaconazole (increased risk of neurotoxicity)
  - Antimalarials: avoidance of vinblastine advised by manufacturer of •piperazine with arteminol
  - Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)
- Antivirals: plasma concentration of vinblastine possibly increased by ritonavir

### Vincristine

- Antifungals: increased risk of vincristine toxicity when given with •itraconazole; metabolism of vincristine

### Vincristine

- Antifungals (*continued*)
    - possibly inhibited by •posaconazole (increased risk of neurotoxicity)
  - Antimalarials: avoidance of vincristine advised by manufacturer of •piperazine with arteminol
  - Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)
- Calcium-channel Blockers: metabolism of vincristine possibly inhibited by nifedipine
- Cardiac Glycosides: vincristine possibly reduces absorption of digoxin tablets

### Vindesine

- Antifungals: possible increased risk of vindesine toxicity when given with •itraconazole
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

### Vinflunine

- Antibacterials: plasma concentration of vinflunine possibly reduced by •rifampicin—manufacturer of vinflunine advises avoid concomitant use
  - Antidepressants: plasma concentration of vinflunine possibly reduced by •St John's wort—manufacturer of vinflunine advises avoid concomitant use
  - Antifungals: possible increased risk of vinflunine toxicity when given with •itraconazole
  - Antimalarials: avoidance of vinflunine advised by manufacturer of •piperazine with arteminol
  - Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)
  - Antivirals: plasma concentration of vinflunine possibly increased by •ritonavir—manufacturer of vinflunine advises avoid concomitant use
- Grapefruit Juice: plasma concentration of vinflunine possibly increased by grapefruit juice—manufacturer of vinflunine advises avoid concomitant use

### Vinorelbine

- Antibacterials: possible increased risk of neutropenia when vinorelbine given with •clarithromycin
- Antifungals: possible increased risk of vinorelbine toxicity when given with •itraconazole
- Antimalarials: avoidance of vinorelbine advised by manufacturer of •piperazine with arteminol
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

### Vismodegib

- Antibacterials: manufacturer of vismodegib advises avoid concomitant use with •rifampicin (plasma concentration of vismodegib possibly reduced)
- Antidepressants: manufacturer of vismodegib advises avoid concomitant use with •St John's wort (plasma concentration of vismodegib possibly reduced)
- Antiepileptics: manufacturer of vismodegib advises avoid concomitant use with •carbamazepine and •phenytoin (plasma concentration of vismodegib possibly reduced)
- Antipsychotics: avoid concomitant use of cytotoxics with •clozapine (increased risk of agranulocytosis)

Vitamin A *see* Vitamins

Vitamin D *see* Vitamins

Vitamin E *see* Vitamins

Vitamin K (Phytomenadione) *see* Vitamins

### Vitamins

- Antibacterials: absorption of vitamin A possibly reduced by neomycin
- Anticoagulants: vitamin E possibly enhances anticoagulant effect of •coumarins; vitamin K antagonises anticoagulant effect of •coumarins and •phenindione
- Antiepileptics: vitamin D requirements possibly increased when given with carbamazepine, phenobarbital or phenytoin
- Antivirals: increased risk of bleeding when high doses of vitamin E given with tipranavir

**Vitamins** (*continued*)

Ciclosporin: vitamin E possibly affects plasma concentration of **ciclosporin**

Diuretics: increased risk of hypercalcaemia when vitamin D given with **thiazides and related diuretics**

Dopaminergics: pyridoxine reduces effects of **levodopa** when given without dopa-decarboxylase inhibitor

Lipid-regulating Drugs: absorption of calcitriol possibly reduced by **colestyramine** (give at least 1 hour before or 4 to 6 hours after colestyramine)

- **Retinoids**: risk of hypervitaminosis A when vitamin A given with ●**retinoids**—avoid concomitant use
- Selenium: ascorbic acid possibly reduces absorption of **selenium** (give at least 4 hours apart)
- Sevelamer: absorption of calcitriol reduced by **sevelamer** (give at least 1 hour before or 3 hours after sevelamer)

**Voriconazole** *see* Antifungals, Triazoles

**Warfarin** *see* Coumarins

**Xipamide** *see* Diuretics

**Xylometazoline** *see* Sympathomimetics

**Zafirlukast** *see* Leukotriene Receptor Antagonists

**Zaleplon** *see* Anxiolytics and Hypnotics

**Zidovudine**

**Note** Increased risk of toxicity with nephrotoxic and myelosuppressive drugs—for further details consult product literature

Analgesics: increased risk of haematological toxicity when zidovudine given with **NSAIDs**; plasma concentration of zidovudine possibly increased by **methadone**

Antibacterials: absorption of zidovudine reduced by **clarithromycin** tablets (give at least 2 hours apart); manufacturer of zidovudine advises avoid concomitant use with **rifampicin**

Antiepileptics: zidovudine increases or decreases plasma concentration of **phenytoin**; plasma concentration of zidovudine possibly increased by **valproate** (increased risk of toxicity)

- Antifungals: plasma concentration of zidovudine increased by ●**fluconazole** (increased risk of toxicity)
- Antimalarials: increased antifolate effect when zidovudine given with **pyrimethamine**
- Antivirals: profound myelosuppression when zidovudine given with ●**ganciclovir** (if possible avoid concomitant administration, particularly during initial ganciclovir therapy); increased risk of granulocytopenia when zidovudine given with ●**nevirapine**; increased risk of anaemia when zidovudine given with ●**ribavirin**—avoid concomitant use; zidovudine possibly inhibits effects of ●**stavudine** (manufac-

**Zidovudine**

- Antivirals (*continued*)

turers advise avoid concomitant use); plasma concentration of zidovudine reduced by ●**tipranavir**

Atovaquone: plasma concentration of zidovudine increased by **atovaquone** (increased risk of toxicity)

- Orlistat: absorption of zidovudine possibly reduced by ●**orlistat**
- Probenecid: excretion of zidovudine reduced by ●**probenecid** (increased plasma concentration and risk of toxicity)

**Zinc**

Antibacterials: zinc reduces absorption of **ciprofloxacin**, **levofloxacin**, **moxifloxacin** and **ofloxacin**; zinc reduces absorption of **norfloxacin** (give at least 2 hours apart); zinc reduces absorption of **tetracyclines**, also absorption of zinc reduced by tetracyclines

Calcium Salts: absorption of zinc reduced by **calcium salts**

Eltrombopag: zinc possibly reduces absorption of **eltrombopag** (give at least 4 hours apart)

Iron: absorption of zinc reduced by **oral iron**, also absorption of **oral iron** reduced by zinc

Penicillamine: absorption of zinc reduced by **penicillamine**, also absorption of penicillamine reduced by zinc

Trientine: absorption of zinc reduced by **trientine**, also absorption of trientine reduced by zinc

**Zoledronic Acid** *see* Bisphosphonates

**Zolmitriptan** *see* 5HT<sub>1</sub>-receptor Agonists (under HT)

**Zolpidem** *see* Anxiolytics and Hypnotics

**Zonisamide**

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and ●**tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ●**SSRIs** and ●**tricyclics** (convulsive threshold lowered)

Antiepileptics: plasma concentration of zonisamide reduced by **carbamazepine**, **phenobarbital** and **phenytoin**

- Antimalarials: anticonvulsant effect of antiepileptics antagonised by ●**mefloquine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ●**antipsychotics** (convulsive threshold lowered)
- Diuretics: manufacturer of zonisamide advises avoid concomitant use with **carbonic anhydrase inhibitors** in children
- Orlistat: possible increased risk of convulsions when antiepileptics given with ●**orlistat**

**Zopiclone** *see* Anxiolytics and Hypnotics

**Zuclopenthixol** *see* Antipsychotics

# A2 Borderline substances

<b>A2.1</b>	<b>Enteral feeds (non-disease specific)</b>	<b>998</b>
A2.1.1	Enteral feeds (non-disease specific): less than 5 g protein/100 mL	998
A2.1.2	Enteral feeds (non-disease specific): 5 g (or more) protein/100 mL	1000
A2.1.3	Enteral feeds (non-disease specific): Child under 12 years	1004
<b>A2.2</b>	<b>Nutritional supplements (non-disease specific)</b>	<b>1004</b>
A2.2.1	Nutritional supplements: less than 5 g protein/100 mL	1004
A2.2.2	Nutritional supplements: 5 g (or more) protein/100 mL	1005
<b>A2.3</b>	<b>Specialised formulas</b>	<b>1010</b>
A2.3.1	Specialised formulas: Infant and child	1010
A2.3.2	Specialised formulas for specific clinical conditions	1010
<b>A2.4</b>	<b>Feed supplements</b>	<b>1015</b>
A2.4.1	High-energy supplements	1015
A2.4.2	Fibre, vitamin, and mineral supplements	1020
<b>A2.5</b>	<b>Feed additives</b>	<b>1021</b>
A2.5.1	Special additives for conditions of intolerance	1021
A2.5.2	Feed thickeners and pre-thickened drinks	1021
A2.5.3	Flavouring preparations	1021
<b>A2.6</b>	<b>Foods for special diets</b>	<b>1022</b>
A2.6.1	Gluten-free foods	1022
A2.6.2	Low-protein foods	1024
<b>A2.7</b>	<b>Nutritional supplements for metabolic diseases</b>	<b>1025</b>

In certain conditions some foods (and toilet preparations) have characteristics of drugs and the Advisory Committee on Borderline Substances (ACBS) advises as to the circumstances in which such substances may be regarded as drugs. Prescriptions issued in accordance with the Committee's advice and endorsed 'ACBS' will normally not be investigated.

General Practitioners are reminded that the ACBS recommends products on the basis that they may be regarded as drugs for the management of specified conditions. Doctors should satisfy themselves that the products can safely be prescribed, that patients are adequately monitored and that, where necessary, expert hospital supervision is available.

**Foods which may be prescribed on FP10 (Scotland), or WP10 (Wales)** All the food products listed in this appendix have ACBS approval. The clinical condition for which the product has been approved is included with each entry.

**Note** Foods included in this appendix may contain cariogenic sugars and patients should be advised to take appropriate oral hygiene measures.

**Enteral feeds and supplements** For most enteral feeds and nutritional supplements, the main source of **carbohydrate** is either maltodextrin or glucose syrup; other carbohydrate sources are listed in the relevant table, below. Feeds containing residual lactose (less than 1 g lactose/100 mL formula) are described as 'clinically lactose-free' or 'lactose-free' by some manufacturers. The presence of lactose (including residual lactose) in feeds is indicated in the relevant table, below. The primary sources of **protein** or **amino acids** are included with each product entry. The **fat** or **oil** content is derived from a variety of sources such as vegetables, soya bean, corn, palm nuts, and seeds; where the fat content is derived from animal or fish sources, this information is included in the relevant table, below. The presence of medium chain triglycerides (MCT) is also noted where the quantity exceeds 30% of the fat content.

Enteral feeds and nutritional supplements can contain varying amounts of **vitamins**, **minerals**, and **trace elements**—the manufacturer's product literature should be consulted for more detailed information. For further information on enteral nutrition, see section 9.4.2. Feeds containing vitamin K may affect the INR in patients receiving warfarin; see **interactions**: Appendix 1 (vitamins).

The suitability of food products for patients requiring a vegan, kosher, halal, or other compliant diet should be confirmed with individual manufacturers.

For details of enteral feeds, nutritional supplements, and specialised formulas suitable for infants and children under 12 years see *BNF for Children*.

**Note** Feeds containing more than 6 g/100 mL protein or 2 g/100 mL fibre should be avoided in children unless recommended by an appropriate specialist or dietician.

## Standard ACBS indications

Disease-related malnutrition, intractable malabsorption, pre-operative preparation of malnourished patients, dysphagia, proven inflammatory bowel disease, following total gastrectomy, short-bowel syndrome, bowel fistula

Prices quoted in Appendix 2 are basic NHS net prices; for further information see Prices in the BNF.

## A2.1 Enteral feeds (non-disease specific)

## A2.1.1 Enteral feeds (non-disease specific): less than 5 g protein/100 mL

## A2.1.1.1 Enteral feeds: 1 kcal/mL and less than 5 g protein/100 mL

Not suitable for use in child under 1 year unless otherwise stated; not recommended for child 1–6 years

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Fresubin® Original (Fresenius Kabi)	Liquid (sip or tube feed) <b>per 100 mL</b>	420 kJ (100 kcal)	3.8 g cows' milk soya	13.8 g (sugars 3.5 g <sup>1</sup> )	3.4 g	Nil	Gluten-free Residual lactose Contains fish gelatin Feed in flexible pack contains fish oil and fish gelatin	Standard, p. 997	Bottle: 200 mL = £2.07 Black currant, chocolate, nut, peach, vanilla Flexible pack: 500 mL = £4.02 1000 mL = £7.96 1500 mL = £11.95

## A2.4 Feed supplements

### A2.4.1 High-energy supplements

#### A2.4.1.1 High-energy supplements: carbohydrate

Flavoured carbohydrate supplements are not suitable for child under 1 year; liquid supplements should be diluted before use in child under 5 years

**ACBS Indications:** disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high or readily available carbohydrate supplement

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Caloreen® (Nestlé)	Powder per 100 g	1640 kJ (390 kcal)	Nil	96 g Maltodextrin	Nil	Nil	Gluten-free Lactose-free	See above Not suitable for child under 3 years	Powder: 500 g = £3.69 Unflavoured (10-g measuring scoop provided)
Maxijul® Super Soluble (SHS)	Powder per 100 g	1615 kJ (380 kcal)	Nil	95 g Glucose polymer (sugars 8.6 g)	Nil	Nil	Gluten-free Lactose-free	See above	Sachets: 4 × 132 g = £6.16 Can: 200 g = £2.48 2.5 kg = £19.25 25 kg = £148.21 Unflavoured
Polycal® (Nutricia Clinical)	Powder per 100 g	1630 kJ (384 kcal)	Nil	96 g Maltodextrin (sugars 6 g)	Nil	Nil	Gluten-free Lactose-free	See above	Can: 400 g = £4.09 Neutral (5-g measuring scoop provided)
	Liquid per 100 mL	1050 kJ (247 kcal)	Nil	61.9 g Maltodextrin (sugars 12.2 g)	Nil	Nil	Gluten-free Lactose-free	See above; liquid not suitable for child under 3 years	Bottle: 200 mL = £1.64 Neutral, orange
S.O.S.® (Vitafo)	Powder per 100 g	1590 kJ (380 kcal)	Nil	95 g (sugars 9 g)	Nil	Nil		For use as an emergency regimen in the dietary management of inborn errors of metabolism in adults and children from birth	Sachets <sup>1</sup> : 30 × 21 g (S.O.S. 10) = £7.05; 30 × 31 g (S.O.S. 15) = £10.40; 30 × 42 g (S.O.S. 20) = £14.09; 30 × 52 g (S.O.S. 25) = £17.44
Contents of each sachet should be reconstituted with water to a total volume of 200 mL									
Vitajoule® (Vitafo)	Powder per 100 g	1590 kJ (380 kcal)	Nil	95 g Dried glucose syrup (sugars 9 g)	Nil	Nil	Gluten-free Lactose-free	See above	Can: 500 g = £4.22 2.5 kg = £20.54 25 kg = £123.70 (10-g measuring scoop provided)

1. S.O.S. products are age-range specific—consult product literature

**A2.4.1.2 High-energy supplements: fat**

Liquid supplements should be diluted before use in child under 5 years

**ACBS indications:** disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high fat (or fat and carbohydrate) supplement

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
Calogen® (Nutricia Clinical)	Liquid (emulsion) <b>per 100 mL</b>	1850 kJ (450 kcal) <sup>1</sup>	Nil	100 mg	50 g (LCT 100%)	Nil	Gluten-free Lactose-free	See above	Bottle: 200 mL = £4.36 500 mL = £10.72 Banana <sup>2</sup> , neutral, strawberry <sup>2</sup>
Fresubin® 5 kcal Shot (Fresenius Kabi)	Liquid (emulsion) <b>per 100 mL</b>	2100 kJ (500 kcal)	Nil	4.0 g (sucrose)	53.8 g	400 mg	Gluten-free Lactose-free	See above Not suitable for child under 3 years	Bottle: 120 mL = £2.55 Lemon, neutral
Liquigen® (SHS)	Liquid (emulsion) <b>per 100 mL</b>	1850 kJ (450 kcal)	Nil	Nil	50 g (MCT 97%) Fractio- nated coco- nut oil	Nil	Gluten-free Lactose-free	Steatorrhea associated with cystic fibrosis of the pancreas, intestinal lymphangiectasia, intestinal surgery, chronic liver disease, liver cirrhosis, other proven malabsorption syndromes, ketogenic diet in epilepsy, and in type 1 lipoproteinaemia Not suitable for child under 1 year	Bottle: 250 mL = £8.83
Medium-chain Triglyceride (MCT) Oil (Nutricia Clinical)	Liquid <b>per 100 mL</b>	3515 kJ (855 kcal)	Nil	Nil	MCT 100%	Nil		Nutritional supplement for steatorrhea associated with cystic fibrosis of the pancreas, intestinal lymphangiectasia, intestinal surgery, chronic liver disease and liver cirrhosis, other proven malabsorption syndromes, ketogenic diet in management of epilepsy, type 1 hyperlipoproteinaemia	Bottle: 500 mL = £13.99
<b>Fat and Carbohydrate</b>									
Duocal® Super Soluble	Powder <b>per 100 g</b>	2061 kJ (492 kcal)	Nil	72.7 g (sugars 6.5 g)	22.3 g (MCT 35%)	Nil	Gluten-free Lactose-free	See above	Can: 400 g = £17.23 (5-g measuring scoop provided)

1. Nutritional values vary with flavour—consult product literature

2. Flavour not suitable for child under 3 years

Energivit <sup>®</sup> (SHS)	Standard dilution (15%) of powder <b>per 100 mL</b>	309 kJ (74 kcal)	Nil	10 g (sugars 900 mg)	3.75 g	Nil	Lactose-free With vitamins, minerals, and trace elements	For children requiring additional energy, vitamins, minerals, and trace elements following a protein- restricted diet	Can: 400 g = £20.95 (5-g measuring scoop provided)
Powder provides: carbohydrate 66.7 g, fat 25 g, energy 2059 kJ (492 kcal)/100 g									
MCT Duocal <sup>®</sup> (SHS)	Powder <b>per 100 g</b>	2082 kJ (497 kcal)	Nil	72 g (sugars 10.1 g)	23.2 g (MCT 83%)	Nil		See above	Can: 400 g = £20.47

### A2.4.1.3 High-energy supplements: protein

ACBS indications: disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high fat or carbohydrate (with protein) supplement

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
ProSource <sup>®</sup> Jelly (Nutrinovo)	Semi-solid <b>per 100 mL</b>	315 kJ (75 kcal)	16.9 g collagen protein hydrolysate whey protein isolate	Less than 1 g	Nil	Less than 1 g	Gluten-free Lactose-free Contains porcine derivatives	Hypoproteinaemia Not recommended for child under 3 years	Cup: 118 mL = £1.74 Fruit punch, orange
Protifar <sup>®</sup> (Nutricia Clinical)	Powder <b>per 100 g</b>	1580 kJ (373 kcal)	88.5 g cows' milk	less than 1.5 g	1.6 g	Nil	Gluten-free Residual lactose Electrolytes/100 mL: Na <sup>+</sup> 1.3 mmol K <sup>+</sup> 1.28 mmol Ca <sup>2+</sup> 33.75 mmol P <sup>+</sup> 22.58 mmol	Nutritional supplement for use in biochemically proven hypoproteinaemia	Can: 225 g = £8.31 Unflavoured (2.5-g measuring scoop provided)
Powder provides: protein 2.2 g per 2.5-g scoopful									
Vitapro <sup>®</sup> (Vitafo)	Powder <b>per 100 g</b>	1632 kJ (390 kcal)	75 g whey protein isolate	9 g (sugars 9 g)	6 g	Nil	Contains lactose	Biochemically proven hypoproteinaemia	Tub: 250 g = £8.60 2 kg = £67.60 (5-g measuring scoop provided)

**A2.4.1.3 High-energy supplements: protein** (*product list continued*)**ACBS indications:** disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high fat or carbohydrate (with protein) supplement

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
<b>Protein and carbohydrate</b>									
Dialamine® (SHS)	Standard dilution (20%) of powder <b>per 100 mL</b>	264 kJ (62 kcal)	4.3 g protein equivalent (essential and non-essential amino acids)	11.2 g (sugars 10.2 g)	Nil	Nil	Contains vitamin C	Hypoproteinaemia, chronic renal failure, wound fistula leakage with excessive protein loss, conditions requiring a controlled nitrogen intake, and haemodialysis Not suitable for child under 6 months	Can: 400 g = £69.99 Orange
Powder provides: protein equivalent 25 g, carbohydrate 65 g, vitamin C 125 mg, energy 1530 kJ (360 kcal)/100 g									
ProSource® Liquid (Nutrinovo)	Liquid <b>per 30 mL</b>	420 kJ (100 kcal)	10 g collagen protein whey protein isolate	15 g (sugars 8 g)	Nil	Nil	Gluten-free Lactose-free May contain porcine derivatives	Biochemically proven hypoproteinaemia Not recommended for child under 3 years	Sachet: 100 × 30 mL = £94.19 Citrus-berry, neutral, orange creme
<b>Protein, fat, and carbohydrate</b>									
Calogen® Extra (Nutricia Clinical)	Liquid <b>per 100 mL</b>	1650 kJ (400 kcal) <sup>1</sup>	5 g cows' milk	4.5 g (sugars 3.5 g)	40.3 g	Nil	Gluten-free Residual lactose With vitamins and minerals	See above Not suitable for child under 3 years; use with caution in child 3–6 years May require dilution for child 3–5 years	Bottle: 200 mL = £4.98 Neutral, strawberry
Calogen® Extra Shots (Nutricia Clinical)	Liquid <b>per 100 mL</b>	1650 kJ (400 kcal) <sup>1</sup>	5 g cows' milk	4.5 g (sugars 3.5 g)	40.3 g	Nil	Gluten-free Residual lactose With vitamins and minerals	See above Not suitable for child under 3 years; use with caution in child 3–6 years May require dilution for child 3–5 years	Pot: 6 × 40 mL = £5.75 Neutral, strawberry
Calshake® (Fresenius Kabi)	Powder <b>per 87 g</b>	1841 kJ (439 kcal) <sup>1</sup>	4.1 g cows' milk	56.4 g (sugars 20 g)	22 g	Nil	Contains lactose Gluten-free	See above Not suitable for child under 1 year	Sachet: 87 g = £2.10 Banana, neutral, strawberry, vanilla 90 g = £2.10 Chocolate
Powder: one sachet reconstituted with 240 mL whole milk provides approx. 2 kcal/mL and protein 12 g									
Enshake® (Abbott)	Powder <b>per 100 g</b>	1893 kJ (450 kcal) <sup>1</sup>	8.4 g cows' milk, soy protein isolate	69 g (sugars 14.5 g)	15.6 g	Nil	Residual lactose With vitamins and minerals	See above Not suitable for child under 1 year; use with caution in child 1–6 years	Sachet: 96.5 g = £2.02 Banana, chocolate, strawberry, vanilla
Powder: one sachet reconstituted with 240 mL whole milk provides approx. 2 kcal/mL and protein 16 g									

1. Nutritional values vary with flavour—consult product literature

MCT Procal® (Vitaflo)	Powder per 100 g	2742 kJ (657 kcal)	12.5 g cows' milk	20.6 g (sugars 3.1 g)	63.1 g (MCT 99%)	Nil	Contains lactose	Dietary management of disorders of long-chain fatty acid oxidation, fat malabsorption, and other disorders requiring a low LCT, high MCT supplement Not suitable for child under 1 year	Sachet: 30 × 16 g = £22.91
Powder 16 g provides: protein 2 g, carbohydrate 3.3 g, fat 10.1 g, energy 439 kJ (105 kcal)									
Pro-Cal® (Vitaflo)	Powder per 100 g	2787 kJ (667 kcal)	13.6 g cows' milk	28.2 g (sugars 16 g)	55.5 g	Nil	Contains lactose Gluten-free	See above Not suitable for child under 1 year; use with caution in child 1–5 years	Sachets: 25 × 15 g = £15.26 Tub: 510 g = £14.14 1.5 kg = £28.81 12.5 kg = £204.74 25 kg = £315.52 (15-g measuring scoop provided)
Powder 15 g provides: protein 2 g, carbohydrate 4.2 g, fat 8.3 g, energy 418 kJ (100 kcal)									
Pro-Cal® Shot (Vitaflo)	Liquid per 100 mL	1385 kJ (334 kcal)	6.7 g cows' milk	13.4 g (sugars 13.3 g)	28.2 g	Nil	Gluten-free Contains lactose Contains soya	See above Not suitable for child under 3 years	Bottle: 6 × 250 mL = £27.06 Banana, neutral, strawberry Starter pack (mixed) 3 × 250 mL = £14.67
Pro-Cal® Singles (Vitaflo)	Liquid per 100 mL	1385 kJ (334 kcal) <sup>1</sup>	6.7 g cows' milk soya	13.4 g (sugars 13.3 g)	28.2 g	Nil	Contains lactose Gluten-free	See above Not suitable for child under 3 years	Pot: 60 × 30 mL = £39.22 Neutral, strawberry Starter pack (mixed): 16 × 30 ml = £10.25
Scandishake® Mix (Nutricia Clinical)	Powder per 100 g	2099 kJ (500 kcal) <sup>1</sup>	4.7 g cows' milk	65 g (sugars 14.3 g)	24.7 g	Nil	Gluten-free Contains lactose	See above Not suitable for child under 3 years	Sachet: 85 g = £2.08 Banana, caramel, chocolate, strawberry, vanilla, unflavoured
Powder: 85 g reconstituted with 240 mL whole milk provides: protein 11.7 g, carbohydrate 66.8 g, fat 30.4 g, energy 2457 kJ (588 kcal)									
Vitasavoury® (Vitaflo)	Powder per 100 g	2562 kJ (619 kcal) <sup>1</sup>	12 g cows' milk	22.5 g (sugars 1.4 g)	52 g	6.4 g	Contains lactose Contains soya (chicken flavour)	See above Not suitable for child under 3 years	Cup (200 kcal): 24 × 33 g = £29.97 Sachet (300 kcal) 10 × 50 g = £18.29 Chicken, leek and potato, mushroom, vegetable Starter pack (mixed): 4 × 33-g cups and 4 × 50-g sachets = £11.93

1. Nutritional values vary with flavour—consult product literature

## A2.4.2 Fibre, vitamin, and mineral supplements

Product	Formulation	Energy	Protein	Carbohydrate	Fat	Fibre	Special Characteristics	ACBS Indications	Presentation & Flavour
<b>High-fibre supplements</b>									
Resource <sup>®</sup> Optifibre <sup>®</sup> (Nestlé)	Powder per 100 g	323 kJ (76 kcal)	Nil	19 g guar gum, partially hydrolysed	Nil	78 g	Gluten-free Lactose-free	Standard, p. 997 except dysphagia Not suitable for child under 5 years	Sachets 16 x 10 g = £8.35 Can: 250 g = £10.28 (5-g measuring scoop provided)
<b>Vitamin and Mineral supplements</b>									
FruitVits <sup>®</sup> (Vitafo)	Powder per 100 g	133 kJ (33 kcal)	Nil	8.3 g (sugars 400 mg)	less than 100 mg	3.3 g		Vitamin, mineral, and trace element supplement in children 3– 10 years with restrictive therapeutic diets	Sachets: 30 x 6 g = £61.92 Orange
Paediatric Seravit <sup>®</sup> (SHS)	Powder per 100 g	1275 kJ (300 kcal)	Nil	75 g (sugars 6.75 g <sup>1</sup> )	Nil	Nil		Vitamin, mineral, and trace element supplement in infants and children with restrictive therapeutic diets	Tub: 200 g = £17.07 Unflavoured <sup>2</sup> 200 g = £18.17 Pineapple <sup>3</sup> (5-g measuring scoop provided)
Renavit <sup>®</sup> (Stanningley)	Tablet per 450 mg	3.15 kJ (0.75 kcal)	Nil	170 mg	Nil	Nil		Dietary management of water- soluble vitamin deficiency in adults with renal failure on dialysis	100 x 450-mg tablets = £12.50

1. Sugar content varies with flavour
2. Flavouring: see *Modjul<sup>®</sup> Flavour System*, p. 1021
3. Flavour not suitable for child under 6 months

## A2.5 Feed additives

### A2.5.1 Special additives for conditions of intolerance

#### Colief<sup>®</sup> (Forum)

**Liquid**, lactase 50 000 units/g, Net price 7-mL dropper bottle = £8.40

For the relief of symptoms associated with lactose intolerance in infants, provided that lactose intolerance is confirmed by the presence of reducing substances and/or excessive acid in stools, a low concentration of the corresponding disaccharide enzyme on intestinal biopsy or by breath hydrogen test or lactose intolerance test. For dosage and administration details, consult product literature

#### Fructose

(Laevulose)

For proven glucose/galactose intolerance

#### Glucose

(Dextrose monohydrate)

Net price 500 g = £1.53

For use as an energy supplement in sucrase-isomaltase deficiency

#### VSL#3<sup>®</sup> (Ferring)

**Powder**, containing 8 strains of live, freeze-dried, lactic acid bacteria. Contains traces of soya, gluten, and lactose. Net price 30 × 4.4-g sachets = £32.98  
Nutritional supplement for use under the supervision of a physician, for the maintenance of remission of ileoanal pouchitis induced by antibacterials in adults. For dosage and administration details, consult product literature

### A2.5.2 Feed thickeners and pre-thickened drinks

For pre-thickened infant feeds see *BNF for Children*.

#### Carobel, Instant<sup>®</sup> (Cow & Gate)

**Powder**, carob seed flour. Net price 135 g = £2.80

For thickening feeds in the treatment of vomiting

#### Multi-thick<sup>®</sup> (Abbott)

**Powder**, modified maize starch, gluten- and lactose-free, net price 250 g = £4.83

For thickening of liquids and foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive

#### Nuttilis<sup>®</sup> Clear (Nutricia Clinical)

**Powder**, maltodextrin, xanthan gum, guar gum, gluten- and lactose-free, net price 175 g = £8.46

For thickening of liquids or foods in dysphagia. Not suitable for children under 3 years

#### Nuttilis<sup>®</sup> Powder (Nutricia Clinical)

**Powder**, modified maize starch, gluten- and lactose-free, net price 20 × 12-g sachets = £6.40; 300 g = £4.92.

For thickening of foods in dysphagia. Not suitable for children under 3 years

#### Resource<sup>®</sup> Thickened Drink (Nestlé)

**Liquid**, carbohydrate 22 g, energy: orange 382 kJ (90 kcal); apple 375 kJ (89 kcal)/100 mL. Syrup and custard consistencies. Gluten- and lactose-free, net price 12 × 114-mL cups = £7.80

For dysphagia. Not suitable for children under 1 year

#### Resource<sup>®</sup> ThickenUp<sup>®</sup> (Nestlé)

**Powder**, modified maize starch. Gluten- and lactose-free, net price 227 g = £4.55; 75 × 4.5-g sachet = £17.44

For thickening of foods in dysphagia. Not suitable for children under 1 year

#### Resource<sup>®</sup> ThickenUp Clear (Nestlé)

**Powder**, maltodextrin, xanthan gum, gluten- and lactose-free, net price 125 g = £8.46; 24 × 1.2-g sachets = £5.28

For thickening of liquids or foods in dysphagia. Not suitable for children under 3 years

#### SLO Drinks<sup>®</sup> (SLO Drinks)

**Powder**, carbohydrate content varies with flavour and chosen consistency (3 consistencies available), see product literature. Flavours: black currant, lemon, orange; (hot drinks) chocolate, white coffee, white tea, net price 25 × 115 mL = £7.50.

Nutritional supplement for patient hydration in the dietary management of dysphagia. Not suitable for children under 3 years

#### Thick and Easy<sup>®</sup> (Fresenius Kabi)

**Powder**, modified maize starch, net price 225-g can = £4.93; 100 × 9-g sachets = £30.00; 4.54 kg = £82.56.

For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive

#### Thicken Aid<sup>®</sup> (M & A Pharmachem)

**Powder**, modified maize starch, maltodextrin, gluten- and lactose-free, net price 225 g = £3.71; 100 × 9-g sachets = £22.40

For thickening of foods in dysphagia. Not suitable for children under 1 year

#### Thixo-D<sup>®</sup> (Sutherland)

**Powder**, modified maize starch, gluten-free. Net price 375-g tub = £7.15.

For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive

#### Vitaquick<sup>®</sup> (Vitafo)

**Powder**. Modified maize starch. Net price 300 g = £6.87; 2 kg = £37.93; 6 kg = £98.22.

For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive

### A2.5.3 Flavouring preparations

#### Flavour Mix<sup>®</sup> (Nestlé)

**Powder**, flavours: banana, chocolate, coffee, lemon-lime, strawberry. Net price 60 g = £7.17

#### FlavourPac<sup>®</sup> (Vitafo)

**Powder**, flavours: black currant, lemon, orange, tropical or raspberry, net price 30 × 4-g sachets = £13.29

For use with Vitafo's range of unflavoured protein substitutes for metabolic diseases; not suitable for child under 1 year

#### Modjül<sup>®</sup> Flavour System (SHS)

**Powder**, flavours: black currant, orange, pineapple, 100 g = £11.60; cherry-vanilla, grapefruit, lemon-lime, 20 × 5-g sachets = £11.60

For use with unflavoured SHS products based on peptides or amino acids; not suitable for child under 6 months

## A2.6 Foods for special diets

### A2.6.1 Gluten-free foods

**ACBS indications:** established gluten-sensitive enteropathies including steatorrhoea due to gluten sensitivity, coeliac disease, and dermatitis herpetiformis.

#### Bread

##### Loaves

##### **Barkat**<sup>®</sup> (Gluten Free Foods Ltd)

**Gluten-free.** Loaf, multigrain 500 g = £5.73. Loaf, sliced, wholemeal 500 g = £3.98. Loaf, sliced, part-baked, country-style 250 g = £4.35. Loaf, sliced, part-baked, white 300 g = £4.13, 550 g = £5.78. Rice bread, brown 500 g = £5.73; white 500 g = £5.73

##### **Dietary Specials**<sup>®</sup> (Nutrition Point)

**Gluten-free.** Loaf, sliced, multigrain, brown 400 g = £3.10; white 400 g = £3.10.

##### **Ener-G**<sup>®</sup> (General Dietary)

**Gluten-free.** Loaf, sliced Seattle brown 600 g = £6.04. Rice bread, sliced, brown 474 g = £5.41; white 456 g = £5.41. Rice loaf, sliced 612 g = £5.41. Tapioca bread, sliced 480 g = £5.41

##### **Genius Gluten Free**<sup>®</sup> (Genius Foods)

**Gluten-free.** Loaf, unsliced, brown 400 g = £2.59; white 400 g = £2.59. Loaf, sliced, brown 400 g = £2.69; white 400 g = £2.69. Sandwich bread, sliced, brown 535 g = £3.48; white 535 g = £3.48

##### **Glutafin**<sup>®</sup> (Nutrition Point)

**Gluten-free.** Loaf, sliced, fibre 400 g = £3.77; white 400 g = £3.77

##### **Glutafin**<sup>®</sup> **Select** (Nutrition Point)

**Gluten-free.** Loaf, sliced, fresh, brown 400 g = £3.43; white 400 g = £3.43. Loaf, sliced, fibre 400 g = £3.36; white 400 g = £3.36. Loaf, seeded 400 g = £3.65.

##### **Juvela**<sup>®</sup> (Juvela)

**Gluten-free.** Loaf, sliced, fresh, fibre 400 g = £3.39; white 400 g = £3.69. Loaf, sliced, white 400 g = £3.59; fibre 400 g = £3.54. Loaf, white 400 g = £3.54; fibre 400 g = £3.54. Loaf, part-baked, fibre 400 g = £3.80; white 400 g = £3.95

##### **Lifestyle**<sup>®</sup> (Ultraparm)

**Gluten-free.** Loaf, sliced, brown 400 g = £2.82; high fibre 400 g = £2.82; white 400 g = £2.82. Loaf, brown 400 g = £2.82; high fibre 400 g = £2.82; white 400 g = £2.82

##### **Livwell**<sup>®</sup> (Livwell)

**Gluten-free.** Loaf, sliced, brown (seeded) 200 g = £2.25; white 200 g = £2.25

##### **Proceli**<sup>®</sup> (Proceli)

**Gluten-free.** Loaf, sliced, white 165 g = £2.30; sandwich 155 g = £2.32. Rice bread, brown 220 g = £2.30; sandwich 220 g = £2.30.

##### **Ultra**<sup>®</sup> (Ultraparm)

**Gluten-free.** Loaf, white 400 g = £2.46; high fibre 500 g = £3.35

##### **Warburtons**<sup>®</sup> (Warburtons)

**Gluten free.** Loaf, sliced, brown 400 g = £2.99; white 400 g = £2.99

##### **Wellfoods**<sup>®</sup> (Wellfoods)

**Gluten-free.** Loaf, sliced 600 g = £4.95; unsliced 600 g = £4.85

#### Baguettes, buns and rolls

##### **Barkat**<sup>®</sup> (Gluten Free Foods Ltd)

**Gluten-free.** Baguette, part-baked 200 g = £4.35. Rolls, part-baked 2 x 100 g = £3.98; 6 x 50 g = £4.35

##### **Ener-G**<sup>®</sup> (General Dietary)

**Gluten-free.** Rolls, dinner x 6 = £3.67; white, long 4 x 55 g = £2.95; round 4 x 55 g = £2.95

##### **Glutafin**<sup>®</sup> (Nutrition Point)

**Gluten-free.** Baguette 2 x 175 g = £3.44. Rolls, fibre 4 x 50 g = £3.61; white 4 x 50 g = £3.61

##### **Glutafin**<sup>®</sup> **Select** (Nutrition Point)

**Gluten-free.** Rolls, part-baked, white 4 x 50 g = £3.61; long 2 x 75 g = £2.76

##### **Juvela**<sup>®</sup> (Juvela)

**Gluten-free.** Rolls, fresh, fibre 5 x 85 g = £4.42; white 5 x 85 g = £4.42. Rolls, fibre 5 x 85 g = £4.77; white 5 x 85 g = £4.77. Rolls, part-baked, fibre 5 x 75 g = £4.94; white 5 x 75 g = £4.94

##### **Lifestyle**<sup>®</sup> (Ultraparm)

**Gluten-free.** Rolls, brown 5 x 80 g = £2.82; high fibre 5 x 80 g = £2.82; white 5 x 80 g = £2.82

##### **Livwell**<sup>®</sup> (Livwell)

**Gluten-free.** Baguette, white 140 g = £2.15. Buns, toasting 4 x 45 g = £2.40. Rolls, white 4 = £2.25. Rolls, part-baked, circle (bagel) 2 x 70 g = £2.30; dinner (square) 2 x 80 g = £2.09

##### **Proceli**<sup>®</sup> (Proceli)

**Gluten-free.** Baguette, part-baked 2 x 125 g = £3.24. Buns 4 x 50 g = £3.41. Lunch rolls, white 8 x 34 g = £3.26. Rolls, hotdog 3 x 35 g = £2.24

##### **Warburtons**<sup>®</sup> (Warburtons)

**Gluten-free.** Baguette, 2 x 75 g = £2.79. Rolls, brown 3 x 100 g = £2.49; white 3 x 100 g = £2.49

##### **Wellfoods**<sup>®</sup> (Wellfoods)

**Gluten-free.** Burger buns 4 x 75 g = £3.95. Rolls 4 x 70 g = £3.65

#### Specialty breads

##### **Livwell**<sup>®</sup> (Livwell)

**Gluten-free.** Flat bread (pitta) 4 = £3.00. Tear-drop shape (naan) 2 x 90 g = £3.00

## Cereals

##### **Juvela**<sup>®</sup> (Juvela)

**Gluten-free.** Fibre flakes 300 g = £2.78; flakes 300 g = £2.78; pure oats 500 g = £2.78

##### **Nairns**<sup>®</sup> (Nairns)

**Gluten-free.** Oat porridge 500 g = £2.89

## Cookies and biscuits

### Barkat<sup>®</sup> (Gluten Free Foods Ltd)

**Gluten-free.** Biscuits, coffee-style 200 g = £3.38; digestive 175 g = £2.61

### Ener-G<sup>®</sup> (General Dietary)

**Gluten-free.** Cookies, vanilla 435 g = £6.16

### Glutafin<sup>®</sup> (Nutrition Point)

**Gluten-free.** Biscuits, plain 200 g = £4.06; digestive 150 g = £2.09; savoury shorts 130 g = £2.75; shortbread 100 g = £1.69; sweet (without chocolate or sultanas) 150 g = £2.09; tea 150 g = £2.05

### Juvela<sup>®</sup> (Juvela)

**Gluten-free.** Biscuits, digestive 150 g = £3.05; savoury 150 g = £3.82; sweet 150 g = £2.88, tea 150 g = £3.05

## Crackers, crispbreads, and breadsticks

### Barkat<sup>®</sup> (Gluten Free Foods Ltd)

**Gluten-free.** Crackers, round (matzo) 200 g = £3.52

### Dietary Specials<sup>®</sup> (Nutrition Point)

**Gluten-free.** Cracker bread 150 g = £2.09

### Glutafin<sup>®</sup> (Nutrition Point)

**Gluten-free.** Crackers, high fibre 200 g = £2.84; plain 200 g = £3.39; mini 175 g = £2.90.

### Juvela<sup>®</sup> (Juvela)

**Gluten-free.** Crispbread, plain 200 g = £4.64

### Ultra<sup>®</sup> (Ultraparm)

**Gluten-free.** Crackerbread 200 g = £1.77

### Warburtons<sup>®</sup> (Warburtons)

**Gluten-free.** Crackers, bran 150 g = £2.29

## Flour mixes and xanthan gum

### Flour mixes

#### Barkat<sup>®</sup> (Gluten Free Foods Ltd)

**Gluten-free.** Flour mix, bread 500 g = £6.81. Plain 750 g = £6.98

#### Finax<sup>®</sup> (Drossa)

**Gluten-free.** Flour mix, bread, fibre 1 kg = £9.92. Flour mix 900 g = £8.66; coarse 900 g = £8.66

#### Glutafin<sup>®</sup> (Nutrition Point)

**Gluten-free.** Flour mix, fibre 500 g = £6.53; white 500 g = £6.53

#### Glutafin Select<sup>®</sup> (Nutrition Point)

**Gluten-free.** Bread mix, net price 500 g = £6.53; white 500 g = £6.53. Fibre 500 g = £6.53; white 500 g = £6.53

#### Heron Foods<sup>®</sup> (Gluten Free Foods Ltd)

**Gluten-free.** Flour mix, organic, bread, standard 500 g = £8.96; high fibre 500 g = £8.96

#### Juvela<sup>®</sup> (Juvela)

**Gluten-free.** Flour mix, fibre 500 g = £7.35; plain 500 g = £7.35; harvest 500 g = £7.35

#### Mrs Crimbles<sup>®</sup> (Stiletto Foods)

**Gluten-free.** Bread mix, net price 275 g = £1.04. Pastry mix, net price 200 g = £1.04

### Organi<sup>®</sup> (Community)

**Gluten-free.** Flour mix, bread 450 g = £3.10. Self-raising 500 g = £3.10. Pastry and pizza 375 g = £3.80

### Procelli<sup>®</sup> (Proceli)

**Gluten-free.** Flour mix, white 1 kg = £9.95

### Pure<sup>®</sup> (Innovative)

**Gluten-free.** Flour mix, blended 1 kg = £4.23. Potato starch 500 g = £1.68. Rice, brown 500 g = £1.58; white 500 g = £1.68. Tapioca starch 500 g = £2.26. Teff, brown 1 kg = £4.77; white 1 kg = £4.77

### Tobia<sup>®</sup> (Tobia Teff)

**Gluten-free.** Flour mix, teff, brown 1 kg = £3.30; white 1 kg = £3.30

### Tritamyl<sup>®</sup> (Gluten Free Foods Ltd)

**Gluten-free.** Flour mix, bread, brown 1 kg = £7.10; white 2 kg = £14.26. Plain 2 kg = £14.26

### Wellfoods<sup>®</sup> (Wellfoods)

**Gluten-free.** Flour mix, plain 1 kg = £7.65

## Xanthan gum

### Ener-G<sup>®</sup> (General Dietary)

**Gluten-free.** Xanthan gum 170 g = £8.53

### Pure<sup>®</sup> (Innovative)

**Gluten-free.** Xanthan gum 100 g = £6.66

## Pasta

### Barkat<sup>®</sup> (Gluten Free Foods Ltd)

**Gluten-free.** Pasta, animal shapes 500 g = £5.88; macaroni 500 g = £5.88; spaghetti 500 g = £5.88; spirals 500 g = £5.88; tagliatelle 500 g = £5.88. Buckwheat, penne 250 g = £2.93; spirals 250 g = £2.93

### BiAlimenta<sup>®</sup> (Drossa)

**Gluten-free.** Pasta, acini di pepe 500 g = £5.97; formati misti 500 g = £5.97; penne 500 g = £5.97; sagnette 500 g = £5.97; spirali 500 g = £5.97; tubetti 500 g = £5.90; potato-based, gnocchi 500 g = £5.59; perle di gnocchi 500 g = £5.60.

### Dietary Specials<sup>®</sup> (Nutrition Point)

**Gluten-free.** Pasta, fusilli 500 g = £3.54; penne 500 g = £3.54; spaghetti 500 g = £3.54

### Ener-G<sup>®</sup> (General Dietary)

**Gluten-free.** Pasta, rice-based, lasagne 454 g = £5.03; macaroni 454 g = £5.03; shells, small 454 g = £5.03; spaghetti 454 g = £5.03; vermicelli 300 g = £5.03

### Glutafin<sup>®</sup> (Nutrition Point)

**Gluten-free.** Pasta, lasagne 250 g = £3.46; macaroni penne 500 g = £6.60; shells 500 g = £6.60; spirals 500 g = £6.60; spaghetti, long 500 g = £6.60; tagliatelle 250 g = £3.46

### Juvela<sup>®</sup> (Juvela)

**Gluten-free.** Pasta, fusilli 500 g = £7.21; lasagne 250 g = £3.68; macaroni 500 g = £7.21; spaghetti 500 g = £7.21; tagliatelle 250 g = £3.47. Fibre, linguine 500 g = £5.79; penne 500 g = £6.61

**Orgran®** (Community)

**Gluten-free.** Pasta, rice and corn, lasagne 200 g = £3.13; macaroni 250 g = £2.42. Spirals, buckwheat 250 g = £2.42; corn 250 g = £2.42; brown rice 250 g = £2.42; rice and corn 250 g = £2.42; rice and millet 250 g = £2.42

**Proceli®** (Proceli)

**Gluten-free.** Pasta, macaroni penne 250 g = £2.95; spirals 250 g = £2.59

**Rizopia®** (PGR Health Foods)

**Gluten-free.** Pasta, brown rice, fusilli 500 g = £2.72; lasagne 375 g = £2.72; penne 500 g = £2.72; spaghetti 500 g = £2.72

**Ultra®** (Ultraparm)

**Gluten-free.** Pasta, fusilli 250 g = £2.95; penne 250 g = £2.95; spaghetti 250 g = £2.95

**Pizza bases****Barkat®** (Gluten Free Foods Ltd)

**Gluten-free.** Pizza crust, rice, brown 150 g = £5.00; white 150 g = £5.00

**Dietary Specials®** (Nutrition Point)

**Gluten-free.** Pizza base 2 × 150 g = £5.68

**Glutafin®** (Nutrition Point)

**Gluten-free.** Pizza base 2 × 150 g = £6.43

**Juvela®** (Juvela)

**Gluten-free.** Pizza base 2 × 180 g = £8.78

**Proceli®** (Proceli)

**Gluten-free.** Pizza base 2 × 250 g = £3.90

**Ultra®** (Ultraparm)

**Gluten-free.** Pizza base 2 × 200 g = £2.65

**Wellfoods®** (Wellfoods)

**Gluten-free.** Pizza base 2 × 300 g = £8.95

**A2.6.1.1 Gluten- and wheat-free foods**

**ACBS indications:** established gluten-sensitive enteropathies with coexisting established wheat sensitivity only.

**Ener-G®** (General Dietary)

**Gluten-free, wheat-free.** Bread loaf, six flour 576 g = £4.54. Rolls, Seattle brown, round (hamburger) 4 × 119 g = £3.96; long (hot dog) 4 × 119 g = £3.96. Pizza base, 3 × 124 g = £4.74

**Glutafin®** (Nutrition Point)

**Gluten-free, wheat-free.** Flour mix, bread 500 g = £6.53; fibre 500 g = £6.53. Crispbread 150 g = £3.19

**Heron Foods®** (Gluten Free Foods Ltd)

**Gluten-free, wheat-free.** Flour mix, organic, bread, fibre 500 g = £8.96. Bread and cake mix 500 g = £8.96

**A2.6.2 Low-protein foods**

**ACBS indications:** inherited metabolic disorders, renal or liver failure, requiring a low-protein diet

**Bread****Ener-G®** (General Dietary)

**Low protein.** Rice bread, 600 g = £5.54

**Juvela®** (Juvela)

**Low protein.** Loaf, sliced 400 g = £3.64. Rolls 5 × 70 g = £4.52

**Loprofin®** (SHS)

**Low protein.** Loaf, part-baked, sliced 400 g = £3.80. Rolls, part-baked 4 × 65 g = £4.00

**PK Foods®** (Gluten Free Foods Ltd)

**Low protein.** Loaf, white, sliced 550 g = £4.75

**Cake, biscuits, and snacks****Harifen®** (Ultraparm)

**Low protein.** Cracker toast, 200 g = £2.75

**Juvela®** (Juvela)

**Low-protein.** Cookies, cinnamon 125 g = £7.62; chocolate chip 110 g = £7.62; orange 125 g = £7.62

**Loprofin®** (SHS)

**Low-protein.** Wafers, chocolate 100 g = £2.46; vanilla 100 g = £2.46. Crackers 150 g = £3.45, herb 150 g = £3.45

**PK Foods®** (Gluten Free Foods Ltd)

**Low-protein.** *Aminex®* biscuits 200 g = £5.04; cookies 150 g = £5.04. Cookies, chocolate chip 150 g = £5.04; cinnamon 150 g = £5.04; orange 150 g = £5.04. Rusks 200 g = £5.04. Crispbread 75 g = £2.42

**Promin®** (Firstplay Dietary)

**Low-protein.** Fried maize and potato starch 'Snax', cheese and onion 12 × 25 g = £9.84; jalapeno 12 × 25 g = £9.84; ready-salted 12 × 25 g = £9.84; salt and vinegar 12 × 25 g = £9.84

**Taranis®** (Firstplay Dietary)

**Low-protein.** Cake bars, apricot 6 × 40 g = £5.91, lemon 6 × 40 g = £5.91, pear 6 × 40 g = £5.91

**Vita Bite®** (Vitaflo)

**Low protein.** Bar, protein 30 mg (less than 2.5 mg phenylalanine), carbohydrate 15.35 g, fat 8.4 g, energy 572 kJ (137 kcal)/25 g. Chocolate flavoured, 25 g = £1.06.

Not recommended for any child under 1 year

**Vitaflo Choices®** (Vitaflo)

**Low-protein.** Mini crackers, 40 g = £0.82  
Not suitable for child under 3 years

**Cereals****Loprofin®** (SHS)

**Low-protein.** Breakfast cereal flakes, apple 375 g = £7.60; chocolate 375 g = £7.60; strawberry 375 g = £7.60. Cereal loops 375 g = £7.88

**Promin**<sup>®</sup> (Firstplay Dietary)

**Low-protein.** Hot breakfast (powder sachets), apple and cinnamon 6 × 57 g = £7.87, banana 6 × 57 g = £7.87, chocolate 6 × 57 g = £7.87; original 6 × 56 g = £7.87

**Desserts****Looprofin**<sup>®</sup> (SHS)

**Low-protein.** Powder, chocolate 150 g = £4.65; strawberry 150 g = £4.65; vanilla 150 g = £4.65

**PK Foods**<sup>®</sup> (Gluten Free Foods Ltd)

**Low-protein.** Jelly, orange 4 × 80 g = £8.03, cherry 4 × 80 g = £8.03

**Promin**<sup>®</sup> (Firstplay Dietary)

**Low-protein.** Dessert mix, caramel 6 × 36.5 g = £6.18; custard 6 × 36.5 g = £6.18; chocolate and banana 6 × 36.5 g = £6.18; strawberry and vanilla 6 × 36.5 g = £6.18. Rice pudding imitation, apple 4 × 69 g = £6.18; banana 4 × 69 g = £6.18; original 4 × 69 g = £6.18; strawberry 4 × 69 g = £6.18

**Flour mixes and egg substitutes****Ener-G**<sup>®</sup> (General Dietary)

**Low-protein.** Egg replacer 454 g = £5.11

**Fate**<sup>®</sup> (Fate)

**Low protein.** All purpose mix 500 g = £6.97. Cake mix, 2 × 250 g = £6.97; chocolate-flavour 2 × 250 g = £6.97

**Juvela**<sup>®</sup> (Juvela)

**Low-protein.** Mix 500 g = £7.79

**Looprofin**<sup>®</sup> (SHS)

**Low-protein.** Mix, plain 500 g = £8.03; chocolate 500 g = £8.50; lemon 500 g = £8.50. Egg replacer 2 × 250 g = £14.78. Egg-white replacer 100 g = £9.50

**PK Foods**<sup>®</sup> (Gluten Free Foods Ltd)

**Low-protein.** Flour mix 750 g = £10.71. Egg replacer 350 g = £5.04

**Pasta****Looprofin**<sup>®</sup> (SHS)

**Low-protein.** Pasta, animal shapes 500 g = £8.09; spirals 500 g = £8.41; lasagne 250 g = £4.09; macaroni elbows 250 g = £4.04; penne 500 g = £8.41; spaghetti 500 g = £8.41; tagliatelle 250 g = £4.04; vermicelli 250 g = £4.17. Rice, imitation 500 g = £8.16

**Promin**<sup>®</sup> (Firstplay Dietary)

**Low-protein.** Pasta, alphabet shapes 500 g = £6.80; lasagne sheets 200 g = £2.95; macaroni 500 g = £6.80; noodles, flat 500 g = £6.80; shells 500 g = £6.80; spaghetti, short-cut 500 g = £6.80; spirals 500 g = £6.80. Rice, imitation 500 g = £6.80. Tricolour pasta, alphabet shapes 500 g = £6.80; shells 500 g = £6.80; spirals 500 g = £6.80.

**Pizza bases****Juvela**<sup>®</sup> (Juvela)

**Low-protein.** Pizza base 2 × 180 g = £8.61

**Savoury meals and mixes****Promin**<sup>®</sup> (Firstplay Dietary)

**Low-protein.** Burger mix 2 × 62 g = £6.18; lamb & mint 2 × 62 g = £6.18. Couscous 500 g = £6.80. Pasta elbows in cheese and broccoli sauce 4 × 66 g = £8.08. Pasta meal 500 g = £6.80. Pasta shells in tomato, pepper, and herb sauce 4 × 72 g = £8.08. Pasta spirals in Moroccan sauce 4 × 72 g = £8.08. Sausage mix, apple & sage 4 × 30 g = £6.95; original 4 × 30 g = £6.95; tomato & basil 4 × 30 g = £6.95. Mac pot, cheese 4 × 61 g = £18.60; tomato 4 × 61 g = £18.60. Potato pot, cabbage and bacon 4 × 50 g = £15.95; onion 4 × 50 g = £15.95; sausage 4 × 50 g = £15.95. Xpot, all day scramble 4 × 60 g = £20.36; beef and tomato 4 × 60 g = £20.36; chip shop curry 4 × 60 g = £20.36; rogan style curry 4 × 60 g = £20.36

**Spreads****Taranis**<sup>®</sup> (Firstplay Dietary)

**Low-protein.** Spread, hazelnut 230 g = £7.65

**A2.7 Nutritional supplements for metabolic diseases****Glutaric aciduria (type 1)****GA1 Anamix**<sup>®</sup> Infant (SHS)

**Powder,** protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided) Nutritional supplement for the dietary management of proven glutaric aciduria (type 1) in children from birth to 3 years

**GA Gel**<sup>®</sup> (VitaFlo)

**Gel,** protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 10 g, carbohydrate 10.3 g, fat trace, energy 339 kJ (81 kcal)/24 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring; see *FlavourPac*<sup>®</sup>, p. 1021), net price 30 × 24-g sachets = £204.80 Nutritional supplement for dietary management of type 1 glutaric aciduria in children 6 months–10 years

**<sup>1</sup>XYLS, Low TRY, Maxamaid**<sup>®</sup> (SHS)

**Powder,** protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring; see *Modjuul*<sup>®</sup> *Flavour System*, p. 1021), net price 500 g = £93.59 Nutritional supplement for the dietary management of type 1 glutaric aciduria

1. Maxamaid products are generally intended for use in children 1–8 years

**XLYS, TRY Glutaridon<sup>®</sup>** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except lysine and tryptophan) 79 g, carbohydrate 4 g, energy 1411 kJ (332 kcal)/100 g. Unflavoured (flavouring: see *Modjul<sup>®</sup> Flavour System*, p. 1021), net price 2 × 500 g = £312.84

Nutritional supplement for the dietary management of type 1 glutaric aciduria in children and adults; requires additional source of vitamins, minerals, and trace elements

### ▲ Glycogen storage disease

**Corn flour and corn starch**

For glycogen storage disease

**Glycosade<sup>®</sup>** (Vitaflo)

**Powder**, protein 200 mg, carbohydrate (maize starch) 47.6 g, fat 100 mg, fibre less than 600 mg, energy 803 kJ (192 kcal)/60 g, net price 30 × 60-g sachets = £107.64

Nutritional supplement for use in the dietary management of glycogen storage disease and other metabolic conditions where a constant supply of glucose is essential. Not suitable for children under 2 years

### ▲ Homocystinuria or hypermethioninaemia

**HCU Anamix<sup>®</sup> Infant** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except methionine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven vitamin B<sub>6</sub> non-responsive homocystinuria or hypermethioninaemia in children from birth to 3 years

**HCU cooler<sup>®</sup> 15** (Vitaflo)

**Liquid**, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 7 g, fat 500 mg, energy 393 kJ (92 kcal)/130 mL, with vitamins, minerals, and trace elements. Orange or red flavour, net price 30 × 130-mL pouch = £289.80

A methionine-free protein substitute for use as a nutritional supplement in patients over 3 years of age with homocystinuria

**HCU Express<sup>®</sup> 15** (Vitaflo)

**Powder**, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 3.8 g, fat 30 mg, energy 315 kJ (75.3 kcal)/25 g with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *FlavourPac<sup>®</sup>*, p. 1021), net price 30 × 25-g sachets = £318.03

A methionine-free protein substitute for use as a nutritional supplement in patients over 8 years of age with homocystinuria

**HCU Express<sup>®</sup> 20** (Vitaflo)

**Powder**, protein (essential and non-essential amino acids except methionine) 20 g, carbohydrate 4.7 g, fat 70 mg, energy 416 kJ (99 kcal)/34 g with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *FlavourPac<sup>®</sup>*, p. 1021), net price 30 × 34-g sachets = £410.89

A methionine-free protein substitute for use as a nutritional supplement in patients over 8 years with homocystinuria

**HCU gel<sup>®</sup>** (Vitaflo)

**Powder**, protein (essential and non-essential amino acids except methionine) 10 g, carbohydrate 10.3 g, fat 20 mg, energy 339 kJ (81 kcal)/24 g with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *FlavourPac<sup>®</sup>*, p. 1021), net price 30 × 24-g sachets = £204.75

A methionine-free protein substitute for use as a nutritional supplement for the dietary management of children 1–10 years with homocystinuria

**HCU Lophlex<sup>®</sup> LQ 20** (Nutricia Clinical)

**Liquid**, protein equivalent (essential and non-essential amino acids except methionine) 20 g, carbohydrate 8.8 g, fat 440 mg, energy 509 kJ (120 kcal)/125 mL, with vitamins, minerals, and trace elements. Juicy berries flavour, net price 125 mL = £15.29

Nutritional supplement for the dietary management of homocystinuria in patients over 3 years

**HCU LV<sup>®</sup>** (SHS)

**Powder**, protein (essential and non-essential amino acids except methionine) 20 g, carbohydrate 2.5 g, fat 190 mg, energy 390 kJ (92 kcal)/27.8-g sachet, with vitamins, minerals and trace elements.

Unflavoured (flavouring: see *Modjul<sup>®</sup> Flavour System*, p. 1021) or tropical flavour (formulation varies slightly), net price 30 × 27.8-g sachets = £469.80  
A nutritional supplement for the dietary management of hypermethioninaemia or vitamin B<sub>6</sub> non-responsive homocystinuria in patients over 8 years.

**XMET Homidon<sup>®</sup>** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except methionine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Unflavoured (flavouring: see *Modjul<sup>®</sup> Flavour system*, p. 1021), net price 500 g = £171.63

Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria in children and adults

**<sup>1</sup>XMET Maxamaid<sup>®</sup>** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except methionine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modjul<sup>®</sup> Flavour System*, p. 1021), net price 500 g = £93.59

Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria

**<sup>2</sup>XMET Maxamum<sup>®</sup>** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except methionine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modjul<sup>®</sup> Flavour System*, p. 1021), net price 500 g = £150.02

Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria

1. Maxamaid products are generally intended for use in children 1–8 years
2. Maxamum products are generally intended for use in children over 8 years and adults

### Hyperlysinaemia

#### HYPER LYS Anamix<sup>®</sup> Infant (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except lysine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven hyperlysinaemia in children from birth to 3 years

#### <sup>1</sup>XLYS Maxamaid<sup>®</sup> (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except lysine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modjul<sup>®</sup> Flavour System*, p. 1021), net price 500 g = £93.59

Nutritional supplement for the dietary management of hyperlysinaemia

### Isovaleric acidemia

#### IVA Anamix<sup>®</sup> Infant (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except leucine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven isovaleric acidemia or other proven disorders of leucine metabolism in children from birth to 3 years

#### XLEU Faladox<sup>®</sup> (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except leucine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Unflavoured (flavouring: see *Modjul<sup>®</sup> Flavour System*, p. 1021), net price 200 g = £70.91

Nutritional supplement for the dietary management of isovaleric acidemia

#### <sup>1</sup>XLEU Maxamaid<sup>®</sup> (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except leucine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modjul<sup>®</sup> Flavour System*, p. 1021), net price 500 g = £93.59

Nutritional supplement for the dietary management of isovaleric acidemia

1. Maxamaid products are generally intended for use in children 1–8 years

### Maple syrup urine disease

#### MSUD Aid III<sup>®</sup> (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 77 g, carbohydrate 4.5 g, energy 1386 kJ (326 kcal)/100 g. Unflavoured, (flavouring: see *Modjul<sup>®</sup> Flavour System*, p. 1021), net price 500 g = £177.29

Nutritional supplement for the dietary management of maple syrup urine disease and related conditions in children and adults where it is necessary to limit the intake of branched chain amino acids

#### MSUD Anamix<sup>®</sup> Infant (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven maple syrup urine disease in children from birth to 3 years

#### MSUD Anamix<sup>®</sup> Junior (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 8.4 g, carbohydrate 11 g, fat 3.9 g, energy 474 kJ (113 kcal)/29-g sachet, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modjul<sup>®</sup> Flavour System*, p. 1021), net price 30 × 29-g sachets = £198.00

Nutritional supplement for the dietary management of maple syrup urine disease in children 1–10 years

#### MSUD Anamix<sup>®</sup> Junior LQ (SHS)

**Liquid**, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 497 kJ (118 kcal)/125 mL, with vitamins, minerals, and trace elements. Lactose-free. Orange flavour, net price 125-mL carton = £8.59

Nutritional supplement for the dietary management of maple syrup urine disease in children 1–10 years

#### MSUD cooler<sup>®</sup> 15 (Vitaflo)

**Liquid**, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 15 g, carbohydrate 7 g, fat 500 mg, energy 393 kJ (92 kcal)/130-mL pouch, with vitamins, minerals, and trace elements. Orange or red flavour, net price 30 × 130-mL = £289.80

Nutritional supplement for the dietary management of maple syrup urine disease in children over 3 years and adults

#### MSUD express<sup>®</sup> 15 (Vitaflo)

**Powder**, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 15 g, carbohydrate 3.8 g, fat less than 100 mg, energy 315 kJ (75 kcal)/25 g with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *FlavourPac<sup>®</sup>*, p. 1021), net price 30 × 25-g sachets = £318.03

Nutritional supplement for the dietary management of maple syrup urine disease in children over 8 years and adults

**MSUD express<sup>®</sup> 20** (Vitaflo)

**Powder**, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 20 g, carbohydrate 4.7 g, fat less than 100 mg, energy 416 kJ (99 kcal)/34 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *FlavourPac<sup>®</sup>*, p. 1021), net price 30 × 34-g sachets = £410.89

Nutritional supplement for the dietary management of maple syrup urine disease in children over 8 years and adults

**MSUD Gel<sup>®</sup>** (Vitaflo)

**Powder**, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 10 g, carbohydrate 10.3 g, fat less than 100 mg, energy 339 kJ (81 kcal)/24 g with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *FlavourPac<sup>®</sup>*, p. 1021), net price 30 × 24-g sachets = £207.15

Nutritional supplement for the dietary management of maple syrup urine disease in children 1–10 years

**MSUD Lophlex<sup>®</sup> LQ 20** (Nutricia Clinical)

**Liquid**, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 20 g, carbohydrate 8.8 g, fat less than 500 mg, energy 509 kJ (120 kcal)/125 mL, with vitamins, minerals, and trace elements. Juicy berries flavour, net price 125 mL = £15.29

Nutritional supplement for the dietary management of maple syrup urine disease in children over 3 years and adults

**<sup>1</sup>MSUD Maxamaid<sup>®</sup>** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *Modjul<sup>®</sup> Flavour System*, p. 1021), net price 500 g = £93.59

Nutritional supplement for the dietary management of maple syrup urine disease

**<sup>2</sup>MSUD Maxamum<sup>®</sup>** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Orange flavour or unflavoured (flavouring: see *Modjul<sup>®</sup> Flavour System*, p. 1021), net price 500 g = £150.02

Nutritional supplement for the dietary management of maple syrup urine disease

**▲Methylmalonic or propionic acidemia****MMA/PA Anamix<sup>®</sup> Infant** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven methylmalonic acidemia or propionic acidemia in children from birth to 3 years

**XMTVI Asadon<sup>®</sup>** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Unflavoured, (flavouring: see *Modjul<sup>®</sup> Flavour System*, p. 1021), net price 200 g = £70.91

Nutritional supplement for the dietary management of methylmalonic acidemia or propionic acidemia in children and adults

**<sup>1</sup>XMTVI Maxamaid<sup>®</sup>** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see *Modjul<sup>®</sup> Flavour System*, p. 1021), net price 500 g = £93.59

Nutritional supplement for the dietary management of methylmalonic acidemia or propionic acidemia

**<sup>2</sup>XMTVI Maxamum<sup>®</sup>** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modjul<sup>®</sup> Flavour System*, p. 1021), net price 500 g = £150.02

Nutritional supplement for the dietary management of methylmalonic acidemia or propionic acidemia

**▲Other inborn errors of metabolism****Cystine500<sup>®</sup>** (Vitaflo)

**Powder**, cystine 500 mg, carbohydrate 3.3 g, fat nil, energy 63 kJ (15 kcal)/4 g, net price 30 × 4-g sachets = £52.03

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth

**DocOmega<sup>®</sup>** (Vitaflo)

**Powder**, protein (cows' milk, soya protein) 100 mg, carbohydrate 3.2 g, fat 500 mg (of which docosahexaenoic acid 200 mg), fibre nil, energy 74 kJ (18 kcal)/4 g, with minerals, net price 30 × 4-g sachets = £37.66

Nutritional supplement for the dietary management of inborn errors of metabolism for adults and children from birth

1. Maxamaid products are generally intended for use in children 1–8 years

2. Maxamum products are generally intended for use in children over 8 years and adults

**EEA<sup>®</sup> Supplement** (VitaFlo)

**Powder**, protein equivalent (essential amino acids) 5 g, carbohydrate 4 g, fat nil, energy 151 kJ (36 kcal)/12.5 g, with vitamins, minerals, and trace elements. Tropical flavour, net price 50 × 12.5-g sachets = £196.32

Nutritional supplement for the dietary management of disorders of protein metabolism including urea cycle disorders. Not suitable for children under 3 years

**Isoleucine50<sup>®</sup>** (VitaFlo)

**Powder**, isoleucine 50 mg, carbohydrate 3.8 g, fat nil, energy 63 kJ (15 kcal)/4 g, net price 30 × 4-g sachets = £52.03

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth

**KeyOmega<sup>®</sup>** (VitaFlo)

**Powder**, protein (cows' milk, soya) 170 mg, carbohydrate 2.8 g, fat 800 mg (of which arachidonic acid 200 mg, docosahexaenoic acid 100 mg), energy 80 kJ (19 kcal)/4 g, net price 30 × 4-g sachet = £38.50

A nutritional supplement for the dietary management of inborn errors of metabolism

**Leucine100<sup>®</sup>** (VitaFlo)

**Powder**, leucine 100 mg, carbohydrate 3.7 g, fat nil, energy 63 kJ (15 kcal)/4 g, net price 30 × 4-g sachets = £52.03

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth

**Low protein drink** (Milupa)

**Powder**, protein (cows' milk) 4.5 g (phenylalanine 100 mg), carbohydrate 59.5 g, fat 29.9 g, fibre nil, energy 2194 kJ (528 kcal)/100 g, with vitamins, minerals, and trace elements. Contains lactose. Net price 400 g = £8.80 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children over 1 year

**Note** Termed *Milupa<sup>®</sup> lp-drink* by manufacturer

**Phenylalanine50<sup>®</sup>** (VitaFlo)

**Powder**, phenylalanine 50 mg, carbohydrate 3.8 g, fat nil, energy 63 kJ (15 kcal)/4 g, net price 30 × 4-g sachets = £50.52

Nutritional supplement for use in the dietary management of inborn errors of metabolism in adults and children from birth

**ProZero<sup>®</sup>** (VitaFlo)

**Liquid**, carbohydrate 8.1 g (of which sugars 3.5 g), fat 3.8 g, energy 278 kJ (66 kcal)/100 mL. Contains lactose. Net price 18 × 250 mL = £22.68; 6 × 1 litre = £30.30

A protein-free nutritional supplement for the dietary management of inborn errors of metabolism in children over 6 months and adults

**Tyrosine1000<sup>®</sup>** (VitaFlo)

**Powder**, tyrosine 1 g, carbohydrate 2.9 g, fat nil, energy 63 kJ (15 kcal)/4-g sachet, net price 30 × 4-g sachets = £4.77

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth

**Valine50<sup>®</sup>** (VitaFlo)

**Powder**, valine 50 mg, carbohydrate 3.8 g, fat nil, energy 63 kJ (15 kcal)/4 g, net price 30 × 4-g sachets = £52.03

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth

**Phenylketonuria****Add-Ins<sup>®</sup>** (SHS)

**Powder**, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate nil, fat 5.1 g, energy 359 kJ (86 kcal)/18.2-g sachet, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modju<sup>®</sup> Flavour System*, p. 1021), net price 60 × 18.2-g sachets = £357.60.

Nutritional supplement for the dietary management of proven phenylketonuria. Not suitable for children under 4 years

**Easiphen<sup>®</sup>** (SHS)

**Liquid**, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 6.7 g, carbohydrate 5.1 g, fat 2 g, energy 275 kJ (65 kcal)/100 mL with vitamins, minerals, and trace elements. Flavours: forest berries, orange, or tropical fruit, net price 250-mL carton = £9.19.

Nutritional supplement for the dietary management of proven phenylketonuria. Not suitable for children under 8 years

**Lophlex<sup>®</sup>** (SHS)

**Powder**, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 2.5 g, fat 60 mg, fibre 220 mg, energy<sup>1</sup> 385 kJ (91 kcal)/27.8-g sachet, with vitamins, minerals, and trace elements. Flavours: berry, orange or unflavoured, net price 30 × 27.8-g sachets = £276.00

Nutritional supplement for the dietary management of proven phenylketonuria in children over 8 years and adults including pregnant women

**Loprofin<sup>®</sup> PKU Drink** (SHS)

**Liquid**, protein (cows' milk) 400 mg (phenylalanine 10 mg), lactose 9.4 g, fat 2 g, energy 165 kJ (40 kcal)/100 mL. Net price 200-mL carton = 72p.

Nutritional supplement for the dietary management of phenylketonuria in children over 1 year and adults

**Loprofin<sup>®</sup> Sno-Pro** (SHS)

**Liquid**, protein (cows' milk) 220 mg (phenylalanine 12.5 mg), carbohydrate 8 g, fat 3.8 g, energy 273 kJ (65 kcal)/100 mL. Contains lactose. Net price 200 mL = £1.19p

Nutritional supplement for the dietary management of phenylketonuria, chronic renal failure, and other inborn errors of amino acid metabolism

**Milupa PKU 2-prima<sup>®</sup>** (Milupa)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 60 g, carbohydrate 10 g, fat nil, energy 1190 kJ (280 kcal)/100 g, with vitamins, minerals, and trace elements. Vanilla flavour, net price 500 g = £149.25

Nutritional supplement for the dietary management of phenylketonuria in children 1–8 years

1. Nutritional values vary with flavour—consult product literature

**Milupa PKU 2-secunda<sup>®</sup>** (Milupa)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 70 g, carbohydrate 6.8 g, fat nil, energy 1306 kJ (307 kcal)/100 g, with vitamins, minerals, and trace elements. Vanilla flavour, net price 500 g = £174.12  
Nutritional supplement for the dietary management of phenylketonuria in children 9–14 years

**Milupa PKU 3-advanta<sup>®</sup>** (Milupa)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 70 g, carbohydrate 4.7 g, fat nil, energy 1270 kJ (299 kcal)/100 g, with vitamins, minerals, and trace elements. Vanilla flavour, net price 500 g = £174.12  
Nutritional supplement for the dietary management of phenylketonuria in patients 15 years and over

**Phlexy-10<sup>®</sup> Exchange System** (SHS)

**Capsules**, protein equivalent (essential and non-essential amino acids except phenylalanine) 416.5 mg/capsule, net price 200-cap pack = £40.55

**Tablets**, protein equivalent (essential and non-essential amino acids except phenylalanine), 833 mg/tablet, net price 75-tab pack = £26.26

**Drink Mix**, powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.33 g, carbohydrate 8.8 g/20-g sachet. Apple-black currant, citrus, or tropical flavour, net price 30 × 20-g sachet = £122.40

Nutritional supplement for the dietary management of phenylketonuria

**Phlexy-Vits<sup>®</sup>** (SHS)

**Powder**, vitamins, minerals, and trace elements, net price 30 × 7-g sachets = £68.10

**Tablets**, vitamins, minerals, and trace elements, net price 180-tab pack = £77.35

For use as a vitamin and mineral component of restricted therapeutic diets in children 11 years and over and adults with phenylketonuria and similar amino acid abnormalities

**PK Aid-4<sup>®</sup>** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 79 g, carbohydrate 4.5 g, fat nil, energy 1420 kJ (334 kcal)/100 g. Unflavoured. (flavouring: see *Modjul<sup>®</sup> Flavour System*, p. 1021), net price 500 g = £136.28 (5-g measuring scoop provided).

Nutritional supplement for the dietary management of phenylketonuria in children and adults

**PKU Anamix<sup>®</sup> Infant** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £33.69 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven phenylketonuria in children from birth to 3 years

**PKU Anamix<sup>®</sup> Junior** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.4 g, carbohydrate 9.9 g, fat 3.9 g, energy 455 (108 kcal)/29-g sachet, with vitamins, minerals, and trace elements. Chocolate, pineapple-vanilla. Unflavoured (carbohydrate 11 g, energy 474 kJ (113 kcal)/29-g sachet), net price 30 × 29-g sachets = £120.30  
Nutritional supplement for the dietary management of phenylketonuria in children 1–10 years

**PKU Anamix<sup>®</sup> Junior LQ** (SHS)

**Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 497 kJ (118 kcal)/125 mL, with vitamins, minerals, and trace elements. Lactose-free. Flavours: Berry, orange, or unflavoured, net price 125-mL carton = £5.35

Nutritional supplement for the dietary management of phenylketonuria in children 1–10 years

**PKU cooler10<sup>®</sup>** (Vitafo)

**Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 5.1 g, energy 258 kJ (62 kcal)/87-mL pouch, with vitamins, minerals, and trace elements. Unflavoured (white) or flavoured (orange, purple, or red), net price 30 × 87 mL = £117.90

Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 3 years

**PKU cooler15<sup>®</sup>** (Vitafo)

**Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine) 15 g, carbohydrate 7.8 g, energy 386 kJ (92 kcal)/130-mL pouch, with vitamins, minerals, and trace elements. Unflavoured (white) or flavoured (orange, purple, or red), net price 30 × 130 mL = £175.80

Nutritional supplement for the dietary management of phenylketonuria, not recommended for children under 3 years

**PKU cooler20<sup>®</sup>** (Vitafo)

**Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 10.2 g, energy 517 kJ (124 kcal)/174-mL pouch, with vitamins, minerals, and trace elements. Unflavoured (white) or flavoured (orange, purple, or red), net price 30 × 174 mL = £236.10

Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 3 years

**PKU express15<sup>®</sup>** (Vitafo)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 15 g, carbohydrate 2.4 g, energy 293 kJ (70 kcal)/25-g sachet, with vitamins, minerals, and trace elements. Lemon, orange, tropical or unflavoured (carbohydrate 3.4 g, energy 310 kJ (74 kcal)/25 g), (flavouring: see *FlavourFac<sup>®</sup>*, p. 1021), net price 30 × 25-g sachets = £192.81

Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 3 years

**PKU express20<sup>®</sup>** (Vitafo)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 3.3 g, energy 389 kJ (93 kcal)/34-g sachet, with vitamins, minerals, and trace elements. Lemon, orange, tropical, or unflavoured (carbohydrate 4.7 g, energy 416 kJ (99 kcal)/34 g), (flavouring: see *FlavourPac<sup>®</sup>*, p. 1021), net price 30 × 34-g sachets = £249.10

Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 3 years

**PKU gel<sup>®</sup>** (Vitafo)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 8.9 g, fat less than 100 mg, energy 318 kJ (76 kcal)/24-g sachet, with vitamins, minerals, and trace elements. Orange, raspberry, or unflavoured (carbohydrate 10.3 g, energy 339 kJ (81 kcal)/24 g), (flavouring: see *FlavourPac<sup>®</sup>*, p. 1021), net price 30 × 24-g sachets = £133.39

Nutritional supplement for use as part of the low-protein dietary management of phenylketonuria in children 1–10 years

**PKU Lophlex<sup>®</sup> LQ 10** (SHS)

**Liquid**, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 4.4 g, fibre 250 mg, energy 245 kJ (58 kcal)/62.5 mL, with vitamins, minerals, and trace elements. Flavours: berry, citrus, orange, or tropical, net price 62.5-mL carton = £4.93; juicy berries, juicy orange (energy 246 kJ (58 kcal)/62.5 mL), 62.5-mL carton = £4.93

Nutritional supplement for the dietary management of phenylketonuria in children over 4 years and adults including pregnant women

**PKU Lophlex<sup>®</sup> LQ 20** (SHS)

**Liquid**, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 8.8 g, fibre 340 mg, energy 490 kJ (115 kcal)/125 mL, with vitamins, minerals, and trace elements. Flavours: berry, citrus, orange, or tropical, net price 125-mL carton = £9.84; juicy berries, juicy orange (fibre 500 mg, energy 493 kJ (116 kcal)/125 mL), 125-mL carton = £9.84

Nutritional supplement for the dietary management of phenylketonuria in children over 4 years and adults including pregnant women

**PKU Lophlex<sup>®</sup> Sensation 20** (SHS)

**Semi-solid**, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 20.2 g, fibre 1 g, energy 706 kJ (166 kcal)/109 g, with vitamins, minerals, and trace elements. Flavours: berry or orange, net price 3 × 109-g pot = £31.44

Nutritional supplement for the dietary management of phenylketonuria in children over 4 years and adults including pregnant women

**PKU squeeze<sup>®</sup>** (Vitafo)

**Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 22.5 g, fat 500 mg, energy 565 kJ (135 kcal)/85 g, with vitamins, minerals, and trace elements. Flavour: apple-banana, net price 30 × 85-g pouch = £127.52

Nutritional supplement for the dietary management of phenylketonuria in children from 6 months to 10 years

**PKU Start<sup>®</sup>** (Vitafo)

**Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine) 2 g, carbohydrate 8.3 g, fat 2.9 g, energy 286 kJ (68 kcal)/100 mL with vitamins, minerals, and trace elements. Contains lactose and fish oil. Net price 500-mL bottle = £6.53

Nutritional supplement for the dietary management of phenylketonuria in children under 1 year

**L-Tyrosine** (SHS)

**Powder**, L-tyrosine 20 g, carbohydrate 76.8 g, fat nil, energy 1612 kJ (379 kcal)/100 g, net price 100 g = £20.87

Nutritional supplement for the dietary management of phenylketonuria in pregnant women with low plasma tyrosine concentrations

**1XP Maxamaid<sup>®</sup>** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Orange flavour or unflavoured (flavouring: see *Modjul<sup>®</sup> Flavour System*, p. 1021), net price 500 g = £55.37

Nutritional supplement for the dietary management of phenylketonuria in children 1–8 years

**2XP Maxamum<sup>®</sup>** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Flavours: orange, unflavoured (flavouring: see *Modjul<sup>®</sup> Flavour System*, p. 1021). Net price 30 × 50-g sachets = £256.80, 500 g = £85.63

Nutritional supplement for the dietary management of phenylketonuria in children over 8 years and adults

**Tyrosinaemia****Methionine-free TYR Anamix<sup>®</sup> Infant** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except methionine, phenylalanine, and tyrosine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven tyrosinaemia type 1 in children from birth to 3 years

**TYR Anamix<sup>®</sup> Infant** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine, and tyrosine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven tyrosinaemia where plasma-methionine concentrations are normal in children from birth to 3 years

1. Maxamaid products are generally intended for use in children 1–8 years
2. Maxamum products are generally intended for use in children over 8 years and adults

**TYR Anamix® Junior** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 8.4 g, carbohydrate 11 g, fat 3.9 g, energy 475 kJ (113 kcal)/29-g sachet, with vitamins, minerals, and trace elements. Unflavoured, net price 30 x 29-g sachets = £196.50

Nutritional supplement for the dietary management of proven tyrosinaemia in children 1–10 years

**TYR Anamix® Junior LQ** (SHS)

**Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 500 kJ (119 kcal)/125 mL, with vitamins, minerals, and trace elements. Orange flavour, net price 36 x 125-mL bottle = £272.79

Nutritional supplement for the dietary management of tyrosinaemia type 1 (when nitisinone (NTBC) is used, see section 9.8.1), type II, and type III, in children over 1 year

**TYR cooler® 15** (Vitaflo)

**Liquid**, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 15 g, carbohydrate 7 g, fat 500 mg, energy 393 kJ (92 kcal)/130 mL, with vitamins, minerals, and trace elements. Orange or red flavour, net price 30 x 130-mL pouch = £289.80

Nutritional supplement for the dietary management of tyrosinaemia in children over 3 years and adults

**TYR express15®** (Vitaflo)

**Powder**, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 15 g, carbohydrate 3.4 g, fat less than 100 mg, energy 310 kJ (74 kcal)/25 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *FlavourPac*®, p. 1021), net price 30 x 25-g sachets = £318.03

Nutritional supplement for the dietary management of tyrosinaemia in children over 8 years and adults

**TYR express20®** (Vitaflo)

**Powder**, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 20 g, carbohydrate 4.7 g, fat less than 100 mg, energy 416 kJ (99 kcal)/34 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *FlavourPac*®, p. 1021), net price 30 x 34-g sachets = £410.89

Nutritional supplement for the dietary management of tyrosinaemia. Not recommended for children under 8 years

**TYR Gel®** (Vitaflo)

**Gel**, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 10 g, carbohydrate 10.3 g, fat less than 100 mg, energy 339 kJ (81 kcal)/24 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *FlavourPac*®, p. 1021), net price 30 x 24-g sachets = £204.75

Nutritional supplement for the dietary management of tyrosinaemia in children 1–10 years

**TYR Lophlex® LQ 20** (Nutricia Clinical)

**Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 20 g, carbohydrate 8.8 g, fat less than 500 mg, fibre 500 mg, energy 509 kJ (120 kcal)/125 mL, with vitamins, minerals, and trace elements. Juicy berries flavour, net price 125 mL = £15.29

Nutritional supplement for the dietary management of tyrosinaemia in children over 3 years and adults

**1XPHEN TYR Maxamaid®** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g with vitamins, minerals, and trace elements. Unflavoured (flavouring: see *Modjul® Flavour System*, p. 1021). Net price 500 g = £93.59

Nutritional supplement for the dietary management of tyrosinaemia in children 1–8 years

**XPHEN TYR Tyrosidon®** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Unflavoured (flavouring: see *Modjul® Flavour System*, p. 1021). Net price 500 g = £177.29

Nutritional supplement for the dietary management of tyrosinaemia in children and adults where plasma-methionine concentrations are normal

**XPTM Tyrosidon®** (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine, tyrosine, and methionine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Unflavoured (flavouring: see *Modjul® Flavour System*, p. 1021). Net price 500 g = £85.82

Nutritional supplement for the dietary management of tyrosinaemia type 1 in children and adults where plasma-methionine concentrations are above normal

## Conditions for which ACBS products can be prescribed

**Birthmarks** See Disfiguring skin lesions, below

**Dermatitis** *Aveeno®* Bath Oil; *Aveeno®* Cream; *Aveeno®* Lotion; *E45®* Emollient Bath Oil; *E45®* Emollient Wash Cream; *E45®* Lotion

For details of preparations see section 13.2.1, p. 781

**Dermatitis herpetiformis** See also Gluten-free foods, p. 1022

**Disfiguring skin lesions (birthmarks, mutilating lesions, scars, vitiligo)** *Covermark®* classic foundation and finishing powder; *Dermablend® Ultra* corrective foundation; *Dermacolor®* Camouflage cream and fixing powder; *Keromask®* masking cream and finishing powder; *Veil®* Cover cream and Finishing Powder. (Cleansing Creams, Cleansing Milks, and Cleansing Lotions are excluded)

For details of preparations see section 13.8.2, p. 814

**Disinfectants (antiseptics)** May be prescribed on an FP10 only when ordered in such quantities and with such directions as are appropriate for the treatment of patients, but not for general hygienic purposes.

**Dry mouth (xerostomia)** For patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome.

*AS Saliva Orthana®*, *Biotène Oralbalance®*, *BioXtra®*, *Glandosane®*, *Saliveze®*.

For details of preparations see section 12.3.5, p. 778

1. Maxamaid products are generally intended for use in children 1–8 years

**Eczema** See Dermatitis, above

**Photodermatoses (skin protection in)** *Anthelios*<sup>®</sup> XL SPF 50+ Melt-in cream; *Sunsense*<sup>®</sup> Ultra; *Uvistat*<sup>®</sup> Lipscreen SPF 50, *Uvistat*<sup>®</sup> Suncream SPF 30 and 50.

For details of preparations see section 13.8.1, p. 812

**Pruritus** See Dermatitis, above

# A3 Cautionary and advisory labels for dispensed medicines

Numbers following the preparation entries in the BNF correspond to the code numbers of the cautionary labels that pharmacists are recommended to add when dispensing. It is also expected that pharmacists will counsel patients when necessary.

Counselling needs to be related to the age, experience, background, and understanding of the individual patient. The pharmacist should ensure that the patient understands how to take or use the medicine and how to follow the correct dosage schedule. Any effects of the medicine on driving or work, any foods or medicines to be avoided, and what to do if a dose is missed should also be explained. Other matters, such as the possibility of staining of the clothes or skin by a medicine should also be mentioned.

For some preparations there is a special need for counselling, such as an unusual method or time of administration or a potential interaction with a common food or domestic remedy, and this is indicated where necessary.

**Original packs** Most preparations are dispensed in unbroken original packs that include further advice for the patient in the form of patient information leaflets. Label 10 may be of value where appropriate. More general leaflets advising on the administration of preparations such as eye drops, eye ointments, inhalers, and suppositories are also available.

**Scope of labels** In general no label recommendations have been made for injections on the assumption that they will be administered by a healthcare professional or a well-instructed patient. The labelling is not exhaustive and pharmacists are recommended to use their professional discretion in labelling new preparations and those for which no labels are shown.

Individual labelling advice is not given on the administration of the large variety of antacids. In the absence of instructions from the prescriber, and if on enquiry the patient has had no verbal instructions, the directions given under 'Dose' should be used on the label.

It is recognised that there may be occasions when pharmacists will use their knowledge and professional discretion and decide to omit one or more of the recommended labels for a particular patient. In this case counselling is of the utmost importance. There may also be an occasion when a prescriber does not wish additional cautionary labels to be used, in which case the prescription should be endorsed 'NCL' (no cautionary labels). The exact wording that is required instead should then be specified on the prescription.

Pharmacists label medicines with various wordings in addition to those directions specified on the prescription. Such labels include 'Shake the bottle', 'For external use only', and 'Store in a cool place', as well as

'Discard. . . days after opening' and 'Do not use after . . .', which apply particularly to antibiotic mixtures, diluted liquid and topical preparations, and to eye-drops. Although not listed in the BNF these labels should continue to be used when appropriate; indeed, 'For external use only' is a legal requirement on external liquid preparations, while 'Keep out of the reach of children' is a legal requirement on all dispensed medicines. Care should be taken not to obscure other relevant information with adhesive labelling.

It is the usual practice for patients to take standard tablets with water or other liquid and for this reason no separate label has been recommended.

The label wordings recommended by the BNF apply to medicines dispensed against a prescription. Patients should be aware that a dispensed medicine should never be taken by, or shared with, anyone other than for whom the prescriber intended it. Therefore, the BNF does not include warnings against the use of a dispensed medicine by persons other than for whom it was specifically prescribed.

The label or labels for each preparation are recommended after careful consideration of the information available. However, it is recognised that in some cases this information may be either incomplete or open to a different interpretation. The BNF will therefore be grateful to receive any constructive comments on the labelling suggested for any preparation.

## Recommended label wordings

For BNF 61 (March 2011), a revised set of cautionary and advisory labels were introduced. All of the existing labels were user-tested, and the revised wording selected reflects terminology that is better understood by patients.

Wordings which can be given as separate warnings are labels 1–19, 29–30, and 32. Wordings which can be incorporated in an appropriate position in the directions for dosage or administration are labels 21–28. A label has been omitted for number 20; labels 31 and 33 no longer apply to any medicines in the BNF and have therefore been deleted.

If separate labels are used it is recommended that the wordings be used without modification. If changes are made to suit computer requirements, care should be taken to retain the sense of the original.

- Warning: This medicine may make you sleepy**  
To be used on *preparations for children* containing antihistamines, or other preparations given to children where the warnings of label 2 on driving or alcohol would not be appropriate.

- 2 Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines. Do not drink alcohol**  
To be used on *preparations for adults that can cause drowsiness*, thereby affecting coordination and the ability to drive and operate hazardous machinery; label 1 is more appropriate for children. *It is an offence to drive while under the influence of drink or drugs.*  
Some of these preparations only cause drowsiness in the first few days of treatment and some only cause drowsiness in higher doses.  
In such cases the patient should be told that the advice applies until the effects have worn off. However many of these preparations can produce a slowing of reaction time and a loss of mental concentration that can have the same effects as drowsiness.  
Avoidance of alcoholic drink is recommended because the effects of CNS depressants are enhanced by alcohol. Strict prohibition however could lead to some patients not taking the medicine. Pharmacists should therefore explain the risk and encourage compliance, particularly in patients who may think they already tolerate the effects of alcohol (see also label 3). Queries from patients with epilepsy regarding fitness to drive should be referred back to the patient's doctor.  
Side-effects unrelated to drowsiness that may affect a patient's ability to drive or operate machinery safely include *blurred vision, dizziness, or nausea*. In general, no label has been recommended to cover these cases, but the patient should be suitably counselled.
- 3 Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines**  
To be used on *preparations containing monoamine-oxidase inhibitors*; the warning to avoid alcohol and dealcoholised (low alcohol) drink is covered by the patient information leaflet.  
Also to be used as for label 2 but where alcohol is not an issue.
- 4 Warning: Do not drink alcohol**  
To be used on *preparations where a reaction such as flushing may occur if alcohol is taken* (e.g. metronidazole). Alcohol may also enhance the hypoglycaemia produced by some oral antidiabetic drugs but routine application of a warning label is not considered necessary.  
Patients should be advised not to drink alcohol for as long as they are receiving/using a course of medication, and in some cases for a period of time after the course is finished.
- 5 Do not take indigestion remedies 2 hours before or after you take this medicine**  
To be used with label 25 on *preparations coated to resist gastric acid* (e.g. enteric-coated tablets). This is to avoid the possibility of premature dissolution of the coating in the presence of an alkaline pH.  
Label 5 also applies to drugs such as gabapentin *where the absorption is significantly affected by antacids*. Pharmacists will be aware (from a knowledge of physiology) that the usual time during which indigestion remedies should be avoided is at least 2 hours before and after the majority of medicines have been taken; when a manufacturer advises a different time period, this can be followed, and should be explained to the patient.
- 6 Do not take indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine**  
To be used on *preparations containing ofloxacin and some other quinolones, doxycycline, lymecycline, minocycline, and penicillamine*. These drugs chelate calcium, iron, and zinc and are less well absorbed when taken with calcium-containing antacids or preparations containing iron or zinc. Pharmacists will be aware (from a knowledge of physiology) that these incompatible preparations should be taken at least 2 hours apart for the majority of medicines; when a manufacturer advises a different time period, this can be followed, and should be explained to the patient.
- 7 Do not take milk, indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine**  
To be used on *preparations containing ciprofloxacin, norfloxacin, or tetracyclines that chelate calcium, iron, magnesium, and zinc*, and are thus less available for absorption. Pharmacists will be aware (from a knowledge of physiol-
- ogy) that these incompatible preparations should be taken at least 2 hours apart for the majority of medicines; when a manufacturer advises a different time period, this can be followed, and should be explained to the patient. Doxycycline, lymecycline, and minocycline are less liable to form chelates and therefore only require label 6 (see above).
- 8 Warning: Do not stop taking this medicine unless your doctor tells you to stop**  
To be used on *preparations that contain a drug which is required to be taken over long periods without the patient necessarily perceiving any benefit* (e.g. antituberculous drugs).  
Also to be used on *preparations that contain a drug whose withdrawal is likely to be a particular hazard* (e.g. clonidine for hypertension). Label 10 (see below) is more appropriate for corticosteroids.
- 9 Space the doses evenly throughout the day. Keep taking this medicine until the course is finished, unless you are told to stop**  
To be used on *preparations where a course of treatment should be completed* to reduce the incidence of relapse or failure of treatment.  
The preparations are antimicrobial drugs given by mouth. Very occasionally, some may have severe side-effects (e.g. diarrhoea in patients receiving clindamycin) and in such cases the patient may need to be advised of reasons for stopping treatment quickly and returning to the doctor.
- 10 Warning: Read the additional information given with this medicine**  
To be used particularly on *preparations containing anticoagulants, lithium, and oral corticosteroids*. The appropriate treatment card should be given to the patient and any necessary explanations given.  
This label may also be used on other preparations to remind the patient of the instructions that have been given.
- 11 Protect your skin from sunlight—even on a bright but cloudy day. Do not use sunbeds**  
To be used on *preparations that may cause phototoxic or photoallergic reactions* if the patient is exposed to ultraviolet radiation. Many drugs other than those listed in Appendix 3 (e.g. phenothiazines and sulfonamides) may, on rare occasions, cause reactions in susceptible patients. Exposure to high intensity ultraviolet radiation from sun-ray lamps and sunbeds is particularly likely to cause reactions.
- 12 Do not take anything containing aspirin while taking this medicine**  
To be used on *preparations containing probenecid and sulfapyrazone* whose activity is reduced by aspirin. Label 12 should not be used for anticoagulants since label 10 is more appropriate.
- 13 Dissolve or mix with water before taking**  
To be used on *preparations that are intended to be dissolved in water* (e.g. soluble tablets) or *mixed with water* (e.g. powders, granules) before use. In a few cases other liquids such as fruit juice or milk may be used.
- 14 This medicine may colour your urine. This is harmless**  
To be used on *preparations that may cause the patient's urine to turn an unusual colour*. These include triamterene (blue under some lights), levodopa (dark reddish), and rifampicin (red).
- 15 Caution: flammable. Keep your body away from fire or flames after you have put on the medicine**  
To be used on *preparations containing sufficient flammable solvent to render them flammable if exposed to a naked flame*.
- 16 Dissolve the tablet under your tongue—do not swallow. Store the tablets in this bottle with the cap tightly closed. Get a new supply 8 weeks after opening**  
To be used on *glyceryl trinitrate tablets* to remind the patient not to transfer the tablets to plastic or less suitable containers.
- 17 Do not take more than . . . in 24 hours**  
To be used on *preparations for the treatment of acute migraine* except those containing ergotamine, for which label 18 is used. The dose form should be specified, e.g.

- tablets or capsules.  
It may also be used on preparations for which no dose has been specified by the prescriber.
- 18 **Do not take more than . . . in 24 hours. Also, do not take more than . . . in any one week**  
To be used on preparations containing ergotamine. The dose form should be specified, e.g. tablets or suppositories.
- 19 **Warning: This medicine makes you sleepy. If you still feel sleepy the next day, do not drive or use tools or machines. Do not drink alcohol**  
To be used on *preparations containing hypnotics (or some other drugs with sedative effects) prescribed to be taken at night*. On the rare occasions when hypnotics are prescribed for daytime administration (e.g. nitrazepam in epilepsy), this label would clearly not be appropriate. Also to be used as an *alternative to the label 2 wording* (the choice being at the discretion of the pharmacist) for *anxiolytics prescribed to be taken at night*. It is hoped that this wording will convey adequately the problem of residual morning sedation after taking 'sleeping tablets'.
- 21 **Take with or just after food, or a meal**  
To be used on *preparations that are liable to cause gastric irritation, or those that are better absorbed with food*. Patients should be advised that a *small amount of food is sufficient*.
- 22 **Take 30 to 60 minutes before food**  
To be used on some preparations whose absorption is thereby improved.  
Most oral antibacterials require label 23 instead (see below).
- 23 **Take this medicine when your stomach is empty. This means an hour before food or 2 hours after food**  
To be used on *oral antibacterials whose absorption may be reduced by the presence of food and acid in the stomach*.
- 24 **Suck or chew this medicine**  
To be used on *preparations that should be sucked or chewed*. The pharmacist should use discretion as to which of these words is appropriate.
- 25 **Swallow this medicine whole. Do not chew or crush**  
To be used on *preparations that are enteric-coated or designed for modified-release*.
- Also to be used on *preparations that taste very unpleasant or may damage the mouth if not swallowed whole*. Patients should be advised (where relevant) that some modified-release preparations can be broken in half, but that the halved tablet should still be swallowed whole, and not chewed or crushed.
- 26 **Dissolve this medicine under your tongue**  
To be used on *preparations designed for sublingual use*. Patients should be advised to hold under the tongue and avoid swallowing until dissolved. The buccal mucosa between the gum and cheek is occasionally specified by the prescriber.
- 27 **Take with a full glass of water**  
To be used on *preparations that should be well diluted* (e.g. chloral hydrate), where a *high fluid intake is required* (e.g. sulfonamides), or where *water is required to aid the action* (e.g. methylcellulose). The patient should be advised that 'a full glass' means at least 150 mL. In most cases fruit juice, tea, or coffee may be used.
- 28 **Spread thinly on the affected skin only**  
To be used on *external preparations* that should be applied sparingly (e.g. corticosteroids, dithranol).
- 29 **Do not take more than 2 at any one time. Do not take more than 8 in 24 hours**  
To be used on containers of dispensed *solid dose preparations containing paracetamol for adults when the instruction on the label indicates that the dose can be taken on an 'as required' basis*. The dose form should be specified, e.g. tablets or capsules.  
This label has been introduced because of the serious consequences of overdosage with paracetamol.
- 30 **Contains paracetamol. Do not take anything else containing paracetamol while taking this medicine. Talk to a doctor at once if you take too much of this medicine, even if you feel well**  
To be used on all containers of dispensed *preparations containing paracetamol*.
- 32 **Contains aspirin. Do not take anything else containing aspirin while taking this medicine**  
To be used on containers of dispensed *preparations containing aspirin when the name on the label does not include the word 'aspirin'*.

## Products and their labels

Proprietary names are in *italic*.

C = counselling advised; see BNF = consult product entry in BNF

### Product Label List

- Abacavir, C, hypersensitivity reactions, see BNF
- Abilify, 2
- Abilify orodispersible tabs, 2, C, administration, see BNF
- Abiraterone, 23
- Abstral, 2, 26, C, administration, see BNF
- Acamprosate, 21, 25
- Acarbose, C, administration, see BNF
- Accolate, 23
- Acebutolol, 8
- Aceclofenac, 21
- Acemeticin, 21, C, driving
- Acenocoumarol, 10, anti-coagulant card
- Acetazolamide, 3
- Acetazolamide m/r, 3, 25
- Aciclovir susp and tabs, 9
- Acipimox, 21
- Acitretin, 10, patient information leaflet, 11, 21
- Acridinium bromide, C, administration
- Acrivastine, C, driving
- Actikerall, 15
- Actiq, 2, C, administration, see BNF
- Actonel, C, administration, food and calcium, see BNF
- Acumor XL, 3, 21, 25
- Acupan, 2, 14, (urine pink)
- Adalat LA, 25
- Adalat Retard, 25
- Adalimumab, 10, Alert card, C, tuberculosis, blood disorders
- Adapalene, 11
- Adartrel, 10, 21, C, driving, see BNF
- Adcal, 24
- Adcal-D<sub>3</sub>, 24
- Adcal-D<sub>3</sub> Dissolve, 13
- Adipine MR, 25
- Adipine XL, 25
- Adizem preps, 25
- Adoport, 23, C, driving, see BNF
- Advagraf, 23, 25, C, driving, see BNF
- Afatinib, 25, C, administration, driving, see BNF
- Afinitor, 25, C, pneumonitis, see BNF
- Airomir, C, administration
- Aknemycin Plus, 11
- Albendazole, 9
- Alclometasone cream, 28, C, application, see BNF
- Aldactone, 21
- Aldara, 10, patient information leaflet
- Aldomet, 3, 8
- Alendronic acid, C, administration, see BNF
- Alfuzosin, C, initial dose, driving, see BNF

- Alfuzosin m/r, 21, 25, C, initial dose, driving, see BNF
- Alimemazine, 2
- Aliskiren, 21
- Alitretinoin, 10, patient information leaflet, 11, 21
- Allegron*, 2
- Allopurinol, 8, 21, 27
- Almogran*, 3
- Almotriptan, 3
- Alphaderm*, 28, C, application, see BNF
- Alprazolam, 2
- Altargo*, 28
- Alvesco*, 8, C, administration
- Amantadine, C, driving
- Amifampridine, 3, 21
- Aminophylline m/r, see preps
- Amiodarone, 11
- Amisulpride, 2
- Amitiza*, 21
- Amitriptyline, 2
- Amorolfine, 10, patient information leaflet
- Amoxicillin, 9
- Amoxicillin dispersible sachets, 9, 13
- Amoxil*, 9
- Amoxil dispersible sachets*, 9, 13
- Amoxil paed susp*, 9, C, use of pipette
- Ampicillin, 9, 23
- Anafranil m/r*, 2, 25
- Anagrelide, C, driving
- Anakinra, C, blood disorder symptoms
- Androcur*, 21
- Angitil SR*, 25
- Angitil XL*, 25
- Anhydrol Forte*, 15
- Anquil*, 2
- Antabuse*, 2, C, alcohol reaction, see BNF
- Antacids, see BNF dose statements
- Antepsin*, 5
- Anticoagulants, oral, 10, anti-coagulant card
- Antihistamines, (see individual preparations)
- APO-go*, 10, C, driving, see BNF
- Apomorphine, 10, C, driving, see BNF
- Aptivus caps*, 5, 21
- Aptivus oral solution*, 5, 21, C, crystallisation
- Arava*, 4
- Aricept Evess*, C, administration
- Aripiprazole, 2
- Aripiprazole orodispersible tabs, 2, C, administration, see BNF
- Arlevert*, 2
- Aromasin*, 21
- Arpicolin*, C, driving
- Artemether with lumefantrine, 21, C, driving
- Arthrotec*, 21, 25
- Arythmol*, 21, 25, C, driving
- Asacol enema and supps*, C, blood disorder symptoms, see BNF
- Asacol MR tabs*, 5, 25, C, blood disorder symptoms, see BNF
- Asasantin Retard*, 21, 25, 32
- Ascorbic acid tabs (500 mg), 24
- Asenapine, 2, 26, C, administration
- Asmabec preps*, 8, C, administration; with high doses, 10, steroid card
- Asmanex*, 8, 10, steroid card, C, administration
- Asmasal*, C, administration
- Aspirin dispersible tabs, 13, 21, also 32 (if 'aspirin' not on label)
- Aspirin e/c, 5, 25, also 32 (if 'aspirin' not on label)
- Aspirin m/r, 25, also 32 (if 'aspirin' not on label)
- Aspirin supps, 32, (if 'aspirin' not on label)
- Aspirin tabs, 21, also 32 (if 'aspirin' not on label)
- Atarax*, 2
- Atazanavir, 5, 21
- Atenolol, 8
- Atimos Modulate*, C, administration
- Atomoxetine, 3
- Atorvastatin chewable tabs, 24, C, muscle effects, see BNF
- Atorvastatin tabs, C, muscle effects, see BNF
- Atovaquone, 21
- Atripla*, 23, 25
- Atrovent inhalations*, C, administration
- Augmentin Duo*, 9
- Augmentin susp and tabs*, 9
- Aureocort*, 28, C, application, see BNF
- Avelox*, 6, 9, C, driving
- Avloclor*, 5, C, malaria prophylaxis, see BNF
- Avodart*, 25
- Avomine*, 2
- Axitinib, 25
- Axorid*, 21, 25
- Azathioprine, 21
- Azithromycin caps, 5, 9, 23
- Azithromycin susp and tabs, 5, 9
- Azzalure*, C, side-effects, see BNF
- Baclofen, 2, 8, 21
- Balsalazide, 21, 25
- Baraclude*, C, administration
- Beclomethasone external preps, 28, C, application, see BNF
- Beclomethasone inhalations, 8, C, administration; with high doses, 10, steroid card
- Benemid*, 12, 21, 27
- Benperidol, 2
- Benzoïn tincture, compound, 15
- Besavar XL*, 21, 25, C, initial dose, driving, see BNF
- Beta-Adalat*, 8, 25
- Betacap*, 15, 28, C, application, see BNF
- Beta-Cardone*, 8
- Betahistine, 21
- Betamethasone external preps, 28, C, application, see BNF
- Betamethasone inj, 10, steroid card
- Betamethasone plaster, C, application, see BNF
- Betamethasone scalp application, 15, 28, C, application, see BNF
- Betamethasone soluble tab, 10, steroid card, 13, 21, (when used as a mouthwash, Label: 10, 13, C, administration)
- Betesil*, C, application, see BNF
- Bethanechol, 22
- Betmiga*, 25
- Betnesol injection*, 10, steroid card
- Betnovate external preps*, 28, C, application, see BNF
- Betnovate scalp application*, 15, 28, C, application, see BNF
- Betnovate-RD*, 28, C, application, see BNF
- Bettamousse*, 28, C, application, see BNF
- Bezafibrate, 21
- Bezafibrate m/r, 21, 25
- Bezalip*, 21
- Bezalip-Mono*, 21, 25
- Bimatoprost, C, see BNF
- Bilastine, 23, C, administration
- BindRen gran*, 21, C, avoid other drugs at the same time, see BNF
- BindRen tabs*, 21, 25, C, avoid other drugs at the same time, see BNF
- Biorphen*, C, driving
- Bisacodyl tabs, 5, 25
- Bisoprolol, 8
- Boceprevir, 21
- Bocouture*, C, side-effects, see BNF
- Bondronat tabs*, C, administration, see BNF
- Bonefos caps and tabs*, C, food and calcium, see BNF
- Bonviva tabs*, C, administration, see BNF
- Bosulif*, 21
- Bosutinib, 21
- Botox*, C, side-effects, see BNF
- Botulinum toxin type A, C, side-effects, see BNF
- Botulinum toxin type B, C, side-effects, see BNF
- Breakyl*, 2, C, administration, see BNF
- Brexidol*, 21
- Bricanyl inhalations*, C, administration
- Brimonidine tartrate gel, 28
- Britlofex*, 2

- Bromocriptine, 10, 21, C, driving, see BNF
- Bronchitol*, C, administration
- Brufen*, 21
- Brufen gran*, 13, 21
- Brufen Retard*, 25, 27
- Buccastem*, 2, C, administration, see BNF
- Buccolam*, 2, C, administration
- Budelin Novolizer*, 8, C, administration; with high doses, 10, steroid card
- Budenofalk caps*, 5, 10, steroid card, 22, 25
- Budenofalk gran*, 5, 10, steroid card, 22, 25, C, administration
- Budesonide caps, 5, 10, steroid card, 22, 25
- Budesonide gran, 5, 10, steroid card, 22, 25, C, administration
- Budesonide inhalations, 8, C, administration; with high doses, 10, steroid card
- Budesonide m/r caps, 5, 10, steroid card, 25
- Buprenorphine patches, 2
- Buprenorphine tabs, 2, 26
- Bupropion, 25, C, driving
- Buserelin nasal spray, C, nasal decongestants, see BNF
- Buspiron, C, driving
- BuTrans*, 2
- Bydureon*, 10, C, administration, see BNF
- Byetta*, 10, C, administration, see BNF
- Cabaser*, 10, 21, C, driving, see BNF
- Cabergoline, 10, 21, C, driving, see BNF
- Cacit*, 13
- Cacit D3*, 13
- Calceos*, 24
- Calcichew-D<sub>3</sub> tabs, chewable*, 24
- Calcichew tabs, chewable*, 24
- Calcium-500*, 25
- Calcium acetate caps, C, with meals
- Calcium acetate tabs, 25, C, with meals, see BNF
- Calcium carbonate tabs, chewable, 24
- Calcium carbonate tabs and gran effervescent, 13
- Calcium gluconate effervescent tabs, 13
- Calcium phosphate sachets, 13
- Calcium Resonium*, 13
- Calcium and ergocalciferol tabs, C, administration, see BNF
- Calcort*, 5, 10, steroid card
- Calfovite D3*, 13, 21
- Calmurid HC*, 28, C, application, see BNF
- Camcolit 250 tabs*, 10, lithium card, C, driving, fluid and salt intake, toxicity symptoms, see BNF
- Camcolit 400 tabs*, 10, lithium card, 25, C, driving, fluid and salt intake, toxicity symptoms, see BNF
- Campral EC*, 21, 25
- Canagliflozin, C, volume depletion, see BNF
- Canesten HC*, 28, C, application, see BNF
- Canesten spray*, 15
- Cannabis sativa extract, C, driving, see BNF
- Capecitabine, 21
- Capexion*, 23, C, driving, see BNF
- Capimune*, C, administration, see BNF
- Caprelsa*, Alert card
- Caprin*, 5, 25, 32
- Capsorin*, C, administration, see BNF
- Caramet CR*, 10, 14, 25, C, driving, see BNF
- Carbaglu*, 13
- Carbamazepine chewable, 3, 8, 21, 24, C, blood, hepatic or skin disorder symptoms, driving, see BNF
- Carbamazepine liq, supps and tabs, 3, 8, C, blood, hepatic or skin disorder symptoms, driving, see BNF
- Carbamazepine m/r, 3, 8, 25, C, blood, hepatic or skin disorder symptoms, driving, see BNF
- Carbimazole, C, blood disorder symptoms, see BNF

# A4 Intravenous additives

**Intravenous additives policies** A local policy on the addition of drugs to intravenous fluids should be drawn up by a multi-disciplinary team in each Strategic Health Authority (or equivalent) and issued as a document to the members of staff concerned.

Centralised additive services are provided in a number of hospital pharmacy departments and should be used in preference to making additions on wards.

The information that follows should be read in conjunction with local policy documents.

## Guidelines

1. Drugs should only be added to infusion containers when constant plasma concentrations are needed or when the administration of a more concentrated solution would be harmful.
2. In general, only one drug should be added to any infusion container and the components should be compatible. Ready-prepared solutions should be used whenever possible. Drugs should not normally be added to blood products, mannitol, or sodium bicarbonate. Only specially formulated additives should be used with fat emulsions or amino-acid solutions (section 9.3).
3. Solutions should be thoroughly mixed by shaking and checked for absence of particulate matter before use.
4. Strict asepsis should be maintained throughout and in general the giving set should not be used for more than 24 hours (for drug admixtures).
5. The infusion container should be labelled with the patient's name, the name and quantity of additives, and the date and time of addition (and the new expiry date or time). Such additional labelling should not interfere with information on the manufacturer's label that is still valid. When possible, containers should be retained for a period after use in case they are needed for investigation.
6. It is good practice to examine intravenous infusions from time to time while they are running. If cloudiness, crystallisation, change of colour, or any other sign of interaction or contamination is observed the infusion should be discontinued.

## Problems

**Microbial contamination** The accidental entry and subsequent growth of micro-organisms converts the infusion fluid pathway into a potential vehicle for infection with micro-organisms, particularly species of *Candida*, *Enterobacter*, and *Klebsiella*. Ready-prepared infusions containing the additional drugs, or infusions prepared by an additive service (when available) should therefore be used in preference to making extemporaneous additions to infusion containers on wards etc. However, when this is necessary strict aseptic procedure should be followed.

**Incompatibility** Physical and chemical incompatibilities may occur with loss of potency, increase in toxicity, or other adverse effect. The solutions may become opalescent or precipitation may occur, but in many instances there is no visual indication of incompatibility. Interaction may take place at any point in the infusion fluid pathway, and the potential for incompatibility is increased when more than one substance is added to the infusion fluid.

**Common incompatibilities** Precipitation reactions are numerous and varied and may occur as a result of pH, concentration changes, 'salting-out' effects, complexation or other chemical changes. Precipitation or other particle formation must be avoided since, apart from lack of control of dosage on administration, it may initiate or exacerbate adverse effects. This is particularly important in the case of drugs which have been implicated in either thrombophlebitis (e.g. diazepam) or in skin sloughing or necrosis caused by extravasation (e.g. sodium bicarbonate and certain cytotoxic drugs). It is also especially important to effect solution of colloidal drugs and to prevent their subsequent precipitation in order to avoid a pyrogenic reaction (e.g. amphotericin).

It is considered undesirable to mix beta-lactam antibiotics, such as semi-synthetic penicillins and cephalosporins, with proteinaceous materials on the grounds that immunogenic and allergenic conjugates could be formed.

A number of preparations undergo significant loss of potency when added singly or in combination to large volume infusions. Examples include ampicillin in infusions that contain glucose or lactates. The breakdown products of decarbazine have been implicated in adverse effects.

**Blood** Because of the large number of incompatibilities, drugs should not normally be added to blood and blood products for infusion purposes. Examples of incompatibility with blood include hypertonic mannitol solutions (irreversible crenation of red cells), dextrans (rouleaux formation and interference with cross-matching), glucose (clumping of red cells), and oxytocin (inactivated).

If the giving set is not changed after the administration of blood, but used for other infusion fluids, a fibrin clot may form which, apart from blocking the set, increases the likelihood of microbial growth.

**Intravenous fat emulsions** These may break down with coalescence of fat globules and separation of phases when additions such as antibacterials or electrolytes are made, thus increasing the possibility of embolism. Only specially formulated products such as *Vitlipid N<sup>®</sup>* (section 9.3) may be added to appropriate intravenous fat emulsions.

**Other infusions** Infusions that frequently give rise to incompatibility include amino acids, mannitol, and sodium bicarbonate.

**Bactericides** Bactericides such as chlorocresol 0.1% or phenylmercuric nitrate 0.001% are present in some injection solutions. The total volume of such solutions

added to a container for infusion on one occasion should not exceed 15 mL.

## Method

Ready-prepared infusions should be used whenever available. **Potassium chloride** is usually available in concentrations of 20, 27, and 40 mmol/litre in sodium chloride intravenous infusion (0.9%), glucose intravenous infusion (5%) or sodium chloride and glucose intravenous infusion. **Lidocaine hydrochloride** is usually available in concentrations of 0.1 or 0.2% in glucose intravenous infusion (5%).

When addition is required to be made extemporaneously, any product reconstitution instructions such as those relating to concentration, vehicle, mixing, and handling precautions should be strictly followed using an aseptic technique throughout. Once the product has been reconstituted, addition to the infusion fluid should be made immediately in order to minimise microbial contamination and, with certain products, to prevent degradation or other formulation change which may occur; e.g. reconstituted ampicillin injection degrades rapidly on standing, and also may form polymers which could cause sensitivity reactions.

It is also important in certain instances that an infusion fluid of specific pH be used (e.g. **furosemide** injection requires dilution in infusions of pH greater than 5.5).

When drug additions are made it is important to mix thoroughly; additions should not be made to an infusion container that has been connected to a giving set, as mixing is hampered. If the solutions are not thoroughly mixed a concentrated layer of the additive may form owing to differences in density. **Potassium chloride** is particularly prone to this 'layering' effect when added without adequate mixing to infusions packed in non-rigid infusion containers; if such a mixture is administered it may have a serious effect on the heart.

A time limit between addition and completion of administration must be imposed for certain admixtures to guarantee satisfactory drug potency and compatibility. For admixtures in which degradation occurs without the formation of toxic substances, an acceptable limit is the time taken for 10% decomposition of the drug. When toxic substances are produced stricter limits may be imposed. Because of the risk of microbial contamination a maximum time limit of 24 hours may be appropriate for additions made elsewhere than in hospital pharmacies offering central additive service.

Certain injections must be protected from light during continuous infusion to minimise oxidation, e.g. dacarbazine and sodium nitroprusside.

Dilution with a small volume of an appropriate vehicle and administration using a motorised infusion pump is advocated for preparations such as unfractionated heparin where strict control over administration is required. In this case the appropriate dose may be dissolved in a convenient volume (e.g. 24–48 mL) of sodium chloride intravenous infusion (0.9%).

## Use of table

The table lists preparations given by three methods:

- continuous infusion;
- intermittent infusion;
- addition via the drip tubing.

Drugs for **continuous infusion** must be diluted in a large volume infusion. Penicillins and cephalosporins are not usually given by continuous infusion because of stability problems and because adequate plasma and tissue concentrations are best obtained by intermittent infusion. Where it is necessary to administer them by continuous infusion, detailed literature should be consulted.

Drugs that are both compatible and clinically suitable may be given by **intermittent infusion** in a relatively small volume of infusion over a short period of time, e.g. 100 mL in 30 minutes. The method is used if the product is incompatible or unstable over the period necessary for continuous infusion; the limited stability of ampicillin or amoxicillin in large volume glucose or lactate infusions may be overcome in this way.

Intermittent infusion is also used if adequate plasma and tissue concentrations are not produced by continuous infusion as in the case of drugs such as dacarbazine, gentamicin, and ticarcillin.

An in-line burette may be used for intermittent infusion techniques in order to achieve strict control over the time and rate of administration, especially for infants and children and in intensive care units. Intermittent infusion may also make use of the 'piggy-back' technique provided that no additions are made to the primary infusion. In this method the drug is added to a small secondary container connected to a Y-type injection site on the primary infusion giving set; the secondary solution is usually infused within 30 minutes.

**Addition via the drip tubing** is indicated for a number of cytotoxic drugs in order to minimise extravasation. The preparation is added aseptically via the rubber septum of the injection site of a fast-running infusion. In general, drug preparations intended for a bolus effect should be given directly into a separate vein where possible. Failing this, administration may be made via the drip tubing provided that the preparation is compatible with the infusion fluid when given in this manner.

## Table of drugs given by intravenous infusion

Covers addition to *Glucose intravenous infusion 5 and 10%, and Sodium chloride intravenous infusion 0.9%*. Compatibility with glucose 5% and with sodium chloride 0.9% indicates compatibility with *Sodium chloride and glucose intravenous infusion*. Infusion of a large volume of hypotonic solution should be avoided therefore care should be taken if water for injections is used. The information in the Table relates to the proprietary preparations indicated; for other preparations suitability should be checked with the manufacturer

### Abatacept (Orencia<sup>®</sup>)

Intermittent *in* Sodium chloride 0.9%

Reconstitute each vial with 10 mL water for injections using the silicone-free syringe provided; dilute requisite dose in infusion fluid to 100 mL (using the same silicone-free syringe); give over 30 minutes through a low protein-binding filter (pore size 0.2–1.2 micron)

### Abciximab (ReoPro<sup>®</sup>)

Continuous *in* Glucose 5% or Sodium chloride 0.9%

Dilute requisite dose in infusion fluid and give via infusion pump; filter upon dilution with infusion fluid through a non-pyrogenic low protein-binding 0.2, 0.22, or 5 micron filter or upon administration through an in-line non-pyrogenic low protein-binding 0.2 or 0.22 micron filter

**Acetylcysteine** (*Parvolex*<sup>®</sup>)

Continuous in Glucose 5% or Sodium chloride 0.9%  
Glucose 5% is preferable—see Emergency Treatment of Poisoning

**Aciclovir (as sodium salt)** (*Zovirax IV*<sup>®</sup>; *Aciclovir IV*, *Hospira*; *Aciclovir IV*, Genus; *Aciclovir Sodium*, Zurich)  
Intermittent in Sodium chloride 0.9% or Sodium chloride and glucose

For *Zovirax IV*<sup>®</sup>, *Aciclovir IV* (Genus) initially reconstitute to 25 mg/mL in water for injections or sodium chloride 0.9% then dilute to not more than 5 mg/mL with the infusion fluid; to be given over 1 hour; alternatively, may be administered in a concentration of 25 mg/mL using a suitable infusion pump and given over 1 hour; for *Aciclovir IV* (Hospira) dilute to not more than 5 mg/mL with infusion fluid; give over 1 hour

**Agalsidase alfa** (*Replagal*<sup>®</sup>)

Intermittent in Sodium chloride 0.9%

Dilute requisite dose with 100 mL infusion fluid and give over 40 minutes using an in-line filter; use within 3 hours of dilution

**Agalsidase beta** (*Fabrazyme*<sup>®</sup>)

Intermittent in Sodium chloride 0.9%

Reconstitute with water for injections (35 mg in 7.2 mL, 5 mg in 1.1 mL) to produce a solution containing 5 mg/mL; dilute with infusion fluid (for doses less than 35 mg dilute with at least 50 mL; doses 35–70 mg dilute with at least 100 mL; doses 70–100 mg dilute with at least 250 mL; doses greater than 100 mg dilute with 500 mL) and give through an in-line low protein-binding 0.2 micron filter at an initial rate of no more than 15 mg/hour; for subsequent infusions, infusion rate may be increased gradually once tolerance has been established

**Alfentanil (as hydrochloride)** (*Rapifen*<sup>®</sup>)

Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%

**Alglucosidase alfa** (*Myozyme*<sup>®</sup>)

Intermittent in Sodium chloride 0.9%

Reconstitute 50 mg with 10.3 mL water for injections to produce 5 mg/mL solution; gently rotate vial without shaking; dilute requisite dose with infusion fluid to give a final concentration of 0.5–4 mg/mL; give through a low protein-binding in-line filter (0.2 micron) at an initial rate of 1 mg/kg/hour increased by 2 mg/kg/hour every 30 minutes to max. 7 mg/kg/hour

**Alteplase** (*Actilyse*<sup>®</sup>)

Continuous or intermittent in Sodium chloride 0.9%

Dissolve in water for injections to a concentration of 1 mg/mL or 2 mg/mL and infuse intravenously; alternatively dilute the solution further in the infusion fluid to a concentration of not less than 200 micrograms/mL; not to be infused in glucose solution

**Amifostine** (*Ethyo*<sup>®</sup>)

Intermittent in Sodium chloride 0.9%

Reconstitute 500-mg vial with 9.7 mL sodium chloride 0.9% to produce a 50 mg/mL solution

**Amikacin sulfate** (*Amikin*<sup>®</sup>)

Intermittent in Glucose 5% or Sodium chloride 0.9%

To be given over 30 minutes

**Aminophylline** Continuous in Glucose 5% or Sodium chloride 0.9%**Amiodarone hydrochloride** (*Cordarone X*<sup>®</sup>)

Continuous or intermittent in Glucose 5%

Suggested initial infusion volume 250 mL given over 20–120 minutes; for repeat infusions up to 1.2 g in max. 500 mL; infusion in extreme emergency see section 2.7.3; should not be diluted to less than 600 micrograms/mL; incompatible with sodium chloride infusion; avoid equipment containing the plasticizer di-2-ethylhexyphthalate (DEHP)

**Amoxicillin (as sodium salt)** (*Amoxil*<sup>®</sup>)

Intermittent in Glucose 5% or Sodium chloride 0.9%

Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes via drip tubing in Glucose 5% or Sodium chloride 0.9%

Continuous infusion not usually recommended

**Amphotericin (lipid complex)** (*Abelcet*<sup>®</sup>)

Intermittent in Glucose 5%

Allow suspension to reach room temperature, shake gently to ensure no yellow settlement, withdraw requisite dose (using 17–19 gauge needle) into one or more 20-mL syringes; replace needle on syringe with a 5-micron filter needle provided (fresh needle for each syringe) and dilute to a concentration of 1 mg/mL (2 mg/mL can be used in fluid restriction and in children); preferably give via an infusion pump at a rate of 2.5 mg/kg/hour (initial test dose of 1 mg given over 15 minutes); an in-line filter (pore size no less than 15 micron) may be used; do not use sodium chloride or other electrolyte solutions, flush existing intravenous line with glucose 5% or use separate line

**Amphotericin (liposomal)** (*AmBisome*<sup>®</sup>)

Intermittent in Glucose 5% or 10%

Reconstitute each vial with 12 mL water for injections and shake vigorously to produce a preparation containing 4 mg/mL; withdraw requisite dose from vial and introduce into infusion fluid through the 5 micron filter provided to produce a final concentration of 0.2–2 mg/mL; infuse over 30–60 minutes, or if non-anaphylactic infusion-related reactions occur infuse over 2 hours (initial test dose 1 mg over 10 minutes); an in-line filter (pore size no less than 1 micron) may be used; incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or 10%, or use separate line

**Amphotericin (as sodium deoxycholate complex)** (*Fungizone*<sup>®</sup>)

Intermittent in Glucose 5%

Reconstitute each vial with 10 mL water for injections and shake immediately to produce a 5 mg/mL colloidal solution; dilute further in infusion fluid to a concentration of 100 micrograms/mL, pH of the glucose must not be below 4.2 (check each container—consult product literature for details of buffer); infuse over 2–4 hours, or longer if not tolerated (initial test dose 1 mg over 20–30 minutes); begin infusion immediately after dilution and protect from light; incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or use separate line; an in-line filter (pore size no less than 1 micron) may be used

**Ampicillin sodium** (*Penbritin*<sup>®</sup>)

Intermittent in Glucose 5% or Sodium chloride 0.9%

Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes via drip tubing in Glucose 5% or Sodium chloride 0.9%

Continuous infusion not usually recommended

**Andidulafungin** (*Ecalta*<sup>®</sup>)

Intermittent in Glucose 5% or Sodium chloride 0.9%

Reconstitute each 100 mg with 30 mL water for injections, allow up to 5 minutes for reconstitution; dilute dose in infusion fluid to a concentration of 770 micrograms/mL; give at a rate not exceeding 1.1 mg/minute

**Note** Follow product information if using stock supplied with ethanol solvent

**Antithymocyte immunoglobulin** (*Thymoglobuline*<sup>®</sup>)

Continuous in Glucose 5% or Sodium chloride 0.9%

Reconstitute each vial with 5 mL water for injections to produce a solution of 5 mg/mL; gently rotate to dissolve. Dilute requisite dose with infusion fluid to a total volume of 50–500 mL (usually 50 mL/vial); begin infusion immediately after dilution; give through an in-line filter (pore size 0.22 micron); not to be given with unfractionated heparin and hydrocortisone in glucose infusion as precipitation reported

**Argatroban monohydrate** (*Exembo*<sup>®</sup>)

Continuous in Glucose 5% or Sodium chloride 0.9%  
Dilute each 2.5-mL vial with 250 mL infusion fluid

**Atenolol** (*Tenormin*<sup>®</sup>)

Intermittent in Glucose 5% or Sodium chloride 0.9%  
Suggested infusion time 20 minutes

**Atosiban** (*Tractocile*<sup>®</sup> concentrate for intravenous infusion)

Continuous in Glucose 5% or Sodium chloride 0.9%  
Withdraw 10 mL infusion fluid from 100-mL bag and replace with 10 mL atosiban concentrate (7.5 mg/mL) to produce a final concentration of 750 micrograms/mL

**Atracurium besilate** (*Tracrium*<sup>®</sup>; *Atracurium besilate injection*, Hospira; *Atracurium injection/infusion*, Genus)

Continuous in Glucose 5% or Sodium chloride 0.9%  
Stability varies with diluent; dilute requisite dose with infusion fluid to a concentration of 0.5–5 mg/mL

**Azathioprine (as sodium salt)** (*Imuran*<sup>®</sup>)

Intermittent in Glucose 5% or Sodium chloride 0.9%  
Reconstitute 50 mg with 5–15 mL water for injections; dilute requisite dose to a volume of 20–200 mL with infusion fluid

**Aztreonam** (*Azactam*<sup>®</sup>)

Intermittent in Glucose 5% or Sodium chloride 0.9%  
Dissolve initially in water for injections (1 g per 3 mL) then dilute to a concentration of less than 20 mg/mL; to be given over 20–60 minutes

**Basiliximab** (*Simulect*<sup>®</sup>)

Intermittent in Glucose 5% or Sodium chloride 0.9%  
Reconstitute 10 mg with 2.5 mL water for injections then dilute to at least 25 mL with infusion fluid; reconstitute 20 mg with 5 mL water for injections then dilute to at least 50 mL with infusion fluid; give over 20–30 minutes

**Belimumab** (*Benlysta*<sup>®</sup>)

Intermittent in Sodium chloride 0.9%  
Reconstitute with water for injections (120 mg in 1.5 mL, 400 mg in 4.8 mL) to produce a solution containing 80 mg/mL; gently swirl vial for 60 seconds, then allow to stand; swirl vial (without shaking) for 60 seconds every 5 minutes until dissolved; dilute requisite dose with infusion fluid to a final volume of 250 mL and give over 1 hour

**Benzyloxy penicillin sodium** (*Crystapen*<sup>®</sup>)

Intermittent in Glucose 5% or Sodium chloride 0.9%  
Suggested volume 100 mL given over 30–60 minutes  
Continuous infusion not usually recommended

**Betamethasone (as sodium phosphate)** (*Betnesol*<sup>®</sup>)

Continuous or intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%

**Bivalirudin** (*Angiox*<sup>®</sup>)

Continuous in Glucose 5% or Sodium chloride 0.9%  
Reconstitute each 250-mg vial with 5 mL water for injections then withdraw 5 mL and dilute to 50 mL with infusion fluid

**Bumetanide**

Intermittent in Glucose 5% or Sodium chloride 0.9%  
Suggested volume 500 mL given over 30–60 minutes; concentrations above 25 micrograms/mL may cause precipitation

**Calcitonin (salmon)** (*Miacalcic*<sup>®</sup>)

Intermittent in Sodium chloride 0.9%  
Diluted solution given without delay; dilute in 500 mL and give over at least 6 hours; glass or hard plastic containers should not be used; some loss of potency on dilution and administration

**Calcium gluconate**

Continuous in Glucose 5% or Sodium chloride 0.9%  
Avoid bicarbonates, phosphates, or sulfates

**Caspofungin** (*Cancidas*<sup>®</sup>)

Intermittent in Sodium chloride 0.9%  
Allow vial to reach room temperature; initially reconstitute each vial with 10.5 mL water for injections, mixing gently to dissolve then dilute requisite dose in 250 mL infusion fluid (35- or 50-mg doses may be diluted in 100 mL infusion fluid if necessary); give over 60 minutes; incompatible with glucose solutions

**Cefotaxime (as sodium salt)**

Intermittent in Glucose 5% or Sodium chloride 0.9%  
Suggested volume 40–100 mL given over 20–60 minutes; incompatible with alkaline solutions

**Ceftaroline fosamil** (*Zinforo*<sup>®</sup>)

Intermittent in Glucose 5% or Sodium chloride 0.9%  
Reconstitute 600 mg with 20 mL water for injections, then dilute with 250 mL infusion fluid (in fluid restriction, may be diluted with 50–100 mL infusion fluid); give over 60 minutes

**Ceftazidime (as pentahydrate)** (*Fortum*<sup>®</sup>, *Kefadim*<sup>®</sup>)

Intermittent or via drip tubing in Glucose 5% or 10% or Sodium chloride 0.9%  
Dissolve 2 g initially in 10 mL (3 g in 15 mL) infusion fluid; for *Fortum*<sup>®</sup> dilute further to a concentration of 40 mg/mL; for *Kefadim*<sup>®</sup> dilute further to a concentration of 20 mg/mL; give over up to 30 minutes

**Ceftriaxone (as sodium salt)** (*Rocephin*<sup>®</sup>; *Ceftriaxone Injection*, Genus)

Intermittent or via drip tubing in Glucose 5% or 10% or Sodium chloride 0.9%  
Reconstitute 2-g vial with 40 mL infusion fluid; give intermittent infusion over at least 30 minutes (60 minutes in neonates); not to be given simultaneously with total parenteral nutrition or infusion fluids containing calcium, even by different infusion lines; may be infused sequentially with infusion fluids containing calcium if flush with sodium chloride 0.9% between infusions or give infusions by different infusion lines at different sites

**Cefuroxime (as sodium salt)** (*Zinacef*<sup>®</sup>)

Intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%  
Dissolve initially in water for injections (at least 2 mL for each 250 mg, 15 mL for 1.5 g); suggested volume 50–100 mL given over 30 minutes

**Chloramphenicol (as sodium succinate)**

(*Kemeticine*<sup>®</sup>)  
Intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%

**Ciclosporin** (*Sandimmun*<sup>®</sup>)

Intermittent or continuous in Glucose 5% or Sodium chloride 0.9%  
Dilute to a concentration of 50 mg in 20–100 mL; give intermittent infusion over 2–6 hours; not to be used with PVC equipment

**Cidofovir** (*Vistide*<sup>®</sup>)

Intermittent in Sodium chloride 0.9%  
Dilute requisite dose with 100 mL infusion fluid; infuse over 1 hour

**Cisatracurium** (*Nimbex*<sup>®</sup>, *Nimbex Forte*<sup>®</sup>)

Continuous in Glucose 5% or Sodium chloride 0.9%  
Solutions of 2 mg/mL and 5 mg/mL may be infused undiluted; alternatively dilute with infusion fluid to a concentration of 0.1–2 mg/mL

**Clarithromycin** (*Klaricia*<sup>®</sup> I.V.)

Intermittent in Glucose 5% or Sodium chloride 0.9%  
Dissolve initially in water for injections (500 mg in 10 mL) then dilute to a concentration of 2 mg/mL; give over 60 minutes

**Clindamycin (as phosphate)** (*Dalacin<sup>®</sup> C Phosphate*)

Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%

Dilute to not more than 18 mg/mL and give over 10–60 minutes at a rate not exceeding 30 mg/minute (1.2 g over at least 60 minutes; higher doses by continuous infusion)

**Co-amoxiclav** (*Augmentin<sup>®</sup>*)

Intermittent in Sodium chloride 0.9%

Reconstitute 600 mg initially with 10 mL water for injections, then dilute with 50 mL infusion fluid; reconstitute 1.2 g initially with 20 mL water for injections, then dilute with 100 mL infusion fluid; give over 30–40 minutes via drip tubing in Sodium chloride 0.9%

**Co-fluampicil (as sodium salts)** (*Magnapen<sup>®</sup>*)

Intermittent in Glucose 5% or Sodium chloride 0.9%

Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes via drip tubing in Glucose 5% or Sodium chloride 0.9%

**Colistimethate sodium** (*Colomycin<sup>®</sup>, Promixin<sup>®</sup>*)

Intermittent in Sodium chloride 0.9% (or Glucose 5% for *Promixin<sup>®</sup>* brand only)

Dilute with 50 mL infusion fluid and give over 30 minutes

**Co-trimoxazole** (*Septrin<sup>®</sup> for infusion*)

Intermittent in Glucose 5% or 10% or Sodium chloride 0.9%

Dilute contents of 1 ampoule (5 mL) to 125 mL, 2 ampoules (10 mL) to 250 mL or 3 ampoules (15 mL) to 500 mL; suggested duration of infusion 60–90 minutes (but may be adjusted according to fluid requirements); if fluid restriction necessary, 1 ampoule (5 mL) may be diluted with 75 mL glucose 5% and infused over max. 60 minutes

**Cyclophosphamide** (*Cyclophosphamide injection*,

Baxter)

via drip tubing in Glucose 5% or Sodium chloride 0.9%

Reconstitute 500 mg with 25 mL sodium chloride 0.9%; reconstitute 1 g with 50 mL sodium chloride 0.9%

**Danaparoid sodium** (*Orgaran<sup>®</sup>*)

Continuous in Glucose 5% or Sodium chloride 0.9%

**Daptomycin** (*Cubicin<sup>®</sup>*)

Intermittent in Sodium chloride 0.9%

Reconstitute with sodium chloride 0.9% (350 mg in 7 mL, 500 mg in 10 mL); gently rotate vial without shaking; allow to stand for at least 10 minutes then rotate gently to dissolve; dilute requisite dose in 50 mL infusion fluid and give over 30 minutes

**Desferrioxamine mesilate** (*Desferal<sup>®</sup>*)

Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%

Reconstitute with water for injections to a concentration of 100 mg/mL; dilute with infusion fluid

**Desmopressin** (*DDAVP<sup>®</sup>, Octim<sup>®</sup>*)

Intermittent in Sodium chloride 0.9%

Dilute with 50 mL and give over 20 minutes

**Dexamethasone sodium phosphate** (*Dexamethasone*,

Hospira; *Dexamethasone*, Organon)

Continuous or intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%

**Dexmedetomidine (as hydrochloride)** (*Dexdor<sup>®</sup>*)

Continuous in Glucose 5% or Sodium chloride 0.9%

Dilute to a concentration of 4 micrograms/mL

**Dexrazoxane** (*Cardioxane<sup>®</sup>*)

Intermittent in Compound sodium lactate

Reconstitute each vial with 25 mL water for injections and dilute each vial with 25–100 mL infusion fluid; give requisite dose over 15 minutes

**Dexrazoxane** (*Savene<sup>®</sup>*)

Intermittent in *Savene<sup>®</sup>* diluent

Reconstitute 500 mg with 25 mL of water for injections then dilute in 500 mL *Savene<sup>®</sup>* diluent; give over 1–2 hours into a large vein in an area other than the one affected

**Diamorphine hydrochloride** (*Diamorphine Injection*, Wockhardt)

Continuous in Glucose 5% or Sodium chloride 0.9%

Glucose is preferred as infusion fluid

**Diazepam (solution)** (*Diazepam*, Wockhardt)

Continuous in Glucose 5% or Sodium chloride 0.9%

Dilute to a concentration of not more than 10 mg in 200 mL; adsorbed to some extent by the plastics of bags and infusion sets

**Diazepam (emulsion)** (*Diazemul<sup>®</sup>*)

Continuous in Glucose 5% or 10%

May be diluted to a max. concentration of 200 mg in 500 mL; max. 6 hours between addition and completion of administration; adsorbed to some extent by the plastics of the infusion set

via drip tubing in Glucose 5% or 10% or Sodium chloride 0.9%

Adsorbed to some extent by the plastics of the infusion set

**Diclofenac sodium** (*Voltarol<sup>®</sup>*)

Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%

Dilute 75 mg with 100–500 mL infusion fluid (previously buffered with 0.5 mL sodium bicarbonate 8.4% solution or with 1 mL sodium bicarbonate 4.2% solution); for intermittent infusion give 25–50 mg over 15–60 minutes or 75 mg over 30–120 minutes; for continuous infusion give at a rate of 5 mg/hour

**Digoxin** (*Lanoxin<sup>®</sup>*)

Intermittent in Glucose 5% or Sodium chloride 0.9%

Dilute to a concentration of not more than 62.5 micrograms/mL. To be given over at least 2 hours

**Digoxin-specific antibody fragments** (*DigiFab<sup>®</sup>*)

Intermittent in Sodium chloride 0.9%

Reconstitute with water for injections (4 mL/vial), then dilute with infusion fluid and give over 30 minutes

**Dinoprostone** (*Prostin E2<sup>®</sup>*)

Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%

**Disopyramide (as phosphate)** (*Rythmodan<sup>®</sup>*)

Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%

Max. rate by continuous infusion 20–30 mg/hour (or 400 micrograms/kg/hour)

**Dobutamine (as hydrochloride)**

Continuous in Glucose 5% or Sodium chloride 0.9%

Dilute to a concentration of 0.5–1 mg/mL and give via an infusion pump; give higher concentration (max. 5 mg/mL) through central venous catheter; incompatible with bicarbonate and other strong alkaline solutions

**Dopamine hydrochloride**

Continuous in Glucose 5% or Sodium chloride 0.9%

Dilute to max. concentration of 3.2 mg/mL; incompatible with bicarbonate

**Dopexamine hydrochloride** (*Dopacard<sup>®</sup>*)

Continuous in Glucose 5% or Sodium chloride 0.9%

Dilute to a concentration of 400 or 800 micrograms/mL; max. concentration via large peripheral vein 1 mg/mL, concentrations up to 4 mg/mL may be infused via central vein; give via infusion pump or other device which provides accurate control of rate; contact with metal should be minimised; incompatible with bicarbonate

**Eculizumab (Soliris<sup>®</sup>)**

Intermittent in Glucose 5% or Sodium chloride 0.9%  
Dilute requisite dose to a concentration of 5 mg/mL and mix gently; give over 25–45 minutes (infusion time may be increased to 2 hours if infusion-related reactions occur)

**Enoximone (Perfan<sup>®</sup>)**

Continuous or intermittent in Sodium chloride 0.9% or Water for injections  
Dilute to a concentration of 2.5 mg/mL; incompatible with glucose solutions; use only plastic containers or syringes

**Epoprostenol (Flolan<sup>®</sup>)**

Continuous in Sodium chloride 0.9% (but see also below)  
Reconstitute using the filter and solvent (glycine buffer diluent) provided to make a concentrate; may be diluted further (consult product literature); for *pulmonary hypertension* dilute further with glycine buffer diluent only, for *renal dialysis* may be diluted further with sodium chloride 0.9%

**Ertapenem (Invanz<sup>®</sup>)**

Intermittent in Sodium chloride 0.9%  
Reconstitute 1 g with 10 mL water for injections or sodium chloride 0.9%; dilute requisite dose in infusion fluid to a final concentration not exceeding 20 mg/mL; give over 30 minutes; incompatible with glucose solutions

**Erythromycin (as lactobionate)**

Intermittent in Glucose 5% (neutralised with sodium bicarbonate) or Sodium chloride 0.9%  
Dissolve initially in water for injections (1 g in 20 mL) then dilute to a concentration of 1–5 mg/mL; give over 20–60 minutes

**Esomeprazole (as sodium salt) (Nexium<sup>®</sup>)**

Continuous or intermittent in Sodium chloride 0.9%  
Reconstitute 40–80 mg with up to 100 mL infusion fluid; for intermittent infusion, give requisite dose over 10–30 minutes; stable for 12 hours in sodium chloride 0.9%

**Ethanol**

Continuous in Glucose 5% or Sodium chloride 0.9%  
Dilute to a concentration of 5–10%

**Fentanyl (Sublimaze<sup>®</sup>)**

Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%

**Ferric carboxymaltose (Ferinject<sup>®</sup>)**

Intermittent in Sodium chloride 0.9%  
Dilute 200–500 mg in up to 100 mL infusion fluid and give over at least 6 minutes; dilute 0.5–1 g in up to 250 mL infusion fluid and give over at least 15 minutes

**Filgrastim (Neupogen<sup>®</sup>, Nivestim<sup>®</sup>, Ratiograstim<sup>®</sup>, Zarzio<sup>®</sup>)**

Continuous or intermittent in Glucose 5%  
For a filgrastim concentration of less than 1 500 000 units/mL (15 micrograms/mL) albumin solution (human albumin solution) is added to produce a final albumin concentration of 2 mg/mL; should not be diluted to a filgrastim concentration of less than 200 000 units/mL (2 micrograms/mL) and should not be diluted with sodium chloride solution

**Flecainide acetate (Tambacor<sup>®</sup>)**

Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%  
Minimum volume in infusion fluids containing chlorides 500 mL

**Flucloxacillin (as sodium salt) (Floxapen<sup>®</sup>)**

Intermittent in Glucose 5% or Sodium chloride 0.9%  
Suggested volume 100 mL given over 30–60 minutes via drip tubing in Glucose 5% or Sodium chloride 0.9%  
Continuous infusion not usually recommended

**Flumazenil**

Continuous in Glucose 5% or Sodium chloride 0.9%

**Fondaparinux (Arixtra<sup>®</sup>)**

Intermittent in Sodium chloride 0.9%  
For ST-segment elevation myocardial infarction, add requisite dose to 25–50 mL infusion fluid and give over 1–2 minutes

**Fosaprepitant (Ivemend<sup>®</sup>)**

Intermittent in Sodium chloride 0.9%  
Reconstitute each 150-mg vial with 5 mL sodium chloride 0.9% gently without shaking to avoid foaming, then dilute in 145 mL infusion fluid; give over 20–30 minutes

**Foscarnet sodium (Foscavir<sup>®</sup>)**

Intermittent in Glucose 5% or Sodium chloride 0.9%  
Dilute to a concentration of 12 mg/mL for infusion into peripheral vein (undiluted solution via central venous line only); infuse over at least 1 hour (infuse doses greater than 60 mg/kg over 2 hours)

**Fosphenytoin Sodium (Pro-Epanutin<sup>®</sup>)**

Intermittent in Glucose 5% or Sodium chloride 0.9%  
Dilute to a concentration of 1.5–25 mg (phenytoin sodium equivalent)/mL

**Furosemide (as sodium salt) (Lasix<sup>®</sup>)**

Continuous in Sodium chloride 0.9%  
Infusion pH must be above 5.5 and rate should not exceed 4 mg/minute; glucose solutions are unsuitable

**Galsulfase (Naglazyme<sup>®</sup>)**

Intermittent in Sodium chloride 0.9%  
Dilute requisite dose with infusion fluid to final volume of 250 mL and mix gently; infuse through a 0.2 micron in-line filter; give approx. 2.5% of the total volume over 1 hour, then infuse remaining volume over next 3 hours; if body-weight under 20 kg and at risk of fluid overload, dilute requisite dose in 100 mL infusion fluid and give over at least 4 hours

**Ganciclovir (as sodium salt) (Cymevene<sup>®</sup>)**

Intermittent in Glucose 5% or Sodium chloride 0.9%  
Reconstitute initially in water for injections (500 mg/10 mL) then dilute to not more than 10 mg/mL with infusion fluid (usually 100 mL); give over 1 hour

**Gentamicin (as sulfate) (Cidomycin<sup>®</sup>; Gentamicin Paediatric Injection, Beacon; Gentamicin Injection, Hospira)**

Intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%  
Suggested volume for intermittent infusion 50–100 mL given over 20–30 minutes (given over 60 minutes for once daily dose regimen)

**Glycerol trinitrate (Nitrocline<sup>®</sup>, Nitronal<sup>®</sup>)**

Continuous in Glucose 5% or Sodium chloride 0.9%  
For Nitrocline<sup>®</sup> suggested infusion concentration 100 micrograms/mL; incompatible with polyvinyl chloride infusion containers such as Viaflex<sup>®</sup> or Steriflex<sup>®</sup>; use glass or polyethylene containers or give via a syringe pump

**Granisetron (as hydrochloride)**

Intermittent in Glucose 5% or Sodium chloride 0.9%  
Dilute up to 3 mL in 20–50 mL infusion fluid (up to 3 mL in a total volume of 10–30 mL for children); give over 5 minutes

**Haem arginate (Normosang<sup>®</sup>)**

Intermittent in Sodium chloride 0.9%  
Dilute requisite dose in 100 mL infusion fluid in glass bottle and give over at least 30 minutes through a filter via large antebachial or central vein; administer within 1 hour after dilution

**Heparin sodium**

Continuous in Glucose 5% or Sodium chloride 0.9%  
Administration with a motorised pump advisable

**Hydralazine hydrochloride** (*Apresoline*®)

Continuous in Sodium chloride 0.9%  
Suggested infusion volume 500 mL

**Hydrocortisone (as sodium phosphate)** (*Efcortisol*®)

Continuous or intermittent or via drip tubing in  
Glucose 5% or Sodium chloride 0.9%

**Hydrocortisone (as sodium succinate)** (*SoluCortef*®)

Continuous or intermittent or via drip tubing in  
Glucose 5% or Sodium chloride 0.9%

**Hydroxocobalamin** (*Cyanokit*®)

Intermittent in Sodium chloride 0.9%  
Reconstitute each 5-g vial with 200 mL infusion fluid; gently invert vial for at least 1 minute to mix; do not shake

**Ibandronic acid** (*Bondronat*®)

Intermittent in Glucose 5% or Sodium chloride 0.9%  
Dilute requisite dose in 500 mL infusion fluid and give over 1–2 hours

**Idursulfase** (*Elaprase*®)

Intermittent in Sodium chloride 0.9%  
Dilute requisite dose in 100 mL infusion fluid and mix gently (do not shake); give over 3 hours (gradually reduced to 1 hour if no infusion-related reactions)

**Imiglucerase** (*Cerezyme*®)

Intermittent in Sodium chloride 0.9%  
Initially reconstitute with water for injections (200 units in 5.1 mL, 400 units in 10.2 mL) to give 40 units/mL solution; dilute requisite dose with infusion fluid to a final volume of 100–200 mL and give initial dose at a rate not exceeding 0.5 units/kg/minute, subsequent doses to be given at a rate not exceeding 1 unit/kg/minute; administer within 3 hours after reconstitution

**Imipenem with cilastatin (as sodium salt)**

(*Primaxin*®)  
Intermittent in Sodium chloride 0.9%  
Dilute to a concentration of 5 mg (as imipenem)/mL; infuse 500 mg (as imipenem) over 20–30 minutes, dose greater than 500 mg (as imipenem) over 40–60 minutes

**Infliximab** (*Remicade*®)

Intermittent in Sodium chloride 0.9%  
Reconstitute each 100-mg vial with 10 mL water for injections using a 21-gauge or smaller needle; gently swirl vial without shaking to dissolve; allow to stand for 5 minutes; dilute requisite dose with infusion fluid to a final volume of 250 mL and give through a low protein-binding filter (1.2 micron or less) over at least 2 hours (adults over 18 years who have tolerated 3 initial 2-hour infusions may be given subsequent infusions of up to 6 mg/kg over at least 1 hour); start infusion within 3 hours of reconstitution

**Insulin (soluble)**

Continuous in Sodium chloride 0.9%  
Adsorbed to some extent by plastics of infusion set; see also section 6.1.3; ensure insulin is not injected into 'dead space' of injection port of the infusion bag

**Insulin aspart**

Continuous in Glucose 5% or Sodium chloride 0.9%  
Dilute to 0.05–1 unit/mL with infusion fluid; adsorbed to some extent by plastics of infusion set

**Insulin glulisine** (*Apidra*®)

Continuous in Sodium chloride 0.9%  
Dilute to 1 unit/mL with infusion fluid; use a co-extruded polyolefin/polyamide plastic infusion bag with a dedicated infusion line

**Insulin lispro**

Continuous in Glucose 5% or Sodium chloride 0.9%  
Adsorbed to some extent by plastics of infusion set

**Iron dextran** (*Cosmofer*®)

Intermittent in Glucose 5% or Sodium chloride 0.9%  
Dilute 100–200 mg in 100 mL infusion fluid; give 25 mg over 15 minutes initially, then give at a rate not exceeding 6.67 mg/minute; total dose infusion diluted in 500 mL infusion fluid and given over 4–6 hours (initial dose 25 mg over 15 minutes)

**Iron isomaltoside 1000** (*Monofer*®)

Intermittent in Sodium chloride 0.9%  
For details consult product literature

**Iron sucrose** (*Venofer*®)

Intermittent in Sodium chloride 0.9%  
Dilute 100 mg in up to 100 mL infusion fluid; give 25 mg over 15 minutes initially, then give at a rate not exceeding 3.33 mg/minute

**Isosorbide dinitrate** (*Isoket 0.05%*®, *Isoket 0.1%*®)

Continuous in Glucose 5% or Sodium chloride 0.9%  
Adsorbed to some extent by polyvinyl chloride infusion containers; preferably use glass or polyethylene containers or give via a syringe pump; *Isoket 0.05%*® can alternatively be administered undiluted using a syringe pump with a glass or rigid plastic syringe

**Itraconazole** (*Sporanox*®)

Intermittent in Sodium chloride 0.9%  
Dilute 250 mg in 50 mL infusion fluid and infuse only 60 mL through an in-line filter (0.2 micron) over 60 minutes

**Ketamine (as hydrochloride)** (*Ketalar*®)

Continuous in Glucose 5% or Sodium chloride 0.9%  
Dilute to 1 mg/mL; microdrip infusion for maintenance of anaesthesia

**Labetalol hydrochloride**

Intermittent in Glucose 5% or Sodium chloride and glucose  
Dilute to a concentration of 1 mg/mL; suggested volume 200 mL; adjust rate with in-line burette

**Lacosamide** (*Vimpat*®)

Intermittent in Glucose 5% or Sodium chloride 0.9%  
May be administered undiluted

**Laronidase** (*Aldurazyme*®)

Intermittent in Sodium chloride 0.9%  
Body-weight under 20 kg, use 100 mL infusion fluid; body-weight over 20 kg use 250 mL infusion fluid; withdraw volume of infusion fluid equivalent to volume of laronidase concentrate being added; give through an in-line filter (0.22 micron) at an initial rate of 2 units/kg/hour then increasing gradually every 15 minutes to max. 43 units/kg/hour

**Lenograstim** (*Granocyte*®)

Intermittent in Sodium chloride 0.9%  
Initially reconstitute with 1 mL water for injection provided (do not shake vigorously) then dilute with up to 50 mL infusion fluid for each vial of *Granocyte-13* or up to 100 mL infusion fluid for *Granocyte-34*; give over 30 minutes

**Levetiracetam** (*Keppra*®)

Intermittent in Glucose 5% or Sodium chloride 0.9%  
Dilute requisite dose with at least 100 mL of infusion fluid; give over 15 minutes

**Magnesium sulfate injection, BP**

Continuous in Glucose 5% or Sodium chloride 0.9%  
Suggested concentration up to 200 mg/mL (20%) (0.8 mmol/mL Mg<sup>2+</sup>) magnesium sulfate heptahydrate; max. rate 150 mg/minute (0.6 mmol/minute Mg<sup>2+</sup>)

**Meropenem** (*Meronem*®)

Intermittent in Glucose 5% or Sodium chloride 0.9%  
Dilute dose in infusion fluid to a final concentration of 1–20 mg/mL; give over 15–30 minutes

**Metaraminol (as tartrate) (Aramine<sup>®</sup>)**

Continuous or via drip tubing in Glucose 5% or Sodium chloride 0.9%  
Suggested volume 500 mL

**Methylprednisolone (as sodium succinate) (Solu-Medrone<sup>®</sup>)**

Continuous or intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%  
Reconstitute initially with water for injections; doses up to 250 mg should be given over at least 5 minutes, high doses over at least 30 minutes

**Micafungin (Mycamine<sup>®</sup>)**

Intermittent in Glucose 5% or Sodium chloride 0.9%  
Reconstitute each vial with 5 mL infusion fluid; gently rotate vial, without shaking, to dissolve; dilute requisite dose with infusion fluid to 100 mL (final concentration 0.5–2 mg/mL); protect infusion from light; give over 60 minutes

**Midazolam (Hypnovel<sup>®</sup>)**

Continuous in Glucose 5% or Sodium chloride 0.9%  
For neonates and children under 15 kg dilute to a max. concentration of 1 mg/mL

**Milrinone (Primacor<sup>®</sup>)**

Continuous in Glucose 5% or Sodium chloride 0.9%  
Dilute to a suggested concentration of 200 micrograms/mL

**Mivacurium (as chloride) (Mivacron<sup>®</sup>)**

Continuous in Glucose 5% or Sodium chloride 0.9%  
Dilute to a concentration of 500 micrograms/mL; may also be given undiluted

**Mycophenolate mofetil (as hydrochloride)**

(CellCept<sup>®</sup>)  
Intermittent in Glucose 5%  
Reconstitute each 500-mg vial with 14 mL glucose 5% and dilute the contents of 2 vials in 140 mL infusion fluid; give over 2 hours

**Naloxone (Minijet<sup>®</sup> Naloxone Hydrochloride)**

Continuous in Glucose 5% or Sodium chloride 0.9%  
Dilute to a concentration of up to 200 micrograms/mL and administer via an infusion pump, see Emergency Treatment of Poisoning

**Natalizumab (Tysabri<sup>®</sup>)**

Intermittent in Sodium chloride 0.9%  
Dilute 300 mg in 100 mL infusion fluid; gently invert to mix, do not shake. Use within 8 hours of dilution and give over 1 hour

**Nimodipine (Nimotop<sup>®</sup>)**

via drip tubing in Glucose 5% or Sodium chloride 0.9%  
Not to be added to infusion container; administer via an infusion pump through a Y-piece into a central catheter; incompatible with polyvinyl chloride giving sets or containers; protect infusion from light

**Nizatidine (Axid<sup>®</sup>)**

Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%  
For continuous infusion, dilute 300 mg in 150 mL and give at a rate of 10 mg/hour; for intermittent infusion, dilute 100 mg in 50 mL and give over 15 minutes

**Noradrenaline/Norepinephrine**

Continuous in Glucose 5% or Sodium chloride and glucose  
Give via controlled infusion device; for administration via syringe pump, dilute 2 mg (2 mL of solution) noradrenaline base with 48 mL infusion fluid; for administration via drip counter dilute 20 mg (20 mL of solution) noradrenaline base with 480 mL infusion fluid; give through a central venous catheter; incompatible with alkalis.  
1 mg of noradrenaline base is equivalent to 2 mg noradrenaline acid tartrate

**Omeprazole (as sodium salt) (Losec<sup>®</sup>)**

Intermittent or continuous in Glucose 5% or Sodium chloride 0.9%  
Reconstitute each 40 mg vial with infusion fluid and dilute to 100 mL; for intermittent infusion, give 40 mg over 20–30 minutes; stable for 3 hours in glucose 5% or 12 hours in sodium chloride 0.9%

**Ondansetron (as hydrochloride) (Zofran<sup>®</sup>)**

Continuous or intermittent in Glucose 5% or Glucose 5% with potassium chloride 0.3% or Sodium chloride 0.9% or Sodium chloride 0.9% with potassium chloride 0.3% or Mannitol 10% or Ringers solution  
For intermittent infusion, dilute the required dose in 50–100 mL of infusion fluid and give over at least 15 minutes

**Oxycodone hydrochloride (OxyNorm<sup>®</sup>)**

Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%  
Dilute to a concentration of 1 mg/mL

**Oxytocin (Syntocinon<sup>®</sup>)**

Continuous in Glucose 5% or Sodium chloride 0.9%  
Preferably given via a variable-speed infusion pump in a concentration appropriate to the pump; if given by drip infusion for induction or enhancement of labour, dilute 5 units in 500 mL infusion fluid or for higher doses, 10 units in 500 mL; for treatment of postpartum uterine haemorrhage dilute 40 units in 500 mL; if high doses given for prolonged period (e.g. for inevitable or missed abortion or for postpartum haemorrhage), use low volume of an electrolyte-containing infusion fluid (not Glucose 5%) given at higher concentration than for induction or enhancement of labour; close attention to patient's fluid and electrolyte status essential

**Pamidronate disodium (Aredia<sup>®</sup>; Pamidronate disodium, Hospira, Medac, Wockhardt)**

Intermittent in Glucose 5% or Sodium chloride 0.9%  
For Aredia<sup>®</sup>, reconstitute initially with water for injections (15 mg in 5 mL, 30 mg or 90 mg in 10 mL); for Pamidronate disodium (Wockhardt), dilute with infusion fluid to a concentration of not more than 60 mg in 250 mL; for Aredia<sup>®</sup>, Pamidronate disodium (Medac, Hospira) dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL; give at a rate not exceeding 1 mg/minute; not to be given with infusion fluids containing calcium

**Pantoprazole (as sodium sesquihydrate) (Protium<sup>®</sup>)**

Intermittent in Glucose 5% or Sodium chloride 0.9%  
Reconstitute 40 mg with 10 mL sodium chloride 0.9% and dilute with 100 mL of infusion fluid; give 40 mg over 15 minutes

**Paracetamol (Perfalgan<sup>®</sup>)**

Intermittent in Glucose 5% or Sodium chloride 0.9%  
Dilute to a concentration of not less than 1 mg/mL and use within 1 hour; may also be given undiluted

**Pentamidine isetionate (Pentacarinat<sup>®</sup>)**

Intermittent in Glucose 5% or Sodium chloride 0.9%  
Dissolve initially in water for injections (300 mg in 3–5 mL) then dilute in 50–250 mL; give over at least 60 minutes

**Phenoxybenzamine hydrochloride**

Intermittent in Sodium chloride 0.9%  
Dilute in 200–500 mL infusion fluid; give over at least 2 hours; max. 4 hours between dilution and completion of administration

**Phenylephrine hydrochloride**

Intermittent in Glucose 5% or Sodium chloride 0.9%  
Dilute 10 mg in 500 mL infusion fluid

**Phenytoin sodium** (*Epanutin*®)

Intermittent in Sodium chloride 0.9%

Flush intravenous line with Sodium chloride 0.9% before and after infusion; dilute in 50–100 mL infusion fluid (final concentration not to exceed 10 mg/mL) and give into a large vein through an in-line filter (0.22–0.50 micron) at a rate not exceeding 1 mg/kg/minute (max. 50 mg/minute); complete administration within 1 hour of preparation

**Phytomenadione (in mixed micelles vehicle)**

(*Konakion*® MM)

Intermittent in Glucose 5%

Dilute with 55 mL; may be injected into lower part of infusion apparatus

**Piperacillin with tazobactam (as sodium salts)**

Intermittent in Glucose 5% or Sodium chloride 0.9%

Reconstitute initially (2.25 g in 10 mL, 4.5 g in 20 mL) with water for injections, or glucose 5% (*Tazocin*® brand only), or sodium chloride 0.9%, then dilute to 150–150 mL with infusion fluid; give over 30 minutes

**Potassium chloride**

Continuous in Glucose 5% or Sodium chloride 0.9%

Dilute in a large-volume infusion; mix thoroughly to avoid 'layering', especially in non-rigid infusion containers; use ready-prepared solutions when possible

**Propofol (emulsion)** (*Diprivan*®, *Propofol-Lipuro*®)

Shake before use; microbiological filter not recommended; may be administered via a Y-piece close to injection site co-administered with Glucose 5% or Sodium chloride 0.9%

**0.5% emulsion**

Intermittent

May be administered undiluted, or diluted with Glucose 5% or Sodium chloride 0.9%; dilute to a concentration not less than 1 mg/mL

**1% emulsion**

Continuous or intermittent

May be administered undiluted, or diluted with Sodium Chloride 0.9% (*Propofol-Lipuro*® only) or Glucose 5%; dilute to a concentration not less than 2 mg/mL; use within 6 hours of preparation

**2% emulsion**

Continuous

Do not dilute

**Quinine dihydrochloride**

Continuous in Glucose 5% or Sodium chloride 0.9%

To be given over 4 hours; see also section 5.4.1

**Ranitidine (as hydrochloride)** (*Zantac*®)

Intermittent in Glucose 5% or Sodium chloride 0.9%

**Rasburicase** (*Fasturtec*®)

Intermittent in Sodium chloride 0.9%

Reconstitute with solvent provided; gently swirl vial without shaking to dissolve; dilute requisite dose to 50 mL with infusion fluid and give over 30 minutes

**Remifentanyl** (*Ultiva*®)

Continuous in Glucose 5% or Sodium chloride 0.9% or Water for injections

Reconstitute with infusion fluid to a concentration of 1 mg/mL then dilute further to a concentration of 20–250 micrograms/mL (50 micrograms/mL recommended for general anaesthesia, 20–25 micrograms/mL recommended for children 1–12 years; 20–50 micrograms/mL recommended when used with target controlled infusion (TCI) device)

**Rifampicin** (*Rifadin*®)

Intermittent in Glucose 5% or Sodium chloride 0.9%

Reconstitute with solvent provided then dilute with 500 mL infusion fluid; give over 2–3 hours

**Rituximab** (*MabThera*®)

Intermittent in Glucose 5% or Sodium chloride 0.9%

Dilute to 1–4 mg/mL and gently invert bag to avoid foaming

**Rocuronium bromide** (*Esmeron*®)

Continuous or *via* drip tubing in Glucose 5% or

Sodium chloride 0.9%

**Salbutamol (as sulfate)** (*Ventolin*® For Intravenous Infusion)

Continuous in Glucose 5%

For bronchodilatation dilute to a concentration of 200 micrograms/mL with glucose 5% or sodium chloride 0.9%; for premature labour dilute with glucose 5% to a concentration of 200 micrograms/mL for use in a syringe pump or for other infusion methods (preferably *via* controlled infusion device), dilute to a concentration of 20 micrograms/mL; close attention to patient's fluid and electrolyte status essential

**Sodium nitroprusside**

Continuous in Glucose 5%

Infuse *via* infusion device to allow precise control; protect infusion from light. For further details consult product literature

**Sodium valproate** (*Epilim*®, *Episenta*®)

Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%

Reconstitute *Epilim*® with solvent provided then dilute with infusion fluid

**Streptokinase** (*Streptase*®)

Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%

Reconstitute with sodium chloride 0.9%, then dilute further with infusion fluid

**Tacrolimus** (*Prograf*®)

Continuous in Glucose 5% or Sodium chloride 0.9%

Dilute concentrate in infusion fluid to a final concentration of 4–100 micrograms/mL; give over 24 hours; incompatible with PVC

**Teicoplanin** (*Targocid*®)

Intermittent in Glucose 5% or Sodium chloride 0.9%

Reconstitute initially with water for injections provided; infuse over 30 minutes

Continuous infusion not usually recommended

**Temocillin** (*Negaban*®)

Intermittent in Glucose 5% or 10% or Sodium

chloride 0.9%

Reconstitute 1 g with 10 mL water for injections then dilute with 50–150 mL infusion fluid; give over 30–40 minutes

**Terbutaline sulfate** (*Bricanyl*®)

Continuous in Glucose 5%

For bronchodilatation dilute 1.5–2.5 mg with 500 mL glucose 5% or sodium chloride 0.9% and give over 8–10 hours; for premature labour dilute in glucose 5% and give *via* controlled infusion device preferably a syringe pump; if syringe pump available dilute to a concentration of 100 micrograms/mL; if syringe pump not available dilute to a concentration of 10 micrograms/mL; close attention to patient's fluid and electrolyte status essential

**Ticarcillin sodium with clavulanic acid** (*Timentin*®)

Intermittent in Glucose 5%

Suggested volume (depending on dose) 100–150 mL; give over 30–40 minutes

**Tigecycline** (*Tyagcil*®)

Intermittent in Glucose 5% or Sodium chloride 0.9%

Reconstitute each vial with 5.3 mL infusion fluid to produce a 10 mg/mL solution; dilute requisite dose in 100 mL infusion fluid; give over 30–60 minutes

**Tirofiban** (*Aggrastat*<sup>®</sup>)

Continuous in Glucose 5% or Sodium chloride 0.9%  
Withdraw 50 mL infusion fluid from 250-mL bag and replace with 50 mL tirofiban concentrate (250 micrograms/mL) to give a final concentration of 50 micrograms/mL

**Tobramycin (as sulfate)** (*Nebcin*<sup>®</sup>)

Intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%

For adult intermittent infusion suggested volume 50–100 mL (children proportionately smaller volume) given over 20–60 minutes

**Tocilizumab** (*RoActemra*<sup>®</sup>)

Intermittent in Sodium chloride 0.9%  
Dilute requisite dose to a volume of 100 mL with infusion fluid and give over 1 hour

**Tramadol hydrochloride** (*Zydol*<sup>®</sup>)

Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%

**Tranexamic acid** (*Cyklokapron*<sup>®</sup>)

Continuous in Glucose 5% or Sodium chloride 0.9%

**Urokinase** (*Syner-KINASE*<sup>®</sup>)

Continuous or intermittent in Sodium chloride 0.9%

**Vancomycin (as hydrochloride)** (*Vancoin*<sup>®</sup>)

Intermittent in Glucose 5% or Sodium chloride 0.9%  
Reconstitute each 500 mg with 10 mL water for injections and dilute with infusion fluid to a concentration of up to 5 mg/mL (10 mg/mL in fluid restriction but increased risk of infusion-related effects); give over at least 60 minutes (rate not to exceed 10 mg/minute for doses over 500 mg); use continuous infusion only if intermittent not feasible

**Vasopressin, synthetic (argipressin)**

Intermittent in Glucose 5%  
Suggested concentration 20 units/100 mL given over 15 minutes

**Vecuronium bromide** (*Norcuron*<sup>®</sup>)

Continuous or via drip tubing in Glucose 5% or Sodium chloride 0.9%  
Reconstitute each vial with 5 mL water for injections to give 2 mg/mL solution; alternatively reconstitute with up to 10 mL glucose 5% or sodium chloride 0.9% or water for injections—unsuitable for further dilution if not reconstituted with water for injections. For continuous intravenous infusion, dilute to a concentration up to 40 micrograms/mL

**Velaglucerase alfa** (*VPRIV*<sup>®</sup>)

Intermittent in Sodium chloride 0.9%  
Reconstitute each 400-unit vial with 4.3 mL water for injections to produce a 100 units/mL solution; dilute requisite dose in 100 mL infusion fluid; give over 60 minutes through a 0.22 micron filter; start infusion within 24 hours of reconstitution

**Verteporfin** (*Visudyne*<sup>®</sup>)

Intermittent in Glucose 5%  
Reconstitute each 15 mg with 7 mL water for injections to produce a 2 mg/mL solution then dilute requisite dose with infusion fluid to a final volume of 30 mL and give over 10 minutes; protect infusion from light and administer within 4 hours of reconstitution. Incompatible with sodium chloride infusion

**Vitamins B & C** (*Fabrinex*<sup>®</sup> I/V High potency)

Intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%  
Ampoule contents should be mixed, diluted, and administered without delay; give over 30 minutes (see MHRA/CHM advice, section 9.6.2)

**Vitamins, multiple**

(*Cernevit*<sup>®</sup>)  
Intermittent in Glucose 5% or Sodium chloride 0.9%  
Dissolve initially in 5 mL water for injections (or infusion fluid)  
(*Solivito N*<sup>®</sup>)  
Intermittent in Glucose 5 and 10%  
Suggested volume 500–1000 mL given over 2–3 hours; see also section 9.3

**Voriconazole** (*Vfend*<sup>®</sup>)

Intermittent in Glucose 5% or Sodium chloride 0.9%  
Reconstitute each 200 mg with 19 mL water for injections or sodium chloride 0.9% to produce a 10 mg/mL solution; dilute dose in infusion fluid to concentration of 0.5–5 mg/mL; give at a rate not exceeding 3 mg/kg/hour

**Zidovudine** (*Retrovir*<sup>®</sup>)

Intermittent in Glucose 5%  
Dilute to a concentration of 2 mg/mL or 4 mg/mL and give over 1 hour

**Zoledronic acid** (*Zometa*<sup>®</sup>)

Intermittent in Glucose 5% or Sodium chloride 0.9%  
Dilute requisite dose according to product literature; infuse over at least 15 minutes; administer as a single intravenous solution in a separate infusion line

A5.7.5 Skin closure dressings	1081		
<b>A5.8 Bandages</b>	<b>1081</b>		
A5.8.1 Non-extensible bandages	1081		
A5.8.2 Light-weight conforming bandages	1082		
			As wound healing passes through its different stages, different types of dressings may be required to satisfy better one or other of these requirements. Under normal circumstances, a moist environment is a necessary part of the wound healing process; exudate provides a moist environment and promotes healing, but excessive exudate can cause maceration of the wound and surrounding healthy tissue. The volume and viscosity of exudate changes as the wound heals. There are certain circumstances where moist wound healing is not appropriate (e.g. gangrenous toes associated with vascular disease).
			<b>Advanced wound dressings</b> , (section A5.2) are designed to control the environment for wound healing, for example to donate fluid ( <b>hydrogels</b> ), maintain hydration ( <b>hydrocolloids</b> ), or to absorb wound exudate ( <b>alginates</b> , <b>foams</b> ).

Practices such as the use of irritant cleansers and desloughing agents may be harmful and are largely obsolete; removal of debris and dressing remnants should need minimal irrigation with lukewarm sterile sodium chloride 0.9% solution or water.

Hydrogel, hydrocolloid, and medical grade honey dressings can be used to deslough wounds by promoting autolytic debridement; there is insufficient evidence to support any particular method of debridement for difficult-to-heal surgical wounds. Sterile larvae (maggots) are also available for biosurgical removal of wound debris.

There have been few clinical trials able to establish a clear advantage for any particular product. The choice between different dressings depends not only on the type and stage of the wound, but also on patient preference or tolerance, site of the wound, and cost. For further information, see *Buyers' Guide: Advanced wound dressings* (October 2008); NHS Purchasing and Supply Agency, Centre for Evidence-based Purchasing.

Prices quoted in Appendix 5 are basic NHS net prices; for further information see Prices in the BNF.

The table below gives suggestions for choices of primary dressing depending on the type of wound (a secondary dressing may be needed in some cases).

## A5.1 Basic wound contact dressings

### A5.1.1 Low adherence dressings

Low adherence dressings are used as interface layers under secondary absorbent dressings. Placed directly on the wound bed, non-absorbent, low adherence dressings are suitable for clean, granulating, lightly exuding wounds without necrosis, and protect the wound bed from direct contact with secondary dressings. Care must be taken to avoid granulation tissue growing into the weave of these dressings.

**Tulle dressings** are manufactured from cotton or viscose fibres which are impregnated with white or yellow soft paraffin to prevent the fibres from sticking, but this

### Wound contact material for different types of wounds

Wound PINK (Epithelialising)		
Low Exudate	Moderate Exudate	
Low adherence A5.1.1 Vapour-permeable film A5.2.2 Soft polymer A5.2.3 Hydrocolloid A5.2.4	Soft polymer A5.2.3 Foam, low absorbent A5.2.5 Alginate A5.2.6	
Wound RED (Granulating)		
Symptoms or signs of infection, see <b>Wounds with signs of infection</b>		
Low Exudate	Moderate Exudate	Heavy Exudate
Low adherence A5.1.1 Soft polymer A5.2.3 Hydrocolloid A5.2.4 Foam, low absorbent A5.2.5	Hydrocolloid-fibrous A5.2.4 Foam A5.2.5 Alginate A5.2.6	Foam with extra absorbency A5.2.5 Hydrocolloid-fibrous A5.2.4 Alginate A5.2.6
Wound YELLOW (Sloughy)		
Symptoms or signs of infection, see <b>Wounds with signs of infection</b>		
Low Exudate	Moderate Exudate	Heavy Exudate
Hydrogel A5.2.1 Hydrocolloid A5.2.4	Hydrocolloid-fibrous A5.2.4 Alginate A5.2.6	Hydrocolloid-fibrous A5.2.4 Alginate A5.2.6 Capillary-action A5.2.7
Wound BLACK (Necrotic/Eschar)		
Consider mechanical debridement alongside autolytic debridement		
Low Exudate or Dry	Moderate Exudate	Heavy Exudate
Hydrogel A5.2.1 Hydrocolloid A5.2.4	Hydrocolloid A5.2.4 Hydrocolloid-fibrous A5.2.4 Foam A5.2.5	Seek advice from wound care specialist
Wounds with signs of infection		
Consider systemic antibacterials if appropriate; also consider odour-absorbent dressings (section A5.2.8) For malodorous wounds with slough or necrotic tissue, consider mechanical or autolytic debridement		
Low Exudate	Moderate Exudate	Heavy Exudate
Low adherence with honey A5.3.1 Low adherence with iodine A5.3.2 Low adherence with silver A5.3.3 Hydrocolloid with silver A5.3.3 Honey—topical A5.3.1	Hydrocolloid-fibrous with silver A5.3.3 Foam with silver A5.3.3 Alginate with silver A5.3.3 Honey—topical A5.3.1 Cadexomer-iodine A5.3.2	Hydrocolloid-fibrous with silver A5.3.3 Foam, extra absorbent, with silver A5.3.3 Alginate with honey A5.3.1 Alginate with silver A5.3.3
<b>Note</b> In each section of this table the dressings are listed in order of increasing absorbency. Some wound contact (primary) dressings require a secondary dressing		

is only partly successful and it may be necessary to change the dressings frequently. The paraffin reduces absorbency of the dressing. Dressings with a reduced content (light loading) of soft paraffin are less liable to interfere with absorption; dressings with 'normal loading' (such as *Jelonet*<sup>®</sup>) have been used for skin graft transfer.

**Knitted viscose primary dressing** is an alternative to tulle dressings for exuding wounds; it can be used as the initial layer of multi-layer compression bandaging in the treatment of venous leg ulcers.

#### Knitted Viscose Primary Dressing, BP 1993

Warp knitted fabric manufactured from a bright viscose monofilament.

**N-A Dressing**<sup>®</sup>, 9.5 cm × 9.5 cm = 35p, 9.5 cm × 19 cm = 67p (Systagenix)

**N-A Ultra**<sup>®</sup> (silicone-coated), 9.5 cm × 9.5 cm = 33p, 9.5 cm × 19 cm = 63p (Systagenix)

**Profore**<sup>®</sup>, 14 cm × 20 cm = 30p (S&N Hlth.)

**Tricotex**<sup>®</sup>, 9.5 cm × 9.5 cm = 32p (S&N Hlth.)

#### Paraffin Gauze Dressing, BP 1993

(Tulle Gras). Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with white or yellow soft paraffin, 10 cm × 10 cm, (light loading) = 25p; (normal loading) = 37p (most suppliers including Synergy Healthcare—*Paranet*<sup>®</sup> (light loading); BSN Medical—*Cuticell*<sup>®</sup> Classic (normal loading); S&N Hlth.—*Jelonet*<sup>®</sup> (normal loading); Neomedic—*Neotulle*<sup>®</sup> (normal loading); C D Medical—*Paragauze*<sup>®</sup> (normal loading))

#### Atrauman<sup>®</sup> (Hartmann)

Non-adherent knitted polyester primary dressing impregnated with neutral triglycerides, 5 cm × 5 cm = 24p, 7.5 cm × 10 cm = 26p, 10 cm × 20 cm = 59p, 20 cm × 30 cm = £1.63

## A5.1.2 Absorbent dressings

**Perforated film absorbent dressings** are suitable only for wounds with mild to moderate amounts of exudate; they are not appropriate for leg ulcers or for other lesions that produce large quantities of viscous exudate. Dressings with an absorbent cellulose or polymer wadding layer are suitable for use on moderately to heavily exuding wounds.

### ▲ For lightly exuding wounds

#### Absorbent Perforated Dressing with Adhesive Border

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

**Adpore**<sup>®</sup>, 7 cm × 8 cm = 8p, 10 cm × 10 cm = 10p, 10 cm × 15 cm = 16p, 10 cm × 20 cm = 30p, 10 cm × 25 cm = 34p, 10 cm × 30 cm = 42p, 10 cm × 35 cm = 50p (Medicareplus International)

**Cosmopor E**<sup>®</sup>, 5 cm × 7.2 cm = 8p, 8 cm × 10 cm = 16p, 8 cm × 15 cm = 26p, 10 cm × 20 cm = 43p, 10 cm × 25 cm = 53p, 10 cm × 35 cm = 74p (Hartmann)

**Cutiplast**<sup>®</sup> Steril, 5 cm × 7.2 cm = 5p, 8 cm × 10 cm = 10p, 8 cm × 15 cm = 23p, 10 cm × 20 cm = 29p, 10 cm × 25 cm = 30p, 10 cm × 30 cm = 40p (S&N Hlth.)

**Leukomed**<sup>®</sup>, 7.2 cm × 5 cm = 8p, 8 cm × 10 cm = 17p, 8 cm × 15 cm = 30p, 10 cm × 20 cm = 40p, 10 cm × 25 cm = 46p, 10 cm × 30 cm = 59p, 10 cm × 35 cm = 68p (BSN Medical)

**Medipore**<sup>®</sup> + Pad, 5 cm × 7.2 cm = 7p, 10 cm × 10 cm = 15p, 10 cm × 15 cm = 24p, 10 cm × 20 cm = 36p, 10 cm × 25 cm = 45p, 10 cm × 35 cm = 62p (3M)

**Medisafe**<sup>®</sup>, 6 cm × 8 cm = 8p, 8 cm × 10 cm = 13p, 8 cm × 12 cm = 23p, 9 cm × 15 cm = 29p, 9 cm × 20 cm = 34p, 9 cm × 25 cm = 36p (Neomedic)

**Mepore**<sup>®</sup>, 7 cm × 8 cm = 10p, 10 cm × 11 cm = 21p, 11 cm × 15 cm = 34p, 9 cm × 20 cm = 42p, 9 cm × 25 cm = 58p, 9 cm × 30 cm = 67p, 9 cm × 35 cm = 73p (Mölnlycke)

**PremierPore**<sup>®</sup>, 5 cm × 7 cm = 5p, 10 cm × 10 cm = 12p, 10 cm × 15 cm = 18p, 10 cm × 20 cm = 32p, 10 cm × 25 cm = 36p, 10 cm × 30 cm = 45p, 10 cm × 35 cm = 52p (Shermond)

**Primapore**<sup>®</sup>, 6 cm × 8.3 cm = 17p, 8 cm × 10 cm = 18p, 8 cm × 15 cm = 31p, 10 cm × 20 cm = 41p, 10 cm × 25 cm = 47p, 10 cm × 30 cm = 59p, 10 cm × 35 cm = 91p (S&N Hlth)

**Softpore**<sup>®</sup>, 6 cm × 7 cm = 6p, 10 cm × 10 cm = 13p, 10 cm × 15 cm = 20p, 10 cm × 20 cm = 35p, 10 cm × 25 cm = 40p, 10 cm × 30 cm = 49p, 10 cm × 35 cm = 58p (Richardson)

**Sterifix**<sup>®</sup>, 5 cm × 7 cm = 19p, 7 cm × 10 cm = 31p, 10 cm × 14 cm = 55p (Hartmann)

**Telfa**<sup>®</sup> Island, 5 cm × 10 cm = 8p, 10 cm × 12.5 cm = 27p, 10 cm × 20 cm = 35p, 10 cm × 25.5 cm = 44p, 10 cm × 35 cm = 61p (Covidien)

#### Absorbent Perforated Plastic Film Faced Dressing

Low-adherence primary dressing consisting of 3 layers—perforated polyester film wound contact layer, absorbent cotton pad, and hydrophobic backing. Where no size specified by the prescriber, the 5 cm size to be supplied

**Absopad**<sup>®</sup>, 5 cm × 5 cm = 7p, 10 cm × 10 cm = 13p, 20 cm × 10 cm = 28p, (Medicareplus International)

**Askina**<sup>®</sup> Pad, 10 cm × 10 cm = 20p, (B. Braun)

**Cutisorb**<sup>®</sup> LA, 5 cm × 5 cm = 8p, 10 cm × 10 cm = 14p, 10 cm × 20 cm = 29p (BSN Medical)

**Interpose**<sup>®</sup>, 5 cm × 5 cm = 9p, 10 cm × 10 cm = 15p, 10 cm × 20 cm = 32p (Frontier)

**Melolin**<sup>®</sup>, 5 cm × 5 cm = 16p, 10 cm × 10 cm = 26p, 20 cm × 10 cm = 51p (S&N Hlth)

**Release**<sup>®</sup>, 5 cm × 5 cm = 14p, 10 cm × 10 cm = 23p, 20 cm × 10 cm = 44p (Systagenix)

**Skintact**<sup>®</sup>, 5 cm × 5 cm = 10p, 10 cm × 10 cm = 17p, 20 cm × 10 cm = 34p (Robinson)

**Solvaline N**<sup>®</sup>, 5 cm × 5 cm = 9p, 10 cm × 10 cm = 17p, 10 cm × 20 cm = 34p (Activa)

**Telfa**<sup>®</sup>, 5 cm × 7.5 cm = 12p, 10 cm × 7.5 cm = 15p, 15 cm × 7.5 cm = 17p, 20 cm × 7.5 cm = 29p (Covidien)

### ▲ For moderately to heavily exuding wounds

#### Absorbent Cellulose Dressing with Fluid Repellent Backing

**CelluDress**<sup>®</sup>, 10 cm × 10 cm = 19p, 10 cm × 15 cm = 20p, 10 cm × 20 cm = 22p, 15 cm × 20 cm = 30p, 20 cm × 25 cm = 40p, 20 cm × 30 cm = 85p (Medicareplus International)

Eclipse<sup>®</sup>, 15 cm × 15 cm = 97p, 20 cm × 30 cm = £2.14, 60 cm × 40 cm = £8.15, 60 cm × 70 cm (boot-shape) = £13.78 (Advancis)

Exu-Dry<sup>®</sup>, 10 cm × 15 cm = £1.06, 15 cm × 23 cm = £2.17, 23 cm × 38 cm = £5.04 (S&N Hlth.)

Mesorb<sup>®</sup>, cellulose wadding pad with gauze wound contact layer and non-woven repellent backing, 10 cm × 10 cm = 59p, 10 cm × 15 cm = 77p, 10 cm × 20 cm = 95p, 15 cm × 20 cm = £1.36, 20 cm × 25 cm = £2.14, 20 cm × 30 cm = £2.43 (Mölnlycke)

Telfa Max<sup>®</sup>, 22.8 cm × 38 cm = £4.62, 38 cm × 45.7 cm = £5.61, 38 cm × 60.9 cm = £8.16 (Covidien)

Zetuvit<sup>®</sup> E, non-sterile, 10 cm × 10 cm = 6p, 10 cm × 20 cm = 8p, 20 cm × 20 cm = 14p, 20 cm × 40 cm = 26p; sterile, 10 cm × 10 cm = 20p, 10 cm × 20 cm = 23p, 20 cm × 20 cm = 37p, 20 cm × 40 cm = £1.04 (Hartmann)

### ▲ For heavily exuding wounds

#### Curea<sup>®</sup> (Bullen)

Super absorbent cellulose and polymer primary dressing.

Curea P1<sup>®</sup>, 7.5 cm × 7.5 cm = £1.68, 10 cm × 10 cm = £2.10, 10 cm × 20 cm = £3.56, 10 cm × 30 cm = £5.09, 20 cm × 20 cm = £6.74, 20 cm × 30 cm = £9.81, 12 cm × 12 cm (drain) = £2.59

Curea P2<sup>®</sup>, (non-adherent) 10 cm × 20 cm = £9.52, 11 cm × 11 cm = £5.70, 20 cm × 20 cm = £16.51, 20 cm × 30 cm = 24.77

#### Cutisorb<sup>®</sup> Ultra (BSN Medical)

Super absorbent cellulose and polymer primary dressing, 10 cm × 10 cm = £2.01, 20 cm × 20 cm = £6.32, 10 cm × 20 cm = £3.37, 20 cm × 30 cm = £9.53

#### Drawtex<sup>®</sup> (Martindale)

Super absorbent hydroconductive dressing with absorbent, cross-action structures of viscose, polyester and cotton, 5 cm × 5 cm = 95p, 7.5 cm × 7.5 cm = £1.77, 10 cm × 10 cm = £2.24, 15 cm × 20 cm = £6.00, 20 cm × 20 cm = £6.98, 7.5 cm × 1 m = £15.50, 10 cm × 1 m = £16.00, 10 cm × 1.3 m = £16.00, 20 cm × 1 m = £25.00

#### DryMax<sup>®</sup> Extra (Aspen Medical)

Super absorbent cellulose and polymer primary dressing, 10 cm × 10 cm = £1.80, 20 cm × 20 cm = £4.20, 10 cm × 20 cm = £2.38, 20 cm × 30 cm = £4.80

#### ELECT Superabsorber<sup>®</sup> (S&N)

Super absorbent cellulose and polymer primary dressing, 10 cm × 10 cm = 93p, 10 cm × 20 cm = £1.10, 20 cm × 20 cm = £1.96, 20 cm × 30 cm = £2.47

#### Zetuvit<sup>®</sup> Plus (Hartmann)

Super absorbent cellulose primary dressing, 10 cm × 10 cm = 60p, 10 cm × 20 cm = 83p, 15 cm × 20 cm = 95p, 20 cm × 25 cm = £1.30, 20 cm × 40 cm = £2.00

## A5.2 Advanced wound dressings

Advanced wound dressings can be used for both acute and chronic wounds. Categories for dressings in this section (A5.2) start with the least absorptive, moisture-donating hydrogel dressings, followed by increasingly more absorptive dressings. These dressings are classified according to their primary component; some dressings are comprised of several components.

### A5.2.1 Hydrogel dressings

Hydrogel dressings are most commonly supplied as an amorphous, cohesive topical application that can take up the shape of a wound. A secondary, non-absorbent dressing is needed. These dressings are generally used to donate liquid to dry sloughy wounds and facilitate autolytic debridement of necrotic tissue; some also have the ability to absorb very small amounts of exudate. Hydrogel products that do not contain propylene glycol should be used if the wound is to be treated with larval therapy.

Hydrogel sheets have a fixed structure and limited fluid-handling capacity; hydrogel sheet dressings are best avoided in the presence of infection, and are unsuitable for heavily exuding wounds.

#### ▲ Hydrogel sheet dressings

##### ActiFormCool<sup>®</sup> (Activa)

Hydrogel dressing, 5 cm × 6.5 cm = £1.70, 10 cm × 10 cm = £2.49, 20 cm × 20 cm = £7.51, 10 cm × 15 cm = £3.58

##### Aquafto<sup>®</sup> (Covidien)

Hydrogel dressing, 7.5 cm diameter = £2.55, 12 cm diameter = £5.26

##### Coolie<sup>®</sup> (Zeroderma)

Hydrogel dressing (without adhesive border), disc 7 cm diameter = £1.96

##### Gel FX<sup>®</sup> (Synergy Healthcare)

Hydrogel dressing (without adhesive border) 10 cm × 10 cm = £1.60, 15 cm × 15 cm = £3.20

##### Gelperm<sup>®</sup> (Geistlich)

Hydrogel sheets, 10 cm × 10 cm = £2.48

##### Hydrosorb<sup>®</sup> (Hartmann)

Absorbent, transparent, hydrogel sheets containing polyurethane polymers covered with a semi-permeable film, 5 cm × 7.5 cm = £1.49; 10 cm × 10 cm = £2.12; 20 cm × 20 cm = £6.37

Hydrosorb<sup>®</sup> Comfort (with adhesive border, waterproof), 4.5 cm × 6.5 cm = £1.76; 7.5 cm × 10 cm = £2.33; 12.5 cm × 12.5 cm = £3.40

##### Intrasite Conformable<sup>®</sup> (S&N Hlth.)

Soft non-woven dressing impregnated with Intrasite<sup>®</sup> gel, 10 cm × 10 cm = £1.70; 10 cm × 20 cm = £2.30; 10 cm × 40 cm = £4.10

##### Novogel<sup>®</sup> (Ford)

Glycerol-based hydrogel sheets, 10 cm × 10 cm = £3.07; 30 cm × 30 cm, standard = £13.00, thin = £12.27; 5 cm × 7.5 cm = £1.95; 15 cm × 20 cm = £5.86; 20 cm × 40 cm = £11.16; 7.5 cm diameter = £2.79

**SanoSkin<sup>®</sup> NET** (SanoMed)

Hydrogel sheet (without adhesive border), 8.5 cm × 12 cm = £2.28

**Vacunet<sup>®</sup>** (Protex)

Non-adherent, hydrogel coated polyester net dressing, 10 cm × 10 cm = £1.93, 10 cm × 15 cm = £2.86

**Hydrogel application (amorphous)****ActivHeal<sup>®</sup> Hydrogel** (MedLogic)

Hydrogel containing guar gum and propylene glycol, 8 g = £1.23, 15 g = £1.41

**Aquaform<sup>®</sup>** (Aspen Medical)

Hydrogel containing modified starch copolymer, 8 g = £1.61, 15 g = £1.96

**Askina<sup>®</sup> Gel** (B. Braun)

Hydrogel containing modified starch and glycerol, 15 g = £1.92

**Cutimed<sup>®</sup>** (BSN Medical)

Hydrogel, 8 g = £1.58, 15 g = £1.92, 25 g = £2.83

**Flexigran<sup>®</sup>** (A1 Pharmaceuticals)

Hydrogel containing starch polymer and glycerol, 15 g = £1.90

**GranuGel<sup>®</sup>** (ConvaTec)

Hydrogel containing carboxymethylcellulose, pectin, and propylene glycol, 15 g = £2.19

**Intrasite<sup>®</sup> Gel** (S&N Hlth.)

Hydrogel containing modified carmellose polymer and propylene glycol, 8-g sachet = £1.70, 15-g sachet = £2.28, 25-g sachet = £3.38

**Nu-Gel<sup>®</sup>** (Systagenix)

Hydrogel containing alginate and propylene glycol, 15 g = £2.09

**Purilon<sup>®</sup> Gel** (Coloplast)

Hydrogel containing carboxymethylcellulose and calcium alginate, 8 g = £1.64, 15 g = £2.14

**A5.2.1.1 Sodium hyaluronate dressings**

The hydrating properties of sodium hyaluronate promote wound healing, and dressings can be applied directly to the wound, or to a primary dressing (a secondary dressing should also be applied). The iodine and potassium iodide in these dressings prevent the bacterial decay of sodium hyaluronate in the wound.

**Hyoiodine<sup>®</sup>** (H&R)

Sodium hyaluronate 1.5%, potassium iodide 0.15%, iodine 0.1%, in a viscous solution, 22-g = £19.95, 50-g = £35.00

**Cautions** thyroid disorders

**A5.2.2 Vapour-permeable films and membranes**

Vapour-permeable films and membranes allow the passage of water vapour and oxygen but are impermeable to water and micro-organisms, and are suitable for lightly exuding wounds. They are highly conformable, provide protection, and a moist healing environment; transparent film dressings permit constant observation of the wound. Water vapour loss can occur at a slower

rate than exudate is generated, so that fluid accumulates under the dressing, which can lead to tissue maceration and to wrinkling at the adhesive contact site (with risk of bacterial entry). Newer versions of these dressings have increased moisture vapour permeability. Despite these advances, vapour-permeable films and membranes are unsuitable for infected, large heavily exuding wounds, and chronic leg ulcers.

Vapour-permeable films and membranes are suitable for partial-thickness wounds with minimal exudate, or wounds with eschar. Most commonly, they are used as a secondary dressing over alginates or hydrogels; film dressings can also be used to protect the fragile skin of patients at risk of developing minor skin damage caused by friction or pressure.

**Vapour-permeable Adhesive Film Dressing (Semi-permeable Adhesive Dressing)**

Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces.

**Askina<sup>®</sup> Derm** (B.Braun)

Film dressing, 6 cm × 7 cm = 36p, 10 cm × 12 cm = £1.04, 10 cm × 20 cm = £1.97, 15 cm × 20 cm = £2.39, 20 cm × 30 cm = £4.27

**Bioclusive<sup>®</sup>** (Systagenix)

Film dressing, 10.2 cm × 12.7 cm = £1.54

**C-View<sup>®</sup>** (Aspen Medical)

Film dressing, 6 cm × 7 cm = 38p, 10 cm × 12 cm = £1.02, 12 cm × 12 cm = £1.09, 15 cm × 20 cm = £2.36

**Dressfilm<sup>®</sup>** (St George's Medical)

Film dressing, 6 cm × 7 cm = 30p, 12 cm × 12 cm = 93p, 15 cm × 20 cm = £1.90

**Hydrofilm<sup>®</sup>** (Hartmann)

Film dressing, 6 cm × 7 cm = 21p, 10 cm × 12.5 cm = 40p, 10 cm × 15 cm = 50p, 10 cm × 25 cm = 77p, 12 cm × 25 cm = 81p, 15 cm × 20 cm = 92p, 20 cm × 30 cm = £1.52

**Hypafix<sup>®</sup> Transparent** (BSN Medical)

Film dressing, 10 cm × 2 m = £8.24

**Leukomed T<sup>®</sup>** (BSN Medical)

Film dressing, 7.2 cm × 5 cm = 35p, 8 cm × 10 cm = 66p, 10 cm × 12.5 cm = 96p, 11 cm × 14 cm = £1.16, 15 cm × 20 cm = £2.23, 15 cm × 25 cm = £2.38

**Mepitel<sup>®</sup> Film** (Mölnlycke)

Film dressing, 6.5 cm × 7 cm = 49p, 10.5 cm × 12 cm = £1.31, 10.5 cm × 25 cm = £2.55, 15.5 cm × 20 cm = £3.24

**Mepore<sup>®</sup> Film** (Mölnlycke)

Film dressing, 6 cm × 7 cm = 44p, 10 cm × 12 cm = £1.18, 10 cm × 25 cm = £2.29, 15 cm × 20 cm = £2.91

**OpSite<sup>®</sup> Flexifix** (S&N Hlth.)

Film dressing, 5 cm × 1 m = £3.69, 10 cm × 1 m = £6.22; *OpSite<sup>®</sup> Flexigrad*, 6 cm × 7 cm = 37p, 12 cm × 12 cm = £1.06, 15 cm × 20 cm = £2.69

**Polyskin<sup>®</sup> II** (Covidien)

Film dressing, 4 cm × 4 cm = 36p, 5 cm × 7 cm = 39p, 10 cm × 12 cm = £1.01, 10 cm × 20 cm = £2.00, 15 cm × 20 cm = £2.31, 20 cm × 25 cm = £4.03

**ProtectFilm®** (Wallace Cameron)

Film dressing, 6 cm × 7 cm = 11p, 10 cm × 12 cm = 20p, 15 cm × 20 cm = 40p

**Suprasorb F®** (Activa)

Film dressing, 5 cm × 7 cm = 32p, 10 cm × 12 cm = 76p, 15 cm × 20 cm = £2.37

**Tegaderm®** (3M)

Film dressing, 6 cm × 7 cm = 38p, 12 cm × 12 cm = £1.09, 15 cm × 20 cm = £2.37

**Tegaderm® diamond**, film dressing, 6 cm × 7 cm = £0.44, 10 cm × 12 cm = £1.19

**Vacuskín®** (Protex)

Film dressing, 6 cm × 7 cm = 40p, 10 cm × 12 cm = £1.06, 10 cm × 25 cm = £2.06, 15 cm × 20 cm = £2.19

**Vellafilm®** (Advancis)

Film dressing, 12 cm × 12 cm = £1.10, 12 cm × 35 cm = £2.75, 15 cm × 20 cm = £2.10

### ▲ Vapour-permeable Adhesive Film Dressing with absorbent pad

**Adpore® Ultra** (Medicare)

Film dressing, with absorbent pad, 7 cm × 8 cm = 12p, 10 cm × 10 cm = 14p, 10 cm × 15 cm = 22p, 10 cm × 20 cm = 33p, 10 cm × 25 cm = 35p, 10 cm × 30 cm = 52p

**Alldress®** (Mölnlycke)

Film dressing, with absorbent pad, 10 cm × 10 cm = 91p, 15 cm × 15 cm = £1.98, 15 cm × 20 cm = £2.44

**Clearpore®** (Richardson)

Film dressing, with absorbent pad, 6 cm × 7 cm = 12p, 6 cm × 10 cm = 15p, 10 cm × 10 cm = 20p, 10 cm × 30 cm = 65p, 15 cm × 10 cm = 24p, 20 cm × 10 cm = 36p, 25 cm × 10 cm = 40p

**C-View® Post-Op** (Aspen Medical)

Film dressing, with absorbent pad, 6 cm × 7 cm = £0.40, 10 cm × 12 cm = £1.10, 10 cm × 25 cm = £1.60, 10 cm × 35 cm = £2.60

**Hydrofilm® Plus** (Hartmann)

Film dressing, with absorbent pad, 5 cm × 7.2 cm = 15p, 9 cm × 10 cm = 20p, 9 cm × 15 cm = 22p, 10 cm × 20 cm = 35p, 10 cm × 25 cm = 37p, 10 cm × 30 cm = 54p

**Leukomed T® Plus** (BSN Medical)

Film dressing, with absorbent pad, 7.2 cm × 5 cm = 25p, 8 cm × 10 cm = 51p, 8 cm × 15 cm = 76p, 10 cm × 20 cm = £1.26, 10 cm × 25 cm = £1.42, 10 cm × 30 cm = £2.38, 10 cm × 35 cm = £2.88

**Mepore®** (Mölnlycke)

**Mepore® Film & Pad**, film dressing, with absorbent pad, 4 cm × 5 cm = 24p, 5 cm × 7 cm = 24p, 9 cm × 10 cm = 62p, 9 cm × 15 cm = 92p, 9 cm × 20 cm = £1.36, 9 cm × 25 cm = £1.50, 9 cm × 30 cm = £2.00, 9 cm × 35 cm = £2.49

**Mepore® Ultra**, film dressing, with absorbent pad, 7 cm × 8 cm = 40p, 9 cm × 20 cm = £1.50, 9 cm × 25 cm = £1.65, 9 cm × 30 cm = £2.73, 10 cm × 11 cm = 79p, 11 cm × 15 cm = £1.16

**OpSite®** (S&N Hlth.)

**OpSite® Plus**, film dressing, with absorbent pad, 6.5 cm × 5 cm = 30p, 9.5 cm × 8.5 cm = 83p, 10 cm × 12 cm = £1.13, 10 cm × 20 cm = £1.90, 35 cm × 10 cm = £3.15

**OpSite® Post-op**, film dressing, with absorbent pad, 8.5 cm × 9.5 cm = 82p, 8.5 cm × 15.5 cm = £1.13, 10 cm × 12 cm = £1.11, 10 cm × 20 cm = £1.86, 10 cm × 25 cm = £2.35, 10 cm × 30 cm = £2.78, 10 cm × 35 cm = £3.09

**Pharmapore-PU®** (Wallace Cameron)

Film dressing, with absorbent pad, 8.5 cm × 15.5 cm = 20p, 10 cm × 25 cm = 38p, 10 cm × 30 cm = 58p

**PremierPore VP®** (Shermond)

Film dressing, with absorbent pad, 5 cm × 7 cm = 13p, 10 cm × 10 cm = 16p, 10 cm × 15 cm = 24p, 10 cm × 20 cm = 36p, 10 cm × 25 cm = 38p, 10 cm × 30 cm = 57p, 10 cm × 35 cm = 69p

**Tegaderm®** (3M)

Film dressing, with absorbent pad, 5 cm × 7 cm = 25p, 9 cm × 10 cm = 63p, 9 cm × 15 cm = 93p, 9 cm × 20 cm = £1.36, 9 cm × 25 cm = £1.53, 9 cm × 35 cm = £2.53

**Tegaderm® Absorbent Clear**, film dressing, with clear acrylic polymer oval-shaped pad, 7.6 cm × 9.5 cm = £3.02, 11.1 cm × 12.7 cm = £3.91, 14.2 cm × 15.8 cm = £5.51; rectangular pad, 14.9 cm × 15.2 cm = £8.26, 20 cm × 20.3 cm = £13.26; 16.8 cm × 19 cm (sacral) = £9.89

### ▲ For intravenous and subcutaneous catheter sites

**Central Gard®** (Unomedical)

Vapour-permeable transparent film dressing with adhesive foam border, 16 cm × 7 cm (central venous catheter) = 94p, 16 cm × 8.8 cm (central venous catheter) = £1.03

**Easi-V®** (ConvaTec)

Vapour-permeable transparent film dressing with adhesive foam border, 7 cm × 7.5 cm (intravenous peripheral cannula) = 38p

**Hydrofilm® I.V. Control** (Hartmann)

Vapour-permeable, transparent, adhesive film dressing, 7 cm × 9 cm = 29p

**IV3000®** (S&N Hlth.)

Vapour-permeable, transparent, adhesive film dressing, 5 cm × 6 cm (1-hand) = 40p, 6 cm × 7 cm (non-winged peripheral catheter) = 52p, 7 cm × 9 cm (ported peripheral catheter) = 69p, 9 cm × 12 cm (PICC line) = £1.37, 10 cm × 12 cm (central venous catheter) = £1.32

**Mepore® IV** (Mölnlycke)

Vapour-permeable, transparent, adhesive film dressing, 5 cm × 5.5 cm = 29p, 8 cm × 9 cm = 38p, 10 cm × 11 cm = 99p

**Niko Fix®** (Unomedical)

Non-woven fabric dressing with viscose-rayon pad, 7 cm × 8.5 cm (intravenous ported peripheral catheter) = 19p

**Pharmapore-PU® IV** (Wallace Cameron)

Vapour-permeable, transparent, adhesive film dressing, 8.5 cm × 7 cm = 7p, 6 cm × 7 cm (ported peripheral cannula) = 8p, 7 cm × 9 cm (peripheral cannula, hand) = 17p

**Tegaderm® IV (3M)**

Vapour-permeable, transparent, adhesive film dressing, 7 cm × 8.5 cm (peripheral catheter) = 58p, 8.5 cm × 10.5 cm (central venous catheter) = £1.12, 10 cm × 15.5 cm (peripherally inserted central venous catheter) = £1.62

### A5.2.3 Soft polymer dressings

Dressings with soft polymer, often a soft silicone polymer, in a non-adherent or gently adherent layer are suitable for use on lightly to moderately exuding wounds. For moderately to heavily exuding wounds, an absorbent secondary dressing can be added, or a soft polymer dressing with an absorbent pad can be used.

Wound contact dressings coated with soft silicone have gentle adhesive properties and can be used on fragile skin areas or where it is beneficial to reduce the frequency of primary dressing changes.

Soft polymer dressings should not be used on heavily bleeding wounds; blood clots can cause the dressing to adhere to the wound surface.

For *silicone keloid dressings* see section A5.4.2.

#### Without absorbent pad

**Adaptic® Touch (Systagenix)**

Non-adherent soft silicone wound contact dressing, 5 cm × 7.6 cm = £1.13, 7.6 cm × 11 cm = £2.25, 12.7 cm × 15 cm = £4.65, 20 cm × 32 cm = £12.50

**Askina® SilNet (B. Braun)**

Soft silicone-coated wound contact dressing, 5 cm × 7.5 cm = £1.09, 7.5 cm × 10 cm = £2.20, 10 cm × 18 cm = £4.80, 20 cm × 30 cm = £11.75

**Mepitel® (Mölnlycke)**

Soft silicone, semi-transparent wound contact dressing, 5 cm × 7 cm = £1.57, 8 cm × 10 cm = £3.13, 12 cm × 15 cm = £6.34, 20 cm × 30 cm = £16.61

**Mepitel® One**, soft silicone, thin, transparent wound contact dressing, 6 cm × 7 cm = £1.79, 9 cm × 10 cm = £3.36, 13 cm × 15 cm = £6.54, 24 cm × 27.5 cm = £16.79

**Physiotulle® (Coloplast)**

Non-adherent soft polymer wound contact dressing, 10 cm × 10 cm = £2.13, 15 cm × 20 cm = £6.50

**Silflex® (Advancis)**

Soft silicone-coated polyester wound contact dressing, 5 cm × 7 cm = £1.25, 8 cm × 10 cm = £2.55, 12 cm × 15 cm = £5.15, 20 cm × 30 cm = £13.25, 35 cm × 60 cm = £39.54

**Silon-TSR® (Jobskin)**

Soft silicone polymer wound contact dressing, 13 cm × 13 cm = £3.52, 13 cm × 25 cm = £5.47, 28 cm × 30 cm = £7.37

**Sorbion® Contact (H&R)**

Non-adherent soft polymer wound contact dressing, 7.5 cm × 7.5 cm = £1.49, 10 cm × 10 cm = £1.99, 10 cm × 20 cm = £3.99, 20 cm × 20 cm = £6.99, 20 cm × 30 cm = £9.99

**Tegaderm® Contact (3M)**

Non-adherent soft polymer wound contact dressing, 7.5 cm × 10 cm = £2.17, 7.5 cm × 20 cm = £4.25, 20 cm × 25 cm = £10.35

**Urgotul® (Urgo)**

Non-adherent soft polymer wound contact dressing, 5 cm × 5 cm = £1.50, 10 cm × 10 cm = £3.00, 10 cm × 40 cm = £10.08, 15 cm × 15 cm = £6.45, 15 cm × 20 cm = £8.49, 20 cm × 30 cm = £13.65

#### With absorbent pad

**Advazorb® Border (Advancis)**

Soft silicone wound contact dressing, with polyurethane foam film backing and adhesive border, 7.5 cm × 7.5 cm = £1.19, 10 cm × 10 cm = £2.10, 10 cm × 20 cm = £2.90, 10 cm × 30 cm = £4.25, 12.5 cm × 12.5 cm = £2.58, 15 cm × 15 cm = £3.15, 20 cm × 20 cm = £5.46

**Advazorb® Border Lite**, soft silicone wound contact dressing, with polyurethane foam film backing and adhesive border, 7.5 cm × 7.5 cm = £1.07, 10 cm × 10 cm = £1.89, 10 cm × 20 cm = £2.61, 10 cm × 30 cm = £3.83, 12.5 cm × 12.5 cm = £2.32, 15 cm × 15 cm = £2.84, 20 cm × 20 cm = £4.91

**Advazorb® Silfix (Advancis)**

Soft silicone wound contact dressing, with polyurethane foam film backing, 7.5 cm × 7.5 cm = £0.99, 10 cm × 10 cm = £1.85, 10 cm × 20 cm = £3.18, 12.5 cm × 12.5 cm = £2.59, 15 cm × 15 cm = £3.36, 20 cm × 20 cm = £4.98

**Advazorb® Silfix Lite**, soft silicone wound contact dressing, with polyurethane foam film backing, 7.5 cm × 7.5 cm = £0.89, 10 cm × 10 cm = £1.67, 10 cm × 20 cm = £2.86, 12.5 cm × 12.5 cm = £2.33, 15 cm × 15 cm = £3.02, 20 cm × 20 cm = £4.48

**Alleyn® Gentle (S&N Hlth.)**

Soft gel wound contact dressing, with polyurethane foam film backing, 5 cm × 5 cm = £1.21, 10 cm × 10 cm = £2.40, 10 cm × 20 cm = £3.86, 15 cm × 15 cm = £4.03, 20 cm × 20 cm = £6.44

**Alleyn® Gentle Border**, silicone gel wound contact dressing, with polyurethane foam film backing, 7.5 cm × 7.5 cm = £1.43, 10 cm × 10 cm = £2.10, 12.5 cm × 12.5 cm = £2.57, 17.5 cm × 17.5 cm = £5.07, 23 cm × 23.2 cm (heel) = £9.24

**Alleyn® Gentle Border Lite**, silicone gel wound contact dressing, with polyurethane foam film backing, 5 cm × 5 cm = 86p, 5.5 cm × 12 cm = £1.77, 7.5 cm × 7.5 cm = £1.33, 8 cm × 15 cm = £3.29, 10 cm × 10 cm = £2.07, 15 cm × 15 cm = £3.65

**Alleyn® Life (S&N Hlth.)**

Soft silicone wound contact dressing, with central mesh screen, polyurethane foam film backing and adhesive border, 10.3 cm × 10.3 cm = £1.65, 12.9 cm × 12.9 cm = £2.42, 15.4 cm × 15.4 cm = £2.96, 21 cm × 21 cm = £5.83

**Cutimed® Siltec** (BSN Medical)

Soft silicone wound contact dressing, with polyurethane foam film backing, 5 cm × 6 cm = £1.24, 10 cm × 10 cm = £2.33, 10 cm × 20 cm = £3.84, 15 cm × 15 cm = £4.35, 20 cm × 20 cm = £6.59, 16 cm × 24 cm (heel) = £6.77; *with adhesive border*, 17.5 cm × 17.5 cm (sacrum) = £4.31, 23 cm × 23 cm (sacrum) = £7.02

**Cutimed® Siltec B**, with adhesive border, for lightly to moderately exuding wounds, 7.5 cm × 7.5 cm = £1.45, 12.5 cm × 12.5 cm = £3.06, 15 cm × 15 cm = £4.71, 17.5 cm × 17.5 cm = £4.97, 22.5 cm × 22.5 cm = £8.16

**Cutimed® Siltec L**, for lightly to moderately exuding wounds, 5 cm × 6 cm = 99p, 10 cm × 10 cm = £2.00, 15 cm × 15 cm = £3.30

**Eclipse® Adherent** (Advancis)

Soft silicone wound contact layer with absorbent pad and film-backing, 10 cm × 10 cm = £2.99, 10 cm × 20 cm = £3.75, 15 cm × 15 cm = £4.99, 20 cm × 30 cm = £9.99, 17 cm × 19 cm (sacral) = £3.76, 22 cm × 23 cm (sacral) = £6.23

**Flivasorb®** (Activa)

Absorbent polymer dressing with non-adherent wound contact layer, 10 cm × 10 cm = £2.16, 20 cm × 20 cm = £6.80, 10 cm × 20 cm = £3.61, 20 cm × 30 cm = £9.62

**Flivasorb® Adhesive**, absorbent polymer dressing with non-adherent wound contact layer and adhesive border, 12 cm × 12 cm = £3.25, 15 cm × 15 cm = £4.45

**Mepilex®** (Mölnlycke)

Absorbent soft silicone dressing with polyurethane foam film backing, 5 cm × 5 cm = £1.21, 10 cm × 11 cm = £2.66, 11 cm × 20 cm = £4.39, 15 cm × 16 cm = £4.82, 20 cm × 21 cm = £7.28, 20 cm × 50 cm = £28.74, 13 cm × 20 cm (heel) = £5.41, 15 cm × 22 cm (heel) = £6.22

**Mepilex® Border**, absorbent soft silicone dressing with polyurethane foam and adhesive border, 7 cm × 7.5 cm = £1.39, 10 cm × 12.5 cm = £2.72, 10 cm × 20 cm = £3.69, 10 cm × 30 cm = £5.55, 15 cm × 17.5 cm = £4.74, 17 cm × 20 cm = £6.07, 15 cm × 15 cm (sacrum) = £3.34, 18 cm × 18 cm (sacrum) = £4.85, 23 cm × 23 cm (sacrum) = £7.91, 18.5 cm × 24 cm (heel) = £6.63

**Mepilex® Border Lite**, thin absorbent soft silicone dressing with polyurethane foam and adhesive border, 4 cm × 5 cm = 92p, 7.5 cm × 7.5 cm = £1.39, 5 cm × 12.5 cm = £2.01, 10 cm × 10 cm = £2.53, 15 cm × 15 cm = £4.13

**Mepilex® Lite**, thin absorbent soft silicone dressing with polyurethane foam, 6 cm × 8.5 cm = £1.82, 10 cm × 10 cm = £2.17, 15 cm × 15 cm = £4.22, 20 cm × 50 cm = £26.66

**Mepilex® Transfer**, soft silicone exudate transfer dressing, 7.5 cm × 8.5 cm = £2.23, 10 cm × 12 cm = £3.51, 15 cm × 20 cm = £10.64, 20 cm × 50 cm = £27.20

**Sorbion® Sana** (H&R)

Non-adherent polyethylene wound contact dressing with absorbent core, 8.5 cm × 8.5 cm = £5.00, 12 cm × 12 cm = £6.78, 12 cm × 22 cm = £12.56, 22 cm × 22 cm = £20.14

**Urgotul® Duo** (Urgo)

Non-adherent, soft polymer wound contact dressing with absorbent pad, 5 cm × 10 cm = £2.33, 10 cm × 12 cm = £3.61, 15 cm × 20 cm = £8.38

**Urgotul® Duo Border**, soft polymer wound contact dressing with absorbent pad and adhesive polyurethane film backing, 8 cm × 8 cm = £2.27, 10 cm × 12 cm = £3.52, 15 cm × 20 cm = £8.17

▲ **Cellulose dressings****Sorbion® Sachet** (H&R)

**Sorbion® Sachet Border**, absorbent polymers in cellulose matrix, hypoallergenic polypropylene envelope, with adhesive border (for moderately to heavily exuding wounds), 10 cm × 10 cm = £2.95, 15 cm × 15 cm = £4.49, 15 cm × 25 cm = £6.99, 25 cm × 25 cm = £11.99

**Sorbion® Sachet Drainage**, absorbent polymers in cellulose matrix, hypoallergenic polypropylene envelope ('v' shaped dressing), 10 cm × 10 cm = £2.64

**Sorbion® Sachet EXTRA**, absorbent polymers in cellulose matrix, hypoallergenic polypropylene envelope (for moderately to heavily exuding wounds), 5 cm × 5 cm = £1.45, 7.5 cm × 7.5 cm = £1.78, 10 cm × 10 cm = £2.25, 10 cm × 20 cm = £3.73, 20 cm × 20 cm = £7.00, 30 cm × 20 cm = £9.99

**Sorbion® Sachet Multi Star**, absorbent polymers in cellulose matrix, hypoallergenic polypropylene envelope (for moderately to heavily exuding wounds), 8 cm × 8 cm = £2.99, 14 cm × 14 cm = £4.89

**Suprasorb® X** (Activa)

Biosynthetic cellulose fibre dressing (for lightly to moderately exuding wounds), 5 cm × 5 cm = £1.93, 9 cm × 9 cm = £4.02, 14 cm × 20 cm = £7.96; 2 cm × 21 cm (rope) = £6.19

## A5.2.4 Hydrocolloid dressings

Hydrocolloid dressings are usually presented as a hydrocolloid layer on a vapour-permeable film or foam pad. Semi-permeable to water vapour and oxygen, these dressings form a gel in the presence of exudate to facilitate rehydration in lightly to moderately exuding wounds and promote autolytic debridement of dry, sloughy, or necrotic wounds; they are also suitable for promoting granulation.

Hydrocolloid-fibrous dressings made from modified carmellose fibres resemble alginate dressings; hydrocolloid-fibrous dressings are more absorptive and suitable for moderately to heavily exuding wounds.

▲ **Without adhesive border****ActivHeal® Hydrocolloid** (MedLogic)

Semi-permeable polyurethane film backing, hydrocolloid wound contact layer, 5 cm × 7.5 cm = 76p, 10 cm × 10 cm = £1.55, 15 cm × 15 cm = £3.37, 15 cm × 18 cm (sacral) = £3.91; *with polyurethane foam layer*, 5 cm × 7.5 cm = 96p, 10 cm × 10 cm = £1.52, 15 cm × 15 cm = £2.86, 15 cm × 18 cm (sacral) = £3.30

**Askina® Biofilm Transparent** (B. Braun)

Semi-permeable, polyurethane film dressing with hydrocolloid adhesive, 10 cm × 10 cm = £1.02, 20 cm × 20 cm = £3.02

**Biatain® Super** (Coloplast)

Semi-permeable hydrocolloid dressing without adhesive border, 10 cm × 10 cm = £3.12, 12.5 cm × 12.5 cm = £4.29, 12 cm × 20 cm = £5.63, 15 cm × 15 cm = £5.43, 20 cm × 20 cm = £8.10

**Comfeel® Plus** (Coloplast)

Hydrocolloid dressings containing carmellose sodium and calcium alginate. *contour*, 6 cm × 8 cm = £2.08, 9 cm × 11 cm = £3.61; *ulcer*, 4 cm × 6 cm = 90p, 10 cm × 10 cm = £2.29, 15 cm × 15 cm = £4.91, 18 cm × 20 cm (triangular) = £5.35, 20 cm × 20 cm = £7.08; *transparent*, 5 cm × 7 cm = 63p, 5 cm × 15 cm = £1.48, 5 cm × 25 cm = £2.41, 9 cm × 14 cm = £2.28, 9 cm × 25 cm = £3.24, 10 cm × 10 cm = £1.20, 15 cm × 15 cm = £3.12, 15 cm × 20 cm = £3.17, 20 cm × 20 cm = £3.19; *pressure relieving*, 7 cm diameter = £3.24, 10 cm diameter = £4.34, 15 cm diameter = £6.54

**DuoDERM® Extra Thin** (ConvaTec)

Semi-permeable hydrocolloid dressing, 5 cm × 10 cm = 72p, 7.5 cm × 7.5 cm = 75p, 10 cm × 10 cm = £1.24, 9 cm × 15 cm = £1.66, 9 cm × 25 cm = £2.66, 9 cm × 35 cm = £3.72, 15 cm × 15 cm = £2.68

**DuoDERM® Signal**, hydrocolloid dressing with "Time to change" indicator, 10 cm × 10 cm = £2.00, 14 cm × 14 cm = £3.52, 20 cm × 20 cm = £6.99, 11 cm × 19 cm (oval) = £3.05, 18.5 cm × 19.5 cm (heel) = £4.92, 22.5 cm × 20 cm (sacral) = £5.74

**Flexigran®** (A1 Pharmaceuticals)

Semi-permeable hydrocolloid dressing without adhesive border, 10 cm × 10 cm = £2.19; *thin*, 10 cm × 10 cm = £1.08

**Granuflex®** (ConvaTec)

Hydrocolloid wound contact layer bonded to plastic foam layer, with outer semi-permeable polyurethane film, 10 cm × 10 cm = £2.64, 15 cm × 15 cm = £5.00, 15 cm × 20 cm = £5.42, 20 cm × 20 cm = £7.52

**Hydrocoll® Basic** (Hartmann)

Hydrocolloid dressing with absorbent wound contact pad, 10 cm × 10 cm = £2.32; *thin*, 7.5 cm × 7.5 cm = 66p, 10 cm × 10 cm = £1.09, 15 cm × 15 cm = £2.46

**NU DERM®** (Systagenix)

Semi-permeable hydrocolloid dressing, 5 cm × 5 cm = 85p, 10 cm × 10 cm = £1.56, 15 cm × 15 cm = £3.18, 20 cm × 20 cm = £6.36, 8 cm × 12 cm (heel/elbow) = £3.18, 15 cm × 18 cm (sacral) = £4.45; *thin*, 10 cm × 10 cm = £1.06

**Tegaderm® Hydrocolloid** (3M)

Hydrocolloid dressing without adhesive border, 10 cm × 10 cm = £2.30, 15 cm × 15 cm = £4.46; *thin*, semi-permeable, clear film dressing with hydrocolloid, 10 cm × 10 cm = £1.51

**Ultec Pro®** (Covidien)

Semi-permeable hydrocolloid dressing, without adhesive border 10 cm × 10 cm = £2.23, 15 cm × 15 cm = £4.36, 20 cm × 20 cm = £6.56

▲ **With adhesive border****Biatain® Super** (Coloplast)

Semi-permeable hydrocolloid dressing with adhesive border, 10 cm × 10 cm = £3.12, 12.5 cm × 12.5 cm = £4.29, 12 cm × 20 cm = £5.63, 15 cm × 15 cm = £5.43, 20 cm × 20 cm = £8.10

**Granuflex® Bordered** (ConvaTec)

Hydrocolloid wound contact layer bonded to plastic foam layer, with outer semi-permeable polyurethane film, 6 cm × 6 cm = £1.66, 10 cm × 10 cm = £3.14, 15 cm × 15 cm = £5.99, 10 cm × 13 cm (triangular) = £3.71, 15 cm × 18 cm (triangular) = £5.78

**Hydrocoll® Border** (Hartmann)

Hydrocolloid dressing with adhesive border and absorbent wound contact pad, 5 cm × 5 cm = 95p, 7.5 cm × 7.5 cm = £1.57, 10 cm × 10 cm = £2.29, 15 cm × 15 cm = £4.30; 8 cm × 12 cm (concave) = £2.01; 12 cm × 18 cm (sacral) = £3.42

**Tegaderm® Hydrocolloid** (3M)

Hydrocolloid dressing with adhesive border, 10 cm × 12 cm (oval) = £2.26, 13 cm × 15 cm (oval) = £4.22; 17.1 cm × 16.1 cm (sacral) = £4.71; *thin*, semi-permeable, clear film dressing with hydrocolloid, 10 cm × 12 cm (oval) = £1.50; 13 cm × 15 cm (oval) = £2.81

**Ultec Pro®** (Covidien)

Semi-permeable hydrocolloid dressing with adhesive border, 21 cm × 21 cm = £4.58, 15 cm × 18 cm (sacral) = £3.23, 19.5 cm × 23 cm (sacral) = £4.88

▲ **Hydrocolloid-fibrous dressings****Aquacel®** (ConvaTec)

Soft non-woven pad containing hydrocolloid-fibres, 4 cm × 10 cm = £1.40, 4 cm × 20 cm = £2.07, 4 cm × 30 cm = £3.11, 5 cm × 5 cm = £1.10; 10 cm × 10 cm = £2.61; 15 cm × 15 cm = £4.91; 1 cm × 45 cm (ribbon) = £1.76, 2 cm × 45 cm (ribbon) = £2.64

**Aquacel® Foam**, soft non-woven pad containing hydrocolloid-fibres with foam layer, without adhesive border, 5 cm × 5 cm = £1.31, 10 cm × 10 cm = £2.48, 15 cm × 15 cm = £4.17, 15 cm × 20 cm = £5.70, 20 cm × 20 cm = £6.80, *with adhesive border*, 8 cm × 8 cm = £1.37, 10 cm × 10 cm = £2.10, 12.5 cm × 12.5 cm = £2.60, 17.5 cm × 17.5 cm = £5.20, 21 cm × 21 cm = £7.61, 25 cm × 30 cm = £9.85, 19.8 cm × 14 cm (heel) = £5.32, 20 cm × 16.9 cm (sacral) = £4.77

**Pad**, hydrocolloid fibres coated with soft-adherent lipo-colloidal wound contact layer, 6 cm × 6 cm = £0.94, 10 cm × 10 cm = £2.09, 15 cm × 20 cm = £3.93

**Rope**, non-woven rope containing hydrocolloid fibres, 2.5 cm × 40 cm = £2.35, 5 cm × 40 cm = £3.11

**Versiva® XC** (ConvaTec)

Hydrocolloid gelling foam dressing, without adhesive border, 7.5 cm × 7.5 cm = £1.39, 11 cm × 11 cm = £2.31, 15 cm × 15 cm = £4.26, 20 cm × 20 cm = £6.37; *with adhesive border*, 10 cm × 10 cm = £2.36, 14 cm × 14 cm = £3.19, 19 cm × 19 cm = £5.09, 22 cm × 22 cm = £5.65, 18.5 cm × 20.5 cm (heel) = £5.65, 21 cm × 25 cm (sacral) = £6.06

### ▲ Polyurethane matrix dressing

#### Cutinova<sup>®</sup> Hydro (S&N Hlth.)

Polyurethane matrix with absorbent particles and waterproof polyurethane film, 5 cm × 6 cm = £1.19, 10 cm × 10 cm = £2.40, 15 cm × 20 cm = £5.07

## A5.2.5 Foam dressings

Dressings containing hydrophilic polyurethane foam (adhesive or non-adhesive), with or without plastic film-backing, are suitable for all types of exuding wounds, but not for dry wounds; some foam dressings have a moisture-sensitive film backing with variable permeability dependant on the level of exudate

Foam dressings vary in their ability to absorb exudate; some are suitable only for lightly to moderately exuding wounds, others have greater fluid-handling capacity and are suitable for heavily exuding wounds. Saturated foam dressings can cause maceration of healthy skin if left in contact with the wound.

Foam dressings can be used in combination with other primary wound contact dressings. If used under compression bandaging or compression garments, the fluid-handling capacity of the foam dressing may be reduced. Foam dressings can also be used to provide a protective cushion for fragile skin. A foam dressing containing ibuprofen is available and may be useful for treating painful exuding wounds.

### ▲ For lightly exuding wounds

#### Polyurethane Foam Film Dressing with Adhesive Border

**PolyMem<sup>®</sup>**, 5 cm × 5 cm = 50p (Aspen Medical)  
**Tielle<sup>®</sup> Lite**, 11 cm × 11 cm = £2.28; 7 cm × 9 cm = £1.21; 8 cm × 15 cm = £2.81; 8 cm × 20 cm = £2.97 (Systagenix)

### Cavi-Care<sup>®</sup> (S&N Hlth.)

Soft, conforming cavity wound dressing prepared by mixing thoroughly for 15 seconds immediately before use and allowing to expand its volume within the cavity. 20 g = £18.62

## A5.2.6 Alginate dressings

Non-woven or fibrous, non-occlusive, alginate dressings, made from calcium alginate, or calcium sodium alginate, derived from brown seaweed, form a soft gel in contact with wound exudate.

Alginate dressings are highly absorbent and suitable for use on exuding wounds, and for the promotion of autolytic debridement of debris in very moist wounds. Alginate dressings also act as a haemostatic, but caution is needed because blood clots can cause the dressing to adhere to the wound surface. Alginate dressings should not be used if bleeding is heavy and extreme caution is needed if used for tumours with friable tissue.

Alginate sheets are suitable for use as a wound contact dressing for moderately to heavily exuding wounds and can be layered into deep wounds; alginate rope can be used in sinus and cavity wounds to improve absorption of exudate and prevent maceration. If the dressing does not have an adhesive border or integral adhesive plastic film backing, a secondary dressing will be required.

### ActivHeal<sup>®</sup> (MedLogic)

**ActivHeal**<sup>®</sup> **Alginate**, calcium sodium alginate dressing, 5 cm × 5 cm = 58p, 10 cm × 10 cm = £1.13, 10 cm × 20 cm = £2.78; cavity dressing, 2 cm × 30 cm = £2.09

**Sorbsan<sup>®</sup>** (Aspen Medical)

**Sorbsan<sup>®</sup> Flat**, calcium alginate fibre, highly absorbent, flat non-woven pads, 5 cm × 5 cm = 80p, 10 cm × 10 cm = £1.68, 10 cm × 20 cm = £3.15

**Sorbsan<sup>®</sup> Plus**, alginate dressing bonded to a secondary absorbent viscose pad, 7.5 cm × 10 cm = £1.70, 10 cm × 15 cm = £3.01, 10 cm × 20 cm = £3.84, 15 cm × 20 cm = £5.33

**Sorbsan<sup>®</sup> Ribbon**, 40 cm (with probe) = £2.04

**Sorbsan<sup>®</sup> Surgical Packing**, 30 cm (2 g, with probe) = £3.47

**Suprasorb<sup>®</sup> A** (Activa)

Calcium alginate dressing, 5 cm × 5 cm = 59p, 10 cm × 10 cm = £1.16; cavity dressing, 30 cm (2 g) = £2.15

**Tegaderm<sup>®</sup> Alginate** (3M)

Calcium alginate dressing, 5 cm × 5 cm = 78p, 10 cm × 10 cm = £1.64; cavity dressing, 2 cm × 30.4 cm = £2.74

**Urgosorb<sup>®</sup>** (Urgo)

Alginate and carboxymethylcellulose dressing without adhesive border, 5 cm × 5 cm = 83p, 10 cm × 10 cm = £1.99, 10 cm × 20 cm = £3.64; cavity dressing, 30 cm = £2.65

**A5.2.7 Capillary-action dressings**

Capillary-action dressings consist of an absorbent core of hydrophilic fibres sandwiched between two low-adherent wound-contact layers to ensure no fibres are shed on to the wound surface. Wound exudate is taken up by the dressing and retained within the highly absorbent central layer.

The dressing may be applied intact to relatively superficial areas, but for deeper wounds or cavities it may be cut to shape to ensure good contact with the wound base. Multiple layers may be applied to heavily exuding wounds to further increase the fluid-absorbing capacity of the dressing. A secondary adhesive dressing is necessary.

Capillary-action dressings are suitable for use on all types of exuding wounds, but particularly on sloughy wounds where removal of fluid from the wound aids debridement; capillary-action dressings are contra-indicated for heavily bleeding wounds or arterial bleeding.

**Advadraw<sup>®</sup>** (Advancis)

Non-adherent dressing consisting of a soft viscose and polyester absorbent pad with central wicking layer between two perforated permeable wound contact layers. 5 cm × 7.5 cm = 57p, 10 cm × 10 cm = 88p, 10 cm × 15 cm = £1.19, 15 cm × 20 cm = £1.57

**Advadraw Spiral<sup>®</sup>**, 0.5 cm × 40 cm = 82p

**Cerdak<sup>®</sup> Basic** (CliniMed)

Non-adhesive wound contact sachet containing ceramic spheres, 5 cm × 5 cm = 70p, 10 cm × 10 cm = £1.56, 10 cm × 15 cm = £2.08; cavity dressing, 10 cm × 10 cm = £2.10, 10 cm × 15 cm = £2.63

**Cerdak<sup>®</sup> Aerocloth**, non-adhesive wound contact sachet containing ceramic spheres, with non-woven fabric adhesive backing, 5 cm × 5 cm = £1.37, 5 cm × 10 cm = £1.94

**Cerdak<sup>®</sup> Aerofilm**, non-adhesive wound contact sachet containing ceramic spheres, with waterproof transparent adhesive film backing, 5 cm × 5 cm = £1.51, 5 cm × 10 cm = £2.07

**Sumar<sup>®</sup>** (Lantor)

**Sumar<sup>®</sup> Lite**, for light to moderately exuding wounds and cavities, 5 cm × 5 cm = 93p, 10 cm × 10 cm = £1.59, 10 cm × 15 cm = £2.12

**Sumar<sup>®</sup> Max**, for heavily exuding wounds, 5 cm × 5 cm = 95p, 10 cm × 10 cm = £1.61, 10 cm × 15 cm = £2.15

**Sumar<sup>®</sup> Spiral**, 0.5 cm × 40 cm = £1.57

**Vacutex<sup>®</sup>** (Protex)

Low-adherent dressing consisting of two external polyester wound contact layers with central wicking polyester/cotton mix absorbent layer. 5 cm × 5 cm = 94p, 10 cm × 10 cm = £1.66, 10 cm × 15 cm = £2.23, 10 cm × 20 cm = £2.68, 15 cm × 20 cm = £3.14, 20 cm × 20 cm = £4.28

**A5.2.8 Odour absorbent dressings**

Dressings containing activated charcoal are used to absorb odour from wounds. The underlying cause of wound odour should be identified. Wound odour is most

effectively reduced by debridement of slough, reduction in bacterial levels, and frequent dressing changes.

Fungating wounds and chronic infected wounds produce high volumes of exudate which can reduce the effectiveness of odour absorbent dressings. Many odour absorbent dressings are intended for use in combination with other dressings; odour absorbent dressings with a suitable wound contact layer can be used as a primary dressing.

#### Askina® Carbosorb (B. Braun)

Activated charcoal and non-woven viscose rayon dressing, 10 cm × 10 cm = £2.77, 10 cm × 20 cm = £5.34

#### CarboFLEX® (ConvaTec)

Dressing in 5 layers: wound-facing absorbent layer containing alginate and hydrocolloid; water-resistant second layer; third layer containing activated charcoal; non-woven absorbent fourth layer; water-resistant backing layer. 10 cm × 10 cm = £3.01, 8 cm × 15 cm = £3.61, 15 cm × 20 cm = £6.85

#### Carbopad® VC (Synergy Healthcare)

Activated charcoal non-absorbent dressing, 10 cm × 10 cm = £1.59, 10 cm × 20 cm = £2.15

#### CliniSorb® Odour Control Dressings (CliniMed)

Activated charcoal cloth enclosed in viscose rayon with outer polyamide coating. 10 cm × 10 cm = £1.78, 10 cm × 20 cm = £2.37, 15 cm × 25 cm = £3.81

#### Sorbsan® Plus Carbon (Aspen Medical)

Alginate dressing with activated carbon, 7.5 cm × 10 cm = £2.48, 10 cm × 15 cm = £4.81, 10 cm × 20 cm = £5.76, 15 cm × 20 cm = £6.63

## A5.3 Antimicrobial dressings

Spreading infection at the wound site requires treatment with systemic antibacterials.

For local wound infection, a topical antimicrobial dressing can be used to reduce the level of bacteria at the wound surface but will not eliminate a spreading infection. Some dressings are designed to release the antimicrobial into the wound, others act upon the bacteria after absorption from the wound. The amount of exudate present and the level of infection should be taken into account when selecting an antimicrobial dressing.

**Medical grade honey** (section A5.3.1), has antimicrobial and anti-inflammatory properties. Dressings impregnated with **iodine** (section A5.3.2), can be used to treat clinically infected wounds. Dressings containing **silver** (section A5.3.3), should be used only when clinical signs or symptoms of infection are present.

Dressings containing other **antimicrobials** (section A5.3.4) such as polyhexanide (polyhexamethylene biguanide) or dialkylcarbamoyl chloride are available for use on infected wounds. Although hypersensitivity is unlikely with chlorhexidine impregnated tulle dressing, the antibacterial efficacy of these dressings has not been established.

### A5.3.1 Honey

**Medical grade honey** has antimicrobial and anti-inflammatory properties and can be used for acute or chronic wounds. Medical grade honey has osmotic properties, producing an environment that promotes autolytic debridement; it can help control wound mal-odour. Honey dressings should not be used on patients with extreme sensitivity to honey, bee stings or bee products. Patients with diabetes should be monitored for changes in blood-glucose concentrations during treatment with topical honey or honey-impregnated dressings.

#### Sheet dressing

##### Actilite® (Advancis)

Knitted viscose impregnated with medical grade manuka honey and manuka oil, 10 cm × 10 cm = 97p, 10 cm × 20 cm = £1.88

##### Activon Tulle® (Advancis)

Knitted viscose impregnated with medical grade manuka honey, 5 cm × 5 cm = £1.82, 10 cm × 10 cm = £3.06

Where no size stated by the prescriber the 5 cm size to be supplied

##### Algivon® (Advancis)

Absorbent, non-adherent calcium alginate dressing impregnated with medical grade manuka honey, 5 cm × 5 cm = £2.13, 10 cm × 10 cm = £3.59

**Algivon® Plus**, reinforced calcium alginate dressing impregnated with medical grade manuka honey, 5 cm × 5 cm = £1.96, 10 cm × 10 cm = £3.36, 2.5 cm × 20 cm (ribbon with probe) = £3.36

##### Medihoney® (Derma Sciences Europe)

**Antibacterial Honey Tulle**, woven fabric impregnated with medical grade manuka honey, 10 cm × 10 cm = £2.98

**Gel sheet**, sodium alginate dressing impregnated with medical grade honey, 5 cm × 5 cm = £1.75, 10 cm × 10 cm = £4.20

**Antibacterial Honey Apinate®**, non-adherent calcium alginate dressing, impregnated with medical grade honey, 5 cm × 5 cm = £2.00, 10 cm × 10 cm = £3.40, 1.9 cm × 30 cm (rope) = £4.20

##### Melladerm® Plus Tulle (Danetre)

Knitted viscose impregnated with medical grade honey (Bulgarian, mountain flower) 45% in a basis containing polyethylene glycol, 10 cm × 10 cm = £2.10

##### MelMax® (CliniMed)

Acetate wound contact layer impregnated with buckwheat honey 75% in ointment basis, 5 cm × 6 cm = £4.82, 8 cm × 10 cm = £9.90, 8 cm × 20 cm = £19.79

##### Mesitran® (Aspen Medical)

Hydrogel, semi-permeable dressing impregnated with medical grade honey, 10 cm × 10 cm = £2.55, 15 cm × 20 cm = £5.31; *with adhesive border*, 10 cm × 10 cm = £2.66, 15 cm × 13 cm (sacral) = £4.50, 15 cm × 15 cm = £4.70

**Mesitran® Mesh**, hydrogel, non-adherent wound contact layer, without adhesive border, 10 cm × 10 cm = £2.45

### ■ Honey-based topical application

Medical grade honey is applied directly to the wound and covered with a primary low adherence wound dressing; an additional secondary dressing may be required for exuding wounds.

#### Activon<sup>®</sup> (Advancis)

Honey, (medical grade, manuka), 25-g tube = £2.02

#### MANUKApli<sup>®</sup> (Manuka Medical)

Honey, (medical grade, manuka), 15-g tube = £2.95

#### Medihoney<sup>®</sup> (Derma Sciences Europe)

**Antibacterial Medical Honey**, honey (medical grade, *Leptospermum* sp.), 20-g tube = £3.96, 50-g tube = £9.90

**Antibacterial Wound Gel**, honey (medical grade, *Leptospermum* sp.), 80% in natural waxes and oils, 10-g tube = £2.69, 20-g tube = £4.02

**Note** *Antibacterial Wound Gel* is not recommended for use in deep wounds or body cavities where removal of waxes may be difficult

#### Melladerm<sup>®</sup> Plus (SanoMed)

Honey, (medical grade; Bulgarian, mountain flower) 45% in basis containing polyethylene glycol, 20-g tube = £3.98, 50-g tube = £8.50

#### Mesitran<sup>®</sup> (Aspen Medical)

Ointment, honey (medical grade) 47%, 15-g tube = £3.47, 50-g tube = £9.55

**Excipients** include lanolin

Ointment S, honey (medical grade) 40%, 15-g tube = £3.46

**Excipients** include lanolin

## A5.3.2 Iodine

**Cadexomer-iodine**, like povidone-iodine, releases free iodine when exposed to wound exudate. The free iodine acts as an antiseptic on the wound surface, the cadexomer absorbs wound exudate and encourages de-sloughing.

Two-component hydrogel dressings containing glucose oxidase and iodide ions generate a low level of free iodine in the presence of moisture and oxygen.

**Povidone-iodine fabric dressing** is a knitted viscose dressing with povidone-iodine incorporated in a hydrophilic polyethylene glycol basis; this facilitates diffusion of the iodine into the wound and permits removal of the dressing by irrigation. The iodine has a wide spectrum of antimicrobial activity but it is rapidly deactivated by wound exudate.

Systemic absorption of iodine may occur, particularly from large wounds or with prolonged use.

#### Iodoflex<sup>®</sup> (S&N Hlth.)

Paste, iodine 0.9% as cadexomer-iodine in a paste basis with gauze backing, 5-g unit = £3.88; 10 g = £7.76; 17 g = £12.29

**Uses** for treatment of chronic exuding wounds; max. single application 50 g, max. weekly application 150 g; max. duration up to 3 months in any single course of treatment

**Cautions** iodine may be absorbed, particularly from large wounds or during prolonged use; severe renal impairment; history of thyroid disorder

**Contra-indications** children; patients receiving lithium; thyroid disorders; pregnancy and breast-feeding

#### Iodosorb<sup>®</sup> (S&N Hlth.)

Ointment, iodine 0.9% as cadexomer-iodine in an ointment basis, 10 g = £4.29; 20 g = £8.58

Powder, iodine 0.9% as cadexomer-iodine microbeads, 3-g sachet = £1.84

**Uses** for treatment of chronic exuding wounds; max. single application 50 g, max. weekly application 150 g; max. duration up to 3 months in any single course of treatment

**Cautions** iodine may be absorbed, particularly from large wounds or during prolonged use; severe renal impairment; history of thyroid disorder

**Contra-indications** children; patients receiving lithium; thyroid disorders; pregnancy and breast-feeding

#### Iodozyme<sup>®</sup> (Archimed)

Hydrogel (two-component dressing containing glucose oxidase and iodide ions), 6.5 cm × 5 cm = £7.50, 10 cm × 10 cm = £12.50

**Uses** antimicrobial dressing for lightly to moderately exuding wounds

**Cautions** children; pregnancy and breast-feeding

**Contra-indications** thyroid disorders; patients receiving lithium

#### Oxyzyme<sup>®</sup> (Archimed)

Hydrogel (two-component dressing containing glucose oxidase and iodide ions), 6.5 cm × 5 cm = £6.00, 10 cm × 10 cm = £10.00

**Uses** non-infected, dry to moderately exuding wounds

**Cautions** children; pregnancy and breast-feeding

**Contra-indications** thyroid disorders; patients receiving lithium

#### Povidone-iodine Fabric Dressing

(Drug Tariff specification 43). Knitted viscose primary dressing impregnated with povidone-iodine ointment 10%, 5 cm × 5 cm = 32p; 9.5 cm × 9.5 cm = 48p (Systagenix—*Inadine*<sup>®</sup>)

**Uses** wound contact layer for abrasions and superficial burns

**Cautions** iodine may be absorbed particularly if large wounds treated; children under 6 months; thyroid disease

**Contra-indications** severe renal impairment; pregnancy; breast-feeding

## A5.3.3 Silver

Antimicrobial dressings containing silver should be used only when infection is suspected as a result of clinical signs or symptoms (see also p. 1073). Silver ions exert an antimicrobial effect in the presence of wound exudate; the volume of wound exudate as well as the presence of infection should be considered when selecting a silver-containing dressing. Silver-impregnated dressings should not be used routinely for the management of uncomplicated ulcers. It is recommended that these dressings should not be used on acute wounds as there is some evidence to suggest they delay wound healing.

Dressings impregnated with silver sulfadiazine have broad antimicrobial activity; if silver sulfadiazine is applied to large areas, or used for prolonged periods, there is a risk of blood disorders and skin discoloration (see section 13.10.1.1). The use of silver sulfadiazine-impregnated dressings is contra-indicated in neonates, in pregnancy, and in patients with significant renal or hepatic impairment, sensitivity to sulfonamides, or G6PD deficiency. Large amounts of silver sulfadiazine applied topically may interact with other drugs—see Appendix 1 (sulfonamides).

### Low adherence dressings

#### Acticoat® (S&N Hlth.)

Three-layer antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 3-day wear), 5 cm × 5 cm = £3.30, 10 cm × 10 cm = £8.07, 10 cm × 20 cm = £12.62, 20 cm × 40 cm = £43.18

**Acticoat® 7** five-layer antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 7-day wear), 5 cm × 5 cm = £5.74, 10 cm × 12.5 cm = £17.11, 15 cm × 15 cm = £30.76

**Acticoat® Flex 3**, conformable antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 3-day wear), 5 cm × 5 cm = £3.32, 10 cm × 10 cm = £8.10, 10 cm × 20 cm = £12.66, 20 cm × 40 cm = £43.34

**Acticoat® Flex 7**, conformable antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 7-day wear), 5 cm × 5 cm = £5.77, 15 cm × 15 cm = £30.88, 10 cm × 12.5 cm = £17.18

#### Atrauman® Ag (Hartmann)

Non-adherent polyamide fabric impregnated with silver and neutral triglycerides, 5 cm × 5 cm = 49p, 10 cm × 10 cm = £1.19, 10 cm × 20 cm = £2.32

### With charcoal

#### Actisorb® Silver 220 (Systagenix)

Knitted fabric of activated charcoal, with one-way stretch, with silver residues, within spun-bonded nylon sleeve. 6.5 cm × 9.5 cm = £1.64, 10.5 cm × 10.5 cm = £2.58, 10.5 cm × 19 cm = £4.70

### Soft polymer dressings

#### Allewyn® Ag Gentle (S&N Hlth.)

Soft polymer wound contact dressing, with silver sulfadiazine impregnated polyurethane foam layer, *with adhesive border*, 7.5 cm × 7.5 cm = £3.99, 10 cm × 10 cm = £5.99, 12.5 cm × 12.5 cm = £7.71, 17.5 cm × 17.5 cm = £14.69; *without adhesive border*, 5 cm × 5 cm = £3.12, 10 cm × 10 cm = £5.82, 10 cm × 20 cm = £9.62, 15 cm × 15 cm = £10.83, 20 cm × 20 cm = £16.04

**Contra-indications** see notes above

#### Mepilex® Ag (Mölnlycke)

Soft silicone wound contact dressing with polyurethane foam film backing, with silver, *with adhesive border*, 7 cm × 7.5 cm = £3.30, 10 cm × 12.5 cm = £5.97, 10 cm × 20 cm = £8.69, 10 cm × 25 cm = £10.88, 10 cm × 30 cm = £13.04, 15 cm × 17.5 cm = £10.96, 17 cm × 20 cm = £14.20, 18 cm × 18 cm (sacral) = £11.46, 20 cm × 20 cm (sacral) = £13.93, 23 cm × 23 cm = £18.30; *without adhesive border*, 10 cm × 10 cm = £5.91, 10 cm × 20 cm = £9.75, 15 cm × 15 cm = £10.98, 20 cm × 20 cm = £16.27, 20 cm × 50 cm = £61.22, 13 cm × 20 cm (heel) = £12.38, 15 cm × 22 cm = £13.87

#### Urgotul® Silver (Urgo)

Non-adherent soft polymer wound contact dressing, with silver, 10 cm × 12 cm = £3.34, 15 cm × 20 cm = £9.09

**Urgotul® Duo Silver**, non-adherent, soft polymer wound contact dressing, with silver, 5 cm × 7 cm = £1.95, 11 cm × 11 cm = £3.87, 15 cm × 20 cm = £9.35

#### Urgotul® SSD (Urgo)

Non-adherent, soft polymer wound contact dressing, with silver sulfadiazine, 11 cm × 11 cm = £2.99, 16 cm × 21 cm = £8.48

**Contra-indications** see notes above

### Hydrocolloid dressings

#### Aquacel® Ag (ConvaTec)

Soft non-woven pad containing hydrocolloid fibres, (silver impregnated), 4 cm × 10 cm = £2.70, 4 cm × 20 cm = £3.52, 4 cm × 30 cm = £5.27, 5 cm × 5 cm = £1.86, 10 cm × 10 cm = £4.44, 15 cm × 15 cm = £8.36, 20 cm × 30 cm = £20.73; 1 cm × 45 cm (ribbon) = £2.97, 2 cm × 45 cm (ribbon) = £4.46

#### Physiotulle® Ag (Coloplast)

Non-adherent polyester fabric with hydrocolloid and silver sulfadiazine, 10 cm × 10 cm = £2.14

**Contra-indications** see notes above

### Foam dressings

#### Acticoat® Moisture Control (S&N Hlth.)

Three layer polyurethane dressing consisting of a silver coated layer, a foam layer, and a waterproof layer, 5 cm × 5 cm = £6.76, 10 cm × 10 cm = £15.82, 10 cm × 20 cm = £30.82

#### Allewyn® Ag (S&N Hlth.)

Silver sulfadiazine impregnated polyurethane foam film dressing *with adhesive border*, 7.5 cm × 7.5 cm = £3.27, 10 cm × 10 cm = £5.16, 12.5 cm × 12.5 cm = £6.78, 17.5 cm × 17.5 cm = £13.03, 17 cm × 17 cm (sacral) = £10.18, 22 cm × 22 cm (sacral) = £13.64; *without adhesive border*, 5 cm × 5 cm = £3.06, 10 cm × 10 cm = £5.76, 15 cm × 15 cm = £10.91, 20 cm × 20 cm = £15.99, 10.5 cm × 13.5 cm (heel) = £10.09

**Contra-indications** see notes above

#### Biatain® Ag (Coloplast)

Silver impregnated polyurethane foam film dressing *with adhesive border*, 12.5 cm × 12.5 cm = £8.71, 18 cm × 18 cm = £17.47, 19 cm × 20 cm (heel) = £17.23, 23 cm × 23 cm (sacral) = £18.31; *without adhesive border*, 10 cm × 10 cm = £7.61, 5 cm × 7 cm = £3.13, 10 cm × 20 cm = £13.99, 15 cm × 15 cm = £15.28, 20 cm × 20 cm = £21.55; 5 cm × 8 cm (cavity) = £3.79

#### PolyMem® Silver (Aspen Medical)

Silver impregnated polyurethane foam film dressing, *with adhesive border*, 5 cm × 7.6 cm (oval) = £2.20, 12.7 cm × 8.8 cm (oval) = £5.43; *without adhesive border*, 10.8 cm × 10.8 cm = £8.60, 17 cm × 19 cm = £17.22; 8 cm × 8 cm (cavity) = £6.84

#### UrgoCell® Silver (Urgo)

Non-adherent, polyurethane foam film dressing with silver in wound contact layer, 6 cm × 6 cm = £4.11, 10 cm × 10 cm = £5.65, 15 cm × 20 cm = £10.17

### Alginat dressings

#### Acticoat® Absorbent (S&N Hlth.)

Calcium alginate dressing with a silver coated antimicrobial barrier, 5 cm × 5 cm = £5.04, 10 cm × 12.5 cm = £12.11; 2 cm × 30 cm (cavity) = £12.18

#### Algisite® Ag (S&N Hlth.)

Calcium alginate dressing, with silver, 5 cm × 5 cm = £1.56, 10 cm × 10 cm = £3.90, 10 cm × 20 cm = £7.17; 2 g, 30 cm (cavity) = £5.38

#### Askina® Calgitrol (B. Braun)

Askina® Calgitrol Ag, Calcium alginate and silver alginate dressing with polyurethane foam backing, 10 cm × 10 cm = £3.14, 15 cm × 15 cm = £6.08, 20 cm × 20 cm = £14.19

Askina® Calgitrol Thin, Calcium alginate and silver alginate matrix, for use with absorptive secondary dressings, 5 cm × 5 cm = £1.94, 10 cm × 10 cm = £4.03, 15 cm × 15 cm = £9.04, 20 cm × 20 cm = £15.97

#### Melgisorb® Ag (Mölnlycke)

Alginate and carboxymethylcellulose dressing, with ionic silver, 5 cm × 5 cm = £1.71, 10 cm × 10 cm = £3.43, 15 cm × 15 cm = £7.25; 3 cm × 44 cm (cavity) = £4.32

#### Seasorb® Ag (Coloplast)

Alginate and carboxymethylcellulose dressing, with ionic silver, 5 cm × 5 cm = £1.53, 10 cm × 10 cm = £3.74, 15 cm × 15 cm = £6.12; 3 cm × 44 cm (cavity) = £4.05

#### Silvercel® (Systagenix)

Alginate and carboxymethylcellulose dressing impregnated with silver, 2.5 cm × 30.5 cm = £4.45, 5 cm × 5 cm = £1.68, 10 cm × 20 cm = £7.68, 11 cm × 11 cm = £4.14

Silvercel® Non-adherent, alginate and carboxymethylcellulose dressing with film wound contact layer, impregnated with silver, 5 cm × 5 cm = £1.62, 11 cm × 11 cm = £3.89, 10 cm × 20 cm = £7.25; 2.5 cm × 30.5 cm (cavity) = £3.94

#### Sorbsan® Silver (Aspen Medical)

Sorbsan® Silver Flat, calcium alginate fibre, highly absorbent, flat non-woven pads, with silver, 5 cm × 5 cm = £1.57, 10 cm × 10 cm = £3.97, 10 cm × 20 cm = £7.26

Sorbsan® Silver Plus, calcium alginate dressing with absorbent backing, with silver, 7.5 cm × 10 cm = £3.31, 10 cm × 15 cm = £5.50, 10 cm × 20 cm = £6.69, 15 cm × 20 cm = £8.98

Sorbsan® Silver Plus SA, calcium alginate dressing with absorbent backing and adhesive border, with silver, 11.5 cm × 14 cm = £5.38, 14 cm × 19 cm = £7.73, 14 cm × 24 cm = £8.51, 19 cm × 24 cm = £9.49

Sorbsan® Silver Ribbon, with silver, 40 cm (with probe) = £4.15

Sorbsan® Silver Surgical Packing, with silver, 30 cm (2 g, with probe) = £5.76

#### Suprasorb® A + Ag (Activa)

Calcium alginate dressing, with silver, 5 cm × 5 cm = £1.54, 10 cm × 10 cm = £3.87, 10 cm × 20 cm = £7.14; cavity dressing, 30 cm (2 g) = £5.72

#### Tegaderm® Alginate Ag (3M)

Calcium alginate and carboxymethylcellulose dressing, with silver, 5 cm × 5 cm = £1.35, 10 cm × 10 cm = £3.15; cavity dressing 3 cm × 30 cm = £3.60

#### Urgosorb® Silver (Urgo)

Alginate and carboxymethylcellulose dressing, impregnated with silver, 5 cm × 5 cm = £1.44, 10 cm × 10 cm = £3.44, 10 cm × 20 cm = £6.48; cavity dressing, 2.5 cm × 30 cm = £3.46

## A5.3.4 Other antimicrobials

#### Chlorhexidine Gauze Dressing, BP 1993

Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with ointment containing chlorhexidine acetate, 5 cm × 5 cm = 28p; 10 cm × 10 cm = 58p (S&N Hlth.—*Bactigras*®)

#### Cutimed® Sorbact (BSN Medical)

Low adherence acetate tissue impregnated with dialkylcarbamoyl chloride, (dressing pad) 7 cm × 9 cm = £3.42, 10 cm × 10 cm = £5.34, 10 cm × 20 cm = £8.33; (swabs) 4 cm × 6 cm = £1.60, 7 cm × 9 cm = £2.67, (round swabs) 3 cm, 5 pad pack = £3.20; (ribbon gauze, cotton) 2 cm × 50 cm = £3.92, 5 cm × 2 m = £7.72

Gel, hydrogel dressing impregnated with dialkylcarbamoyl chloride, 7.5 cm × 7.5 cm = £2.58, 7.5 cm × 15 cm = £4.35

Cutimed® Sorbact Hydroactive, non-adhesive gel dressing with hydrolymer matrix and acetate fabric coated with dialkylcarbamoyl chloride, 7 cm × 8.5 cm = £3.57, 14 cm × 14 cm = £5.21, 14 cm × 24 cm = £8.35, 19 cm × 19 cm = £9.81, 24 cm × 24 cm = £14.87

Cutimed® Sorbact Hydroactive B, gel dressing with hydrolymer matrix and acetate fabric coated with dialkylcarbamoyl chloride, with adhesive border, 5 cm × 6.5 cm = £3.86, 10 cm × 10 cm = £6.88, 10 cm × 20 cm = £11.02, 15 cm × 15 cm = £12.95, 20 cm × 20 cm = £19.63

Cutimed® Siltec Sorbact, polyurethane foam dressing with acetate fabric coated with dialkylcarbamoyl chloride, with adhesive border, 7.5 cm × 7.5 cm = £2.47, 12.5 cm × 12.5 cm = £6.33, 15 cm × 15 cm = £7.84, 17.5 cm × 17.5 cm = £10.97, 22.5 cm × 22.5 cm = £16.69, 17.5 cm × 17.5 cm (sacral) = £7.93, 23 cm × 23 cm (sacral) = £11.92

#### Flaminal® (Crawford)

Forté gel, alginate with glucose oxidase and lactoperoxidase, for moderately to heavily exuding wounds, 15 g = £7.26, 50 g = £24.04

Hydro gel, alginate with glucose oxidase and lactoperoxidase, for lightly to moderately exuding wounds, 15 g = £7.26, 50 g = £24.04

#### Kendall AMD® (Covidien)

Foam dressing with polihexanide, without adhesive border, 5 cm × 5 cm = £2.45, 10 cm × 10 cm = £4.62, 15 cm × 15 cm = £8.75, 20 cm × 20 cm = £12.82, 8.8 cm × 7.5 cm (fenestrated) = £4.15, 10 cm × 20 cm = £8.75

Kendall AMD® Plus 10 cm × 10 cm = £4.85, 8.8 cm × 7.5 cm (fenestrated) = £4.35

**Octenilin<sup>®</sup>** (Schülke)

Wound gel, hydroxyethylcellulose and propylene glycol, with octenidine hydrochloride, 20 mL = £4.78

**Protosan<sup>®</sup> Wound Gel** (B. Braun)

Hydrogel containing betaine surfactant and polihexanide, 30 mL = £6.12

**Suprasorb<sup>®</sup> X + PHMB** (Activa)

Biosynthetic cellulose fibre dressing with polihexanide, 5 cm × 5 cm = £2.42, 9 cm × 9 cm = £4.81, 14 cm × 20 cm = £10.95; 2 cm × 21 cm (rope) = £6.82

**Telfa<sup>®</sup> AMD** (Covidien)

Low adherence absorbent perforated plastic film faced dressing with polihexanide, 7.5 cm × 10 cm = 17p, 7.5 cm × 20 cm = 28p  
Telfa<sup>®</sup> AMD Island, low adherence dressing with adhesive border and absorbent pad, with polihexanide, 10 cm × 12.5 cm = 58p, 10 cm × 20 cm = 85p, 10 cm × 25.5 cm = 96p, 10 cm × 35 cm = £1.19

### ■ Irrigation fluids

**Octenilin<sup>®</sup>** (Schülke)

Wound irrigation solution, aqueous solution containing glycerol, ethylhexylglycerin and octenidine hydrochloride, 350 mL = £4.60

**Protosan<sup>®</sup> Wound Irrigation Solution** (B. Braun)

Aqueous solution containing betaine surfactant and polihexanide, 40 mL = £0.58, 350 mL = £4.66

## A5.4 Specialised dressings

### A5.4.1 Protease-modulating matrix dressings

Protease-modulating matrix dressings alter the activity of *proteolytic enzymes* in chronic wounds; the clinical significance of this approach is yet to be demonstrated.

**Cadesorb<sup>®</sup>** (S&N Hlth.)

Ointment, starch-based, 10 g = £5.10, 20 g = £8.69

**Catrix<sup>®</sup>** (Cranage)

Powder, collagen matrix (cartilage, bovine), 1-g sachet = £3.80

**Promogran<sup>®</sup>** (Systagenix)

Collagen and oxidised regenerated cellulose matrix, applied directly to wound and covered with suitable dressing, 28 cm<sup>2</sup> (hexagonal) = £5.19, 123 cm<sup>2</sup> (hexagonal) = £15.62

Promogran<sup>®</sup> Prisma<sup>®</sup> Matrix, collagen, silver and oxidised regenerated cellulose matrix, applied directly to wound and covered with suitable dressing, 28 cm<sup>2</sup> (hexagonal) = £6.31, 123 cm<sup>2</sup> (hexagonal) = £17.98

**Tegaderm<sup>®</sup> Matrix** (3M)

Cellulose acetate matrix, impregnated with polyhydrated ionogens ointment in polyethylene glycol basis, 5 cm × 6 cm = £4.75, 8 cm × 10 cm = £9.75

**UrgoStart<sup>®</sup>** (Urgo)

Soft adherent polymer matrix containing nano-oligosaccharide factor (NOSF), with polyurethane foam film backing, 6 cm × 6 cm = £4.30, 10 cm × 10 cm = £5.95, 15 cm × 20 cm = £10.70, 12 cm × 19 cm (heel) = £8.20

**UrgoStart<sup>®</sup> Contact** (Urgo)

Non-adherent soft polymer wound contact dressing containing nano-oligosaccharide factor (NOSF), 5 cm × 7 cm = £2.80, 11 cm × 11 cm = £3.98, 16 cm × 21 cm = £9.50

**Xelma<sup>®</sup>** (Mölnlycke)

Gel, alginate and propylene glycol with extracellular matrix proteins (amelogenins), 0.5-mL syringe = £56.98, 1-mL syringe = £99.72

### A5.4.2 Silicone keloid dressings

Silicone gel and gel sheets are used to reduce or prevent hypertrophic and keloid scarring. They should not be used on open wounds. Application times should be increased gradually. Silicone sheets can be washed and reused.

#### ■ Silicone sheets

**Advasil<sup>®</sup> Conform** (Advancis)

Self-adhesive silicone gel sheet with polyurethane film backing, 10 cm × 10 cm = £5.20, 10 cm × 15 cm = £9.17

**BAP Scar Care T<sup>®</sup>** (BAP)

Self-adhesive silicone gel sheet, 5 cm × 7 cm = £3.15, 5 cm × 30 cm = £9.00, 10 cm × 15 cm = £9.00

**Cica-Care<sup>®</sup>** (S&N Hlth.)

Soft, self-adhesive, semi-occlusive silicone gel sheet with backing, 6 cm × 12 cm = £13.79; 15 cm × 12 cm = £26.89

**Ciltech<sup>®</sup>** (Su-Med)

Silicone gel sheet, 10 cm × 10 cm = £7.50, 15 cm × 15 cm = £14.00, 10 cm × 20 cm = £12.50

**Dermatix<sup>®</sup>** (Meda)

Self-adhesive silicone gel sheet (clear- or fabric-backed), 4 cm × 13 cm = £6.69, 13 cm × 13 cm = £15.34, 13 cm × 25 cm = £27.73, 20 cm × 30 cm = £50.49

**Mepiform<sup>®</sup>** (Mölnlycke)

Self-adhesive silicone gel sheet with polyurethane film backing, 5 cm × 7 cm = £3.26, 9 cm × 18 cm = £12.76, 4 cm × 31 cm = £10.31

**Scar FX<sup>®</sup>** (Jobskin)

Self-adhesive, transparent, silicone gel sheet, 10 cm × 20 cm = £16.00, 25.5 cm × 30.5 cm = £60.00, 3.75 cm × 22.5 cm = £12.00, 7.5 cm diameter = £8.50, 22.5 cm × 14.5 cm = £12.00

**Silgel<sup>®</sup>** (Nagor)

Silicone gel sheet, 10 cm × 10 cm = £13.50; 20 cm × 20 cm = £40.00; 40 cm × 40 cm = £144.00; 10 cm × 5 cm = £7.50; 15 cm × 10 cm = £19.50; 30 cm × 5 cm = £19.50; 10 cm × 30 cm = £31.50; 25 cm × 15 cm (submammary) = £21.12; 46 cm × 8.5 cm (abdominal) = £39.46; 5.5 cm diameter (circular) = £4.00

### ▲ Silicone gel

**BAP Scar Care<sup>®</sup>** (BAP)  
Silicone gel, 20 g = £17.00

**Ciltech<sup>®</sup>** (Su-Med)  
Silicone gel, 15 g = £17.50, 60 g = £50.00

**Dermatix<sup>®</sup>** (Meda)  
Silicone gel, 15 g = £16.18, 60 g = £58.81

**Kelo-cote<sup>®</sup>** (Sinclair IS)  
Silicone gel, 15 g = £17.88, 60 g = £51.00  
Silicone spray, 100 mL = £51.00  
**Kelo-cote<sup>®</sup> UV**, Silicone gel with SPF 30 UV protection, 15 g = £17.88

**NewGel+<sup>®</sup>E** (Advantech Surgical)  
Silicone gel with vitamin E, 15 g = £17.70

**ScarSil<sup>®</sup>** (Jobskin)  
Silicone gel, 30 g = £15.00

**Silgel<sup>®</sup> STC-SE** (Nagor)  
Silicone gel, 20-mL tube = £19.00

### ▲ Gauze and tissue

#### Absorbent Cotton Gauze, BP 1988

Cotton fabric of plain weave, in rolls and as swabs (see below), usually Type 13 light, sterile, 90 cm (all) × 1 m = £1.08; 3 m = £2.26; 5 m = £3.52; 10 m = £6.73 (most suppliers). 1-m packet supplied when no size stated

**Note** Drug Tariff also includes unsterilised absorbent cotton gauze, 25 m roll = £15.42

#### Absorbent Cotton and Viscose Ribbon Gauze, BP 1988

Woven fabric in ribbon form with fast selvedge edges, warp threads of cotton, weft threads of viscose or combined cotton and viscose yarn, sterile. 5 m (both) × 1.25 cm = 81p; 2.5 cm = 90p

#### Gauze and Cotton Tissue, BP 1988

Consists of absorbent cotton enclosed in absorbent cotton gauze type 12 or absorbent cotton and viscose gauze type 2. 500 g = £7.01 (most suppliers, including Robinsons—*Gamgee Tissue<sup>®</sup>* (blue label))

#### Gauze and Cotton Tissue

(Drug Tariff specification 14). Similar to above. 500 g = £5.12 (most suppliers, including Robinsons—*Gamgee Tissue<sup>®</sup>* (pink label))  
Drug Tariff specifies to be supplied only where specifically ordered

### ▲ Lint<sup>®</sup>

#### Absorbent Lint, BPC

Cotton cloth of plain weave with nap raised on one side from warp yarns. 25 g = 89p; 100 g = £2.74; 500 g = £11.52 (most suppliers).

Drug Tariff specifies 25-g pack supplied where no quantity stated

**Note** Not recommended for wound management

### ▲ Pads

#### Absorbent Dressing Pads, Sterile

**Disorb<sup>®</sup>**, 10 cm × 20 cm = 17p (Synergy Healthcare)

**PremierPad<sup>®</sup>**, 10 cm × 20 cm = 18p, 20 cm × 20 cm = 25p (Shermond)

**Xupad<sup>®</sup>**, 10 cm × 20 cm = 17p, 20 cm × 20 cm = 28p, 20 cm × 40 cm = 40p (Richardson)

## A5.5.2 Wound drainage pouches

Wound drainage pouches can be used in the management of wounds and fistulas with significant levels of exudate.

#### Biotrol<sup>®</sup> (B. Braun)

**Draina S Fistula**, wound drainage pouch, mini (cut to 20 mm), 150-mL capacity = £2.44; medium (cut to 50 mm), 350-mL capacity = £3.64; large (cut to 88 mm), 500-mL capacity = £4.48

**Draina S Vision**, wound drainage pouch, (cut to 50 mm), 150-mL capacity = £9.39; (cut to 88 mm), 250-mL capacity = £9.92; (cut to 100 mm), 300-mL capacity = £11.51

## A5.5 Adjunct dressings and appliances

### A5.5.1 Surgical absorbents

Surgical absorbents applied directly to the wound have many disadvantages—dehydration of and adherence to the wound, shedding of fibres, and the leakage of exudate ('strike through') with an associated risk of infection. Gauze and cotton absorbent dressings can be used as secondary layers in the management of heavily exuding wounds (but see also Capillary-action dressings, section A5.2.7). Absorbent cotton gauze fabric can be used for swabbing and cleaning skin. Ribbon gauze can be used post-operatively to pack wound cavities, but adherence to the wound bed will cause bleeding and tissue damage on removal of the dressing—an advanced wound dressing (e.g. hydrocolloid-fibrous (section A5.2.4), foam (section A5.2.5), or alginate (section A5.2.6)) layered into the cavity is often more suitable.

### ▲ Cotton

#### Absorbent Cotton, BP

Carded cotton fibres of not less than 10 mm average staple length, available in rolls and balls, 25 g = 72p; 100 g = £1.64; 500 g = £5.53 (most suppliers).

Drug Tariff specifies 25-g pack to be supplied when weight not stated

#### Absorbent Cotton, Hospital Quality

As for absorbent cotton but lower quality materials, shorter staple length etc. 100 g = £1.14; 500 g = £3.60 (most suppliers)

Drug Tariff specifies to be supplied only where specifically ordered

**Note** Not suitable for wound cleansing

**Eakin®** (Eakin)

**Wound pouch, fold and tuck closure**, small (wound size up to 45 mm × 30 mm) = £4.50; medium (wound size up to 110 mm × 75 mm) = £6.50; large (wound size up to 175 mm × 110 mm) = £8.50; extra large (horizontal wound up to 245 mm × 160 mm) = £15.00

**Wound pouch, bung closure**, small (wound size up to 45 mm × 30 mm) = £5.00; medium (wound size up to 110 mm × 75 mm) = £7.00; large (wound size up to 175 mm × 110 mm) = £9.50; extra large (horizontal or vertical wound up to 245 mm × 160 mm) = £17.00, (vertical incision wound up to 290 mm × 130 mm) = £17.00; (horizontal wound up to 245 mm × 160 mm), *with access window* = £19.00  
**Access window**, for use with *Eakin®* pouches = £7.00

**Oakmed® Option** (OakMed)

**Wound Manager**, extra small (wound size up to 90 mm × 180 mm) = £11.00; small (horizontal wound size up to 245 mm × 160 mm) = £12.23; medium (vertical wound size up to 90 mm × 260 mm) = £12.50; large (wound size up to 160 mm × 260 mm) = £14.90; square (vertical wound up to 160 mm × 200 mm) = £13.05

**Wound Manager, with access port**, extra small (wound size up to 90 mm × 180 mm) = £12.02; small (horizontal wound size up to 245 mm × 160 mm) = £12.77; medium (vertical wound size up to 90 mm × 260 mm) = £13.05; large (wound size up to 160 mm × 260 mm) = £15.93; square (vertical wound size up to 160 mm × 200 mm) = £13.59

**Wound Manager, cut-to-fit**, small (10–30 mm) = £2.25, medium (10–50 mm) = £2.49, large (10–50 mm) = £2.61

**Welland®** (CliniMed)

**Fistula bag**, wound manager, *cut-to-fit* (wound size up to 40 mm × 70 mm) = £2.54

**Wound Drainage Collector** (Hollister)

**Pouch**, drainable, small (wound size up to 76 mm) = £7.45, medium (wound size up to 95 mm) = £8.13, large (wound size up to 100 mm × 200 mm) = £16.10

**A5.5.3 Physical debridement pads**

*DebriSoft®* is a pad that is used for the debridement of superficial wounds containing loose slough and debris, and for the removal of hyperkeratosis from the skin. *DebriSoft®* must be fully moistened with a wound cleansing solution before use and is not appropriate for use as a wound dressing.

**DebriSoft®** (Activa)

**Pad**, polyester fibres with bound edges and knitted outer surface coated with polyacrylate, 10 cm × 10 cm = £6.19

**A5.6 Complex adjunct therapies**

Topical negative pressure (or vacuum-assisted) therapy requires specific wound dressings for use with the vacuum-pump equipment.

Other complex adjunct therapies include sterile larvae (maggots).

**A5.6.1 Topical negative pressure therapy****▲ Vacuum assisted closure products****Exsu-Fast®** (Synergy Healthcare)

**Dressing kit**, Kit 1 (small wound, low exudate) = £28.04; Kit 2 (large wound, heavy exudate) = £35.83; Kit 3 (large wound, medium to low exudate) = £35.83; Kit 4 (small wound, heavy exudate) = £28.04

**Renasy® F/P** (S&N Hlth.)

**Dressing kit**, foam dressing with round drain (plus port, drapes and fixation film), small = £19.49, medium = £22.64, large = £26.85, extra large = £45.28

**Renasy® G** (S&N Hlth.)

**Dressing kit**, non-adherent gauze and transparent film dressing, with flat drain, small = £16.64, medium = £20.86, large = £26.48; round drain, small = £16.64, large = £26.48; channel drain, medium = £20.86

**V.A.C.®** (KCI Medical)

**GranuFoam® dressing kit**, polyurethane foam dressing (with adhesive drapes and pad connector), 10 cm × 7.5 cm × 3.3 cm (small) = £21.73, 18 cm × 12.5 cm × 3.3 cm (medium) = £25.87, 26 cm × 15 cm × 3.3 cm (large) = £30.01; bridge dressing kit (for diabetic foot wound) = £30.63; *with silver*, small = £31.86, medium = £36.96

**Simplace® dressing kit**, spiral-cut polyurethane foam dressings, vapour-permeable adhesive film dressings (with adhesive drapes and pad connector), small = £25.43, medium = £29.23

**WhiteFoam®**, polyvinyl alcohol foam dressing 10 cm × 7.5 cm (small) = £10.18, 10 cm × 15 cm (large) = £16.29; dressing kit (with adhesive drape and pad connector), 10 cm × 7.5 cm (small) = £24.77, 10 cm × 15 cm (large) = £32.06

**Venturi®** (Talley)

**Wound sealing kit**, flat drain, standard = £15.00, large = £17.50; channel drain = £15.00

**WoundASSIST®** (Huntleigh)

**Wound pack**, small–medium = £20.81, medium–large = £23.85, extra large = £34.05; channel drain, small–medium = £20.81, medium–large = £23.85

**▲ Wound drainage collection devices****ActiV.A.C.®** (KCI Medical)

**Canister** (with gel), 300 mL = £26.91

**Renasy® Go** (S&N Hlth.)

**Canister kit** (with solidifier), 300 mL = £18.77, 750 mL = £25.88

**S-Canister®** (S&N Hlth.)

**Canister kit**, 250 mL (with solidifier) = £19.00

**V.A.C Freedom®** (KCI Medical)

**Canister** (with gel), 300 mL = £27.58

**Venturi®** (Talley)

**Canister kit**, (with solidifier) = £12.50; *Compact canister kit* (with solidifier) = £12.50

**WoundASSIST®** (Huntleigh)

**Canister**, 500 mL = £20.30

## Accessories

### Renasys® (S&N Hlth.)

Port for foam dressing = £9.31, Y-connector = £3.10

### V.A.C.® (KCI Medical)

Drape = £8.97. Gel for canister = £3.59. Sensa T.R. A.C. pad = £10.29. T.R.A.C. Y-connector = £2.94

### Venturi® (Talley)

Gel patches, adhesive, pack of 5 = £15.00. Y-connector, pack of 5 = £15.00

### WoundASSIST® (Huntleigh)

Gel strip = £3.37

## A5.7 Wound care accessories

### A5.7.1 Dressing packs

The role of dressing packs is very limited. They are used to provide a clean or sterile working surface; some packs shown below include cotton wool balls, which are not recommended for use on wounds.

#### Multiple Pack Dressing No. 1

(Drug Tariff). Contains absorbent cotton, absorbent cotton gauze type 13 light (sterile), open-wove bandages (banded). 1 pack = £4.09

#### Non-Drug Tariff Specification Sterile Dressing Pack

**Dressit®** contains vitrex gloves, large apron, disposable bag, paper towel, softswabs, adsorbent pad, sterile field = 60p (Richardson)

**Nurse It®** contains latex-free, powder-free nitrile gloves, sterile laminated paper sheet, large apron, non-woven swabs, paper towel, disposable bag, compartmented tray, disposable forceps, paper measuring tape = 52p (Medicare)

**Polyfield® Nitrile Patient Pack** contains powder-free nitrile gloves, laminate sheet, non-woven swabs, towel, polythene disposable bag, apron = 52p (Shermond)

**Propax® SDP** contains paper towel, disposable bag, gauze swabs, dressing pad, sterile field = 46p (BSN Medical)

**Woundcare®** contains nitrile gloves, sterile field, compartmented tray, large apron, disposable bag, non-woven swabs, drape = 44p (Frontier)

#### Sterile Dressing Pack

(Drug Tariff specification 10). Contains gauze and cotton tissue pad, gauze swabs, absorbent cotton wool balls, absorbent paper towel, water repellent inner wrapper. 1 pack = 51p (Synergy Healthcare—Vernaid®)

#### Sterile Dressing Pack with Non-woven Pads

(Drug Tariff specification 35). Contains non-woven fabric covered dressing pad, non-woven fabric swabs, absorbent cotton wool balls, absorbent paper towel, water repellent inner wrapper. 1 pack = 50p (Synergy Healthcare—Vernaid®)

### A5.7.2 Woven and fabric swabs

#### Gauze Swab, BP 1988

Consists of absorbent cotton gauze type 13 light or absorbent cotton and viscose gauze type 1 folded into squares or rectangles of 8-ply with no cut edges exposed, sterile, 7.5 cm × 7.5 cm 5-pad packet = 39p; non-sterile, 10 cm × 10 cm, 100-pad packet = £1.37 (most suppliers)

#### Filmed Gauze Swab, BP 1988

As for Gauze Swab, but with thin layer of Absorbent Cotton enclosed within, non-sterile, 10 cm × 10 cm, 100-pad packet = £3.67 (Synergy Healthcare—Cotfil®)

#### Non-woven Fabric Swab

(Drug Tariff specification 28). Consists of non-woven fabric folded 4-ply; alternative to gauze swabs, type 13 light, sterile, 7.5 cm × 7.5 cm, 5-pad packet = 25p; non-sterile, 10 cm × 10 cm, 100-pad packet = 79p

#### Filmed Non-woven Fabric Swab

(Drug Tariff specification 29). Film of viscose fibres enclosed within non-woven viscose fabric folded 8-ply, non-sterile, 10 cm × 10 cm, 100-pad packet = £3.55 (Systagenix—Regal®)

### A5.7.3 Surgical adhesive tapes

Adhesive tapes are useful for retaining dressings on joints or awkward body parts. These tapes, particularly those containing rubber, can cause irritant and allergic reactions in susceptible patients; synthetic adhesives have been developed to overcome this problem, but they, too, may sometimes be associated with reactions. Synthetic adhesive, or silicon adhesive, tapes can be used for patients with skin reactions to plasters and strapping containing rubber, or undergoing prolonged treatment.

Adhesive tapes that are occlusive may cause skin maceration. Care is needed not to apply these tapes under tension, to avoid creating a tourniquet effect. If applied over joints they need to be orientated so that the area of maximum extensibility of the fabric is in the direction of movement of the limb.

#### Permeable adhesive tapes

##### Elastic Adhesive Tape, BP 1988

(Elastic Adhesive Plaster). Woven fabric, elastic in warp (crepe-twisted cotton threads), weft of cotton and/or viscose threads, spread with adhesive mass containing zinc oxide. 4.5 m stretched × 2.5 cm = £1.71 (S&N—Elastoplast®)

For 5 cm width, see Elastic Adhesive Bandage

##### Permeable, Apertured Non-Woven Synthetic Adhesive Tape, BP 1988

Non-woven fabric with a polyacrylate adhesive.  
**Chemifix®**, 2.5 cm × 5 m = 90p, 5 cm × 5 m = £1.25, 10 cm × 5 m = £2.10, 2.5 cm × 10 m = £1.00, 5 cm × 10 m = £1.40, 10 cm × 10 m = £2.10 (Medicareplus International)  
**Hypafix®**, 5 cm × 5 m = £1.36, 10 cm × 5 m = £2.28, 10 m (all): 2.5 cm = £1.58, 5 cm = £2.51, 10 cm = £4.38, 15 cm = £6.49, 20 cm = £8.61, 30 cm = £12.45 (BSN Medical)

**Mefix**<sup>®</sup>, 5 m (all): 2.5 cm = 98p, 5 cm = £1.72; 10 cm = £2.76, 15 cm = £3.76, 20 cm = £4.82, 30 cm = £6.91 (Mölnlycke)

**Omnifix**<sup>®</sup>, 10 m (all): 5 cm = £2.28, 10 cm = £3.84, 15 cm = £5.66 (Hartmann)

**Primafix**<sup>®</sup>, 5 cm × 10 m = £1.50, 10 cm × 10 m = £2.20, 15 cm × 10 m = £3.25, 20 cm × 10 m = £4.00 (S&N Hlth.)

#### Permeable Non-woven Synthetic Adhesive Tape, BP 1988

Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass:

**Chemipore**<sup>®</sup>, 5 m (all) 1.25 cm = 27p, 2.5 cm = 45p, 5 cm = 95p; 2.5 cm × 10 m = 70p (Medicareplus International)

**Clinipore**<sup>®</sup>, 5 m (all) 1.25 cm = 35p, 2.5 cm = 59p, 5 cm = 99p; 2.5 cm × 10 m = 73p (Clinisupplies)

**Leukofix**<sup>®</sup>, 5 m (all) 1.25 cm = 52p, 2.5 cm = 84p, 5 cm = £1.47 (BSN Medical)

**Leukopor**<sup>®</sup>, 5 m (all) 1.25 cm = 46p, 2.5 cm = 72p, 5 cm = £1.27 (BSN Medical)

**Mediplast**<sup>®</sup>, 5 m (all) 1.25 cm = 30p, 2.5 cm = 50p (Neomedic)

**Micropore**<sup>®</sup>, 5 m (all) 1.25 cm = 60p, 2.5 cm = 89p, 5 cm = £1.57 (3M)

**Scanpor**<sup>®</sup>, 5 m (all) 1.25 cm = 41p, 2.5 cm = 66p, 5 cm = £1.14; 10 m (all), 1.25 cm = 53p, 2.5 cm = 88p, 5 cm = £1.68, 7.5 cm = £2.46 (BioDiagnostics)

**Transpore**<sup>®</sup>, 5 m (all) 1.25 cm = 51p, 2.5 cm = 82p, 5 cm = £1.44 (3M)

Where no brand stated by prescriber, net price of tape supplied not to exceed 35p (1.25 cm), 59p (2.5 cm), 99p (5 cm)

#### Silicone adhesive tape

Soft silicone, water-resistant, knitted fabric, polyurethane film adhesive tape

**3M<sup>®</sup> Kind Removal Silicone Tape**, 5 m (all), 2.5 cm = £3.52, 5 cm = £6.38 (3M)

**Insit**<sup>®</sup>, 2 cm × 3 m = £5.77, 4 cm × 1.5 m = £5.77 (Insight)

**Mepitac**<sup>®</sup>, 2 cm × 3 m = £6.87, 4 cm × 1.5 m = £6.87 (Mölnlycke)

**OpSite<sup>®</sup> Flexifix Gentle**, 5 m (all), 2.5 cm = £10.00, 5 cm = £18.75 (S&N)

**Siltape**<sup>®</sup>, 2 cm × 3 m = £5.60, 4 cm × 1.5 m = £5.60 (Advancis)

#### Zinc Oxide Adhesive Tape, BP 1988

(Zinc Oxide Plaster). Fabric, plain weave, warp and weft of cotton and/or viscose, spread with an adhesive containing zinc oxide. 5 m (all): 1.25 cm = 97p; 2.5 cm = £1.40; 5 cm = £2.37; 7.5 cm = £3.57 (most suppliers)

#### Zinc Oxide Adhesive Tape

**Mediplast**<sup>®</sup>, 5 m (all), 1.25 cm = 82p, 2.5 cm = £1.19, 5 cm = £1.99, 7.5 cm = £2.99 (Neomedic)

**Strappa**<sup>®</sup>, 5 m (all): 2.5 cm = £1.30, 5 cm = £2.20, 7.5 cm = £3.31 (BSN Medical)

#### Occlusive adhesive tapes

#### Impermeable Plastic Adhesive Tape, BP 1988

Extensible water-impermeable plastic film spread with an adhesive mass. 2.5 cm × 3 m = £1.36; 2.5 cm × 5 m = £2.03; 5 cm × 5 m = £2.57; 7.5 cm × 5 m = £3.74 (BSN Medical—*Sleek*<sup>®</sup>)

#### Impermeable Plastic Synthetic Adhesive Tape, BP 1988

Extensible water-impermeable plastic film spread with a polymeric adhesive mass. 5 m (both): 2.5 cm = £1.72; 5 cm = £3.27 (3M—*Blenderm*<sup>®</sup>)

## A5.7.4 Adhesive dressings

Adhesive dressings (also termed 'island dressings') have a limited role for minor wounds only. The inclusion of an antiseptic is not particularly useful and may cause skin irritation in susceptible subjects.

### ▲ Vapour permeable adhesive dressings

#### Vapour-permeable Waterproof Plastic Wound Dressing, BP 1993

(former Drug Tariff title: Semipermeable Waterproof Plastic Wound Dressing). Consists of absorbent pad, may be dyed and impregnated with suitable antiseptic (see under Elastic Adhesive Dressing), attached to piece of semi-permeable waterproof surgical adhesive tape, to leave suitable adhesive margin; both pad and margin covered with suitable protector (S&N Hlth—*Elastoplast Airstrip*<sup>®</sup>)

## A5.7.5 Skin closure dressings

Skin closure strips are used as an alternative to sutures for minor cuts and lacerations. Skin tissue adhesive (section 13.10.5) can be used for closure of minor skin wounds and for additional suture support.

#### Skin closure strips, sterile

**Leukostrip**<sup>®</sup>, 6.4 mm × 76 mm, 3 strips per envelope. 10 envelopes = £5.95 (S&N Hlth.)

**Omnistrip**<sup>®</sup>, 6 mm × 76 mm, 3 strips per envelope. 50 envelopes = £22.89 (Hartmann)

**Steri-strip**<sup>®</sup>, 6 mm × 75 mm, 3 strips per envelope. 12 envelopes = £8.52 (3M)

Drug Tariff specifies that these are specifically for personal administration by the prescriber

## A5.8 Bandages

According to their structure and performance bandages are used for dressing retention, for support, and for compression.

### A5.8.1 Non-extensible bandages

Bandages made from non-extensible, woven fabrics have generally been replaced by more conformable products, therefore their role is now extremely limited. Triangular calico bandage has a role as a sling.

#### Open-weave Bandage, Type 1 BP 1988

Cotton cloth, plain weave, warp of cotton, weft of cotton, viscose, or combination, one continuous length. 5 m (all): 2.5 cm = 31p; 5 cm = 53p; 7.5 cm = 75p; 10 cm = 98p (most suppliers)

#### Triangular Calico Bandage, BP 1980

Unbleached calico right-angled triangle, 90 cm × 90 cm × 1.27 m = £1.17 (most suppliers)

## A5.8.2 Light-weight conforming bandages

Lightweight conforming bandages are used for dressing retention, with the aim of keeping the dressing close to the wound without inhibiting movement or restricting blood flow. The elasticity of **conforming-stretch bandages** (also termed contour bandages) is greater than that of **cotton conforming bandages**.

### Conforming Bandage (Synthetic)

Fabric, plain weave, warp of polyamide, weft of viscose. 4 m stretched (all):

**Hospiform**<sup>®</sup>, 6 cm = 13p, 8 cm = 16p, 10 cm = 18p, 12 cm = 22p (Hartmann)

### Cotton Conforming Bandage, BP 1988

Cotton fabric, plain weave, treated to impart some elasticity to warp and weft. 3.5 m (all): type A, 5 cm = 64p, 7.5 cm = 78p, 10 cm = 97p, 15 cm = £1.32 (BSN Medical—*Easifix Crinx*<sup>®</sup>)

### Knitted Polyamide and Cellulose Contour Bandage, BP 1988

Fabric, knitted warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length. 4 m stretched (all):

**Easifix K**<sup>®</sup>, 2.5 cm = 9p, 5 cm = 10p, 7.5 cm = 15p, 10 cm = 17p, 15 cm = 30p (BSN Medical)

**K-Band**<sup>®</sup>, 5 cm = 19p, 7 cm = 24p, 10 cm = 27p, 15 cm = 47p (Urigo)

**Knit-Band**<sup>®</sup>, 5 cm = 10p, 7 cm = 15p, 10 cm = 17p, 15 cm = 30p (CliniMed)

**Knit Fix**<sup>®</sup>, 5 cm = 12p, 7 cm = 17p, 10 cm = 17p, 15 cm = 33p (Steraid)

### Polyamide and Cellulose Contour Bandage

**Peha-haft**<sup>®</sup>, cohesive, latex-free, 4 m (all) 2.5 cm = 69p, 4 cm = 45p, 6 cm = 53p, 8 cm = 63p, 10 cm = 72p, 12 cm = 85p (Hartmann)

**PremierBand**<sup>®</sup>, 4 m (all); 5 cm = 12p, 7.5 cm = 14p, 10 cm = 17p, 15 cm = 25p (Shermond)

### Polyamide and Cellulose Contour Bandage, BP 1988

(Nylon and Viscose Stretch Bandage)

Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4 m stretched (all):

**Acti-Wrap**<sup>®</sup>, cohesive, latex-free, 6 cm = 44p, 8 cm = 64p, 10 cm = 76p (Activa)

**Easifix**<sup>®</sup>, 2.5 cm = 9p, 5 cm = 33p, 7.5 cm = 40p, 10 cm = 48p, 15 cm = 81p (BSN Medical)

**Kontour**<sup>®</sup>, cohesive, 5 cm = 28p, 7.5 cm = 35p, 10 cm = 40p, 15 cm = 66p (Easigrip)

**Mollelast**<sup>®</sup>, latex-free, 4 cm = 28p (Activa)

**Slinky**<sup>®</sup>, 7.5 cm = 57p, 10 cm = 68p, 15 cm = 98p (Mölnlycke)

**Stayform**<sup>®</sup>, 5 cm = 29p, 7.5 cm = 36p, 10 cm = 40p, 15 cm = 68p (Robinsons)

## A5.8.3 Tubular bandages and garments

**Tubular bandages** are available in different forms, according to the function required of them. Some are used under orthopaedic casts and some are suitable for protecting areas to which creams or ointments (other than those containing potent corticosteroids) have been

applied. The conformability of the elasticated versions makes them particularly suitable for retaining dressings on difficult parts of the body or for soft tissue injury, but their use as the only means of applying pressure to an oedematous limb or to a varicose ulcer is not appropriate, since the pressure they exert is inadequate.

**Compression hosiery** (section A5.9.1) reduces the recurrence of venous leg ulcers and should be considered for use after wound healing.

**Silk clothing** is available as an alternative to elasticated viscose stockinette garments, for use in the management of severe eczema and allergic skin conditions (see below).

### ▲Elasticated

#### Elasticated Surgical Tubular Stockinette, Foam padded

(Drug Tariff specification 25). Fabric as for Elasticated Tubular Bandage with polyurethane foam lining. Heel, elbow, knee, small = £3.00, medium = £3.23, large = £3.46; sacral, medium, and large (all) = £15.28 (Mölnlycke—*Tubipad*<sup>®</sup>)

**Uses** relief of pressure and elimination of friction in relevant area; porosity of foam lining allows normal water loss from skin surface

#### Elasticated Tubular Bandage, BP 1993

(formerly Elasticated Surgical Tubular Stockinette).

Knitted fabric, elasticated threads of rubber-cored polyamide or polyester with cotton or cotton and viscose yarn, tubular. Lengths 50 cm and 1 m, widths 6.25 cm, 6.75 cm, 7.5 cm, 8.75 cm, 10 cm, 12 cm; Synergy—*Comfigrip*<sup>®</sup>; Easigrip—*EasiGRIP*<sup>®</sup>; Sallis—*Eesiban*<sup>®</sup>; Mölnlycke—*Tubigrip*<sup>®</sup>. Where no size stated by prescriber the 50 cm length should be supplied and width endorsed

#### Elasticated Viscose Stockinette

(Drug Tariff specification 46). Lightweight plain-knitted elasticated tubular bandage.

**Acti-Fast**<sup>®</sup>, 3.5 cm red line (small limb), length 1 m = 62p; 5 cm green line (medium limb), length 1 m = 65p, 3 m = £1.90, 5 m = £3.30; 7.5 cm blue line (large limb), length 1 m = 90p, 3 m = £2.50, 5 m = £4.40; 10.75 cm yellow line (child trunk), length 1 m = £1.45, 3 m = £4.10, 5 m = £7.10; 17.5 cm beige line (adult trunk), length 1 m = £2.15; 20 cm purple line (large adult trunk), length 1 m = £3.20, 5 m = £16.15 (Activa)

**CliniFast**<sup>®</sup>, 3.5 cm red line (small limb), length 1 m = 56p; 5 cm green line (medium limb), length 1 m = 58p, 3 m = £1.62, 5 m = £2.81; 7.5 cm blue line (large limb), length 1 m = 77p, 3 m = £2.13, 5 m = £3.74; 10.75 cm yellow line (child trunk), length 1 m = £1.20, 3 m = £3.49, 5 m = £6.04; 17.5 cm beige line (adult trunk), length 1 m = £1.83; *vest (long-sleeved)*, 6–24 months = £7.13, 2–5 years = £9.50, 5–8 years = £10.69, 8–11 years = £11.88, 11–14 years = £11.88, adult, small, = £12.75, medium = £14.54, large = £16.58; *vest (short-sleeved)*, adult, small = £12.50, medium = £14.25, large = £16.25; *tights (pair)* 6–24 months = £7.13; *leggings (pair)* 2–5 years = £9.50, 5–8 years = £10.69, 8–11 years = £11.88, 11–14 years = £11.88, adult, small, = £12.75, medium = £14.54, large = £16.58; *cycle shorts*, adult, small = £12.50, medium = £14.25, large = £16.25; *socks (pair)* up to 8 years = £2.97, 8–14 years = £2.97; *mittens (pair)* up to 24 months = £2.97, 2–8 years = £2.97, 8–14 years = £2.97; *gloves*,

child, small, medium, large = £4.99, adult, small, medium, large = £4.99; *clava*, 6 months–5 years = £5.85, 5–14 years = £6.75 (Clinisupplies)

**Comffast®**, 3.5 cm red line (small limb), length 1 m = 56p; 5 cm green line (medium limb), length 1 m = 58p, 3 m = £1.62, 5 m = £2.81; 7.5 cm blue line (large limb), length 1 m = 77p, 3 m = £2.13, 5 m = £3.74; 10.75 cm yellow line (child trunk), length 1 m = £1.20, 3 m = £3.49, 5 m = £6.04; 17.5 cm beige line (adult trunk), length 1 m = £1.83 (Synergy)

**Comffast® Easy Wrap**, vest (long-sleeved), 6–24 months = £7.13, 2–5 years = £9.50, 5–8 years = £10.69, 8–11 years = £11.88, 11–14 years = £11.88, adult, small = £12.75, medium = £14.54, large = £16.58; *tights (pair)*, 6–24 months = £7.13; *leggings (pair)*, 2–5 years = £9.50, 5–8 years = £10.69, 8–11 years = £11.88, 11–14 years = £11.88, adult, small = £12.75, medium = £14.54, large = £16.58; *socks (pair)*, up to 8 years = £2.97, 8–14 = £2.97; *mittens (pair)*, up to 24 months = £2.97, 2–8 years = £2.97, 8–14 years = £2.97; *clava*, 6 months–5 years = £5.85, 5–14 years = £6.75 (Synergy)

**Comffast® Multistretch**, 3.5 cm red line (small limb), length 1 m = 72p; 5 cm green line (medium limb), length 1 m = 78p, 3 m = £2.23, 5 m = £3.82; 7.5 cm blue line (large limb), length 1 m = £1.05, 3 m = £2.93, 5 m = £5.12; 10.75 cm yellow line (child trunk), length 1 m = £1.67, 3 m = £4.78, 5 m = £8.21; 17.5 cm beige line (adult trunk), length 1 m = £2.49 (Synergy Healthcare)

**Coverflex®**, 3.5 cm red line (small limb), length 1 m = 78p; 5 cm green line (medium limb), length 1 m = 81p, 3 m = £2.38, 5 m = £4.10; 7.5 cm blue line (large limb), length 1 m = £1.13, 3 m = £2.70, 5 m = £5.35; 10.75 cm yellow line (child trunk), length 1 m = £1.78, 3 m = £5.13, 5 m = £9.02; 17.5 cm beige line (adult trunk), length 1 m = £2.38 (Hartmann)

**Easifast®**, 3.5 cm red line (small limb), length 1 m = 65p; 5 cm green line (medium limb), length 1 m = 69p, 3 m = £1.95, 5 m = £3.40; 7.5 cm blue line (large limb), length 1 m = 94p, 3 m = £2.60, 5 m = £4.50; 10.75 cm yellow line (child trunk), length 1 m = £1.50, 3 m = £4.25, 5 m = £7.20; 17.5 cm beige line (adult trunk), length 1 m = £1.90 (Easigrip)

**Skinnies®**, *body-suit*, premature, 0–3 months, or 3–6 months = £15.90, 6–12 months = £17.90; *clava*, 6 months–5 years = £6.62, 5–14 years = £7.60; *gloves* child (small) = £5.20, (medium or large) = £5.25, adult (small) = £5.20, (medium or large) = £5.25; *leggings (pair)*, 6–24 months = £10.30, 2–5 years = £13.50, 5–8 years = £15.25, 8–11 years or 11–14 years = £16.90, adult (small) = £20.90, (medium) = £22.80, (large) = £24.70; *mittens*, 0–24 months, 2–8 years, or 8–14 years = £3.80; *socks, ankle (pair)*, 6 months–8 years or 8–14 years = £4.20; *socks, knee (pair)*, child (small, medium, or large, up to shoe size 4) = £13.70, adult (shoe size 4–6, 6–8, 8–11, or size 11+) = £13.70; *vest (long-sleeved)*, 6–24 months = £10.30, 2–5 years = £13.50, 5–8 years = £15.25, 8–11 years or 11–14 years = £16.90, adult (small) = £20.90, (medium) = £22.80, (large) = £24.70; *vest (short-sleeved)*, 6–24 months = £10.20, 2–5 years = £13.40, 5–8 years = £15.10, 8–11 years or 11–14 years = £15.15, 8–11 years = £16.80, 11–14 years = £16.80, adult (small) = £20.80, (medium) = £22.70, (large) = £24.60; *vest (sleeveless)*, 6–24 months = £10.20, 2–5 years = £13.40, 5–8 years = £15.15, 8–11 years = £16.80, 11–14 years = £16.80, adult (small) = £20.80, (medium) = £22.70, (large) = £24.60 (Skinnies)

**Tubifast® 2-way stretch**, 3.5 cm red line (small limb), length 1 m = 88p; 5 cm green line (medium limb), length 1 m = 95p, 3 m = £2.70, 5 m = £4.61; 7.5 cm blue line (large limb), length 1 m = £1.26, 3 m = £3.55, 5 m = £6.19; 10.75 cm yellow line (child trunk), length 1 m = £2.02, 3 m = £5.78, 5 m = £9.92; 20 cm purple line (large adult trunk), length 1 m = £3.27, 5 m = £16.00; *vest (long-sleeved)*, 6–24 months = £10.97, 2–5 years = £14.63, 5–8 years = £16.46, 8–11 years = £18.28, 11–14 years = £18.28; *tights (pair)*, 6–24 months = £10.97; *leggings (pair)*, 2–5 years = £14.63, 5–8 years = £16.46, 8–11 years = £18.28, 11–14 years = £18.28; *socks (pair)*, one-size = £4.58; *gloves*, (small-medium or medium-large adult, extra small or small child) = £5.50 (Mölnlycke)

#### ▲ Non-elasticated

##### Cotton Stockinette, Bleached, BP 1988

Knitted fabric, cotton yarn, tubular length, 1 m (all), 2.5 cm = 37p; 5 cm = 58p; 7.5 cm = 69p; 6 m × 10 cm = £4.75 (Sallis—Eesiban®)

**Uses** 1 m lengths, basis (with wadding) for Plaster of Paris bandages etc.; 6 m length, compression bandage

##### Ribbed Cotton and Viscose Surgical Tubular Stockinette, BP 1988

Knitted fabric of 1:1 ribbed structure, singles yarn spun from blend of two-thirds cotton and one-third viscose fibres, tubular. Length 5 m (all):

Type A (lightweight): arm/leg (child), arm (adult) 5 cm = £2.45; arm (OS adult), leg (adult) 7.5 cm = £3.22; leg (OS adult) 10 cm = £4.27; trunk (child) 15 cm = £6.15; trunk (adult) 20 cm = £7.11; trunk (OS adult) 25 cm = £8.50 (Mölnlycke)

Type B (heavyweight): sizes as for Type A, net price £2.55–£8.83 (Sallis—Eesiban®)

Drug Tariff specifies various combinations of sizes to provide sufficient material for part or full body coverage

**Uses** protective dressings with tar-based and other non-steroid ointments

#### ▲ Silk Clothing

Knitted, medical grade silk clothing can be used as an adjunct to normal treatment for severe eczema and allergic skin conditions. When used in combination with medical creams and ointments, care should be taken to ensure that the medication is fully absorbed into the skin before the silk clothing is worn; silk garments are not suitable for use in direct contact with emollients used in 'wet wrapping techniques'.

##### DermaSilk® (Espere)

Knitted silk fabric, hypoallergenic, sericin-free, *body suit*, child 0–3 months (height 62 cm) = £36.18, 3–6 months (height 68 cm) = £36.82, 6–9 months (height 74 cm) = £37.87, 9–12 months (height 74 cm) = £38.25, 12–18 months (height 86 cm) = £38.92, 18–24 months (height 92 cm) = £39.29, 2–3 years (height 98 cm) = £38.71, 3–4 years (height 110 cm) = £41.03; *boxer shorts*, adult (male), small–XXXL = £39.95; *briefs*, 3–4 years = £20.95, 5–6 years = £20.95, 7–8 years = £20.95, 10–12 years = £20.95, adult (female), small–XXL = £29.39; *facial mask*, child (head circumference up to 47 cm) = £15.80, child (head circumference up to 50 cm) = £15.80, teen or adult = £20.19; *gloves*, adult (small, medium, large, or extra large) = £19.96, child (small or medium) = £14.22; *leggings*, child 0–3 months (height 62 cm) = £25.83, 3–6 months (height 68 cm) = £26.28, 6–9 months (height 74 cm) = £27.34, 9–12

months (height 74 cm) = £27.90, 12–18 months (height 86 cm) = £28.39, 18–24 months (height 92 cm) = £28.94, 2–3 years (height 98 cm) = £28.51, 3–4 years (height 110 cm) = £30.50, adult (male), small–XXL = £75.60, adult (female), small–XXL = £75.60; *pyjamas*, child 3–4 years (height 110 cm) = £68.42, 5–6 years (height 120 cm) = £72.63, 7–8 years (height 135 cm) = £75.79, 10–12 years (height 150 cm) = £78.95; *shirt, roll-neck*, 3–4 years = £45.56, 5–6 years = £48.49, 7–8 years = £50.51, 10–12 years = £52.54, adult, small–XXL = £74.72; *shirt, round-neck*, adult (male), small–XXL = £74.72, adult (female), small–XXL = £74.72; *sleeves (tubular)*, length 33 cm = £26.28, 50 cm = £32.50; *undersocks, (heel-less)*, 2 pairs standard or longer length = £23.39; *undersocks*, adult shoe-size 5½–6½, 7–8½, 9–10½, 11–13, child shoe-size 3–8, 9–1, 2–5, 2 pairs = £17.78

#### DreamSkin® (Dreamskin)

Knitted silk fabric, hypoallergenic, sericin-free, with methacrylate copolymer and zinc-based antibacterial, *body suit (with foldaway mitts)*, child 0–3 months = £35.15, 0–6 months = £35.65, 3–6 months = £35.65, 6–9 months = £36.67, 9–12 months = £37.20, 12–18 months = £37.69, 18–24 months = £38.20, 2–3 years = £38.71, 3–4 years = £39.73; *briefs or fitted boxers*, 3–4 years = £20.95, 5–6 years = £20.95, 7–8 years = £20.95, 9–10 years = £20.95, 11–12 years = £20.95, adult (male) small–XXL = £32.95, adult (female) small–XXL = £30.95; *eye mask*, one size = £9.95; *gloves*, child (small or medium) = £13.98, adult (small, medium, large, or extra large) = £19.62; *head mask*, child up to 1 year (head circumference 39–45 cm) = £15.30, child 1–8 years (head circumference 48–50 cm) = £15.30, child 12–18 years = £19.96, adult = £19.96; *baby leggings (with foldaway feet)*, child 0–3 months = £24.95, 0–6 months = £25.45, 3–6 months = £25.45, 6–9 months = £26.47, 9–12 months = £26.98, 12–18 months = £27.49, 18–24 months = £28.00, 2–3 years = £28.51, 3–4 years = £29.53; *leggings (without feet; male or female styles)*, 3–4 years = £29.53, 5–6 years = £30.99, 7–8 years = £31.49, 9–10 years = £31.99, 11–12 years = £32.49, adult small–XXL = £74.74; *pyjamas (male or female styles)*, 3–4 years = £66.25, 5–6 years = £70.33, 7–8 years = £73.39, 9–10 years = £74.95, 11–12 years = £76.45; *shirt, polo-neck, long-sleeved (male or female styles)*, 3–4 years = £44.94, 5–6 years = £47.94, 7–8 years = £49.94, 9–10 years = £50.94, 11–12 years = £51.94, adult small–XXL = £73.87; *shirt, round-neck, long-sleeved (male or female styles)*, 3–4 years = £44.95, 5–6 years = £46.95, 7–8 years = £48.95, 9–10 years = £49.95, 11–12 years = £50.95, adult small–XXL = £73.87; *sleeves, (tubular)*, pair, length 33 cm = £25.83, 50 cm = £32.13; *tights*, adult (female) small–XL = £22.95; *undersocks, (liner socks)*, 2 pairs, child shoe-size 3–5½, 6–8½, 9–12, 12½–3½, 4–5½, = £17.58, adult (male) shoe-size 6–8½, 9–11 = £17.58, adult (female) shoe-size 4–5½, 6–8½ = £17.58; *undersocks (heel-less)*, one size = £23.12

sprains and joints but their effectiveness has not been proven for this purpose. Since they have limited extensibility, they are able to provide light support without exerting undue pressure. For a warning against injudicious compression see section A5.8.7.

#### Crepe Bandage, BP 1988

Fabric, plain weave, warp of wool threads and crepe-twisted cotton threads, weft of cotton threads; stretch bandage. 4.5 m stretched (all): 5 cm = 93p; 7.5 cm = £1.31; 10 cm = £1.71; 15 cm = £2.48 (most suppliers)

#### Cotton Crepe Bandage

Light support bandage, 4.5 m stretched (all): 5 cm = 44p; 7.5 cm = 62p; 10 cm = 80p; 15 cm = £1.17 (Hartmann—Hospicrepe® 239) 4.5 m stretched (all), 5 cm = 44p, 7.5 cm = 61p, 10 cm = 79p, 15 cm = £1.16 (Hartmann—Hospicrepe® 229)

#### Cotton Crepe Bandage, BP 1988

Fabric, plain weave, warp of crepe-twisted cotton threads, weft of cotton and/or viscose threads; stretch bandage. 4.5 m stretched (both): 7.5 cm = £2.93; 10 cm = £3.76 (most suppliers)

#### Cotton, Polyamide and Elastane Bandage

Fabric, cotton, polyamide, and elastane; light support bandage (Type 2), 4.5 m stretched (all) *Hospilite®*, 5 cm = 35p, 7.5 cm = 48p, 10 cm = 58p, 15 cm = 85p (Hartmann) *Neosport®*, 5 cm = 54p, 7.5 cm = 73p, 10 cm = 91p, 15 cm = £1.12 (Neomedic) *Profore® #2*, 10 cm = £1.27, latex-free = £1.35 (S&N Hlth) *Setocrepe®*, 10 cm = £1.13 (Mölnlycke) *Soffcrepe®*, 5 cm = 65p, 7.5 cm = 92p, 10 cm = £1.16, 15 cm = £1.69 (BSN Medical)

#### Cotton Stretch Bandage, BP 1988

Fabric, plain weave, warp of crepe-twisted cotton threads, weft of cotton threads; stretch bandage, lighter than cotton crepe, 4.5 m stretched (all): *Hospicrepe® 233*, 5 cm = 52p; 7.5 cm = 72p; 10 cm = 96p; 15 cm = £1.36 (Steraid) *PremierBand®*, 5 cm = 45p, 7.5 cm = 63p, 10 cm = 79p, 15 cm = £1.18 (Shermond)

#### Cotton Suspensory Bandage

(Drug Tariff). Type 1: cotton net bag with draw tapes and webbing waistband; small, medium, and large (all) = £1.62, extra large = £1.71. Type 2: cotton net bag with elastic edge and webbing waistband; small = £1.79, medium = £1.84, large = £1.91, extra large = £1.98. Type 3: cotton net bag with elastic edge and webbing waistband with elastic insertion; small, medium, and large (all) = £1.93; extra large = £2.00. Type supplied to be endorsed

#### Knitted Elastomer and Viscose Bandage

Knitted fabric, viscose and elastomer yarn. *Type 2 (light support bandage)* *CliniLite®*, 4.5 m (all), 5 cm = 44p, 7.5 cm = 61p, 10 cm = 80p, 15 cm = £1.16 (Clinisupplies) *K-Lite®*, 4.5 m stretched, 5 cm = 52p, 7 cm = 73p, 10 cm = 95p, 15 cm = £1.38; 5.2 m stretched, 10 cm = £1.09 (Urgo) *Knit-Firm®*, 4.5 m stretched, 5 cm = 36p, 7 cm = 51p, 10 cm = 66p, 15 cm = 96p (Steraid) *Type 3a (light compression bandage)* *CliniPlus®*, 8.7 m × 10 cm = £1.80 (Clinisupplies)

## A5.8.4 Support bandages

Light support bandages, which include the various forms of crepe bandage, are used in the prevention of oedema; they are also used to provide support for mild

**Elset<sup>®</sup>**, 6 m stretched, 10 cm = £2.46, 15 cm = £2.66; 8 m stretched, 10 cm = £3.14; 12 m stretched, 15 cm = £5.27 (Mölnlycke)

**K-Plus<sup>®</sup>**, 8.7 m stretched, 10 cm = £2.14; long, 10.25 m stretched, 10 cm = £2.47 (Urgo)

**Profore<sup>®</sup> #3**, 8.7 m stretched, 10 cm = £3.70, latex-free = £4.02 (S&N Hlth.)

**L3**, 8.6 m stretched, 10 cm = £2.07 (S&N Hlth.)

### A5.8.5 Adhesive bandages

**Elastic adhesive bandages** are used to provide compression in the treatment of varicose veins and for the support of injured joints; they should no longer be used for the support of fractured ribs and clavicles. They have also been used with **zinc paste bandage** in the treatment of venous ulcers, but they can cause skin reactions in susceptible patients and may not produce sufficient pressures for healing (significantly lower than those provided by other compression bandages).

#### Elastic Adhesive Bandage, BP 1993

Woven fabric, elastic in warp (crepe-twisted cotton threads), weft of cotton and/or viscose threads spread with adhesive mass containing zinc oxide.

4.5 m stretched (all): 5 cm = £3.56; 7.5 cm = £5.15; 10 cm = £6.85

Drug Tariff specifies 7.5 cm width supplied when size not stated

### A5.8.6 Cohesive bandages

**Cohesive bandages** adhere to themselves, but not to the skin, and are useful for providing support for sports use where ordinary stretch bandages might become displaced and adhesive bandages are inappropriate. Care is needed in their application, however, since the loss of ability for movement between turns of the bandage to equalise local areas of high tension carries the potential for creating a tourniquet effect. Cohesive bandages can be used to support sprained joints and as an outer layer for multi-layer compression bandaging; they should not be used if arterial disease is suspected.

#### ▲ Cohesive extensible bandages

##### **Coban<sup>®</sup>** (3M)

**Bandage**, 6 m (stretched), 10 cm = £2.79

##### **K-Press<sup>®</sup>** (Urgo)

**Bandage**, 6.5 m × 10 cm (0, short) = £2.78; 7.5 m, 18–25 cm ankle circumference, 8 cm = £3.06, 10 cm = £3.25, 12 cm = £4.09; 10.5 m, 25–32 cm ankle circumference, 8 cm = £3.33, 10 cm = £3.55, 12 cm = £4.48

##### **Profore<sup>®</sup> #4** (S&N Hlth.)

**Bandage**, 2.5 m (unstretched) = £3.06, latex-free = £3.32

##### **Ultra Fast<sup>®</sup>** (Robinsons)

**Bandage**, 6.3 m (stretched), 10 cm = £2.59

### A5.8.7 Compression bandages

High compression products are used to provide the high compression needed for the management of gross varices, post-thrombotic venous insufficiency, venous leg

ulcers, and gross oedema in average-sized limbs. Their use calls for an expert knowledge of the elastic properties of the products and experience in the technique of providing careful graduated compression. Incorrect application can lead to uneven and inadequate pressures or to hazardous levels of pressure. In particular, injudicious use of compression in limbs with arterial disease has been reported to cause severe skin and tissue necrosis (in some instances calling for amputation). Doppler testing is required before treatment with compression. Oral pentoxifylline (section 2.6.4) can be used as adjunct therapy if a chronic venous leg ulcer does not respond to compression bandaging [unlicensed indication].

#### ▲ High compression bandages

##### **PEC High Compression Bandage**

Polyamide, elastane, and cotton compression (high) extensible bandage, 3.5 m unstretched, 10 cm = £3.34 (Mölnlycke—*Setopress<sup>®</sup>*)

##### **VEC High Compression Bandage**

Viscose, elastane, and cotton compression (high) extensible bandage, 3 m unstretched (both); 7.5 cm = £2.56; 10 cm = £3.29 (S&N—*Tensopress<sup>®</sup>*)

##### **High Compression Bandage**

Cotton, viscose, nylon, and Lycra<sup>®</sup> extensible bandage, 3 m (unstretched), 10 cm = £3.42 (ConvaTec—*SurePress<sup>®</sup>*); 3 m (unstretched), 10 cm = £2.66 (Urgo—*K-ThreeC<sup>®</sup>*)

#### ▲ Short stretch compression bandage

Short stretch bandages help to reduce oedema and promote healing of venous leg ulcers. They are also used to reduce swelling associated with lymphoedema. They are applied at full stretch over padding (*see* Sub-compression Wadding Bandage below) which protects areas of high pressure and sites at high risk of pressure damage.

##### **Actico<sup>®</sup>** (Activa)

**Bandage**, cohesive, 6 m (all), 4 cm = £2.25, 6 cm = £2.64, 8 cm = £3.03, 10 cm = £3.15, 12 cm = £4.02

##### **Comprilan<sup>®</sup>** (BSN Medical)

**Bandage**, 5 m (all), 6 cm = £2.55; 8 cm = £2.99; 10 cm = £3.22; 12 cm = £3.92

##### **Rosidal K<sup>®</sup>** (Activa)

**Bandage**, 5 m (all), 4 cm = £1.79, 6 cm = £2.50, 8 cm = £2.98, 10 cm = £3.26, 12 cm = £3.95; 10 m × 10 cm = £5.67

##### **Silkolan<sup>®</sup>** (Urgo)

**Bandage**, 5 m (all), 8 cm = £3.00; 10 cm = £3.39

#### ▲ Sub-compression wadding bandage

##### **Cellona<sup>®</sup> Undercast Padding** (Activa)

**Padding**, 2.75 m unstretched (all): 5 cm = 29p, 7.5 cm = 36p; 10 cm = 44p; 15 cm = 57p

##### **Flexi-Ban<sup>®</sup>** (Activa)

**Padding**, 3.5 m unstretched, 10 cm = 47p

##### **K-Soft<sup>®</sup>** (Urgo)

**Padding**, absorbent, 3.5 m unstretched, 10 cm = 43p; 4.5 m unstretched, 10 cm = 53p

**K-Tech**<sup>®</sup> (Urgo)

**Padding**, 5 m × 10 cm (0, short) = £3.76; 6 m, 18–25 cm ankle circumference, 8 cm = £4.26, 10 cm = £4.51, 12 cm = £5.69; 7.3 m, 25–32 cm ankle circumference, 8 cm = £4.64, 10 cm = £4.92, 12 cm = £6.21

**Note** *K-Tech*<sup>®</sup> also includes a short stretch compressive fabric component

**K-Tech**<sup>®</sup> **Reduced** (Urgo)

**Padding**, 6 m × 10 cm, 18–25 cm ankle circumference = £4.51; 7.3 m × 10 cm, 25–32 cm ankle circumference = £4.92

**Note** *K-Tech*<sup>®</sup> **Reduced** also includes a short stretch compressive fabric component

**Ortho-Band Plus**<sup>®</sup> (Steraid)

**Padding**, 10 cm × 3.5 cm unstretched = 37p

**Profore**<sup>®</sup> #1 (S&N Hlth.)

**Padding**, viscose fleece, 3.5 m unstretched, 10 cm = 66p, latex-free = 72p

**Softex**<sup>®</sup> (Mölnlycke)

**Padding**, absorbent, 3.5 m unstretched, 10 cm = 60p

**SurePress**<sup>®</sup> (ConvaTec)

**Padding**, absorbent, 3 m unstretched, 10 cm = 56p

**Ultra Soft**<sup>®</sup> (Robinsons)

**Padding**, absorbent, 3.5 m unstretched, 10 cm = 39p

**Velband**<sup>®</sup> (BSN Medical)

**Padding**, absorbent, 4.5 m unstretched, 10 cm = 68p

**Multi-layer compression bandaging kit**, four layer system, for ankle circumference up to 18 cm = £9.58, 18–25 cm = £8.92, 25–30 cm = £7.41, above 30 cm = £11.09, latex-free, 18–25 cm = £9.53; *Profore Lite*<sup>®</sup> above 18 cm = £5.15, latex-free = £5.60

**System 4**<sup>®</sup> (Mölnlycke)

*System 4*<sup>®</sup> #1 (*Softex*<sup>®</sup>)—see Sub-compression Wadding Bandage, p. 1086); *System 4*<sup>®</sup> #2 (*Setocrepe*<sup>®</sup>)—see Cotton, Polyamide and Elastane Bandage, p. 1084); *System 4*<sup>®</sup> #3 (*Elset*<sup>®</sup>)—see Knitted Elastomer and Viscose Bandage, p. 1084); *System 4*<sup>®</sup> #4 (*Meban*<sup>®</sup>)

**Multi-layer compression bandaging kit**, four layer system, for ankle circumference 18–25 cm = £7.46

**Ultra Four**<sup>®</sup> (Robinsons)

*Ultra Four*<sup>®</sup> #1 (*Ultra Soft*<sup>®</sup>)—see Sub-compression Wadding Bandage, p. 1086); *Ultra Four*<sup>®</sup> #2 (*Ultra Lite*<sup>®</sup>) 10 cm × 4.5 cm (stretched) = 85p; *Ultra Four*<sup>®</sup> #3 (*Ultra Plus*<sup>®</sup>) 10 cm × 8.7 cm (stretched) = £1.89; *Ultra Four*<sup>®</sup> #4 (*Ultra Fast*<sup>®</sup>)—see Cohesive Bandages, p. 1085)

**Multi-layer compression bandaging kit**, four layer system, for ankle circumference up to 18 cm = £6.41, 18–25 cm = £5.67; *Ultra Four*<sup>®</sup> RC (reduced compression) 18–25 cm = £4.14

▲ **Two layer systems****Coban**<sup>®</sup> 2 (3M)

**Multi-layer compression bandaging kit**, two layer system (latex-free, foam bandage and cohesive compression bandage), one size = £8.08; *Coban*<sup>®</sup> 2 *Lite* (reduced compression), one size = £8.08

**K-Two**<sup>®</sup> (Urgo)

*K-Tech*<sup>®</sup> (see Sub-compression Wadding Bandages, p. 1086); *K-Press*<sup>®</sup> (see Cohesive bandages, p. 1085)

**Multi-layer compression bandaging kit**, two layer system, size 0 (short) = £6.55; 18–25 cm ankle circumference, 8 cm = £7.32, 10 cm = £7.76, 12 cm = £9.78; 25–32 cm ankle circumference, 8 cm = £7.96, 10 cm = £8.48, 12 cm = £10.69

*K-Two*<sup>®</sup> Latex Free, *K-Tech*<sup>®</sup> (see Sub-compression Wadding Bandages, above); *K-Press*<sup>®</sup> Latex Free

**Multi-layer compression bandaging kit**, two layer system, for ankle circumference 18–25 cm = £8.38; 25–32 cm = £9.16

*K-Two*<sup>®</sup> Reduced, *K-Tech*<sup>®</sup> Reduced (see Sub-compression Wadding Bandages, above); *K-Press*<sup>®</sup> (see Cohesive Bandages, p. 1085)

**Multi-layer compression bandaging kit**, two layer system, for ankle circumference 18–25 cm = £7.76; 25–32 cm = £8.48

*K-Two*<sup>®</sup> Reduced Latex Free, *K-Tech*<sup>®</sup> (see Sub-compression Wadding Bandages, above); *K-Press*<sup>®</sup> Reduced Latex Free

**Multi-layer compression bandaging kit**, two layer system, for ankle circumference 18–25 cm = £8.38; 25–32 cm = £9.16

*K-Two*<sup>®</sup> *Start*, *UrgoStart*<sup>®</sup> *Contact* (see Protease-modulating matrix, p. 1077); *K-Tech*<sup>®</sup> (see Sub-compression Wadding Bandages, p. 1086); *K-Press*<sup>®</sup> (see Cohesive Bandages, p. 1085)

**Multi-layer compression bandaging kit**, two-layer system, for ankle circumference 18–25 cm = £9.68; 25–32 cm = £10.33

## A5.8.8 Multi-layer compression bandaging

Multi-layer compression bandaging systems are an alternative to High Compression Bandages (section A5.8.7) for the treatment of venous leg ulcers. Compression is achieved by the combined effects of two or three extensible bandages applied over a layer of orthopaedic wadding and a wound contact dressing.

▲ **Four layer systems****K-Four**<sup>®</sup> (Urgo)

*K-Four*<sup>®</sup> #1 (*K-Soft*<sup>®</sup>)—see Sub-compression Wadding Bandage, p. 1085); *K-Four*<sup>®</sup> #2 (*K-Lite*<sup>®</sup>)—see Knitted Elastomer and Viscose Bandage, p. 1084); *K-Four*<sup>®</sup> #3 (*K-Plus*<sup>®</sup>)—see Knitted Elastomer and Viscose Bandage, p. 1084); *K-Three C*<sup>®</sup>—see High compression bandages, p. 1085; *K-Four*<sup>®</sup> #4 (*Ko-Flex*<sup>®</sup>), 6 m (stretched), 10 cm = £2.84; 7 m (stretched), 10 cm = £3.25

**Multi-layer compression bandaging kit**, four layer system, for ankle circumference up to 18 cm = £6.73, 18–25 cm = £6.44, 25–30 cm = £6.44, above 30 cm = £8.87; *reduced compression*, 18 cm and above = £4.21

**Profore**<sup>®</sup> (S&N Hlth.)

*Profore*<sup>®</sup> wound contact layer (see Knitted Viscose Primary Dressing, p. 1063); *Profore*<sup>®</sup> #1 (see Sub-compression Wadding Bandage, p. 1086); *Profore*<sup>®</sup> #2 (see Cotton, Polyamide and Elastane Bandage, p. 1084); *Profore*<sup>®</sup> #3 (see Knitted Elastomer and Viscose Bandage, p. 1084); *Profore*<sup>®</sup> #4 (see Cohesive bandages, p. 1085); *Profore*<sup>®</sup> *Plus* 3 m (unstretched), 10 cm = £3.46, latex-free = £3.70

## A5.8.9 Medicated bandages

**Zinc Paste Bandage** has been used with compression bandaging for the treatment of venous leg ulcers. However, paste bandages are associated with hypersensitivity reactions and should be used with caution.

Zinc paste bandages are also used with **coal tar** or **ichthammol** in chronic lichenified skin conditions such as chronic eczema (ichthammol often being preferred since its action is considered to be milder). They are also used with **calamine** in milder eczematous skin conditions.

### Zinc Paste Bandage, BP 1993

Cotton fabric, plain weave, impregnated with suitable paste containing zinc oxide; requires additional bandaging, 6 m × 7.5 cm = £3.44 (S&N Hlth.—*Viscopaste PB7*<sup>®</sup> (10%), *excipients*: include cetostearyl alcohol, hydroxybenzoates)

### Zinc Paste and Ichthammol Bandage, BP 1993

Cotton fabric, plain weave, impregnated with suitable paste containing zinc oxide and ichthammol; requires additional bandaging, 6 m × 7.5 cm = £3.47 S&N Hlth.—*Ichthopaste*<sup>®</sup> (6/2%), *excipients*: include cetostearyl alcohol

**Uses** see section 13.5

### Stripaste<sup>®</sup> (Mölnlycke)

Cotton fabric, selvedge weave impregnated with paste containing zinc oxide (requires additional bandaging), 6 m × 7.5 cm = £3.24

**Excipients** include polysorbate 80

## Medicated stocking

### Zipzoc<sup>®</sup> (S&N Hlth.)

Sterile rayon stocking impregnated with ointment containing zinc oxide 20%. 4-pouch carton = £12.52; 10-pouch carton = £31.30

**Note** Can be used under appropriate compression bandages or hosiery in chronic venous insufficiency

## A5.9 Compression hosiery and garments

**Compression (elastic) hosiery** is used to treat conditions associated with chronic venous insufficiency, to prevent recurrence of thrombosis, or to reduce the risk of further venous ulceration after treatment with compression bandaging (section A5.8.7). Doppler testing to confirm arterial sufficiency is required before recommending the use of compression hosiery.

Before elastic hosiery can be dispensed, the quantity (single or pair), article (including accessories), and compression class must be specified by the prescriber. There are different compression values for graduated compression hosiery and lymphoedema garments (see table below). All dispensed elastic hosiery articles must state on the packaging that they conform with Drug Tariff technical specification No. 40, for further details see Drug Tariff.

**Note** Graduated compression tights are .

## Compression values for hosiery and lymphoedema garments

Compression class	Compression hosiery (British standard)	Lymphoedema garments (European classification)
Class 1	14–17 mmHg	18–21 mmHg
Class 2	18–24 mmHg	23–32 mmHg
Class 3	25–35 mmHg	34–46 mmHg
Class 4	Not available	49–70 mmHg
Class 4 super	Not available	60–90 mmHg

## A5.9.1 Graduated compression hosiery

### Class 1 Light Support

**Hosiery**, compression at ankle 14–17 mmHg, thigh length or below knee with knitted in heel. 1 pair, circular knit (standard), thigh length = £7.61, below knee = £6.95, (made-to-measure), thigh length = £37.79, below knee = £23.64; lightweight elastic net (made-to-measure), thigh length = £20.38, below knee = £15.91

**Uses** superficial or early varices, varicosis during pregnancy

### Class 2 Medium Support

**Hosiery**, compression at ankle 18–24 mmHg, thigh length or below knee with knitted in heel. 1 pair, circular knit (standard), thigh length = £11.31, below knee = £10.16, (made-to-measure), thigh length = £37.79, below knee = £23.64; net (made-to-measure), thigh length = £20.38, below knee = £15.91; flat bed (made-to-measure, only with closed heel and open toe), thigh length = £37.79, below knee = £23.64

**Uses** varices of medium severity, ulcer treatment and prophylaxis, mild oedema, varicosis during pregnancy

### Class 3 Strong Support

**Hosiery**, compression at ankle 25–35 mmHg, thigh length or below knee with open or knitted in heel. 1 pair, circular knit (standard), thigh length = £13.40, below knee = £11.52, (made-to-measure) thigh length = £37.79, below knee = £23.64; flat bed (made-to-measure, only with open heel and open toe), thigh length = £37.79, below knee = £23.64

**Uses** gross varices, post thrombotic venous insufficiency, gross oedema, ulcer treatment and prophylaxis

## Accessories

In addition to the product listed below, accessories such as application aids for hosiery are available, see Drug Tariff for details

### Suspender

**Suspender**, for thigh stockings = 67p, belt (specification 13), = £5.16, fitted (additional price) = 62p

### Anklets

#### Class 2 Medium Support

**Anklets**, compression 18–24 mmHg, circular knit (standard and made-to-measure), 1 pair = £6.66; flat bed (standard and made-to-measure) = £13.84; net (made-to-measure) = £13.09

**Class 3 Strong Support**

**Anklelets**, compression 25–35 mmHg, circular knit (standard and made-to-measure), 1 pair = £9.09; flat bed (standard) = £9.29, (made-to-measure) = £13.84

**■ Knee caps****Class 2 Medium Support**

**Kneecaps**, compression 18–24 mmHg, circular knit (standard and made-to-measure), 1 pair = £6.66; flat bed (standard and made-to-measure) = £13.84; net (made-to-measure) = £10.87

**Class 3 Strong Support**

**Kneecaps**, compression 25–35 mmHg, circular knit (standard and made-to-measure), 1 pair = £8.88; flat bed (standard) = £8.88, (made-to-measure) = £13.84

**A5.9.2 Lymphoedema garments**

**Lymphoedema compression garments** are used to maintain limb shape and prevent additional fluid retention. Either flat-bed or circular knitting methods are used in the manufacture of elasticated compression garments. Seamless, circular-knitted garments (in standard sizes) can be used to prevent swelling if the lymphoedema is well controlled and if the limb is in good shape and without skin folds. Flat-knitted garments (usually made-to-measure) with a seam, provide greater rigidity and stiffness to maintain reduction of lymphoedema following treatment with compression bandages.

A standard range of light, medium, or high compression garments are available, as well as low compression (12–16 mmHg) armsleeves, made-to-measure garments up to compression 90 mmHg, and accessories—see Drug Tariff for details.

**Note** There are different compression values for lymphoedema garments and graduated compression hosiery, see table, p. 1087.

# Dental Practitioners' Formulary

## List of Dental Preparations

The following list has been approved by the appropriate Secretaries of State, and the preparations therein may be prescribed by dental practitioners on form FP10D (GP14 in Scotland, WP10D in Wales).

Licensed **sugar-free** versions, where available, are preferred.

Licensed **alcohol-free** mouthwashes, where available, are preferred.

Aciclovir Cream, BP

Aciclovir Oral Suspension, BP, 200 mg/5 mL

Aciclovir Tablets, BP, 200 mg

Aciclovir Tablets, BP, 800 mg

Amoxicillin Capsules, BP

Amoxicillin Oral Powder, DPF

Amoxicillin Oral Suspension, BP

Artificial Saliva Gel, DPF

Artificial Saliva Oral Spray, DPF

Artificial Saliva Pastilles, DPF

Artificial Saliva Protective Spray, DPF

<sup>1</sup>Artificial Saliva Substitutes as listed below (to be prescribed only for indications approved by ACBS):

*AS Saliva Orthana*®

*Glandosane*®

*BioXtra*® Gel Mouthspray

*BioXtra*® Moisturising Gel

*Saliveze*®

<sup>2</sup>Aspirin Tablets, Dispersible, BP

Azithromycin Capsules, 250 mg, DPF

Azithromycin Oral Suspension, 200 mg/5 mL, DPF

Azithromycin Tablets, 250 mg, DPF

Azithromycin Tablets, 500 mg, DPF

Beclometasone Pressurised Inhalation, BP, 50 micrograms/metered inhalation, CFC-free, as:

*Clenil Module*®

Benzydamine Mouthwash, BP 0.15%

Benzydamine Oromucosal Spray, BP 0.15%

Betamethasone Soluble Tablets, 500 micrograms, DPF

Carbamazepine Tablets, BP

Cefalexin Capsules, BP

Cefalexin Oral Suspension, BP

Cefalexin Tablets, BP

Cefradine Capsules, BP

Cetirizine Oral Solution, BP, 5 mg/5 mL

Cetirizine Tablets, BP, 10 mg

Chlorhexidine Gluconate Gel, BP

Chlorhexidine Mouthwash, BP

Chlorhexidine Oral Spray, DPF

Chlorphenamine Oral Solution, BP

Chlorphenamine Tablets, BP

Choline Salicylate Dental Gel, BP

Clarithromycin Oral Suspension, 125 mg/5 mL, DPF

Clarithromycin Oral Suspension, 250 mg/5 mL, DPF

Clarithromycin Tablets, BP

Clindamycin Capsules, BP

Co-amoxiclav Tablets, BP, 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt)

Co-amoxiclav Oral Suspension, BP, 125/31 (amoxicillin 125 mg as trihydrate, clavulanic acid 31.25 mg as potassium salt)/5 mL

Co-amoxiclav Oral Suspension, BP, 250/62 (amoxicillin 250 mg as trihydrate, clavulanic acid 62.5 mg as potassium salt)/5 mL

Diazepam Oral Solution, BP, 2 mg/5 mL

Diazepam Tablets, BP

Diclofenac Sodium Tablets, Gastro-resistant, BP

Dihydrocodeine Tablets, BP, 30 mg

Doxycycline Tablets, Dispersible, BP

Doxycycline Capsules, BP, 100 mg

<sup>3</sup>Doxycycline Tablets, 20 mg, DPF

Ephedrine Nasal Drops, BP

Erythromycin Ethyl Succinate Oral Suspension, BP

Erythromycin Ethyl Succinate Tablets, BP

Erythromycin Stearate Tablets, BP

Erythromycin Tablets, Gastro-resistant, BP

Fluconazole Capsules, 50 mg, DPF

Fluconazole Oral Suspension, 50 mg/5 mL, DPF

Hydrocortisone Cream, BP, 1%

Hydrocortisone Oromucosal Tablets, BP

Hydrogen Peroxide Mouthwash, BP, 6%

Ibuprofen Oral Suspension, BP, sugar-free

Ibuprofen Tablets, BP

Lansoprazole Capsules, Gastro-resistant, BP

Lidocaine Ointment, BP, 5%

Lidocaine Spray 10%, DPF

Loratadine Syrup, 5 mg/5 mL, DPF

Loratadine Tablets, BP, 10 mg

<sup>4</sup>Menthol and Eucalyptus Inhalation, BP 1980

Metronidazole Oral Suspension, BP

Metronidazole Tablets, BP

Miconazole Cream, BP

Miconazole Oromucosal Gel, BP

Miconazole and Hydrocortisone Cream, BP

Miconazole and Hydrocortisone Ointment, BP

Nystatin Oral Suspension, BP

Ormeprazole Capsules, Gastro-resistant, BP

Oxytetracycline Tablets, BP

<sup>5</sup>Paracetamol Oral Suspension, BP

Paracetamol Tablets, BP

Paracetamol Tablets, Soluble, BP

Penciclovir Cream, DPF

Phenoxyethylpenicillin Oral Solution, BP

Phenoxyethylpenicillin Tablets, BP

Promethazine Hydrochloride Tablets, BP

Promethazine Oral Solution, BP

Saliva Stimulating Tablets, DPF

Sodium Chloride Mouthwash, Compound, BP

Sodium Fluoride Mouthwash, BP

Sodium Fluoride Oral Drops, BP

1. Indications approved by the ACBS are: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy or sicca syndrome

2. The BP directs that when soluble aspirin tablets are prescribed, dispersible aspirin tablets should be dispensed

3. May be difficult to obtain

4. This preparation does not appear in subsequent editions of the BP

5. The BP directs that when Paediatric Paracetamol Oral Suspension or Paediatric Paracetamol Mixture is prescribed and no strength stated Paracetamol Oral Suspension 120 mg/5 mL should be dispensed

Sodium Fluoride Tablets, BP  
 Sodium Fluoride Toothpaste 0.619%, DPF  
 Sodium Fluoride Toothpaste 1.1%, DPF  
 Sodium Fusidate Ointment, BP  
 Temazepam Oral Solution, BP  
 Temazepam Tablets, BP  
 Tetracycline Tablets, BP

Preparations in this list which are not included in the BP or BPC are described under Details of DPF preparations, p. 1090.

For details of preparations that can be prescribed, see individual entries under the relevant drug monographs throughout the BNF.

## Details of DPF preparations

Preparations on the List of Dental Preparations which are specified as DPF are described as follows in the DPF.

Although brand names have sometimes been included for identification purposes preparations on the list should be prescribed by non-proprietary name.

**Amoxicillin Oral Powder** <sup>(PoM)</sup>  
 amoxicillin (as trihydrate) 3 g sachet

**Artificial Saliva Gel**  
 (proprietary product: *Biotene Oralbalance*), lactoperoxidase, lactoferrin, lysozyme, glucose oxidase, xylitol in a gel basis

**Artificial Saliva Oral Spray**  
 (proprietary product: *Xerotin*) consists of water, sorbitol, carmellose (carboxymethylcellulose), potassium chloride, sodium chloride, potassium phosphate, magnesium chloride, calcium chloride and other ingredients, pH neutral

**Artificial Saliva Pastilles**  
 (proprietary product: *Salivix*), consists of acacia, malic acid, and other ingredients

**Artificial Saliva Protective Spray**  
 (proprietary product: *Aquoral*) consists of oxidised glycerol triesters, silicon dioxide, flavouring agents, aspartame (section 9.4.1)

**Azithromycin Capsules** <sup>(PoM)</sup>  
 azithromycin 250 mg

**Azithromycin Oral Suspension 200 mg/5 mL** <sup>(PoM)</sup>  
 azithromycin 200 mg/5 mL when reconstituted with water

**Azithromycin Tablets** <sup>(PoM)</sup>  
 azithromycin 250 mg and 500 mg

**Betamethasone Soluble Tablets**  
**500 micrograms** <sup>(PoM)</sup>  
 betamethasone (as sodium phosphate) 500 micrograms

**Chlorhexidine Oral Spray**  
 (proprietary product: *Corsodyl Oral Spray*), chlorhexidine gluconate 0.2%

**Clarithromycin Oral Suspension 125 mg/5 mL** <sup>(PoM)</sup>  
 clarithromycin 125 mg/5 mL when reconstituted with water

**Clarithromycin Oral Suspension 250 mg/5 mL** <sup>(PoM)</sup>  
 clarithromycin 250 mg/5 mL when reconstituted with water

**Doxycycline Tablets 20 mg** <sup>(PoM)</sup>  
 (proprietary product: *Periostat*), doxycycline (as hydrate) 20 mg

**Fluconazole Capsules 50 mg** <sup>(PoM)</sup>  
 fluconazole 50 mg

**Fluconazole Oral Suspension 50 mg/5 mL** <sup>(PoM)</sup>  
 (proprietary product: *Diflucan*), fluconazole 50 mg/5 mL when reconstituted with water

**Lidocaine Spray 10%**  
 (proprietary product: *Xylocaine Spray*), lidocaine 10% supplying 10 mg lidocaine/spray

**Loratadine Syrup 5 mg/5 mL**  
 loratadine 5 mg/5 mL

**Penciclovir Cream** <sup>(PoM)</sup>  
 (proprietary product: *Vectavir Cream*), penciclovir 1%

**Saliva Stimulating Tablets**  
 (proprietary product: *SST*), citric acid, malic acid and other ingredients in a sorbitol base

**Sodium Fluoride Toothpaste 0.619%** <sup>(PoM)</sup>  
 (proprietary product: *Duraphat '2800 ppm' Toothpaste*), sodium fluoride 0.619%

**Sodium Fluoride Toothpaste 1.1%** <sup>(PoM)</sup>  
 (proprietary product: *Duraphat '5000 ppm' Toothpaste*), sodium fluoride 1.1%

## Changes to Dental Practitioners' Formulary since September 2013

### Additions

Artificial Saliva Pastilles, DPF  
 Artificial Saliva Protective Spray, DPF

### Deletions

Ampicillin Capsules, BP  
 Ampicillin Oral Suspension, BP  
 Mouthwash Solution-tablets, DPF

### Changes of title

None

# Nurse Prescribers' Formulary

## Nurse Prescribers' Formulary for Community Practitioners

**Nurse Prescribers' Formulary Appendix** (Appendix NPF). List of preparations approved by the Secretary of State which may be prescribed on form FP10P (form HS21(N) in Northern Ireland, form GP10(N) in Scotland, forms WP10CN and WP10PN in Wales) by Nurses for National Health Service patients.

Community practitioners who have completed the necessary training may only prescribe items appearing in the nurse prescribers' list set out below. Community Practitioner Nurse Prescribers are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved generic name.

## Medicinal Preparations

Preparations on this list which are not included in the BP or BPC are described on p. 1092

Almond Oil Ear Drops, BP  
 Arachis Oil Enema, NPF  
<sup>1</sup>Aspirin Tablets, Dispersible, 300 mg, BP  
 Bisacodyl Suppositories, BP (includes 5-mg and 10-mg strengths)  
 Bisacodyl Tablets, BP  
 Catheter Maintenance Solution, Sodium Chloride, NPF  
 Catheter Maintenance Solution, 'Solution G', NPF  
 Catheter Maintenance Solution, 'Solution R', NPF  
 Chlorhexidine Gluconate Alcoholic Solutions containing at least 0.05%  
 Chlorhexidine Gluconate Aqueous Solutions containing at least 0.05%  
 Choline Salicylate Dental Gel, BP  
 Clotrimazole Cream 1%, BP  
 Co-danthramer Capsules, NPF  
 Co-danthramer Capsules, Strong, NPF  
 Co-danthramer Oral Suspension, NPF  
 Co-danthramer Oral Suspension, Strong, NPF  
 Co-danthrusate Capsules, BP  
 Co-danthrusate Oral Suspension, NPF  
 Crotamiton Cream, BP  
 Crotamiton Lotion, BP  
 Dimeticone barrier creams containing at least 10%  
 Dimeticone Lotion, NPF  
 Docusate Capsules, BP  
 Docusate Enema, NPF  
 Docusate Oral Solution, BP  
 Docusate Oral Solution, Paediatric, BP  
 Econazole Cream 1%, BP  
 Emollients as listed below:  
 Aquadrate<sup>®</sup> 10% w/w Cream  
 Arachis Oil, BP  
 Balneum<sup>®</sup> Plus Cream  
 Cetaben<sup>®</sup> Emollient Cream  
 Dermamist<sup>®</sup>  
 Diprobase<sup>®</sup> Cream

Diprobase<sup>®</sup> Ointment  
 Doublebase<sup>®</sup>  
 Doublebase<sup>®</sup> Dayleve Gel  
 E45<sup>®</sup> Cream  
 E45<sup>®</sup> Itch Relief Cream  
 Emulsifying Ointment, BP  
 Eucerin<sup>®</sup> Intensive 10% w/w Urea Treatment Cream  
 Eucerin<sup>®</sup> Intensive 10% w/w Urea Treatment Lotion  
 Hydromol<sup>®</sup> Cream  
 Hydromol<sup>®</sup> Intensive  
 Hydrous Ointment, BP  
 Lipobase<sup>®</sup>  
 Liquid and White Soft Paraffin Ointment, NPF  
 Neurogena<sup>®</sup> Norwegian Formula Dermatological Cream  
 Nutraplus<sup>®</sup> Cream  
 Oilatum<sup>®</sup> Cream  
 Oilatum<sup>®</sup> Junior Cream  
 Paraffin, White Soft, BP  
 Paraffin, Yellow Soft, BP  
 Ultrabase<sup>®</sup>  
 Unguentum M<sup>®</sup>

Emollient Bath and Shower Preparations as listed below:

Aqueous Cream, BP  
<sup>2</sup>Balneum<sup>®</sup>  
<sup>2</sup>Balneum Plus<sup>®</sup> Bath Oil  
 Cetaben<sup>®</sup> Emollient Bath Additive  
 Dermal<sup>®</sup> Bath Emollient  
 Doublebase<sup>®</sup> Emollient Bath Additive  
 Doublebase<sup>®</sup> Emollient Shower Gel  
 Doublebase<sup>®</sup> Emollient Wash Gel  
 Hydromol<sup>®</sup> Bath and Shower Emollient  
 Oilatum<sup>®</sup> Emollient  
 Oilatum<sup>®</sup> Gel  
 Oilatum<sup>®</sup> Junior Bath Additive  
 Zerolatum<sup>®</sup> Emollient Medicinal Bath Oil  
 Folic Acid Tablets 400 micrograms, BP  
 Glycerol Suppositories, BP  
<sup>3</sup>Ibuprofen Oral Suspension, BP  
<sup>3</sup>Ibuprofen Tablets, BP  
 Ispaghula Husk Granules, BP  
 Ispaghula Husk Granules, Effervescent, BP  
 Ispaghula Husk Oral Powder, BP  
 Lactulose Solution, BP  
 Lidocaine Ointment, BP  
 Lidocaine and Chlorhexidine Gel, BP  
 Macrogol Oral Liquid, Compound, NPF  
 Macrogol Oral Powder, Compound, NPF  
 Macrogol Oral Powder, Compound, Half-strength, NPF  
 Magnesium Hydroxide Mixture, BP  
 Magnesium Sulfate Paste, BP  
 Malathion aqueous lotions containing at least 0.5%  
 Mebendazole Oral Suspension, NPF  
 Mebendazole Tablets, NPF  
 Methylcellulose Tablets, BP

2. Except pack sizes that are not to be prescribed under the NHS (see Part XVIII of the Drug Tariff, Part XI of the Northern Ireland Drug Tariff)
3. Except for indications and doses that are (P<sub>o</sub>M)

Miconazole Cream 2%, BP  
 Miconazole Oromucosal Gel, BP  
 Mouthwash Solution-tablets, NPF  
 Nicotine Inhalation Cartridge for Oromucosal Use, NPF  
 Nicotine Lozenge, NPF  
 Nicotine Medicated Chewing Gum, NPF  
 Nicotine Nasal Spray, NPF  
 Nicotine Oral Spray, NPF  
 Nicotine Sublingual Tablets, NPF  
 Nicotine Transdermal Patches, NPF  
 Nystatin Oral Suspension, BP  
 Olive Oil Ear Drops, BP  
 Paracetamol Oral Suspension, BP (includes 120 mg/5 mL and 250 mg/5 mL strengths—both of which are available as sugar-free formulations)

<sup>1</sup>Paracetamol Tablets, BP

<sup>2</sup>Paracetamol Tablets, Soluble, BP (includes 120-mg and 500-mg tablets)

Permethrin Cream, NPF

Phosphates Enema, BP

Povidone-Iodine Solution, BP

Senna Oral Solution, NPF

Senna Tablets, BP

Senna and Ispaghula Granules, NPF

Sodium Chloride Solution, Sterile, BP

Sodium Citrate Compound Enema, NPF

Sodium Picosulfate Capsules, NPF

Sodium Picosulfate Elixir, NPF

Spermicidal contraceptives as listed below:

Gygel® Contraceptive Jelly

Sterculia Granules, NPF

Sterculia and Frangula Granules, NPF

Titanium Ointment, BP

Water for Injections, BP

Zinc and Castor Oil Ointment, BP

Zinc Oxide and Dimeticone Spray, NPF

Zinc Oxide Impregnated Medicated Bandage, NPF

Zinc Oxide Impregnated Medicated Stocking, NPF

Zinc Paste Bandage, BP 1993

Zinc Paste and Ichthammol Bandage, BP 1993

## Appliances and Reagents (including Wound Management Products)

Community Practitioner Nurse Prescribers in England, Wales and Northern Ireland can prescribe any appliance or reagent in the relevant Drug Tariff. In the Scottish Drug Tariff, Appliances and Reagents which may not be prescribed by Nurses are annotated Nx.

**Appliances** (including Contraceptive Devices<sup>2</sup>) as listed in Part IXA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 (Appliances) and Part 2 (Dressings) of the Scottish Drug Tariff)

**Incontinence Appliances** as listed in Part IXB of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 5 of the Scottish Drug Tariff)

**Stoma Appliances and Associated Products** as listed in Part IXC of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 6 of the Scottish Drug Tariff)

1. Max. 96 tablets; max. pack size 32 tablets
2. Nurse Prescribers in Family Planning Clinics—where it is not appropriate for nurse prescribers in family planning clinics to prescribe contraceptive devices using form FP10(P) (forms WP10CN and WP10PN in Wales), they may prescribe using the same system as doctors in the clinic

**Chemical Reagents** as listed in Part IXR of the Drug Tariff (Part II of the Northern Ireland Drug Tariff, Part 9 of the Scottish Drug Tariff)

The Drug Tariffs can be accessed online at: National Health Service Drug Tariff for England and Wales: [www.ppa.org.uk/ppa/edt\\_intro.htm](http://www.ppa.org.uk/ppa/edt_intro.htm)  
 Health and Personal Social Services for Northern Ireland Drug Tariff: [www.dhsspsni.gov.uk/pas-tariff](http://www.dhsspsni.gov.uk/pas-tariff)  
 Scottish Drug Tariff: [www.isdscotland.org/Health-topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/](http://www.isdscotland.org/Health-topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/)

## Details of NPF preparations

Preparations on the Nurse Prescribers' Formulary which are not included in the BP or BPC are described as follows in the Nurse Prescribers' Formulary.

Although brand names have sometimes been included for identification purposes, it is recommended that non-proprietary names should be used for prescribing medicinal preparations in the NPF except where a non-proprietary name is not available.

### Arachis Oil Enema

arachis oil 100%

### Catheter Maintenance Solution, Sodium Chloride

(proprietary products: *OptiFlo S*; *Uro-Tainer Sodium Chloride*; *Urflex-S*), sodium chloride 0.9%

### Catheter Maintenance Solution, 'Solution G'

(proprietary products: *OptiFlo G*; *Uro-Tainer Suby G*; *Urflex G*), citric acid 3.23%, magnesium oxide 0.38%, sodium bicarbonate 0.7%, disodium edetate 0.01%

### Catheter Maintenance Solution, 'Solution R'

(proprietary products: *OptiFlo R*; *Uro-Tainer Solution R*; *Urflex R*), citric acid 6%, gluconolactone 0.6%, magnesium carbonate 2.8%, disodium edetate 0.01%

### Chlorhexidine gluconate alcoholic solutions

(proprietary products: *ChloraPrep*; *Hydrex Solution*; *Hydrex spray*), chlorhexidine gluconate in alcoholic solution

### Chlorhexidine gluconate aqueous solutions

(proprietary product: *Unisept*) chlorhexidine gluconate in aqueous solution

### Co-danthramer Capsules (PoM)

co-danthramer 25/200 (dantron 25 mg, poloxamer '188' 200 mg)

### Co-danthramer Capsules, Strong (PoM)

co-danthramer 37.5/500 (dantron 37.5 mg, poloxamer '188' 500 mg)

### Co-danthramer Oral Suspension (PoM)

(proprietary product: *Codalax*), co-danthramer 25/200 in 5 mL (dantron 25 mg, poloxamer '188' 200 mg/5 mL)

### Co-danthramer Oral Suspension, Strong (PoM)

(proprietary product: *Codalax Forte*), co-danthramer 75/1000 in 5 mL (dantron 75 mg, poloxamer '188' 1 g/5 mL)

### Co-danthrusate Oral Suspension (PoM)

(proprietary product: *Normax*), co-danthrusate 50/60 (dantron 50 mg, docusate sodium 60 mg/5 mL)

**Dimeticone barrier creams**

(proprietary products: *Conotrane Cream*, dimeticone '350' 22%; *Siopel Barrier Cream*, dimeticone '1000' 10%), dimeticone 10–22%

**Dimeticone Lotion**

(proprietary product: *Hedrin*), dimeticone 4%

**Docusate Enema**

(proprietary product: *Norgalax Micro-enema*) docusate sodium 120 mg in 10 g

**Liquid and White Soft Paraffin Ointment**

liquid paraffin 50%, white soft paraffin 50%

**Macrogol Oral Liquid, Compound**

(proprietary product: *Movicol Liquid*), macrogol '3350' (polyethylene glycol '3350') 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/25 mL

**Macrogol Oral Powder, Compound**

(proprietary products: *Laxido Orange*, *Molaxole*, *Movicol*) macrogol '3350' (polyethylene glycol '3350') 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/sachet

**Note** Amount of potassium chloride varies according to flavour of *Movicol*<sup>®</sup> as follows: plain-flavour (sugar-free) = 50.2 mg/sachet; lime and lemon flavour = 46.6 mg/sachet; chocolate flavour = 31.7 mg/sachet. 1 sachet when reconstituted with 125 mL water provides K<sup>+</sup> 5.4 mmol/litre

**Macrogol Oral Powder, Compound, Half-strength**

(proprietary product: *Movicol-Half*), macrogol '3350' (polyethylene glycol '3350') 6.563 g, sodium bicarbonate 89.3 g, sodium chloride 175.4 mg, potassium chloride 23.3 mg/sachet

**Malathion aqueous lotions**

(proprietary products: *Derbac-M Liquid*), malathion 0.5% in an aqueous basis

**Mebendazole Oral Suspension (PoM)**

(proprietary product: *Vermox*), mebendazole 100 mg/5 mL

**<sup>1</sup>Mebendazole Tablets (PoM)**

(proprietary products: *Oxev*, *Vermox*), mebendazole 100 mg

**Mouthwash Solution-tablets**

consist of tablets which may contain antimicrobial, colouring and flavouring agents in a suitable soluble effervescent basis to make a mouthwash

**<sup>2</sup>Nicotine Inhalation Cartridge for Oromucosal Use**

(proprietary products: *NicAssist Inhalator*, *Nicorette Inhalator*), nicotine 10 mg or 15 mg

**Nicotine Lozenge**

nicotine (as bitartrate) 1 mg or 2 mg (proprietary product: *Nicorette Mint Lozenge*, *Nicotinell Mint Lozenge*), or nicotine (as resinolate) 1.5 mg, 2mg, or 4 mg (proprietary product: *NiQuitin Lozenges*, *NiQuitin Minis*, *NiQuitin Pre-quit*)

**Nicotine Medicated Chewing Gum**

(proprietary products: *NicAssist Gum*, *Nicorette Gum*, *Nicotinell Gum*, *NiQuitin Gum*), nicotine 2 mg or 4 mg

**Nicotine Nasal Spray**

(proprietary product: *NicAssist Nasal Spray*, *Nicorette Nasal Spray*), nicotine 500 micrograms/metered spray

**Nicotine Oral Spray**

(proprietary product: *Nicorette Quickmist*), nicotine 1 mg/metered spray

**<sup>3</sup>Nicotine Sublingual Tablets**

(proprietary product: *NicAssist Microtab*, *Nicorette Microtab*), nicotine (as a cyclodextrin complex) 2 mg

**<sup>4</sup>Nicotine Transdermal Patches**

releasing in each 16 hours, nicotine approx. 5 mg, 10 mg, or 15 mg (proprietary products: *Boots NicAssist Patch*, *Nicorette Patch*) or releasing in each 16 hours approx. 10 mg, 15 mg, or 25 mg (proprietary products: *NicAssist Translucent Patch*, *Nicorette Invisi Patch*), or releasing in each 24 hours nicotine approx. 7 mg, 14 mg, or 21 mg (proprietary products: *Nicopatch*, *Nicotinell TTS*, *NiQuitin*, *NiQuitin Clear*)

**Permethrin Cream**

(proprietary product: *Lyclear Dermal Cream*), permethrin 5%

**Senna Oral Solution**

(proprietary product: *Senokot Syrup*), sennosides 7.5 mg/5 mL

**Senna and Ispaghula Granules**

(proprietary product: *Manevac Granules*), senna fruit 12.4%, ispaghula 54.2%

**Sodium Citrate Compound Enema**

(proprietary products: *Micolette Micro-enema*; *Micralax Micro-enema*; *Relaxit Micro-enema*), sodium citrate 450 mg with glycerol, sorbitol and an anionic surfactant

**Sodium Picosulfate Capsules**

(proprietary products: *Dulcolax Perles*), sodium picosulfate 2.5 mg

**Sodium Picosulfate Elixir**

(proprietary products: *Dulcolax Liquid*), sodium picosulfate 5 mg/5 mL

**Sterculia Granules**

(proprietary product: *Normacol Granules*), sterculia 62%

**Sterculia and Frangula Granules**

(proprietary product: *Normacol Plus Granules*), sterculia 62%, frangula (standardised) 8%

**Zinc Oxide and Dimeticone Spray**

(proprietary product: *Sprilon*), dimeticone 1.04%, zinc oxide 12.5% in a pressurised aerosol unit

**Zinc Oxide Impregnated Medicated Bandage**

(proprietary product: *Steripaste*), sterile cotton bandage impregnated with paste containing zinc oxide 15%

**Zinc Oxide Impregnated Medicated Stocking**

(proprietary product: *Zipzoc*), sterile rayon stocking impregnated with ointment containing zinc oxide 20%

1. For (PoM) exemption, see p. 452

2. For use with inhalation mouthpiece; to be prescribed as either a starter pack (6 cartridges with inhalator device and holder) or refill pack (42 cartridges with inhalator device)

3. To be prescribed as either a starter pack (2 x 15-tablet discs with dispenser) or refill pack (7 x 15-tablet discs)

4. Prescriber should specify the brand to be dispensed

# Non-medical prescribing

A range of non-medical healthcare professionals can prescribe medicines for patients as either Independent or Supplementary Prescribers.

Independent prescribers are practitioners responsible and accountable for the assessment of patients with previously undiagnosed or diagnosed conditions and for decisions about the clinical management required, including prescribing. They are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved non-proprietary name.

Supplementary prescribing is a partnership between an independent prescriber (a doctor or a dentist) and a supplementary prescriber to implement an agreed Clinical Management Plan for an individual patient with that patient's agreement.

Independent and Supplementary Prescribers are identified by an annotation next to their name in the relevant professional register.

Information and guidance on non-medical prescribing is available on the Department of Health website at [www.dh.gov.uk/health/2012/04/prescribing-change](http://www.dh.gov.uk/health/2012/04/prescribing-change).

For information on the mixing of medicines by Independent and Supplementary Prescribers, see *Mixing of medicines prior to administration in clinical practice—responding to legislative changes*, National Prescribing Centre, May 2010 (available at [www.npc.nhs.uk/improving\\_safety/mixing\\_meds/resources/mixing\\_of\\_medicines.pdf](http://www.npc.nhs.uk/improving_safety/mixing_meds/resources/mixing_of_medicines.pdf)).

For information on the supply and administration of medicines to groups of patients using Patient Group Directions, see p. 3.

dipipanone, or cocaine for treating organic disease or injury, but not for treating addiction.

Pharmacist Independent Prescribers must work within their own level of professional competence and expertise.

---

## Optometrists

Optometrist Independent Prescribers can prescribe any licensed medicine for ocular conditions affecting the eye and the tissues surrounding the eye, except Controlled Drugs or medicines for parenteral administration. Optometrist Independent Prescribers must work within their own level of professional competence and expertise.

---

## Nurses

Nurse Independent Prescribers (formerly known as Extended Formulary Nurse Prescribers) are able to prescribe any medicine for any medical condition.

Nurse Independent Prescribers are able to prescribe, administer, and give directions for the administration of Schedule 2, 3, 4, and 5 Controlled Drugs. This extends to diamorphine, dipipanone, or cocaine for treating organic disease or injury, but not for treating addiction.

Nurse Independent Prescribers must work within their own level of professional competence and expertise.

For information on prescribing from the Nurse Prescribers' Formulary for Community Practitioners, see Nurse Prescribers' Formulary for Community Practitioners p. 1091

---

## Pharmacists

Pharmacist Independent Prescribers can prescribe any medicine for any medical condition.

They are also able to prescribe, administer, and give directions for the administration of Schedule 2, 3, 4, and 5 Controlled Drugs. This extends to diamorphine,

# Index of manufacturers

The following is an alphabetical list of manufacturers and other companies referenced in the BNF, with their medicines information or general contact details. For information on 'special-order' manufacturers and specialist importing companies see p. 1104.

# Special-order Manufacturers

Unlicensed medicines are available from 'special-order' manufacturers and specialist-importing companies; the MHRA maintains a register of these companies at <http://tinyurl.com/cdsike>

Licensed **hospital manufacturing units** also manufacture 'special-order' products as unlicensed medicines, the principal NHS units are listed below. A database (*Pro-File*, [www.pro-file.nhs.uk](http://www.pro-file.nhs.uk)) provides information on medicines manufactured in the NHS; access is restricted to NHS pharmacy staff.

The Association of Pharmaceutical Specials Manufacturers may also be able to provide further information about commercial companies ([www.apsm-uk.com](http://www.apsm-uk.com)).

The MHRA recommends that an unlicensed medicine should only be used when a patient has special requirements that cannot be met by use of a licensed medicine

As well as being available direct from the hospital manufacturer(s) concerned, many NHS-manufactured Specials may be bought from the Oxford Pharmacy Store, owned and operated by Oxford Health NHS Foundation Trust.

## England

### London

#### Barts and the London NHS Trust

Mr J. Singh  
Head of PMU  
Barts Health NHS Trust  
Pathology and Pharmacy Building

# Cardiovascular Risk Prediction Charts

Heart 2005; 91(Suppl V): v1-v52

## How to use the Cardiovascular Risk Prediction Charts for Primary Prevention

These charts are for estimating cardiovascular disease (CVD) risk (non-fatal myocardial infarction and stroke, coronary and stroke death and new angina pectoris) for individuals who have **not** already developed coronary heart disease (CHD) or other major atherosclerotic disease. They are an aid to making clinical decisions about how intensively to intervene on lifestyle and whether to use antihypertensive, lipid lowering and anti-platelet medication, but should **not** replace clinical judgment.

- The use of these charts is **not appropriate** for patients who have existing diseases which already put them at high risk such as:
  - coronary heart disease or other major atherosclerotic disease;
  - familial hypercholesterolaemia or other inherited dyslipidaemias;
  - renal dysfunction including diabetic nephropathy;
  - type 1 and 2 diabetes mellitus.
- The charts should **not** be used to decide whether to introduce antihypertensive medication when blood pressure is persistently at or above 160/100 mmHg or when target organ damage due to hypertension is present. In both cases antihypertensive medication is recommended regardless of CVD risk. Similarly the charts should **not** be used to decide whether to introduce lipid-lowering medication when the ratio of serum total to HDL cholesterol exceeds 6. Such medication is generally then indicated regardless of estimated CVD risk.
- To estimate an individual's absolute 10-year risk of developing CVD choose the chart for his or her sex, lifetime smoking status and age. Within this square identify the level of risk according to the point where the coordinates for systolic blood pressure and the ratio of total cholesterol to high density lipoprotein (HDL) cholesterol meet. If no HDL cholesterol result is available, then assume this is 1.0 mmol/litre and the lipid scale can be used for total cholesterol alone.
- Higher risk individuals (red areas) are defined as those whose 10-year CVD risk exceeds 20%, which is approximately equivalent to the coronary heart disease risk of > 15% over the same period.
- The chart also assists in identifying individuals whose 10-year CVD risk is moderately increased in the range 10–20% (orange areas) and those in whom risk is lower than 10% over 10 years (green areas).
- Smoking status should reflect lifetime exposure to tobacco and not simply tobacco use at the time of assessment. For example, those who have given up smoking within 5 years should be regarded as current smokers for the purposes of the charts.
- The initial blood pressure and the first random (non-fasting) total cholesterol and HDL cholesterol can be used to estimate an individual's risk. However, the decision on using drug therapy should generally be based on repeat risk factor measurements over a period of time.
- Men and women do not reach the level of risk predicted by the charts for the three age bands until they reach the ages 49, 59, and 69 years respectively. The charts will overestimate current risk most in the under 40s. Clinical judgement must be exercised in deciding on treatment in younger patients. However, it should be recognised that blood pressure and cholesterol tend to rise most and HDL cholesterol to decline most in younger people already with adverse levels. Left untreated, their risk at the age of 49 years is likely to be higher than the projected risk shown on the age-under-50-years chart. From age 70 years the CVD risk, especially for men, is usually  $\geq 20\%$  over 10 years and the charts will underestimate true total CVD risk.
- These charts (and all other currently available methods of CVD risk prediction) are based on groups of people with **untreated** levels of blood pressure, total cholesterol and HDL cholesterol. In patients already receiving antihypertensive therapy in whom the decision is to be made about whether to introduce lipid-lowering medication, or vice versa, the charts can only act as a guide. Unless recent pre-treatment risk factor values are available it is generally safest to assume that CVD risk is higher than that predicted by current levels of blood pressure or lipids on treatment.
- CVD risk is also higher than indicated in the charts for:
  - those with a family history of premature CVD (male first-degree relatives aged < 55 years and female first-degree relatives aged < 65 years) which increases the risk by a factor of approximately 1.5;
  - men with HDL cholesterol < 1 mmol/litre or women with HDL cholesterol < 1.2 mmol/litre;
  - those with raised triglyceride levels (> 1.7 mmol/litre);
  - those with BMI  $\geq 30$  kg/m<sup>2</sup>;
  - women with premature menopause;
  - those who are not yet diabetic, but have impaired fasting glycaemia (6.1–6.9 mmol/litre) or impaired glucose tolerance (2 hour glucose  $\geq 7.8$  mmol/litre but < 11.1 mmol/litre in an oral glucose tolerance test).
- The charts have not been validated in ethnic minorities and in some may underestimate CVD risk. For example, in people originating from the Indian subcontinent it is safest to assume that the CVD risk is higher than predicted from the charts (1.4 times).

(Continued over)

- An individual can be shown on the chart the direction in which his or her risk of CVD can be reduced by changing smoking status, blood pressure, or cholesterol, but it should be borne in mind that the estimate of risk is for a group of people with similar risk factors and that within that group there will be considerable variation in risk. It should also be pointed out in younger people that the estimated risk will generally not be reached before the age of 50, if their current blood pressure and lipid levels remain unchanged. The charts are primarily to assist in directing intervention to those who typically stand to benefit most.

The estimation of CVD risk in NICE clinical guideline 67 (May 2008): *Lipid modification—Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease* (available at [www.nice.org.uk](http://www.nice.org.uk)) differs from that shown here as follows:

- estimated CVD risk increases by a factor of 1.5 in those with a family history of premature CHD (male first-degree relatives aged < 55 years and female first-degree relatives aged < 65 years)
- estimated CVD risk increases by a factor of 1.5–2 if more than one first-degree relative has a history of premature CHD
- estimated CVD risk for South Asian **men** is increased by a factor of 1.4
- CVD risk is higher than estimated in those with BMI > 40 kg/m<sup>2</sup>

The NICE guideline does not include the recommendation to treat all patients with a serum total to HDL cholesterol ratio of greater than 6 with lipid-lowering drugs.

The NICE guideline advises that the following factor is also taken into account when calculating CVD risk:

- presence of left ventricular hypertrophy

In addition, NICE advises that all patients over the age of 75 years should be considered at increased risk of CVD, and are likely to benefit from treatment.

In February 2010, NICE withdrew the recommendation that the Framingham risk equation should be the equation of choice for assessment of CVD risk, but agreed that it should be considered as one of the possible equations to use.

# Nondiabetic Men

Non-smoker

Smoker

Age under 50 years

Age 50–59 years

Age 60 years and over

- CVD risk <10% over next 10 years
- CVD risk 10-20% over next 10 years
- CVD risk >20% over next 10 years

SBP = systolic blood pressure mmHg  
 TC : HDL = serum total cholesterol to HDL cholesterol ratio

(Continued over)

# Nondiabetic Women

Non-smoker

Smoker

Age under 50 years

Age 50–59 years

Age 60 years and over

- CVD risk <10% over next 10 years
- CVD risk 10-20% over next 10 years
- CVD risk >20% over next 10 years

SBP = systolic blood pressure mmHg  
TC : HDL = serum total cholesterol to HDL cholesterol ratio

# ADULT ADVANCED LIFE SUPPORT ALGORITHM

## During CPR

- Ensure high-quality CPR: rate, depth, recoil
- Plan actions before interrupting CPR
- Give oxygen
- Consider advanced airway and capnography
- Continuous chest compressions when advanced airway in place
- Vascular access (intravenous, intraosseous)
- Give adrenaline every 3-5 min
- Correct reversible causes

## Reversible causes

- Hypoxia
- Hypovolaemia
- Hypo- / hyperkalaemia / metabolic
- Hypothermia
- Thrombosis - coronary or pulmonary
- Tamponade - cardiac
- Toxins
- Tension pneumothorax

## Medical emergencies in the community

Drug treatment outlined below is intended for use by appropriately qualified healthcare professionals. Only drugs that are used for immediate relief are shown; advice on supporting care is not given. Where the patient's condition requires investigation and further treatment, the patient should be transferred to hospital promptly.

### Anaphylaxis

(section 3.4.3)

**Adrenaline injection** (1 mg/mL (1 in 1000))

- By intramuscular injection  
**CHILD UNDER 6 YEARS** 150 micrograms (0.15 mL), repeated every 5 minutes if necessary  
**CHILD 6–12 YEARS** 300 micrograms (0.3 mL), repeated every 5 minutes if necessary  
**CHILD 12–18 YEARS** 500 micrograms (0.5 mL), repeated every 5 minutes if necessary; 300 micrograms (0.3 mL) if **CHILD** is small or prepubertal  
**ADULT** 500 micrograms (0.5 mL), repeated every 5 minutes if necessary

High-flow **oxygen** (section 3.6) and **intravenous fluids** should be given as soon as available.

**Chlorphenamine injection** by intramuscular or intravenous injection (section 3.4.1) may help counter histamine-mediated vasodilation and bronchoconstriction.

**Hydrocortisone** (preferably as sodium succinate) by intravenous injection (section 6.3.2) has delayed action but should be given to severely affected patients to prevent further deterioration.

### Angina: unstable

(section 2.10.1)

**Aspirin dispersible tablets** (75 mg, 300 mg)

- By mouth (dispersed in water or chewed)  
**ADULT** 300 mg

*Plus*

*either* **Glyceryl trinitrate aerosol spray** (400 micrograms/metered dose)

- Sublingually  
**ADULT** 1–2 sprays, repeated as required

*or* **Glyceryl trinitrate tablets** (300 micrograms, 500 micrograms, 600 micrograms)

- Sublingually  
**ADULT** 0.3–1 mg, repeated as required

### Asthma: acute

(section 3.1)

Regard each emergency consultation as being for **severe acute asthma** until shown otherwise; failure to respond adequately at **any time** requires immediate transfer to hospital

*Either* **salbutamol aerosol inhaler** (100 micrograms/metered inhalation)

- By aerosol inhalation via large-volume spacer (and a close-fitting face mask if child under 3 years)  
**ADULT** and **CHILD** 2–10 puffs each inhaled separately, repeated every 10–20 minutes or as necessary

*or* **salbutamol nebuliser solution** (1 mg/mL, 2 mg/mL)

- By inhalation of nebulised solution (via oxygen-driven nebuliser if available)  
**CHILD UNDER 5 YEARS** 2.5 mg every 20–30 minutes or as necessary  
**CHILD 5–12 YEARS** 2.5–5 mg every 20–30 minutes or as necessary  
**ADULT** 5 mg every 20–30 minutes or as necessary

*or* **terbutaline nebuliser solution** (2.5 mg/mL)

- By inhalation of nebulised solution (via oxygen-driven nebuliser if available)  
**CHILD UNDER 5 YEARS** 5 mg every 20–30 minutes or as necessary  
**CHILD 5–12 YEARS** 5–10 mg every 20–30 minutes or as necessary  
**ADULT** 10 mg every 20–30 minutes or as necessary

*Plus* (in all cases)

*either* **prednisolone tablets (or prednisolone soluble tablets)** (5 mg)

- By mouth  
**CHILD UNDER 12 YEARS** 1–2 mg/kg (max. 40 mg) once daily for up to 3 days or longer if necessary; if child has been taking an oral corticosteroid for more than a few days, give prednisolone 2 mg/kg (max. 60 mg) once daily  
**ADULT** 40–50 mg once daily for at least 5 days

*or* **hydrocortisone** (preferably as sodium succinate)

- By intravenous injection  
**CHILD UNDER 12 YEARS** 4 mg/kg (max. 100 mg) every 6 hours until conversion to oral prednisolone is possible; alternative dose if weight unavailable,  
**CHILD UNDER 2 YEARS** 25 mg, **2–5 YEARS** 50 mg, **5–12 YEARS** 100 mg  
**ADULT** 100 mg every 6 hours until conversion to oral prednisolone is possible

High-flow **oxygen** (section 3.6) if available (via face mask in children)

Monitor response 15 to 30 minutes after nebulisation; if any signs of acute asthma persist, arrange hospital admission. While awaiting ambulance, repeat **nebulised beta<sub>2</sub> agonist** (as above) and give with

**ipratropium nebuliser solution** (250 micrograms/mL)

- By inhalation of nebulised solution (via oxygen-driven nebuliser if available)  
**CHILD UNDER 12 YEARS** 250 micrograms, repeated every 20–30 minutes for the first 2 hours, then every 4–6 hours as necessary  
**ADULT** 500 micrograms every 4–6 hours as necessary

---

## Convulsive (including febrile) seizures lasting longer than 5 minutes

(section 4.8.2 and section 4.8.3)

Either **diazepam** rectal solution (2 mg/mL, 4 mg/mL)

- By rectum
  - NEONATE** 1.25–2.5 mg, repeated once after 10–15 minutes if necessary
  - CHILD 1 MONTH–2 YEARS** 5 mg, repeated once after 10–15 minutes if necessary
  - CHILD 2–12 YEARS** 5–10 mg, repeated once after 10–15 minutes if necessary
  - ADULT and CHILD OVER 12 YEARS** 10–20 mg (**ELDERLY** 10 mg), repeated once after 10–15 minutes if necessary

or **midazolam** oromucosal solution

- By buccal administration, repeated once after 10 minutes if necessary
  - NEONATE** 300 micrograms/kg
  - CHILD 1–3 MONTHS** 300 micrograms/kg (max. 2.5 mg)
  - CHILD 3 MONTHS–1 YEAR** 2.5 mg
  - CHILD 1–5 YEARS** 5 mg
  - CHILD 5–10 YEARS** 7.5 mg
  - ADULT and CHILD OVER 10 YEARS** 10 mg

---

## Croup

(section 3.1)

**Dexamethasone** oral solution (2 mg/5 mL)

- By mouth
  - CHILD 1 MONTH–2 YEARS** 150 micrograms/kg as a single dose

---

## Diabetic hypoglycaemia

(section 6.1.4)

**Glucose or sucrose**

- By mouth
  - ADULT and CHILD OVER 2 YEARS** approx. 10–20 g (55–110 mL *Lucozade® Energy Original* or 100–200 mL *Coca-Cola®*—both non-diet versions or 2–4 teaspoonsful of sugar or 3–6 sugar lumps) repeated after 10–15 minutes if necessary

or if hypoglycaemia unresponsive or if oral route cannot be used

**Glucagon** injection (1 mg/mL)

- By subcutaneous or intramuscular injection
  - CHILD BODY-WEIGHT UNDER 25 KG** 500 micrograms (0.5 mL)
  - CHILD BODY-WEIGHT OVER 25 KG** 1 mg (1 mL)
  - ADULT** 1 mg (1 mL)

or if hypoglycaemia prolonged or unresponsive to glucagon after 10 minutes

**Glucose intravenous infusion** (10%)

- By intravenous injection into large vein
  - CHILD 1 MONTH–18 YEARS** 5 mL/kg (glucose 500 mg/kg)

**Glucose intravenous infusion** (20%)

- By intravenous injection into large vein
  - ADULT** 50 mL

---

## Meningococcal disease

(Table 1, section 5.1)

**Benzylpenicillin sodium injection** (600 mg, 1.2 g)

- By intravenous injection (or by intramuscular injection if venous access not available)
  - NEONATE** 300 mg
  - CHILD 1 MONTH–1 YEAR** 300 mg
  - CHILD 1–10 YEARS** 600 mg
  - CHILD 10–18 YEARS** 1.2 g
  - ADULT** 1.2 g

**Note** A single dose should be given before urgent transfer to hospital, so long as this does not delay the transfer

or if history of allergy to penicillin

**Cefotaxime injection** (1 g)

- By intravenous injection (or by intramuscular injection if venous access not available)
  - NEONATE** 50 mg/kg
  - CHILD 1 MONTH–12 YEARS** 50 mg/kg (max. 1 g)
  - CHILD 12–18 YEARS** 1 g
  - ADULT** 1 g

**Note** A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer

or if history of immediate hypersensitivity reaction (including anaphylaxis, angioedema, urticaria, or rash immediately after administration) to penicillin or to cephalosporins

**Chloramphenicol injection** (1 g)

- By intravenous injection
  - CHILD 1 MONTH–18 YEARS** 12.5–25 mg/kg
  - ADULT** 12.5–25 mg/kg

**Note** A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer

---

## Myocardial infarction: ST-segment elevation

(section 2.10.1)

**Aspirin dispersible tablets** (75 mg, 300 mg)

- By mouth (dispersed in water or chewed)
  - ADULT** 300 mg

**Glyceryl trinitrate aerosol spray** (400 micrograms/metered dose)

- Sublingually
  - ADULT** 1–2 sprays, repeated as required

or **Glyceryl trinitrate tablets** (300 micrograms, 500 micrograms, 600 micrograms)

- Sublingually
  - ADULT** 0.3–1 mg, repeated as required

**Metoclopramide injection** (5 mg/mL)

- By intravenous injection
  - ADULT (UNDER 60 KG) 18–19 YEARS** 5 mg
  - ADULT (OVER 60 KG) 18–19 YEARS** 10 mg
  - ADULT OVER 19 YEARS** 10 mg

**Diamorphine injection** (5 mg powder for reconstitution)

- By slow intravenous injection (1–2 mg/minute)  
**ADULT** 5 mg followed by a further 2.5–5 mg if necessary; **ELDERLY** or **FRAIL** patients, reduce dose by half

or **Morphine sulphate injection** (10 mg/mL)

- By slow intravenous injection (1–2 mg/minute)  
**ADULT** 5–10 mg followed by a further 5–10 mg if necessary; **ELDERLY** or **FRAIL** patients, reduce dose by half

**Oxygen**, if appropriate

---

## **Myocardial infarction: non-ST-segment elevation**

Treat as for *Angina: unstable*, above

## Approximate conversions and units

lb	kg	stones	kg	mL	fl oz
1	0.45	1	6.35	50	1.8
2	0.91	2	12.70	100	3.5
3	1.36	3	19.05	150	5.3
4	1.81	4	25.40	200	7.0
5	2.27	5	31.75	500	17.6
6	2.72	6	38.10	1000	35.2
7	3.18	7	44.45		
8	3.63	8	50.80		
9	4.08	9	57.15		
10	4.54	10	63.50		
11	4.99	11	69.85		
12	5.44	12	76.20		
13	5.90	13	82.55		
14	6.35	14	88.90		
		15	95.25		

## Length

1 metre (m)	= 1000 millimetres (mm)
1 centimetre (cm)	= 10 mm
1 inch (in)	= 25.4 mm
1 foot (ft)	= 12 inches
12 inches	= 304.8 mm

## Mass

1 kilogram (kg)	= 1000 grams (g)
1 gram (g)	= 1000 milligrams (mg)
1 milligram (mg)	= 1000 micrograms
1 microgram	= 1000 nanograms
1 nanogram	= 1000 picograms

## Volume

1 litre	= 1000 millilitres (mL)
1 millilitre (1 mL)	= 1000 microlitres
1 pint	≈ 568 mL

## Other units

1 kilocalorie (kcal)	= 4186.8 joules (J)
1000 kilocalories (kcal)	= 4.1868 megajoules (MJ)
1 megajoule (MJ)	= 238.8 kilocalories (kcal)
1 millimetre of mercury (mmHg)	= 133.3 pascals (Pa)
1 kilopascal (kPa)	= 7.5 mmHg (pressure)

**Plasma-drug concentrations** in the BNF are expressed in mass units per litre (e.g. mg/litre). The approximate equivalent in terms of amount of substance units (e.g. micromol/litre) is given in brackets.

## Prescribing for children

### Weight, height, and gender

The table below shows the **mean values** for weight, height, and gender by age; these values have been derived from the UK-WHO growth charts 2009 and UK1990 standard centile charts, by extrapolating the 50th centile, and may be used to calculate doses in the absence of measurements. However, an individual's weight and height might vary considerably from the values in the table and it is important to ensure that the value chosen is appropriate. In most cases the actual measurement should be obtained as soon as possible and the dose re-calculated.

Age	Weight	Height
	kg	cm
Full-term neonate	3.5	51
1 month	4.3	55
2 months	5.4	58
3 months	6.1	61
4 months	6.7	63
6 months	7.6	67
1 year	9	75
3 years	14	96
5 years	18	109
7 years	23	122
10 years	32	138
12 years	39	149
14 year-old boy	49	163
14 year-old girl	50	159
Adult male	68	176
Adult female	58	164

---

## Recommended wording of cautionary and advisory labels

For details see Appendix 3

1. Warning: This medicine may make you sleepy
2. Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines. Do not drink alcohol
3. Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines
4. Warning: Do not drink alcohol
5. Do not take indigestion remedies 2 hours before or after you take this medicine
6. Do not take indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine
7. Do not take milk, indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine
8. Warning: Do not stop taking this medicine unless your doctor tells you to stop
9. Space the doses evenly throughout the day. Keep taking this medicine until the course is finished, unless you are told to stop
10. Warning: Read the additional information given with this medicine
11. Protect your skin from sunlight—even on a bright but cloudy day. Do not use sunbeds
12. Do not take anything containing aspirin while taking this medicine
13. Dissolve or mix with water before taking
14. This medicine may colour your urine. This is harmless
15. Caution: flammable. Keep your body away from fire or flames after you have put on the medicine
16. Dissolve the tablet under your tongue—do not swallow. Store the tablets in this bottle with the cap tightly closed. Get a new supply 8 weeks after opening
17. Do not take more than... in 24 hours
18. Do not take more than... in 24 hours. Also, do not take more than... in any one week
19. Warning: This medicine makes you sleepy. If you still feel sleepy the next day, do not drive or use tools or machines. Do not drink alcohol
21. Take with or just after food, or a meal
22. Take 30 to 60 minutes before food
23. Take this medicine when your stomach is empty. This means an hour before food or 2 hours after food
24. Suck or chew this medicine
25. Swallow this medicine whole. Do not chew or crush
26. Dissolve this medicine under your tongue
27. Take with a full glass of water
28. Spread thinly on the affected skin only
29. Do not take more than 2 at any one time. Do not take more than 8 in 24 hours
30. Contains paracetamol. Do not take anything else containing paracetamol while taking this medicine. Talk to a doctor at once if you take too much of this medicine, even if you feel well
32. Contains aspirin. Do not take anything else containing aspirin while taking this medicine

## Abbreviations and symbols

Internationally recognised units and symbols are used in the BNF where possible.

ACBS	Advisory Committee on Borderline Substances, see Appendix 2
ACE	Angiotensin-converting enzyme
ADHD	Attention deficit hyperactivity disorder
AIDS	Acquired immunodeficiency syndrome
approx.	approximately
AV	atrioventricular
BAN	British Approved Name
BMI	body mass index
BP	British Pharmacopoeia 2013, unless otherwise stated
BPC	British Pharmaceutical Codex 1973 and Supplement 1976, unless otherwise stated
CAPD	Continuous ambulatory peritoneal dialysis
	preparation in Schedule 1 of the Misuse of Drugs Regulations 2001 (and subsequent amendments). For regulations see Controlled Drugs and Drug Dependence
	preparation in Schedule 2 of the Misuse of Drugs Regulations 2001 (and subsequent amendments). For regulations see Controlled Drugs and Drug Dependence
	preparation in Schedule 3 of the Misuse of Drugs Regulations 2001 (and subsequent amendments). For regulations see Controlled Drugs and Drug Dependence
	preparation in Schedule 4 (Part I) of the Misuse of Drugs Regulations 2001 (and subsequent amendments). For regulations see Controlled Drugs and Drug Dependence
	preparation in Schedule 4 (Part II) of the Misuse of Drugs Regulations 2001 (and subsequent amendments). For regulations see Controlled Drugs and Drug Dependence
CHM	Commission on Human Medicines
CHMP	Committee for Medicinal Products for Human Use
CNS	central nervous system
CSM	Committee on Safety of Medicines (now subsumed under Commission on Human Medicines)
d. c.	direct current
DMARD	Disease-modifying antirheumatic drug
DPF	Dental Practitioners' Formulary
e/c	enteric-coated (termed gastro-resistant in BP)
ECG	electrocardiogram
EEG	electro-encephalogram
eGFR	estimated glomerular filtration rate, see Prescribing in renal impairment
f/c	film-coated
G6PD	glucose 6-phosphate dehydrogenase
HIV	Human immunodeficiency virus
HRT	Hormone replacement therapy
i/m	intramuscular
i/v	intravenous
INR	international normalised ratio
MAOI	Monoamine-oxidase inhibitor
max.	maximum
MHRA	Medicines and Healthcare products Regulatory Agency
m/r	modified-release
NCL	no cautionary labels, see Appendix 3
NHS	National Health Service
	not prescribable under National Health Service (NHS)
NICE	National Institute for Health and Care Excellence
NPF	Nurse Prescribers' Formulary
NSAID	Non-steroidal anti-inflammatory drug
NSTEMI	non-ST-segment elevation myocardial infarction

PGD	patient group direction
PHE	Public Health England (formerly Health Protection Agency (HPA))
	prescription-only medicine, see Fig. 1 How to use the BNF
®	trade mark
rINN	Recommended International Non-proprietary Name
RSV	respiratory syncytial virus
s/c	sugar-coated
SLS	Selected List Scheme
SMC	Scottish Medicines Consortium
SPC	Summary of Product Characteristics
spp.	species
SSRI	Selective serotonin reuptake inhibitor
STEMI	ST-segment elevation myocardial infarction
UK	United Kingdom
Units	for SI units see Prescription Writing
WHO	World Health Organization
▼	limited experience of the use of this product and the MHRA requests that all suspected adverse reactions should be reported, see Adverse Reactions to Drugs

## Latin abbreviations

Directions should be in English without abbreviation. However, Latin abbreviations have been used when prescribing.

The following is a list of appropriate abbreviations. It should be noted that the English version is not always an exact translation.

a. c.	= ante cibum (before food)
b. d.	= bis die (twice daily)
o. d.	= omni die (every day)
o. m.	= omni mane (every morning)
o. n.	= omni nocte (every night)
p. c.	= post cibum (after food)
p. r. n.	= pro re nata (when required)
q. d. s.	= quater die sumendum (to be taken four times daily)
q. q. h.	= quarta quaque hora (every four hours)
stat	= immediately
t. d. s.	= ter die sumendum (to be taken three times daily)
t.i.d.	= ter in die (three times daily)

## E numbers

The following is a list of common E numbers and the inactive ingredients to which they correspond.

E102 Tartrazine	E211 Sodium Benzoate
E104 Quinoline Yellow	E223 Sodium Metabisulfite
E110 Sunset Yellow FCF	E320 Butylated Hydroxyanisole
E123 Amaranth	E321 Butylated Hydroxytoluene
E124 Ponceau 4R	E322 Lecithins
E127 Erythrosine BS	E420 Sorbitol
E132 Indigo Carmine	E421 Mannitol
E142 Green S	E422 Glycerol
E171 Titanium Dioxide	E901 Beeswax (white and yellow)
E172 Iron oxides, iron hydroxides	E1520 Propylene Glycol
E200 Sorbic Acid
